</table>
1 Introduction

The support backbone is the infrastructure that we use to provide you with technical support. Your systems connect to the support backbone to exchange information, such as support incident data, maintenance planner data, and SAP EarlyWatch Alert data.

Due to the increasing demand placed on the support backbone, we have updated the infrastructure so that we can continue to provide you with the support you require. As part of this process, the way in which systems connect to SAP has been redesigned to include the following changes:

- The HTTPS protocol is now used instead of RFC.
- A technical communication user handles the data transfer instead of generic users.
- There is no generic inbound interface.
- Applications send data asynchronously unless the data is sent manually.

To help you transition smoothly to the updated support backbone, the legacy infrastructure will remain in place until January 8, 2020.

This document provides step-by-step tasks to help you retain connectivity to the support backbone after this date.

⚠️ Caution

This checklist is not intended for value-added resellers (VAR) or partners running another multi-customer scenario.

Before you start to work through this checklist, please familiarize yourself with the following information:

- **SAP Support Backbone Update: How the SAP Support Backbone Update Affects SAP Solution Manager and Focused Run** (including a list of affected SAP Solution Manager scenarios)
2 Step-by-Step Checklist

Before You Begin

We recommend that you work through the configuration steps with a user that has extended basic authorizations, as well as authorizations for SAP Solution Manager Configuration.

For the latest updates to SAP Solution Manager authorizations, see SAP Note 2250709.

⚠️ Caution

Information about the changes you need to make to connect to the updated support backbone is provided in this checklist, documentation in SAP Solution Manager Configuration (transaction SOLMAN_SETUP), and task list documentation in transaction STC01. If, despite our best efforts, you find discrepancies between these sources, please treat them with the following order of priority:

1. This checklist
2. Task list documentation
3. Documentation in SAP Solution Manager Configuration

If You Need Help

Throughout this document, we provide some hints that you can use to resolve any problems that you may encounter. However, if your system does not run as expected after you have migrated to the updated support backbone, please refer to the central point of call for troubleshooting at Support Hub Connectivity: Guided Answers.

If you have configured all of the settings described in this document but you continue to experience connectivity issues, please open a message on component SV-SMG-INS-CFG and prefix your message title with "Backbone Update:" to simplify processing.

If you have a question about the technical infrastructure of the new communication channels, please open an incident on component XX-SER-NET-HTL. If you require more background about the relationship between the support backbone and SAP Solution Manager, see Connectivity to SAP's Support Backbone.

Procedure

Use the following overview to work through the steps required to retain communication with the updated support backbone.
1. Request a Technical Communication User [page 6]
   Where: SAP ONE Support Launchpad | Useful SAP Notes: 2174416, 2740667, 2805811, 2911301
2. Check the Required Kernel Version [page 8]
   Where: SAP Solution Manager system
3. Check and Install CommonCryptoLib [page 9]
   Where: transaction STRUST | Useful SAP Notes: 2390726
4. Check and Adjust the TLS/SSL Protocol Version [page 10]
   Where: transaction RZ11 | Useful SAP Notes: 510007
5. Configure and Activate HTTPS/SSL [page 11]
   Where: transaction SMICM | Useful SAP Notes: 510007
6. Check the Application Server [page 14]
   Where: system OS
7. Install SSL Certificates [page 15]
   Where: transaction STRUST | Useful SAP Notes: 2631190
8. Execute Task List SAP_SUPPORT_HUB_CONFIG [page 16]
   Where: transactions STC01, SM59 | Useful SAP Notes: 2500061, 2454045
9. Execute Task List SAP_BASIS_CONFIG_OSS_COMM [page 19]
   Where: transactions STC01, SM59 | Mandatory SAP Notes: 2827658
10. Prepare Note Assistant [page 22]
    Where: transactions SA38, SNOTE | Mandatory SAP Notes: 2576306 | Important SAP Notes: 2537133, 2721941, 2836302
11. Adjust Your User Logon Information [page 23]
    Where: transaction AISUSER | Useful SAP Notes: 2000132, 2174416
    Where: transaction SOLMAN_SETUP | Useful SAP Notes: 2525999, 2880549
13. Check Jobs Using the New Connections [page 26]
    Where: transaction SM37 | Useful SAP Notes: 2250709, 2525987
14. Apply Final Corrections [page 29]
    After you have completed the upgrade tasks, there are handful of SAP Notes that you must implement and some related activities to work through.

2.1 Request a Technical Communication User

Where: SAP ONE Support Launchpad | Useful SAP Notes: 2174416, 2740667, 2805811, 2911301

Technical communication users allow machine-to-machine communication and data exchange. Only super administrators and user administrators have access to the Technical Users app, where they can create, activate, and delete technical communication users.

Note

Depending on your current release, you may already have at least one technical communication user (although you can request more if required). Technical communication users were introduced with SAP Solution Manager 7.2. They are also occasionally referred to as “technical S-users”, “support hub users”, or “users for support hub communication”.
Make sure that you request your technical communication users in good time. It can take up to 24 hours to receive them.

The number of technical communication users that you require depends on your company policy. It is possible to use one technical communication user for all systems. However, this may lead to connectivity issues if the user gets locked.

→ Recommendation

We recommend that you request one technical communication user per installation / system track (for example, DEV-QAS-PRD). The highest level of flexibility and security can be reached by using one technical communication user per system.

Procedure

1. Request your technical communication user as described in SAP Note 2174416 and create client certificates for it as described in 2805811 (initial creation) and 2911301 (automated renewal).
2. Replace generic users with the technical communication user(s) as instructed in SAP Note Request your technical communication user as defined in SAP Note 2740667.
3. Make sure that you activate your technical communication user as described in SAP Note 2174416.

For a list of frequently asked questions about technical communication users, see the User Handling section at Update of SAP’s Support Backbone: Frequently Asked Questions (FAQ).

Check

You can check whether your technical communication user has been activated successfully at https://launchpad.support.sap.com/#/techuser.

Your Notes

SAP Note 2805811
How to enable client certificate authentication for technical communication users

SAP Note 2911301
SAP Support Portal connection - Renew client certificate of technical S-user

2.2 Check the Required Kernel Version

Where: SAP Solution Manager system

To retain communication with the support backbone, you must make sure that your SAP Solution Manager system is running on the correct kernel version and Support Package level.

Valid kernel versions and Support Package levels are:

- Kernel release 742, Support Package level 401 and above
- Kernel release 745, Support Package level 400 and above
- Kernel release > 745

Procedure

1. In your SAP Solution Manager system, choose System > Status...
2. Click (Other kernel info.) or press SHIFT + F5.

Your kernel release and Support Package level are shown in the Kernel Information area. If they are below the required levels, patch to the level specified above.

Your Notes

____________________________________________________________________________________________________
____________________________________________________________________________________________________
____________________________________________________________________________________________________
____________________________________________________________________________________________________
____________________________________________________________________________________________________
____________________________________________________________________________________________________
2.3 Check and Install CommonCryptoLib

Where: transaction STRUST | Useful SAP Notes: 2390726

You require at least version 8.4.48 of the CommonCryptoLib library to retain your connection to the support backbone.

→ Recommendation

We recommend that you always upgrade to the latest version of CommonCryptoLib.

Procedure

1. In your SAP Solution Manager system, call transaction STRUST and choose Environment Display SSF Version from the menu.
2. Check the installed version of CommonCryptoLib.

3. If you have to update your version of CommonCryptoLib, go to the Software Downloads area of SAP Support Portal and search for CommonCryptoLib in the Support Packages and Patches area.

For more information, see the Prerequisites section of Support Hub Connectivity Configuration in SAP Solution Manager 7.2 SP05 or Higher.

Your Notes
SAP Note 2390726
Fixes in CommonCryptoLib 8.5.7

2.4 Check and Adjust the TLS/SSL Protocol Version

Where: transaction RZ11 | Useful SAP Notes: 510007

The connection to the support backbone requires SSL protocol version TLS1.1 or higher for outbound HTTP connections. TLS versions 1.0, 1.1, and 1.2 are enabled by the ssl/client_ciphersuites parameter value.

To communicate properly with the support backbone, make sure that SSL profile parameter ssl/client_ciphersuites for outgoing HTTP connections is set correctly. We recommend a value of 150:PFS:HIGH::EC_P256:EC_HIGH provided that you have implemented the correction instructions and manual activities in SAP Note 2781565. For detailed, expert information, see SAP Note 510007. You can also use the value 918:PFS:HIGH::EC_P256:EC_HIGH for SAP Solution Manager (in which case, SAP Note 2781565 is not required). However, this will not work with TLS protocol versions above 1.2.

Also make sure that you are using the most recent version of CommonCryptoLib (8.4.31 or higher).

Check

1. Call transaction RZ11 and enter ssl/client_ciphersuites.
2. Check that the value of parameter ssl/client_ciphersuites is set to 150:PFS:HIGH::EC_P256:EC_HIGH (unless you have an exceptional use case, in which case refer to the values in SAP Note 510007).
2.5 Configure and Activate HTTPS/SSL

Where: transaction SMICM | Useful SAP Notes: 510007

Check that the communication between your Web browser and your SAP Solution Manager system is handled using the HTTPS protocol.

→ Recommendation

Allow yourself plenty of time to complete this step. It may take a few hours.

The connection to the updated support backbone concerns only ABAP systems, although we recommend that you use HTTPS in your Java systems as well.

Most functions in SAP Solution Manager use either BSP or Web Dynpro technologies, which are both based on the HTTP or HTTPS protocols. The infrastructure required to handle HTTP and HTTPS requests using work processes in the SAP system is provided by the Internet Communication Framework (ICF). The ICF also handles Internet communication between systems that use the standard protocols HTTP, HTTPS, and SMTP.

To secure communication with a Web browser, you do not require any additional SAP program libraries. The only condition is that your system platform is able to access the Internet, meaning that you have the greatest amount of flexibility when responding to various communication requirements.
Recommendation

For security reasons, always use the secure HTTPS protocol for communication between Web browsers and your SAP systems.

Procedure

1. Check whether HTTPS communication is used in your SAP Solution Manager system in one of the following ways:
   - Check the URL that you use to access SAP Solution Manager applications. If it starts with https://, the HTTPS protocol is used in your system.
   - Call transaction **SMICM** and choose ➔ Goto ➔ Services ➔ from the menu. Check whether the HTTPS protocol is listed under Active Services.

   **Note**
   - If both HTTP and HTTPS are used in your system, consider using HTTPS only.
   - If you want to configure the support backbone connection in a sandbox/test environment, HTTPS is not mandatory and this step can be skipped.

2. If an HTTPS connection is not used, see the SAP NetWeaver Security Guide on SAP Help Portal and pay particular attention to the following topics:
   - Transport Layer Security
   - Configuring SAP NetWeaver AS for ABAP to Support SSL
   - Configuring Transport Layer Security on SAP NetWeaver AS for Java

3. After you have configured the HTTPS connection, enter it in SAP Solution Manager Configuration (transaction SOLMAN_SETUP) in the System Preparation scenario. Navigate to the Check Prerequisites step and maintain the activity Check Secure Web Browser Comm. (HTTPS).

Using HTTPS in SAP Solution Manager ABAP and Java Only

In your SAP Solution Manager ABAP system, you can use transaction RZ11 to set the value of parameter login/ticket_only_by_https to 1 to make sure that only the HTTPS protocol is used. SAP Solution Manager then also uses HTTPS whenever a “jump-in” URL to the SAP Solution Manager Java system is generated.

However, setting this parameter to 1 may cause inconsistencies when applications submit calls via HTTP (for example, from the SAP Fiori launchpad). To avoid these inconsistencies, open SAP Solution Manager Configuration (transaction SOLMAN_SETUP) and under Infrastructure Preparation, navigate to ➔ Set Up Connectivity ➔ Define HTTP Connectivity ➔. From there, you can specify that only HTTPS is to be used.

Using SAP Web Dispatcher

For information about the protocols used for SAP Web Dispatcher, see SAP Web Dispatcher and SSL.

Table **HTTPURLLOC**

Table HTTPURLLOC is automatically updated with the external access URLs that are specified in the Define HTTP Connectivity step of the Infrastructure Preparation scenario. If you have a special landscape layout and
you want to manually maintain table HTTPURLLOC, remember to change the status of the Update HTTPURLLOC Table activity to Manually Performed (you can find this activity in the Enable Connectivity step of the Infrastructure Preparation scenario).

For more information, see Configuration Table HTTPURLLOC.

Troubleshooting

For troubleshooting information, see the guided answer Check the SMICM Log.

Parent topic: Step-by-Step Checklist [page 5]
Previous: Check and Adjust the TLS/SSL Protocol Version [page 10]
Next: Check the Application Server [page 14]

Related Information

SAP Note 510007
Setting up SSL on Application Server ABAP
2.6  Check the Application Server

Where: system OS

Make sure that the SAP Solution Manager application server can reach a server outside your network (that is to say, check your network access at OS level). In particular, the following servers must be reachable:

- apps.support.sap.com
- documents.support.sap.com
- notesdownloads.sap.com
- servicepoint.sap.com

External access can be managed in any of the following ways:

- The application server has direct access to the Internet via HTTPS
- The application server has indirect access to the Internet via HTTPS and a Web proxy.
- The application server has indirect access to external networks via HTTPS and the SAP proxy “SAProuter”.

For more information, see the guided answer Check All Prerequisites.

____________________________________________________________________________________________________

Parent topic: Step-by-Step Checklist [page 5]

Previous: Configure and Activate HTTPS/SSL [page 11]

Next task: Install SSL Certificates [page 15]
2.7 Install SSL Certificates

Where: transaction STRUST | Useful SAP Notes: 2631190

Context

The following certificates are required for the support backbone:

- VeriSign Class 3 Public Primary Certification Authority - G5
- DigiCert Global Root CA
- DigiCert Global Root G2
- DigiCert High Assurance EV Root CA

Procedure

1. Call transaction STRUST and check that SSL client SSL Client (Standard) and SSL client SSL Client (Anonymous) are correct.
2. Check that the status is green and that all of the above certificates are present for both the anonymous and standard PSEs. If this is the case, no further action is required. Otherwise, proceed with step 3 [page 15].
3. Download the required certificates from SAP Note 2631190.
4. In transaction STRUST, choose Certificate Import to add the certificates to SSL client SSL Client (Standard) and SSL client SSL Client (Anonymous).

Task overview: Step-by-Step Checklist [page 5]

Previous: Check the Application Server [page 14]

Next: Execute Task List SAP_SUPPORT_HUB_CONFIG [page 16]

Related Information

SAP Note 2631190
- Download location of SSL certificates required for Support Hub Connectivity configuration
2.8 Execute Task List SAP_SUPPORT_HUB_CONFIG

Where: transactions STC01, SM59 | Useful SAP Notes: 2500061, 2454045

Task list SAP_SUPPORT_HUB_CONFIG contains a number of tasks, some of which you may have already set up. In this case, you can use the task list to check your setup.

The task list also creates connection SAP-SUPPORT_PORTAL, which is required for the updated support backbone. Other required connections are created by task list SAP_BASIS_CONFIG_OSS_COMM.

All of the relevant information is provided in the task list itself.

**i Note**

The user and password defined in this task list must be correct. User RFC_OSS is no longer supported for any of the new connections. Make sure that you have the correct users and that they are correctly assigned.

Use your technical communication user only for communication with the support backbone. Do not use it for any other connections. If you try to log in to a system such as SAP ONE Support Launchpad using the technical communication user, you risk locking it.

If you change the password, wait for 30 minutes so that the new password can be propagated to all of the relevant SAP systems. During this time, avoid testing the channels, starting jobs, and uploading data (for example, via LMDB). The technical communication user will be locked after five failed logon attempts.

If your technical communication user does become locked (“SAP service point ping error: 401 Unauthorized”), please see SAP Note 2392726 for instructions on how to unlock it.

**Procedure**

1. Call transaction STC01.
2. Enter the name of the task list.
3. Run all of the activities described here.
4. Call transaction STC02 to check that the task list ran successfully.

For more information, see How to Configure the Step “Support Hub Connectivity” in SAP Solution Manager 7.2 as of SP05.

**Troubleshooting**

For information about changing the technical communication user, password, SAProuter string, or proxy settings for the support backbone, see this guided answer.

General troubleshooting information is available at Configuration: Support Hub Connectivity. For specific errors, refer to the table below.
### Issue

The step “Check connectivity and credentials to SAP Support Portal” fails with the error message HTTP ERROR 401: Unauthorized (SP05) or SAP service point ping error: 401 Unauthorized (SP06).

The step “Check connectivity and credentials to SAP Support Portal” fails with the error message SAP portal connection error 404: Proxy Connection Refused.

The step “Check connectivity and credentials to SAP Support Portal” fails with the error message SAP portal connection error 500: SSL Peer Certificate Untrusted.

RFC destination and connection type are incorrect in the documentation.

All applications that use a synchronous communication channel return an error message even though configuration was successful.

### Check

See the guided answer at Check the Possible Root Causes.

See the guided answer at Check Relevant HTTP Proxy or SAProuter Is Reachable from SAP Solution Manager 7.2.

See the guided answer at Check the Certificate SSL Client (Anonymous) in Transaction STRUST.

See the guided answer at Documentation Errors in Help Text of the Task List in Transaction STC01 in SAP Solution Manager 7.2 SP05.

See the guided answer at Delete the Value in Field Path Prefix in HTTP Destination SAP-SUPPORT_PORTAL and Save the Entry.

Support Hub Connectivity: Configuration Steps in SAP Solution Manager 7.2 as of SP05
2.8.1 Check the SAP-SUPPORT_PORTAL Connection

After you have executed task list SAP_SUPPORT_HUB_CONFIG, connection SAP-SUPPORT_PORTAL (HTTP Connection to ABAP System) [type H]) should be fully operational. You can verify this in transaction SM59.

Procedure

1. Call transaction SM59 and open the connection SAP-SUPPORT_PORTAL.
2. Enter the path prefix /sap/bc/bsp/svt/sapping and run the connection check.
3. If the check is successful, delete the prefix from the connection and reenter the credentials for the technical communication user.

Troubleshooting

2.9 **Execute Task List** SAP_BASIS_CONFIG_OSS_COMM

Where: transactions STC01, SM59 | Mandatory SAP Notes: 2827658

Task list SAP_BASIS_CONFIG_OSS_COMM contains a number of tasks, some of which you may have already set up. In this case, you can use the task list to check your setup.

The task list also creates connections SAP-SUPPORT_PARCELBOX and SAP-SUPPORT_NOTE_DOWNLOAD, which are required for the updated support backbone. Other required connections are created by task list SAP_SUPPORT_HUB_CONFIG.

**iNote**

Make sure that you have implemented SAP Note 2827658 to include this task list in your system.

Make sure that you run the activity *Create/Test HTTPS Connections for SAP Services (SM59)*.

**Procedure**

1. Call transaction STC01.
2. Enter the name of the task list.
3. Run all of the activities described here.
4. Call transaction STC02 to check that the task list ran successfully.
Troubleshooting

For information about changing the technical communication user, password, SAProuter string, or proxy settings for the support backbone, see this guided answer.

____________________________________________________________________________________________________
____________________________________________________________________________________________________
2.10 Prepare Note Assistant

**Where:** transactions SA38, SNOTE | **Mandatory SAP Notes:** 2576306 | **Important SAP Notes:** 2537133, 2721941, 2836302

**i Note**
This section applies only to systems to which you want to download SAP Notes (such as development or quality assurance environments). If you are transporting SAP Notes to your SAP Solution Manager system, this section is not relevant.

With the updated support backbone, downloading SAP Notes no longer uses RFC connection SAPPOSS. Instead, the SAP NetWeaver Download Service is used. This service supports the automated download of TCIs (transport-based correction instructions), including any prerequisite SAP Notes to the SAP Note you want to download.

**Procedure**

To implement the SAP NetWeaver download service, proceed as follows:

1. Configure Note Assistant to use the SAP NetWeaver download service as described in SAP Note 2537133.

2. In your SAP Solution Manager system, execute report RCWB_UNSIGNED_NOTE_CONFIG and select the option *Do not download unsigned SAP Note*.

**Check**

Check that Note Assistant connects to the updated support backbone via the download service by running the report *Defining Procedure for Downloading SAP Note* (RCWB_SNOTE_DWNLD_PROC_CONFIG). Check that the option *Download Service Application* is selected. If either of the other options is selected, return to the procedure and check your configuration.

**i Note**
Changing the setting of the radio button in report RCWB_SNOTE_DWNLD_PROC_CONFIG is not sufficient. You must go back to the procedure and set up Note Assistant correctly.

**→ Tip**
Regardless of which procedure you use to download SAP Notes, you can check the log of the downloaded SAP Note to see whether it is digitally signed. The log also includes the procedure that was used for the download.

2.11 Adjust Your User Logon Information

Where: transaction AISUSER | Useful SAP Notes: 2000132, 2174416

An S-user is a user in the support backbone with actual authorizations and must be assigned to SAP Solution Manager system users in table AISUSER, specifically to the users SOLMAN_BTC, SOLMAN_ADMIN, and SAPSUPPORT. This will allow the assigned system users to perform specific activities with the support backbone (such as sending an incident to SAP).

i Note

Table AISUSER contains your S-user, not your technical communication user. The technical communication user is intended only to establish the connection to the support backbone, and does not have any authorizations itself.
Procedure

1. Call transaction AISUSER and check that the correct contact person (S-user number) is correctly assigned to the users SOLMAN_BTC, SOLMAN_ADMIN, and SAPSUPPORT.
2. If the contact person is incorrect, enter the correct S-user.

> Recommendation

Most of the RFC destinations that were previously used to connect to the support backbone are now superfluous. After you have updated the destinations, we recommend that you disable or remove all of the RFCs that are no longer required. For example, you can disable or remove SAP-OSS, SAP-OSS-LIST-O01, SAPNET_RTCC, SDCC_OSS and even SAPOSS. (SAPOSS is being kept alive through July 2020 as an emergency fallback RFC destination; its continued use is, however, no longer recommended because of its imminent expiry.)

The status column indicates whether the destinations are active. Inactive destinations are shown with a red traffic light; removed destinations are not shown at all.

2.12 Finalize Support Hub Connectivity

Where: transaction SOLMAN_SETUP | Useful SAP Notes: 2525999, 2880549

“Finalize Support Hub Connectivity” is an automatic activity in SAP Solution Manager Configuration. It creates logical ports and checks whether the communication channels (both synchronous and asynchronous) are operational. Specifically, it creates logical port LP_SISE_SUPPORTHUB for the following consumer proxies:

- CO_SISEHUB_MI_O_AS_PUT_EXTERNA
- CO_SISEHUB_MI_O_S_SHB_GET_EX
- CO_SISEHUB_MI_O_S_SHB_LIST
- CO_SISEHUB_MI_O_S_SHB_REMOVE

Procedure

1. Open SAP Solution Manager Configuration (transaction SOLMAN_SETUP) and navigate to step 3.2 (Support Hub Connectivity) in the System Preparation scenario.
2. Execute the automatic activity Finalize Support Hub Connectivity.

Check

1. Open SOA Management (transaction SOAMANAGER) and click Web Service Configuration.
2. Change the selection filter for the object name from is to contains and search for object names that contain *HUB*.
   The search returns the consumer proxies mentioned above.
3. Click each of the consumer proxies in turn to open their details and ping logical port LP_SISE_SUPPORTHUB by clicking (Ping Web Services).

For more information, see How to Check the Asynchronous Channel.

Troubleshooting

For troubleshooting information, see Error Messages in Task “Check Connectivity and Credentials to SAP Support Portal”.

Your Notes
2.13  Check Jobs Using the New Connections

Where: transaction SM37 | Useful SAP Notes: 2250709, 2525987

User SOLMAN_BTC runs a number of jobs that connect to the support backbone. These are:

<table>
<thead>
<tr>
<th>Job Name</th>
<th>Job Frequency</th>
<th>Relevant for Systems...</th>
</tr>
</thead>
<tbody>
<tr>
<td>REFRESH_ADMIN_DATA_FROM_SUPPOTHUB</td>
<td>Daily</td>
<td>Production only</td>
</tr>
<tr>
<td>SEND_SYSTEM_RELATIONSHIP_TO_SUPP</td>
<td>Daily</td>
<td>All</td>
</tr>
<tr>
<td>SERVICE_CONNECTION_LISTENER</td>
<td>Every minute</td>
<td>Production only</td>
</tr>
<tr>
<td>SM:AGS_SISE_SUPHUB_OUTBOX_PROCESSES</td>
<td>Hourly</td>
<td>All</td>
</tr>
<tr>
<td>SM:EXEC_SERVICES</td>
<td>Daily</td>
<td>All</td>
</tr>
<tr>
<td>SM:GET_PPMS_DATA_FROM_OSS</td>
<td>Daily</td>
<td>Production only</td>
</tr>
</tbody>
</table>
### Job Name

<table>
<thead>
<tr>
<th>Job Name</th>
<th>Job Frequency</th>
<th>Relevant for Systems...</th>

<tr>
<td>SM:TOP ISSUE TRANSFER</td>
<td>Daily</td>
<td>Production only</td>
</tr>
<tr>
<td>SM:UPDATE RULES</td>
<td>Daily</td>
<td>All</td>
</tr>
<tr>
<td>SM:UPLOAD SYSTEM DATA</td>
<td>Daily</td>
<td>All</td>
</tr>
</tbody>
</table>

### Note

The background job SM:UPLOAD SYSTEM DATA has been deactivated as of January 27, 2020. For more information, see SAP Note [2863831](https://support.sap.com). Tasks that were handled by this job are now handled by job SM:LMDB GENERIC UPLOAD.

Background job SM:REFRESH RFCDEST (not listed above) is now completely obsolete (see SAP Note [894279](https://support.sap.com)) and can be deleted (using transaction SM37).

### Procedure

1. Even though you are using a lower Support Package Stack, update role SAP_SM_BATCH as specified in SAP Note [2250709](https://support.sap.com).

### Check

1. Call transaction SM37 and make sure that there are no errors or references to old destinations in the logs for the jobs mentioned above.
   
   Note that some jobs use legacy destinations (such as SAPOSS) as a fallback if communication with SAP fails using a new destination. The overall status of a job can therefore be misleading, and so we recommend that you check the job logs and not just the overall status of a job in SM37.
2. If a job runs infrequently and a scheduled run hasn't taken place since you migrated your system to the updated support backbone, wait for the first scheduled run to take place and then check your system.

### Troubleshooting

<table>
<thead>
<tr>
<th>Issue</th>
<th>Check</th>
</tr>
</thead>
<tbody>
<tr>
<td>General issues regarding the job log.</td>
<td>See the guided answer at Check the Job Log.</td>
</tr>
<tr>
<td>When you check the response from SAP, the job fails with the message Internal Server Error SRT_CORE 122 or Timeout error (ICM_HTTP_TIMEOUT).</td>
<td>See SAP Note 2525987.</td>
</tr>
<tr>
<td>Logical port LP_SISE_SUPPORThUB isn't available for proxy class CO_SISEHUB_MI_O_S_SHB_LIST</td>
<td>See SAP Note 2665368.</td>
</tr>
</tbody>
</table>

2.14 Apply Final Corrections

After you have completed the upgrade tasks, there are handful of SAP Notes that you must implement and some related activities to work through.

Service Data Control Center (SDCCN) – Universally Relevant (for Example, for SAP EarlyWatch Alert)

You cannot update to the new support backbone infrastructure on ST-PI plug-in levels lower than ST-PI 740 SP09 (equivalent to ST-PI 2008_1_[700-710] SP19) and ST-A/PI plug-in levels lower than ST-A/PI O1T* SP01. Once your SAP Solution Manager systems are on sufficiently high plug-in versions, proceed as follows.

If your SAP Solution Manager 7.2 SP 5 system is running together with ST-PI 740 SP11, implement the following SAP Note:

2802999 – SDCCN activation fails without errors or red icons in Migrate tab

Then call transaction SDCCN and check whether the Migrate tab appears. If so, follow the instructions there.

If your SAP Solution Manager 7.2 system is running together with ST-PI 740 SP09 or SP10, see New communication channel to SAP Backbone for transaction SDCCN and follow the instructions for your Support Package.

Also implement SAP Notes 2760811 (Self Diagnosis: Alert 025 gives wrong alert after migrated SDCCN to new Support Hub) and 2744825 (Self-Diagnosis: Alert 211 - Changes for SDCC_OSS Shutdown) to avoid false positives in the SAP Solution Manager Self-Diagnosis framework.

Service Content Update – Universally Relevant

This application ensures that the contents of SAP’s services and monitoring infrastructure remain up-to-date and secure. Deploy the correction to it by implementing the following SAP Notes:

- 2714210 – New communication channel to SAP Backbone for Service Content Update
- 2722875 – Recommended corrections to resolve issues with the new communication channel in Service content update
