These settings are saved to the configuration file, which governs how the `btP` CLI works. You can have more than one configuration file for working in different accounts at the same time by logging in with the `--config PATH` option and then also providing it with each command call. See [Specify the Location of the Configuration File \[page 2165\]](#).

To find out where the configuration file is stored, use `btP --info`. Use the following commands to manage your configuration settings:

### Procedure

1. To change a setting, run:

```
btP [OPTIONS] set config [--format FORMAT] [--verbose BOOL] [--target.hierarchy BOOL]
```

<code>--format FORMAT</code>	The output format of commands. Valid values: text (default), json
<code>--verbose BOOL</code>	If set to true, command output includes tracing information for support. Valid values: false (default), true
<code>--target.hierarchy BOOL</code>	If set to true, <code>btP target</code> displays the full hierarchy of all global accounts. Valid values: false (default), true  See <a href="#">Set a Target for Subsequent Commands with <code>btP target</code> [page 2159]</a> .
<code>--login.sso MODE</code>	Single sign-on mode of <code>btP login</code> . Valid values: none (default), browser, manual. For example, if you want <code>btP login</code> to always open a browser for login at your identity provider, use <code>btP set config --login.sso browser</code> .

2. To list the current settings, run:

```
btP [OPTIONS] list config
```

3. To reset individual or all settings back to their default values, run:

```
btp [OPTIONS] reset config [--format] [--verbose] [--target.hierarchy] [--all]
```

## Related Information

[Specify the Location of the Configuration File \[page 2165\]](#)

### 6.1.3.3.8 Change the Output Format to JSON

Use the `--format json` option to change the output format to JSON. This is the recommended output format for automation with the `btp` CLI.

## Context

The standard output format of the `btp` CLI is plain text, formatted in a way that an interactive user of the `btp` CLI can easily read it and therefore often limited to the most relevant information. We don't recommend using this plain text output for automatic parsing and extracting information. The text output is not stable enough, as, for example, column width or the appearance of new lines may depend on the actual content of a response.

If you're using responses of the `btp` CLI for automation, such as in scripts, we recommend the JSON output format, as JSON is a data format that can be parsed by most programming languages. The JSON output is much more stable than the plain text output and it often includes more information in the JSON response than the respective text output. Because it is optimized for post-processing, it doesn't include non-essential information such as an OK at the end of a successful call.

#### → Tip

To set the command output to json persistently, you can change the configuration settings with `btp set config --format json`. This makes using the `--format json` option obsolete. See [Change Configuration Settings \[page 2162\]](#).

See this [Getting BTP resource GUIDs with the btp CLI](#) blog post for some examples.

## Procedure

Start commands with `--format json`. Currently, the only valid value is `json`.

```
btp --format json list accounts/subaccount
```

## Results

### Example with text output

```
btpt list accounts/subaccount
subaccounts in global account c8XXXX3d-6XX7-4XXb-8dXX-89XXXX372eXX...
subaccount id:                display
name:                          subdomain:
region:          beta-enabled:  parent id:
state:           state
message:

88XXXX80-9844-4XX7-8XXd-beXXXX42bfb2    my-
subaccount-1                            my-CF-subdomain1
us10-TEST          false                c8XXXX3d-6XX7-4XXb-8dXX-89XXXX372eXX
OK
Subaccount
created.

ebXXXX3e-f3a2-4XXf-a080-3eXXXX9b9ced    my-
subaccount-2                            my-CF-subdomain2
us10-TEST          false                c8XXXX3d-6XX7-4XXb-8dXX-89XXXX372eXX
OK
Subaccount created.
```

### Example with JSON output

```
btpt --format json list accounts/subaccount
{
  "value": [
    {
      "guid": "88XXXX80-9844-4XX7-8XXd-beXXXX42bfb2",
      "displayName": "my-subaccount-1",
      "globalAccountGUID": "c8XXXX3d-6XX7-4XXb-8dXX-89XXXX372eXX",
      "parentGUID": "c8XXXX3d-6XX7-4XXb-8dXX-89XXXX372eXX",
      "parentType": "ROOT",
      "region": "us10-TEST",
      "subdomain": "my-CF-subdomain1",
      "betaEnabled": false,
      "usedForProduction": "UNSET",
      "description": null,

    }
  ]
}
```

```
}  
 ]  
 }
```

## Related Information

[Change Configuration Settings \[page 2162\]](#)

### 6.1.3.3.9 Specify the Location of the Configuration File

You can change the location of the configuration file by using the `--config` option or the environment variable.

## Context

Upon successful login, the btp CLI creates a configuration file (`config.json`) in the default location of your user config directory:

- Microsoft Windows: `C:\Users\<username>\AppData\Roaming\SAP\btp\config.json`
- Apple macOS: `~/Library/Application Support/.btp/config.json`
- Linux: `~/.config/.btp/config.json`

This folder serves as the working directory of the btp CLI, that is, it's necessary for its proper functioning, and is used with each command execution.

If you want the configuration file to be created in a different folder, you can use the `--config` option in your login command and then specify this location in each command call with this `--config` option.

## Procedure

1. Specify the location of the configuration file with your login command:

```
btp --config "<file path>" login
```

2. Specify this location either with the `BTP_CLIENTCONFIG` environment variable, or use the `--config` option with each subsequent command call.

### Sample Code

```
btp --config "<file path>"
```

### Note

In version 2.14, the environment variable `BTP_CLIENTCONFIG` was introduced. If you use an older client version, you need to use `SAPCP_CLIENTCONFIG`. Although the old one is kept, we recommend to switch to `BTP_CLIENTCONFIG`.

## Example

Let's assume you want to work in two subaccounts in parallel, using two terminals. For example, with the first terminal (A), you want to work in a subaccount with ID 1000, with the second terminal (B) you want to work in a subaccount with ID 2000, and you want to list the users in each subaccount.

Terminal A	Terminal B
<p>1. Log in to your global account using the default location of the configuration file:</p> <pre>btp login</pre> <p>Run all commands as usual. The btp CLI uses the default configuration file.</p>	<p>1. Log in to your global account using a different location of the configuration file:</p> <pre>btp --config "C:\my-cli-folder" login</pre> <p>Use this option with each command call.</p>
<p>2. Set the target to subaccount 1000:</p> <pre>btp target --subaccount 1000</pre>	<p>2. Set the target to subaccount 2000:</p> <pre>btp --config "C:\my-cli-folder" target --subaccount 2000</pre>
<p>3. List the users of subaccount 1000:</p> <pre>btp list security/user</pre>	<p>3. List the users of subaccount 2000:</p> <pre>btp --config "C:\my-cli-folder" list security/user</pre>

### 6.1.3.3.10 Provide Feedback about the btp CLI

With `btp feedback`, you can open a feedback survey in a web browser in which you can share your opinion about the btp CLI with the development team.

## Context

A short survey will open in your web browser, in which you're asked how satisfied you are with the btp CLI, and where you can share additional comments. This feedback is carefully analyzed by the development team and a valuable source of input for further improving the btp CLI.

You can also fill it out now: [Take our survey about the btp CLI](#) 

Thanks a lot for your participation. Your feedback is greatly appreciated.

## Procedure

Open the feedback survey with the following command:

```
btp feedback
```

### 6.1.3.4 Commands in the btp CLI

Find a full reference of all btp CLI commands and their parameters here: [btp CLI Command Reference](#).

#### [Working with Global Accounts, Directories, and Subaccounts Using the btp CLI \[page 2168\]](#)

Use the SAP BTP command line interface (btp CLI) to manage operations with global accounts, directories, and subaccounts.

#### [Setting Entitlements Using the btp CLI \[page 2171\]](#)

Use the SAP BTP command line interface (btp CLI) to set entitlements to define the functionality or permissions available for users of global accounts, directories, and subaccounts.

#### [Working with Environments Using the btp CLI \[page 2172\]](#)

Use the SAP BTP command line interface (btp CLI) to manage runtime environment instances in a subaccount. For example, enable the Cloud Foundry environment by creating a Cloud Foundry org (environment instance).

#### [Working with Multitenant Applications Using the btp CLI \[page 2173\]](#)

Use the SAP BTP command line interface (btp CLI) to manage the multitenant applications to which a subaccount is entitled to subscribe.

#### [Working with External Resource Providers Using the btp CLI \[page 2174\]](#)

Use the SAP BTP command line interface (btp CLI) to get details, or to create or delete resource provider instances in a global account.

#### [Managing Trust from SAP BTP to an Identity Authentication Tenant \[page 2175\]](#)

SAP BTP supports identity federation. Its concept is to reuse the user bases of identity providers. To use a custom identity provider, your global account or subaccount in SAP BTP must have a trust relationship to the identity provider you want to use.

#### [Managing Users and Their Authorizations Using the btp CLI \[page 2177\]](#)

User authorizations are managed by assigning role collections to users (for example, Subaccount Administrator). Use the SAP BTP command-line interface (btp CLI) to manage roles and role collections, and to assign role collections to users.

#### [Managing Signing Keys for Access Tokens \[page 2180\]](#)

Use the SAP BTP command line interface (btp CLI) to manage signing keys for access tokens in the subaccount.

#### [Managing Security Settings \[page 2181\]](#)

Use the SAP BTP command line interface (btp CLI) to display and update the security settings for the subaccount.

[Managing API Credentials for Calling REST APIs of SAP Authorization and Trust Management Service \[page 2182\]](#)

Use the SAP BTP command line interface (btp CLI) to manage API credentials, which enable you to access the REST APIs of the SAP Authorization and Trust Management service.

[Working with Resources of the SAP Service Manager Using the btp CLI \[page 2183\]](#)

Use the SAP BTP command line interface to perform various operations related to your platforms, attached service brokers, service instances, and service bindings.

## 6.1.3.4.1 Working with Global Accounts, Directories, and Subaccounts Using the btp CLI

Use the SAP BTP command line interface (btp CLI) to manage operations with global accounts, directories, and subaccounts.

### Working with Global Accounts

#### → Tip

These global account commands are always executed in the global account you're logged in to. You don't need to pass the global account parameter, even if you've targeted a subaccount or directory. See [Set a Target for Subsequent Commands with btp target \[page 2159\]](#).

Task	Run the command...	Command help
Get details about a global account, and the account structure (directories and subaccounts) of the global account.	<code>btp get accounts/global-account</code>	<a href="#">btp get accounts/global-account</a>
Update the display name and/or description of a global account.	<code>btp update accounts/global-account</code>	<a href="#">btp update accounts/global-account</a>

For more information, see [Global Accounts \[page 75\]](#).

### Working with Directories

Directories allow you to organize and manage your subaccounts according to your technical and business needs.

#### → Tip

By default, all commands are executed in the global account you're logged in to. To change the target to a directory, use `btp target -dir <my-directory-id>`. See [Set a Target for Subsequent Commands with btp target \[page 2159\]](#).

Task	Run the command...	Command help
Get details about a directory and list the subaccounts and subdirectories in the directory	<code>btm get accounts/directory</code>	<a href="#">btm get accounts/directory</a>
Create a directory	<code>btm create accounts/directory</code>	<a href="#">btm create accounts/directory</a>
Update a directory	<code>btm update accounts/directory</code>	<a href="#">btm update accounts/directory</a>
Delete a directory	<code>btm delete accounts/directory</code>	<a href="#">btm delete accounts/directory</a>
Change the set of enabled features (user and entitlement management) for a directory	<code>btm enable accounts/directory</code>	<a href="#">btm enable accounts/directory</a>
List the user-defined labels assigned to a directory	<code>btm list accounts/labels</code>	<a href="#">btm list accounts/label</a>
List the custom properties assigned to a directory	<code>btm list accounts/custom-property</code>	<a href="#">btm list accounts/custom-property</a>

#### Note

Custom properties are deprecated. Custom properties support only single values per key and are now replaced by the string array `labels`, which supports multiple values per key. Use `btm list accounts/labels` instead.

For more information, see [Directories \[Feature Set B\] \[page 77\]](#).

## Working with Subaccounts

### → Tip

By default, all commands are executed in the global account you're logged in to. To change the target to a subaccount, use `btm target -sa <my-subaccount-id>`. See [Set a Target for Subsequent Commands with `btm target` \[page 2159\]](#).

Task	Run the command...	Command help
List all subaccounts in a global account	<code>btm list accounts/subaccount</code>	<a href="#">btm list accounts/subaccount</a>

Task	Run the command...	Command help
Get details about a subaccount	<code>btpt get accounts/ subaccount</code>	<a href="#">btpt get accounts/subaccount</a>
Create a subaccount	<code>btpt create accounts/ subaccount</code>	<a href="#">btpt create accounts/subaccount</a>
Update a subaccount	<code>btpt update accounts/ subaccount</code>	<a href="#">btpt update accounts/subaccount</a>
Delete a subaccount	<code>btpt delete accounts/ subaccount</code>	<a href="#">btpt delete accounts/subaccount</a>
Move a subaccount	<code>btpt move accounts/ subaccount</code>	<a href="#">btpt move accounts/subaccount</a>
List the user-defined labels assigned to a subaccount	<code>btpt list accounts/labels</code>	<a href="#">btpt list accounts/label</a>
List the custom properties assigned to a subaccount	<code>btpt list accounts/custom- property</code>	<a href="#">btpt list accounts/custom-property</a>
<div style="background-color: #f0f0f0; padding: 10px; border: 1px solid #ccc;"> <p><b>Note</b></p> <p>Custom properties are deprecated. Custom properties support only single values per key and are now replaced by the string array <code>labels</code>, which supports multiple values per key. Use <code>btpt list accounts/labels</code> instead.</p> </div>		
Get all available regions for global account	<code>btpt list accounts/ available-region</code>	<a href="#">btpt list accounts/available-region</a>

For more information, see [Subaccounts \[page 75\]](#).

### 6.1.3.4.5 Working with External Resource Providers Using the btp CLI

Use the SAP BTP command line interface (btp CLI) to get details, or to create or delete resource provider instances in a global account.

#### Note

The use of this functionality is subject to the availability of the supported non-SAP cloud vendors in your country or region.

Creating a resource provider instance allows your global account to connect to your provider account on a non-SAP cloud vendor. Through this channel, you can then consume remote service resources that you already own and which are supported by SAP BTP.

Task	Run the command...	Command help
List all resource provider instances in a global account	<code>btp list accounts/ resource-provider</code>	<a href="#">btp list accounts/resource-provider</a>
Get details about a resource provider instance	<code>btp get accounts/resource- provider</code>	<a href="#">btp get accounts/resource-provider</a>
Create a resource provider instance	<code>btp create accounts/ resource-provider</code>	<a href="#">btp create accounts/resource-provider</a>
Update a resource provider instance	<code>btp update accounts/ resource-provider</code>	<a href="#">btp update accounts/resource-provider</a>
Delete a resource provider instance	<code>btp delete accounts/ resource-provider</code>	<a href="#">btp delete accounts/resource-provider</a>

For more information, see [Managing Resource Providers \[page 1947\]](#).

Parent topic: [Commands in the btp CLI \[page 2167\]](#)

[btp CLI Command Reference](#)

### 6.1.3.4.6 Managing Trust from SAP BTP to an Identity Authentication Tenant

SAP BTP supports identity federation. Its concept is to reuse the user bases of identity providers. To use a custom identity provider, your global account or subaccount in SAP BTP must have a trust relationship to the identity provider you want to use.

#### Note

We recommend that you always use SAP Cloud Identity Services - Identity Authentication as a single identity provider for SAP BTP. If you use corporate identity providers, connect them to your Identity Authentication tenant, which then acts as a hub.

## Prerequisites

- You have a tenant of SAP Cloud Identity Services - Identity Authentication.  
For more information, see [Tenant Model and Licensing](#) in the documentation for Identity Authentication.
- The Identity Authentication tenant is associated with the customer IDs of the relevant global account of SAP BTP.  
For more information, see [Reuse SAP Cloud Identity Services Tenants for Different Customer IDs](#) in the documentation for Identity Authentication.
- Make sure that the email addresses of all users in your identity provider are unique and correct.

## Note

We recommend that you request your own Identity Authentication tenant (see [Getting a Tenant](#)).

## Managing Trust Configurations

### → Tip

All of these commands can be executed in the global account or in a subaccount. To choose the level, use the `btptarget` command. See [Set a Target for Subsequent Commands with `btptarget`](#) [page 2159].

To manage trust with your identity provider, use the following commands.

```
btpt create security/trust --idp my-tenant --subaccount my-subaccount-id --name my-trust-configuration --description "My Trust Configuration"
```

See [Trust and Federation with Identity Providers](#) [page 2014].

Task	Run the command...	Command help
List all trust configurations that are configured for your global account or subaccount tenants to which you can connect this global account or subaccount	<code>btpt list security/trust</code>	<a href="#">btpt list security/trust</a>
Get details about a trust configuration	<code>btpt get security/trust</code>	<a href="#">btpt get security/trust</a>
Establish trust from a global account or subaccount to an Identity Authentication tenant to which you can connect this global account or subaccount	<code>btpt create security/trust</code>	<a href="#">btpt create security/trust</a>
Update a trust configuration of a global account or subaccount	<code>btpt update security/trust</code>	<a href="#">btpt update security/trust</a>
Delete a trust configuration from a global account or subaccount	<code>btpt delete security/trust</code>	<a href="#">btpt delete security/trust</a>
Migrate from SAML trust to OpenID Connect trust	<code>btpt migrate security/trust</code>	<a href="#">btpt migrate security/trust</a>
Roll back the migration of an existing SAML trust with any identity provider to OpenID Connect trust with an Identity Authentication tenant	<code>btpt restore security/trust</code>	<a href="#">btpt restore security/trust</a>

## Finding Available Identity Authentication Tenants

Task	Run the command...	Command help
List all Identity Authentication	<code>btpt list security/available-idp</code>	<a href="#">btpt list security/available-idp</a>
Get details about an Identity Authentication tenant that is available for a global account or a subaccount	<code>btpt get security/available-idp</code> To see available tenants, run <code>btpt list security/available-idp</code>	<a href="#">btpt get security/available-idp</a>

[Working with Resources of the SAP Service Manager Using the btpt CLI \[page 2183\]](#)

### 6.1.3.4.7 Managing Users and Their Authorizations Using the btpt CLI

User authorizations are managed by assigning role collections to users (for example, Subaccount Administrator). Use the SAP BTP command-line interface (btpt CLI) to manage roles and role collections, and to assign role collections to users.

#### → Tip

All of these commands can be executed in the global account, a directory, or in a subaccount. To choose the level, use the `btpt target` command. See [Set a Target for Subsequent Commands with btpt target \[page 2159\]](#).

## Managing Users and Assigning Role Collections

Role collections are user-related authorizations that allow access to resources and services. You give users permissions by assigning role collections to them. All users in the global accounts, directories, and subaccounts are stored in identity providers, either in the default or in a custom identity provider. When the first role collection assignment to a user happens, SAP BTP creates a copy of this user in the global account, directory, or subaccount. This copy of the user is called shadow user.

When you do the first role collection assignment to a user through the `bt` CLI, such a shadow user is created by default. If you want to prevent this, you need to pass the `--create-user-if-missing` parameter with value `false`.

See [Role Collections and Roles in Global Accounts, Directories, and Subaccounts \[Feature Set B\] \[page 89\]](#) and [User and Member Management \[page 85\]](#).

Task	Run the command ...	Command help
List users	<code>bt list security/user</code>	<a href="#">bt list security/user</a>
Get details about a specific user, including role collections	<code>bt get security/user</code>	<a href="#">bt get security/user</a>
Delete a user	<code>bt delete security/user</code>	<a href="#">bt delete security/user</a>
Assign a role collection to a user, user group, or to an attribute	<code>bt assign security/role-collection</code>	<a href="#">bt assign security/role-collection</a>
Unassign a role collection from a user, user group, or from an attribute	<code>bt unassign security/role-collection</code>	<a href="#">bt unassign security/role-collection</a>

## Managing Roles

A role is an instance of a role template; you can build a role based on a role template and assign the role to a role collection. See [Add Roles to Role Collections on the Application Level \[page 2107\]](#).

Task	Run the command ...	Command help
List apps	<code>bt list security/app</code>	<a href="#">bt list security/app</a>
Get details about a specific application	<code>bt get security/app</code> To get the ID of a specific app, run <code>bt list security/app</code>	<a href="#">bt get security/app</a>
List roles	<code>bt list security/role</code>	<a href="#">bt list security/role</a>

Task	Run the command ...	Command help
Get details about a specific role	<code>btm get security/role</code>	<a href="#">btm get security/role</a>
Create a role	<code>btm create security/role</code>	<a href="#">btm create security/role</a>
Delete a role	<code>btm delete security/role</code>	<a href="#">btm delete security/role</a>
Add a role to a role collection	<code>btm add security/role</code>	<a href="#">btm add security/role</a>
Remove a role from a role collection	<code>btm remove security/role</code>	<a href="#">btm remove security/role</a>

## Managing Role Collections

Role collections consist of roles, which, in turn, are based on role templates. Role collections are specific to account entities, that is, there are different role collections in global accounts, subaccounts, and directories. There are predefined role collections, such as *Global Account Administrator* and *Subaccount Viewer*. For more information, see [Role Collections and Roles in Global Accounts, Directories, and Subaccounts \[Feature Set B\] \[page 89\]](#) and [Working with Role Collections \[page 2087\]](#).

Task	Run the command ...	Command help
List role collections	<code>btm list security/role-collection</code>	<a href="#">btm list security/role-collection</a>
Get details about a specific role collection	<code>btm get security/role-collection</code>	<a href="#">btm get security/role-collection</a>
Create a role collection	<code>btm create security/role-collection</code>	<a href="#">btm create security/role-collection</a>
Change the description of a role collection	<code>btm update security/role-collection</code>	<a href="#">btm update security/role-collection</a>
Delete a role collection	<code>btm delete security/role-collection</code>	<a href="#">btm delete security/role-collection</a>

### 6.1.3.4.8 Managing Signing Keys for Access Tokens

Use the SAP BTP command line interface (btp CLI) to manage signing keys for access tokens in the subaccount.

You can create a new signing key for access tokens.

#### Note

The newly created key only becomes active once you enable it. The number of keys is restricted to 2 per subaccount.

When a signing key is enabled, all newly requested tokens are signed with this key and the existing signing key is disabled. It's also possible to list all signing keys, no matter whether they're enabled or disabled. You can also delete a disabled signing key.

For more information, see [Rotate Signing Keys of Access Tokens](#).

Task	Run the command ...	Command help
Create a new signing key for access tokens	<code>btp create security/token-key</code>	<a href="#">btp create security/token-key</a>
Enable an existing key as signing key for access tokens	<code>btp enable security/token-key</code>	<a href="#">btp enable security/token-key</a>

Task	Run the command ...	Command help
Delete a disabled signing key for access tokens	<code>btpt delete security/token-key</code>	<a href="#">btpt delete security/token-key</a>
List the existing signing keys for access tokens and indicates which key is currently enabled	<code>btpt list security/token-key</code>	<a href="#">btpt list security/token-key</a>

### 6.1.3.4.9 Managing Security Settings

Use the SAP BTP command line interface (btpt CLI) to display and update the security settings for the subaccount.

The security settings comprise configuration settings, such as information about signing keys, URLs for cross origin resource sharing or iframing, and about bindings.

For more information, see [Configure Trusted Domains for SAP Authorization and Trust Management Service \[Feature Set B\] \[page 2129\]](#) and [Configure Token Policy for SAP Authorization and Trust Management Service \[page 2130\]](#).

Task	Run the command ...	Command help
Show the security settings of a subaccount	<code>btpt list security/settings</code>	<a href="#">btpt list security/settings</a>

Task	Run the command ...	Command help
Update the security settings of a subaccount	<code>btpt update security/settings</code>	<a href="#">btpt update security/settings</a>

**Parent topic:** [Commands in the btpt CLI \[page 2167\]](#)

### 6.1.3.4.10 Managing API Credentials for Calling REST APIs of SAP Authorization and Trust Management Service

Use the SAP BTP command line interface (btpt CLI) to manage API credentials, which enable you to access the REST APIs of the SAP Authorization and Trust Management service.

If you want to access the REST APIs of SAP Authorization and Trust Management service in multi-environment subaccounts, global accounts, or directories, you must provide the required API credentials. One main use case is for customers who want to provision users including their authorizations, for example into a global account or a directory. They need credentials (with a client ID) for provisioning of users, especially when using SAP Cloud Identity Services - Identity Provisioning.

The API credentials are only passed on when they are created. They can't be retrieved later. If lost, new credentials must be generated.

See [Application Security Descriptor Configuration Syntax \[page 511\]](#) for the credential types and [SAP Business Accelerator Hub](#) for the APIs of the SAP Authorization and Trust Management service.

Task	Run the command ...	Command help
Create API credentials	<code>btpt create security/api-credential</code>	<a href="#">btpt create security/api-credential</a>
Show all API credentials	<code>btpt list security/api-credential</code>	<a href="#">btpt list security/api-credential</a>
Show details about specific API credentials	<code>btpt get security/api-credential</code>	<a href="#">btpt get security/api-credential</a>
Delete API credentials	<code>btpt delete security/api-credential</code>	<a href="#">btpt delete security/api-credential</a>

### 6.1.3.4.11 Working with Resources of the SAP Service Manager Using the btpt CLI

Use the SAP BTP command line interface to perform various operations related to your platforms, attached service brokers, service instances, and service bindings.

You can also get information about the service plans and service offerings associated with your subaccount.

For more information about the SAP Service Manager, see [SAP Service Manager](#).

#### → Tip

All of these commands are executed in subaccounts. If you know you are working in a specific subaccount, we recommend using the `btpt target` command to set the target to this subaccount. Then you won't have

to provide the subaccount ID with every command call. See [Set a Target for Subsequent Commands with `btptarget`](#) [page 2159].

For detailed descriptions of all SAP Service Manager CLI commands, see [SAP Service Manager Commands for SAP BTP command line interface](#) [Feature Set B].

## Managing Platforms

Task	Run the command ...	Command help
List all registered platforms in the current subaccount	<code>btpt list services/platform</code>	<a href="#">btpt list services/platform</a>
Get details about a specific platform registered in the current subaccount	<code>btpt get services/platform</code>	<a href="#">btpt get services/platform</a>
Register a new platform in the current subaccount	<code>btpt register services/platform</code>	<a href="#">btpt register services/platform</a>
Update an existing platform registered in the current subaccount	<code>btpt update services/platform</code>	<a href="#">btpt update services/platform</a>
Unregister an existing platform in the current subaccount	<code>btpt unregister services/platform</code>	<a href="#">btpt unregister services/platform</a>

## Managing Service Brokers

Task	Run the command ...	Command help
List all registered brokers in the current subaccount	<code>btpt list services/broker</code>	<a href="#">btpt list services/broker</a>
Get a specific service broker in the current subaccount	<code>btpt get services/broker</code>	<a href="#">btpt get services/broker</a>
Register a new service broker in the current subaccount	<code>btpt register services/broker</code>	<a href="#">btpt register services/broker</a>
Update an existing service broker in the current subaccount	<code>btpt update services/broker</code>	<a href="#">btpt update services/broker</a>
Unregister an existing service broker in the current subaccount	<code>btpt unregister services/broker</code>	<a href="#">btpt unregister services/broker</a>

## Managing Service Instances

Task	Run the command ...	Command help
List all service instances associated with the current subaccount.	<code>btpt list services/instance</code>	<a href="#">btpt list services/instance</a>
Get details about a specific service instance associated with the current subaccount.	<code>btpt get services/instance</code>	<a href="#">btpt get services/instance</a>
Create a new service instance of the service you want to consume.	<code>btpt create services/instance</code>	<a href="#">btpt create services/instance</a>
Delete an existing service instance.	<code>btpt delete services/instance</code>	<a href="#">btpt delete services/instance</a>
Share a service instance	<code>btpt share services/instance</code>	
Unshare a service instance	<code>btpt unshare services/instance</code>	

### Note

The optional `--show-parameters` available for `btpt get services/instance` and `btpt get services/binding` commands returns parameters only if the service offering associated with the instance or binding for which to view parameters has the `instances_retrievable` or `bindings_retrievable` parameter values respectively set to **true**.

### → Tip

To check associated service offering's `instances_retrievable` value, run the following commands:

1. `btpt get services/instance` and find the `plan_id` for the instance. Use the plan ID in
2. `btpt get services/plan` and check the `offering_id` for the instance. Use the offering ID in
3. `btpt get services/offering` and see whether the `instances_retrievable` parameter's value is set to true.

Start with `btpt get services/binding` and then use the same commands for plan and offering details if you're checking the `bindings_retrievable` value.

## Managing Service Bindings

Task	Run the command ...	Command help
List all service bindings associated with the current subaccount.	<code>btpt list services/binding</code>	<a href="#">btpt list services/binding</a>
Get details about a specific service binding associated with the current subaccount.	<code>btpt get services/binding</code>	<a href="#">btpt get services/binding</a>
Create a new binding between an existing service instance and an application.	<code>btpt create services/binding</code>	<a href="#">btpt create services/binding</a>
Delete an existing binding between a service instance and an application.	<code>btpt delete services/binding</code>	<a href="#">btpt delete services/binding</a>

## Viewing Service Plans

Task	Run the command ...	Command help
List all service plans of services available for consumption that are associated with your current subaccount.	<code>btpt list services/plan</code>	<a href="#">btpt list services/plan</a>
Get details about a specific service plan of a service that is available for consumption and associated with your current subaccount.	<code>btpt get services/plan</code>	<a href="#">btpt get services/plan</a>

## Viewing Service Offerings

Task	Run the command ...	Command help
List all service offerings associated with your current subaccount.	<code>btpt list services/offering</code>	<a href="#">btpt list services/offering</a>
Get details about a specific service offering associated with your subaccount.	<code>btpt get services/offering</code>	<a href="#">btpt get services/offering</a>

## 6.1.3.5 Troubleshooting and Support

Troubleshooting and support information for the btp CLI.

### Make sure that you are using a recent version of the btp CLI client

We recommend checking for updates of the client on a regular basis. Most new functionality is added via the CLI server, so no update from your side is required. But if new functionality is added to the client, the only way to get it is by downloading and installing a newer version.

Run the command `btp` or `btp --info` to find out which version of the client you are using. Then check on our [download page](#) for the current version and install the latest client.

Use `btp --help` to display an overview of all commands. If new commands are available but cannot be used with your client version, these commands are marked with a notice to update your client. If you run such a command, you get an error message pointing you to the client version that you need.

### I cannot log on

The btp CLI is part of our cloud management tools feature set B. This means that you can only access a global account that uses this feature set B. For example, all trial accounts are on feature set B. For more information, see [Cloud Management Tools — Feature Set Overview \[page 111\]](#).

To log on, we recommend to run `btpt login --sso` or `btpt login` without parameters. Then confirm the server URL that is proposed by the CLI and provide your credentials when you are prompted. After successful authentication, the `btpt` CLI will log you into your global account, or, if you have more than one, will show all available global accounts for you to select the one you need.

To log on with SAP Universal ID, you need to use the `--sso` parameter. Otherwise log on with the password associated with your account (S-user or P-user) in the default identity provider, SAP ID service. If you've forgotten this password and this user is associated with your SAP Universal ID user, reset your password.

For more information, see SAP Note [3085908](#) and [Log in with Single Sign-On \[page 2153\]](#).

## I'd like to setup a global account with the command line

If you don't know how to get started, you might want to have a look at the appropriate workflow: [Setting Up a Trial Account via the Command Line \[Feature Set B\] \[page 137\]](#) or [Setting Up a Global Account via the Command Line \[page 145\]](#).

## I'd like to see a more detailed output (verbose mode)

If you get an error message that is not helpful enough, or if you want to find out more about what exactly happened after you ran a command, use the `btpt --verbose` option with your command and run it again. The `btpt` CLI will try to execute the command again, but also print information about each step of the command execution. This might help you understand what exactly went wrong and provide hints for you to solve the issue. If you need to create a support request, providing this information helps us analyze the error and provide a solution more quickly.

Here is an example of the `btpt list security/role-collection` command call without the option:

### Sample Code

```
btpt list security/role-collection
name                               description
Global Account Administrator      Administrative access to the global account
Global Account Viewer             Read-only access to the global account
OK
```

If you use `btpt --verbose list security/role-collection`, the output is much more lengthy. It contains information such as client version and the current context, the correlation ID, and request and response details. This output may include sensitive information, so we recommend to use the verbose mode only for troubleshooting, not as default, and only on your local machine.

### Caution

The `--verbose` option prints input data that you pass as parameters through files. For example, if you pass a `.json` file as a parameter without the `--verbose` option, its content is sent directly to the backend service to be processed. If you use the `--verbose` option, the `btpt` CLI prints the content of the file to the terminal. If there is sensitive information in such a file, the `btpt` CLI cannot filter it out, as it doesn't understand its semantics.

Use the verbose output only if you can control the output of your terminal, i.e. only locally. It should not be used in production or shared environments, where logs may be persisted or even transported out of the system.

## I need support

Use component BC-CP-TOOLS-CLI to contact support.

If a correlation ID is printed with your error message, please provide it with your support ticket. The correlation ID is created for each command execution, and is passed with all of its steps. It allows the identification of all log messages related to a command execution.

See [Getting Support \[page 2863\]](#).

## 6.1.4 Account Administration Using APIs

SAP BTP provides REST APIs that enable you to perform administrative tasks on the global account, directory, and subaccount level, such as creating or updating subaccounts, monitoring usage information, managing access, and managing service resources.

### Related Information

[Account Administration Using APIs of the SAP Cloud Management Service \[Feature Set B\] \[page 2190\]](#)

[Monitoring Usage Information Using APIs of the SAP Usage Data Management Service \[Feature Set B\] \[page 2222\]](#)

[Accessing Administration Using APIs of the SAP Authorization and Trust Management Service \[page 2229\]](#)

[Managing Service Resources Using the APIs of the SAP Service Manager \[page 2235\]](#)

### 6.1.4.1 Account Administration Using APIs of the SAP Cloud Management Service [Feature Set B]

#### Note

The content in this section is only relevant for cloud management tools feature set B. For more information, see [Cloud Management Tools - Feature Set Overview](#).

Provides information about using the APIs of the SAP Cloud Management service for SAP BTP (technical name: `cis`) to manage some of the administrative operations in your accounts.

The APIs of the core services for SAP BTP allow you to manage, build, and extend the core capabilities of SAP BTP. Each core service focuses on a different aspect of the platform, such as the management of accounts and product entitlements, and the registration and provisioning of subscriptions for multitenant applications and services.

The APIs of the SAP Cloud Management service are included in the core services for SAP BTP.

The following table provides an overview of the SAP Cloud Management service APIs:

API / Microservice	Description	Region Availability <sup>(1)</sup>
Accounts	Provides functions to manage the directories and subaccounts in your global accounts' structure in SAP BTP.	Central region <sup>(2)</sup>
Entitlements	Provides functions to manage product entitlements and assignments across your global account, directories, and subaccounts.	Central region <sup>(2)</sup>
Provisioning	Provides functions to manage the provisioning of your environment instances, multitenant application subscriptions, and services for subaccounts in their corresponding region.	All regions
Events	Provides functions to get information about events relating to administrative operations in your accounts.	All regions

<sup>(1)</sup> For more information about available regions, see [Regions \[page 17\]](#).

<sup>(2)</sup> Refers to the eu10 Europe (Frankfurt) region, unless your global account is located in the China (Shanghai) and Government Cloud (US) regions then use the landscape domain of your central region.

For detailed information about the APIs, including their specifications and endpoints, go to [SAP Core Services for SAP BTP](#) on SAP Business Accelerator Hub

Alternatively, go to `https://events-service.<app domain>.<landscape domain>/swagger-index.html` where you can try out the APIs.

#### ❖ Example

If your global account is running on the US East (VA) region, use this URL:

```
https://events-service.cfapps.us10.hana.ondemand.com/swagger-index.html
```

#### → Remember

- When using the `Accounts` and `Entitlements` APIs, make sure the endpoint you are using points to the landscape domain of the central region.
- To call the core platform API methods, you must obtain an access token. See [Getting an Access Token for SAP Cloud Management Service APIs \[page 2192\]](#).

For information about the APIs of the SAP Service Manager service, see [Working with Service Management APIs](#).

For additional information about using the SAP Cloud Management service APIs with subaccounts in the Neo environment, see [Working with Cloud Management Tools Feature Set B in the Neo Environment](#).

### 6.1.4.1.1 Getting an Access Token for SAP Cloud Management Service APIs

The APIs of the SAP Cloud Management service for SAP BTP are protected with the OAuth 2.0 Password grant type and, in some cases, also the Client Credentials grant type. This procedure guides you through the steps to create an OAuth client and obtain an access token from SAP Authorization and Trust Management service (xsuaa) to call the APIs of the SAP Cloud Management service.

#### Note

The Client Credentials grant type is currently available for the SAP Cloud Management service only when creating the instances of this service on a subaccount level by using the SAP Service Manager API, CLI, or when creating an instance of an SAP Cloud Management service by using the SAP BTP cockpit and selecting the *Other* environment.

For more information, see [Consuming Services in Other Environments Using the Service Management Instances](#).

#### Note

For `central-viewer` or `local-viewer` service plans, you can only use the Client Credentials grant type.

The scopes included in the access token depend on the service plan you chose for the SAP Cloud Management service. For the list of the available service plans, see [SAP Cloud Management Service - Service Plans \[page 2198\]](#).

## Prerequisites

Your global account admin has entitled at least one of the plans of the SAP Cloud Management service in your subaccount. See [SAP Cloud Management Service - Service Plans \[page 2198\]](#) and [Managing Entitlements and Quotas Using the Cockpit \[page 1995\]](#).

## Procedure

1. Create a service instance for the SAP Cloud Management service (`cis`).

When you create the service instance, specify the following:

- The name of the service plan you want to use. See [SAP Cloud Management Service - Service Plans \[page 2198\]](#).
- A name for the new service instance.
- (Optional) Using the `directoryId` parameter, you can specify the ID of a directory in the account hierarchy for which you want to allow directory administrators to perform account management actions, such as creating subaccounts and setting entitlements in the directory, using the APIs of the [Accounts and Entitlements services](#). The specified directory must exist in the current global account and the `AUTHORIZATIONS` feature must be enabled for the directory. You can apply this parameter only with the `central` plan of the SAP Cloud Management service (`cis`).

There are several options available to create instances depending on the environment you use.

- To create a service instance in the Cloud Foundry environment using the SAP BTP cockpit or the cf CLI, see [Creating Service Instances \[page 231\]](#).
- To create a service instance in other environments using the Service Manager Control (SMCTL) CLI or SAP Service Manager APIs, see [Consuming Services in Other Environments Using the Service Management Instances](#).

You can also create and manage service instances and bindings in other environments by using the following APIs in the Accounts service:

URL	Name
<code>POST/accounts/v1/subaccounts/{subaccountGUID}/serviceManagementBinding</code>	Create a Service Management binding
<code>GET/accounts/v1/subaccounts/{subaccountGUID}/serviceManagementBinding</code>	Get a Service Management binding
<code>DELETE/accounts/v1/subaccounts/{subaccountGUID}/serviceManagementBinding</code>	Delete a Service Management binding

For more information about the APIs, see the `Subaccount Operations` section of the Accounts service in the [SAP Business Accelerator Hub](#).

### Note

If you use the SAP Service Manager API, CLI, or the SAP BTP cockpit to create the service instance of the SAP Cloud Management service (`cis`), you can get a Client Credentials grant

type token by specifying the following parameter during the instance creation: {"grantType": "clientCredentials"}.

If you don't specify this parameter, the Password grant type is chosen by default.

#### → Remember

For `central-viewer` or `local-viewer` service plans, you can only use the Client Credentials grant type.

- To create a service instance in Kyma using the Kyma dashboard, see [Using SAP BTP Services in the Kyma Environment \[page 1732\]](#).

#### → Recommendation

If you aren't working in Cloud Foundry, Kyma, or Kubernetes, use the SAP Service Manager to create and manage service instances. These instances are platform agnostic and can be deployed and integrated with any other environment of your choice.

## 2. Create a service key.

When you create the service key, specify:

- The name of the service instance for which to create the service key.
- A name for the service key.

There are several options available to create service keys depending on the environment you use.

- To create a service key in the Cloud Foundry environment using the SAP BTP cockpit or the cf CLI, see [Creating Service Keys \[page 236\]](#).
- To create bindings in other environments, see [Consuming Services in Other Environments Using the Service Management Instances](#).
- To create credentials for calling the service and retrieving information in the Kyma environment, see [Using SAP BTP Services in the Kyma Environment \[page 1732\]](#).

#### 🔗 Sample Code

The following example shows the service key information displayed in the Cloud Foundry environment:

```
{
  "endpoints": {
    "external_provider_registry_url": <external provider registry URL>,
    "accounts_service_url": <accounts service URL>,
    "entitlements_service_url": <entitlements service URL>,
    "events_service_url": <events service URL>,
    "order_processing_url": <order processing service URL>,
    "provisioning_service_url": <provisioning service URL>,
    "saas_registry_service_url": <saas registry service URL>,
  },
  "grant_type": "user_token",
  "uaa": {
    ...
    "clientid": <client_id>,
    "clientsecret": <client_secret>,
    "url": <uaa_url>,
    ...
  }
}
```

3. Use the `uaa_url`, `clientid`, and `clientsecret` to request an access token using the following commands:

#### Sample Code

For Windows OS (Password grant type):

```
curl -L -X POST "<uaa_url>/oauth/token" ^
-H "Content-Type: application/x-www-form-urlencoded" ^
-u "<clientid>:<clientsecret>" ^
-d "grant_type=password" ^
-d "username=<user_email>" ^
-d "password=<password>"
```

#### Sample Code

For Windows OS (Client Credentials grant type):

```
curl -L -X POST "<uaa_url>/oauth/token" ^
-H "Content-Type: application/x-www-form-urlencoded" ^
-u "<clientid>:<clientsecret>" ^
-d "grant_type=client_credentials" ^
```

#### Sample Code

For Mac OS (Password grant type):

```
curl -L -X POST '<uaa_url>/oauth/token' \
-H 'Content-Type: application/x-www-form-urlencoded' \
-u '<clientid>:<clientsecret>' \
-d 'grant_type=password' \
-d 'username=<user_email>' \
-d 'password=<password>'
```

#### Sample Code

For Mac OS (Client Credentials grant type):

```
curl -L -X POST '<uaa_url>/oauth/token' \
-H 'Content-Type: application/x-www-form-urlencoded' \
-u '<clientid>:<clientsecret>' \
-d 'grant_type=client_credentials' \
```

#### Note

If two-factor authentication (2FA) is activated on the SAP BTP landscape, then you need to append the passcode generated by the SAP Authenticator to your password.

For example, if your password is `Abcd` and the authenticator-generated passcode is `1234`, enter the password as **Abcd1234**.

Two-factor authentication is only relevant for Password grant type authorization.

### Note

The access token received also contains the scopes that are granted for this access token. Therefore, only APIs that require one of these scopes can be used with this access token.

```
{
  "access_token": "<access_token>",
  "token_type": "bearer",
  "expires_in": 43199,
  "scope": "<xsappname>.job.read <xsappname>.event.read"
}
```

See [Get Access to the APIs Using the apiaccess Service Plan](#)

4. Call the SAP Cloud Management service APIs using Swagger with the `access_token` that you received in the previous step:
  1. Choose one of the endpoints of your instance. See step 2 and the sample code for a service instance in Cloud Foundry.
  2. Browse to `<endpoint url>/swagger-ui.html`.
  3. In Swagger, choose *Authorize*.
  4. Enter the `api_key` and choose *Authorize*.

### Note

Use the `<access_token>` that you received in the step 3 to compose the `api_key` in the format:  
`bearer <access_token>`

5. Choose the API that you want to call, provide the relevant parameters, and choose *Try it out!*

## Trying Out SAP Cloud Management Service API in SAP Business Accelerator Hub

To learn more about SAP Business Accelerator Hub, see [What Is the SAP Business Accelerator Hub?](#)

### Note

In the SAP Business Accelerator Hub, you find SAP Cloud Management Service APIs under the **Core Services for SAP BTP API Package**.

To start working with SAP Cloud Management Service APIs in SAP Business Accelerator Hub, you'll need to configure an environment. See [Trying Out APIs in a Configured Environment](#).

### Note

You configure an environment by populating all mandatory fields in the *Create New Environment* wizard.

Refer to steps 2 and 3 of this topic to see how to get the values for Client ID, Client Secret, and Token URL fields.

[Get Access to the APIs Using the apiaccess Service Plan \[page 2233\]](#)

## 6.1.4.1.1.1 SAP Cloud Management Service - Service Plans

Describes the service plans for the SAP Cloud Management service for SAP BTP and the scopes that they provide. The technical name for this service is `cis`.

Service Display Name	Technical Name	Service Plan	Scopes	Additional Configuration Parameters
Cloud Management Service	<code>cis</code>	central:Service plan for using SAP Cloud Management service APIs to manage your global accounts, sub-accounts, directories, and entitlements.	<ul style="list-style-type: none"> <li>global-account.read</li> <li>global-account.update</li> <li>global-account.subaccount.read</li> <li>global-account.subaccount.create</li> <li>global-account.subaccount.update</li> <li>global-account.subaccount.delete</li> <li>global-account.account-directory.read</li> <li>global-account.account-directory.create</li> <li>global-account.account-directory.update</li> <li>global-account.account-directory.delete</li> <li>global-account.entitlement</li> <li>global-account.entitlement.subaccount.update</li> <li>global-account.region.read</li> <li>catalog.product.update</li> <li>catalog.product.delete</li> <li>directory.entitlement.update</li> </ul>	<ul style="list-style-type: none"> <li>grantType: Choose whether to get a Client Credentials or Password grant type token when using the SAP Service Manager API, CLI, or the SAP BTP cockpit to create the service instance of the SAP Cloud Management service (<code>cis</code>). If you don't specify this parameter, the Password grant type is chosen by default.</li> <li>directoryId: ID of a directory to allow directory administrators to use the APIs of the <a href="#">Accounts and Entitlements services</a> to perform account management actions, such as creating subaccounts and setting entitlements, in the directory.</li> </ul> <p>For more information, see <a href="#">Getting an Access Token for SAP Cloud Management Service APIs</a> [page 2192].</p>

Service Display Name	Technical Name	Service Plan	Scopes	Additional Configuration Parameters
			<ul style="list-style-type: none"> <li>directory.entitlement.read</li> <li>job.read</li> <li>cis-central.event.read</li> <li>account-automation-request.read</li> </ul>	
Cloud Management Service		local:Service plan for using SAP Cloud Management service APIs to manage your environments and subscriptions to multitenant applications.	<ul style="list-style-type: none"> <li>subaccount.entitlement.read</li> <li>subaccount.environment.read</li> <li>subaccount.environment.create</li> <li>subaccount.environment.delete</li> <li>subaccount.application.subscription.read</li> <li>subaccount.application.subscription.update</li> <li>job.read</li> <li>cis-local.event.read</li> </ul>	grantType: Choose whether to get a Client Credentials or Password grant type token when using the SAP Service Manager API, CLI, or the SAP BTP cockpit to create the service instance of the SAP Cloud Management service (cis). If you don't specify this parameter, the Password grant type is chosen by default. For more information, see <a href="#">Getting an Access Token for SAP Cloud Management Service APIs [page 2192]</a> .

Service Display Name	Technical Name	Service Plan	Scopes	Additional Configuration Parameters
Cloud Management Service		central-viewer:Service plan for using SAP Cloud Management service APIs to read your global accounts, subaccounts, directories, and service entitlements and assignments.	<ul style="list-style-type: none"> <li>global-account.read</li> <li>global-account.subaccount.read</li> <li>global-account.account-directory.read</li> <li>global-account.entitlement.read</li> <li>global-account.region.read</li> <li>directory.entitlement.read</li> <li>job.read</li> <li>automation-module.read</li> <li>automation-solution.read</li> <li>automation-request.read</li> <li>account-automation-request.read</li> <li>account-automation-solution.read</li> </ul>	grantType: The Client Credentials grant type is available when using the SAP Cloud Management service APIs to read the SAP BTP entities included with this plan. For more information, see <a href="#">Getting an Access Token for SAP Cloud Management Service APIs [page 2192]</a> .
Cloud Management Service		local-viewer:Service plan for using SAP Cloud Management service APIs to read your environments and subscriptions to SaaS multitenant applications.	<ul style="list-style-type: none"> <li>subaccount.entitlement.read</li> <li>subaccount.environment.read</li> <li>subaccount.application.subscription.read</li> <li>event.read</li> <li>job.read</li> </ul>	grantType: The Client Credentials grant type is available when using the SAP Cloud Management service APIs to read the SAP BTP entities included with this plan. For more information, see <a href="#">Getting an Access Token for SAP Cloud Management Service APIs [page 2192]</a> .
SaaS Provisioning Service	saas-registry	application:Service plan for application owners to manage the lifecycle of multitenant applications with SAP Software-as-a-Service Provisioning service APIs.	<ul style="list-style-type: none"> <li>job.read</li> <li>subscription.read</li> <li>subscription.write</li> <li>entitlement.read</li> </ul>	See configuration JSON file properties in <a href="#">Register the Multitenant Application to the SAP SaaS Provisioning Service [page 337]</a> .

For information about assigning these plans to a subaccount, see [Managing Entitlements and Quotas Using the Cockpit \[page 1995\]](#).

## Related Information

### 6.1.4.1.2 Using the Events Service APIs

The Events service provides REST APIs that collect information about events relating to account administrative operations in the microservices of the SAP Cloud Management service for SAP BTP, such as Accounts, Entitlements, Provisioning, and the SAP SaaS Provisioning service, within central and local regions.

You can filter the events by various query parameters, such as a specific time frame, event type, or the type of entity associated with the event.

You can also use the APIs to get all available event types.

Here are some examples of scenarios that can be implemented or built by reacting to account administrative events:

- A global account admin can implement an automatic tagging system for newly created subaccounts by polling for subaccount creation events, `Subaccount_Creation`, from the Accounts service and then adding custom property to each one of the subaccounts according to predefined criteria.
- Set up automatic notifications when a global account admin assigns quota to subaccounts. This scenario uses the `SubaccountEntitlements_Update` event from the Entitlements service.
- Send automatic alerts when a directory is deleted. This scenario uses the event `AccountDirectory_Deletion` from the Accounts service.
- Use the subscription events information, `SubaccountAppSubscription_Creation`, from the SAP SaaS Provisioning service, to send emails notifying when applications are subscribed to from a subaccount.

**Permissions:** A service instance of the SAP Cloud Management service is required. The scopes required to get the events are available for all of the plans for the SAP Cloud Management service. See [SAP Cloud Management Service - Service Plans \[page 2198\]](#).

For more information about permissions, see [Getting an Access Token for SAP Cloud Management Service APIs \[page 2192\]](#).

**Base URI:** `https://events-service.<app domain>.<landscape domain>`

## Methods

HTTP Method	Action	URI
GET	Get events	events-service.<app domain>.<landscape domain>/cloud-management/v1/events
GET	Get event types	events-service.<app domain>.<landscape domain>/cloud-management/v1/events/types

## Related Information

[Getting an Access Token for SAP Cloud Management Service APIs \[page 2192\]](#)

### 6.1.4.1.2.1 Get Events

Get all events associated with administrative operations in your accounts.

The events you get depend on the scopes you used to access the API.

To learn more about the scopes, see [SAP Cloud Management Service - Service Plans \[page 2198\]](#).

## Prerequisites

You have obtained an access token with the `XSAPPNAME.event.read` scope.

## Request

**URI:** `https://events-service.<app domain>.<landscape domain>/cloud-management/v1/events`

**HTTP Method:** `GET`

## Query Parameters

Parameter Name	Required	Parameter Type	Description
entityId	No	Array of strings	The ID of the entity associated with the event.
entityType	No	Array of strings	The type of entity associated with the event.  For example Subaccount, Directory, or Tenant.

Parameter Name	Required	Parameter Type	Description
eventType	No	Array of strings	<p>The type of the event that was triggered.</p> <p>There are two groups of event types, Central Events and Local Events group.</p> <p>The group you get depends on the scopes granted to you after you authorized to use the API.</p> <p>You can query any event listed in the group that is relevant for your scope.</p> <p>To retrieve all available event types, use the Event Types API.</p> <p>See <a href="#">Get Event Types [page 2214]</a>.</p> <p>The examples of some of the events for both groups:</p> <ul style="list-style-type: none"> <li> <b>Central Events group:</b> GlobalAccount_Update, AccountDirectory_Creation, AccountDirectory_Update, AccountDirectory_Update_Type, AccountDirectory_Deletion, Subaccount_Creation, Subaccount_Deletion, Subaccount_Update, Subaccount_Move, AccountDirectoryTenant_Creation, AccountDirectoryTenant_Deletion, GlobalAccountEntitlements_Update, EntityEntitlements_Update, EntityEntitlements_Move </li> <li> <b>Local Events group:</b> SubaccountAppSubscription_Cre- </li> </ul>

Parameter Name	Required	Parameter Type	Description
			<p>ation, SubaccountAppSubscription_Deletion, SubaccountAppSubscription_Update, AppRegistration_Creation, AppRegistration_Deletion, AppRegistration_Update, SubaccountTenant_Creation, SubaccountTenant_Update, SubaccountTenant_Deletion, EnvironmentInstance_Creation, EnvironmentInstance_Deletion, EnvironmentInstances_Deletion</p>
fromActionTime	No	Integer	<p>Start date and time to query the events by the action that triggered them.</p> <p>Use the Unix epoch time in milliseconds (you can find an online converter from a regular date-time format to the Unix epoch time format).</p> <div style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 10px; margin-top: 10px;"> <p><b>❖ Example</b></p> <p>Monday, June 1, 2020 9:40:22 AM is 1590993622000 in Unix epoch milliseconds time.</p> </div>

Parameter Name	Required	Parameter Type	Description
fromCreationTime	No	Integer	<p>Start date and time to query the events by when they were created.</p> <p>Use the Unix epoch time in milliseconds (you can find an online converter from a regular date-time format to the Unix epoch time format).</p> <div style="border: 1px solid #0070c0; padding: 5px; background-color: #e6e6e6;"> <p><b>Example</b></p> <p>Monday, June 10, 2020 04:32:22 AM is 1591752742000 in Unix epoch milliseconds time.</p> </div>
id	No	Array of integers	The ID of the event.
pageNum	No	Integer	The page number to retrieve.
pageSize	No	Integer	The number of events to retrieve per page (max = 150).
searchParams	No	JSON Object	Additional search parameters that depend on the type of the events.
sortField	No	String	Field by which to sort the events.
sortOrder	No	String	<p>Sort order for the events.</p> <p>Can be ascending or descending.</p> <p>Available values: ASC,DESC.</p>

Parameter Name	Required	Parameter Type	Description
toActionTime	No	Integer	<p>End date and time to query the events by the action that triggered them.</p> <p>Use the Unix epoch time in milliseconds (you can find an online converter from a regular date-time format to the Unix epoch time format).</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;"> <p><b>❖ Example</b></p> <p>Monday, June 4, 2020 11:40:22 AM is 1591260022000 in Unix epoch milliseconds time.</p> </div>
toCreationTime	No	Integer	<p>End date and time to query the events by when they were created.</p> <p>Use the Unix epoch time in milliseconds (you can find an online converter from a regular date-time format to the Unix epoch time format).</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;"> <p><b>❖ Example</b></p> <p>Monday, June 6, 2020 12:32:22 AM is 1591392742000 in Unix epoch milliseconds time.</p> </div>

## Response

Returns the list of events, and its associated objects.

**Content Type:** *JSON*

## Response Status and Error Codes

Code	Description
200	Found events (OK)
400	Bad Request Possible reasons: <ul style="list-style-type: none"><li>The requested event type doesn't belong to the events group associated with the scope you used to access the API</li><li>Requested event type is unknown</li><li>Query arguments are invalid</li></ul>
401	Unauthorized Possible reasons: <ul style="list-style-type: none"><li>Invalid token</li><li>A token with the scopes for central region was used to access the Events APIs in a local region.</li></ul>
403	Forbidden
404	Not Found
429	Rate Limit Exceeded
500	Internal Server Error Possible reasons: <ul style="list-style-type: none"><li>Failed to obtain global account or subaccount info</li></ul>

## Response Objects and Their Parameters

`BusinessEventsResponseCollection`

A collection of the event objects associated with the API call and the used scopes.

Parameter Name	Parameter Type	Description
<code>events</code>	Array of JSON objects: <code>BusinessEventResponseObject</code>	List of the event objects. See the next table <code>BusinessEventResponseObject</code> for its parameters.
<code>morePages</code>	Boolean	Whether there are more pages with event objects to return.
<code>pageNum</code>	Integer	The current page number.
<code>total</code>	Integer	Total number of results.
<code>totalPages</code>	Integer	Total number of pages.

`BusinessEventResponseObject`

Includes details about an event in the list.

Parameter Name	Parameter Type	Description
actionTime	String	The time the action triggered the event. The format is Unix epoch time in milliseconds.
creationTime	String	The time the event record was created. The format is Unix epoch time in milliseconds.
details	JSON object	Contains description and details about the requested events.
entityId	String	The ID of the entity associated with the event.
entityType	String	The type of the entity associated with the event.
eventOrigin	String	The service that reported the event.

Parameter Name	Parameter Type	Description
eventType	String	<p>The type of the event that was triggered.</p> <p>There are two groups of event types: Local Events and Central Events group.</p> <p>Only event types that belong to one of the groups is returned as the result of a single API call.</p> <p>The event types group you get depends on the scope you used to access the API.</p> <p>The examples of some of the events for both groups:</p> <ul style="list-style-type: none"> <li>Central Events group: GlobalAccount_Update, AccountDirectory_Creation, AccountDirectory_Update, AccountDirectory_Update_Type, AccountDirectory_Deletion, Subaccount_Creation, Subaccount_Deletion, Subaccount_Update, Subaccount_Move, AccountDirectoryTenant_Creation, AccountDirectoryTenant_Deletion, GlobalAccountEntitlements_Update, EntityEntitlements_Update, EntityEntitlements_Move</li> <li>Local Events group: SubaccountAppSubscription_Creation, SubaccountAppSubscription_Deletion, SubaccountAppSubscription_Update, AppRegistration_Creation, AppRegistration_Deletion, AppRegistration_Update, SubaccountTenant_Creation, SubaccountTenant_Update, SubaccountTenant_Deletion, EnvironmentInstance_Creation, EnvironmentInstance_Deletion, EnvironmentInstances_Deletion</li> </ul>
globalAccountGUID	String	The unique ID of the global account associated with the event.
id	Integer	The ID of the event.

## Response Example

```
{
  "total": 3,
  "totalPages": 1,
  "pageNum": 0,
  "morePages": false,
  "events": [

## Related Information

[Getting an Access Token for SAP Cloud Management Service APIs \[page 2192\]](#)

[Using the Events Service APIs \[page 2201\]](#)

[Get Event Types \[page 2214\]](#)

### 6.1.4.1.2.2 Get Event Types

Get all available event types, including their categories and their available search parameters.

The event types you get are either for a central or for a local region, and the region you get depends on the scopes you used to access the API.

To learn more about the scopes, see [SAP Cloud Management Service - Service Plans \[page 2198\]](#).

## Prerequisites

You have obtained an access token with the `XSAPPNAME.event.read` scope.

## Request

**URI:** `https://events-service.<app domain>.<landscape domain>/cloud-management/v1/events/types`

**HTTP Method:** `GET`

## Response

Returns the event types, their descriptions and categories.

**Content Type:** `JSON`

### Response Status and Error Codes

Code	Description
200	OK
401	Unauthorized Possible reasons: <ul style="list-style-type: none"><li>Invalid token</li></ul>
403	Forbidden
404	Not Found
429	Rate Limit Exceeded
500	Internal Server Error Possible reasons: <ul style="list-style-type: none"><li>Failed to obtain global account or subaccount info</li></ul>

### Response Objects and Their Parameters

`BusinessEventTypeResponseObject`

A JSON object that contains details about event types.

Parameter Name	Parameter Type	Description
category	String	<p>Category to which the event type belongs.</p> <p>Possible values:</p> <ul style="list-style-type: none"> <li>• <b>LOCAL</b>: The event is associated with the local region within a multi-region universe.</li> <li>• <b>CENTRAL</b>: The event is associated with the central region within a multi-region universe.</li> </ul>
description	String	The description of the event type.
searchParams	Array	<p>List of all the search parameters for the event type.</p> <p>Provided inline.</p> <div data-bbox="1002 891 1398 1030" style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;"> <p><b>❖ Example</b></p> <pre>&lt;URL HOST&gt;?searchParam-Key1=searchParamValue1</pre> </div>

Parameter Name	Parameter Type	Description
type	String	<p>The type of the event that was triggered.</p> <p>There are two groups of event types: Local Events and Central Events group.</p> <p>Only event types that belong to one of the groups are returned as the result of a single API call.</p> <p>The event types group you get depends on the scope you used to access the API.</p> <p>The examples of some of the events for both groups:</p> <ul style="list-style-type: none"> <li>Central Events group: GlobalAccount_Update, AccountDirectory_Creation, AccountDirectory_Update, AccountDirectory_Update_Type, AccountDirectory_Deletion, Subaccount_Creation, Subaccount_Deletion, Subaccount_Update, Subaccount_Move, AccountDirectoryTenant_Creation, AccountDirectoryTenant_Deletion, GlobalAccountEntitlements_Update, EntityEntitlements_Update, EntityEntitlements_Move</li> <li>Local Events group: SubaccountAppSubscription_Creation, SubaccountAppSubscription_Deletion, SubaccountAppSubscription_Update, AppRegistration_Creation, AppRegistration_Deletion, AppRegistration_Update, SubaccountTenant_Creation, SubaccountTenant_Update, SubaccountTenant_Deletion, EnvironmentInstance_Creation, EnvironmentInstance_Deletion, EnvironmentInstances_Deletion</li> </ul>

## Response Example

### 6.1.4.1.3 Error Response Format

Describes the response format for the errors from the SAP Cloud Management service for SAP BTP.

Standard HTTP codes are used to indicate successful execution or if errors occur. The response includes additional information about the error, including an application error code and human readable error description. This example represents a common error response resulting from a failed API request.

```

HTTP/1.1 400 Bad Request
{
  "error": {
    "code": 11000,

```

```

"message": "Request payload is invalid",
"target": "/accounts/v1/subaccounts/125e2778-e457-4c24-9db8-e3e10a3a0ed5",
"details": [
  {
    "code": 11001,
    "message": "description: length must be between 0 and 255"
  }
]
}

```

Parameter	Description	Type
<code>error.code</code>	A unique application error code. Common values are listed below.	Number
<code>error.message</code>	A description of the error.	String
<code>error.target</code>	The resource URL of the request.	String
<code>error.details</code>	An array of additional error codes and descriptions with further details about the error and its root cause. If this field exists, the array will contain at least one element.	Array

An application error code is not necessarily coupled with a specific HTTP status code.

## Error Codes

Provides a list of error codes and the details of the errors.

Error Code	Description
10XXX	Server errors
11XXX	General request errors
12XXX	General operations failures
2XXXX	Accounts service errors
3XXXX	Entitlements service errors
40XXX	Tenants operations failures
41XXX	Environment instances operations failures
42XXX	Provisioning service errors
5XXXX	Service Management service proxy errors
6XXXX	Order Processing service errors
7XXXX	CLI backend errors
8XXXX	Asynchronous jobs failures
9XXXX	SaaS Provisioning service errors
10XXXX	Events service errors

## 6.1.4.1.4 Asynchronous Jobs

Describes the asynchronous calls that are supported by some functionality from the SAP Cloud Management service for SAP BTP.

When the API responds with the status code [202](#), the request can be processed as an asynchronous job.

The status of the request can be fetched using the path provided in the *Location* header. The response of the API provided in the *Location* header is normally:

```
{
  "status": "<IN_PROGRESS/COMPLETED/FAILED>",
  "description": "<meaningful description in case one needed>"
}
```

### Note

The response includes the `status` (always) and `description` (optional) fields.

For example, you can trigger a brand new job.

## 6.1.4.1.5 Rate Limiting

Describes how all API requests to the SAP Cloud Management service for SAP BTP adhere to rate limiting rules.

Every API endpoint defines its own custom rate limit rule for the number of requests per time window and per identified caller.

Authenticated requests are associated either with the authenticated username, tenant ID or with the OAuth client ID. Unauthenticated requests are associated with the originating IP address, and not the user making requests.

When the rate limit is exceeded, the client receives the HTTP [429](#) Too Many Requests response status code.

### Response Example

For example, if you try to perform more than five GET requests to the `/accounts/v1/globalAccounts` endpoint in the `accounts-service` in less than a three second time window, you will receive the following error:

```
HTTP/1.1 429 Too Many Requests
{
  "error": {
    "code": 11006,
    "message": "Request rate limit exceeded.",
    "target": "/accounts/v1/globalAccounts",
    "details": [
      {
        "code": 11007,
        "message": "Maximum request rate limit is <X> requests in <Y> seconds"
      }
    ]
  }
}
```

```
}  
  ]  
}
```

#### Note

- The error code for the rate limit exceeded error is always **11006** and the details contains the list of exceeded rate limit rules with the **11007** error code.
- No HTTP headers are returned to show your current rate limit status (for example, the number of requests remaining in the current rate limit window).

## 6.1.4.2 Monitoring Usage Information Using APIs of the SAP Usage Data Management Service [Feature Set B]

#### Note

The content in this section is only relevant for cloud management tools feature set B. For more information, see [Cloud Management Tools - Feature Set Overview](#).

Provides information about using the *Resource Consumption* APIs of the SAP Usage Data Management service for SAP BTP for gathering, storing, and making usage information available for all services and applications in all regions in a cloud deployment. This information is for the purpose of central analysis, reporting, and license auditing.

The service accumulates the information and provides reports in SAP BTP cockpit via APIs for resource planning and cross-billing purposes.

#### Note

The SAP Usage Data Management service is not sold to SAP BTP customers as a service; however, customers can see their usage data in the cockpit, for example, in the Usage Analytics pages.

## Accessing the API

For more information about the APIs, including their specifications and endpoints, go to [Resource Consumption](#) for the list of all SAP Usage Data Management service APIs in the SAP Business Accelerator Hub.

#### → Remember

To call the core platform API methods, you must obtain an access token. See [Configuration for Using the Resource Consumption APIs in the SAP Business Accelerator Hub \[page 2223\]](#).

**Base URI:** `https://uas-reporting.cfapps.<landscape domain>/reports/v1`

Your global account admin has entitled the service plan for the SAP Usage Data Management service in your subaccount. See [SAP Usage Data Management Service - Service Plans \[page 2227\]](#).

## Methods

HTTP Method	Action	URI
GET	Get the cloud credit data history for a global account.	<code>/cloudCreditDetails</code>
GET	Get monthly usage reporting data for a directory and a specified time period.	<code>/monthlyDirectoryUsage</code>
GET	Get monthly usage-reporting data for a global account and a specified time period.	<code>/monthlyUsage</code>
GET	Get usage-reporting data for a subaccount.	<code>/subaccountUsage</code>
GET	Get monthly cost reporting data for all subaccounts for the Cloud Platform Enterprise Agreement (CPEA) consumption-based commercial model.	<code>/monthlySubaccountsCost</code>

## Related Information

[Configuration for Using the Resource Consumption APIs in the SAP Business Accelerator Hub \[page 2223\]](#)

[SAP Usage Data Management Service - Service Plans \[page 2227\]](#)

[Cloud Management Tools — Feature Set Overview \[page 111\]](#)

### 6.1.4.2.1 Configuration for Using the Resource Consumption APIs in the SAP Business Accelerator Hub

The **Resource Consumption** APIs of the SAP Usage Data Management service for SAP BTP are protected with OAuth 2.0 Client Credentials grant type and in some cases, also the Password grant type.

#### Note

OAuth 2.0 Password grant type is only mandatory for the `subaccountUsage` API.

## Prerequisites

- To use the *Resource Consumption* APIs of the SAP Usage Data Management service
  - You must have service access to the relevant **uas** service plan. For information about available service plans, see [SAP Usage Data Management Service - Service Plans \[page 2227\]](#).
  - When using **Password grant type** the user must be assigned one of the following role collections:

API	Role Collection Required
monthlyUsage, /monthlySubaccountsCost, and subaccountUsage	Global Account Administrator and Global Account Viewer

For more information, see [Role Collections and Roles in Global Accounts, Directories, and Subaccounts \[Feature Set B\] \[page 89\]](#).

### Note

To create a service instance in other environments using the Service Manager Control (SMCTL) CLI, SAP Service Manager APIs, or the SAP BTP cockpit, see [Consuming Services in Other Environments Using the SAP Service Manager Instances](#).

## Procedure

1. Create a service instance for the service plans that correspond to the APIs that you want to use. When you create the service instance, specify the following parameters:
  - **PLAN**: The name of the service plan that you want to use. See [SAP Usage Data Management Service - Service Plans \[page 2227\]](#).
  - **SERVICE\_INSTANCE**: Name of the service instance.

There are several options available to create instances depending on the environment you use.

- To create a service instance in other environments using the Service Manager Control (SMCTL) CLI or SAP Service Manager APIs, see [Consuming Services in Other Environments Using the SAP Service Manager Instances](#).
- To create a service instance in the Cloud Foundry environment using the SAP BTP cockpit or the cf CLI, see [Creating Service Instances \[page 231\]](#).
- To create a service instance in Kyma using the Kyma dashboard, see [Using SAP BTP Services in the Kyma Environment \[page 1732\]](#).

### → Recommendation

If you are not working in Cloud Foundry, Kyma, or Kubernetes, use the SAP Service Manager to create and manage service instances. These instances are platform-agnostic and can be deployed and integrated with any other environment of your choice.

2. Get the OAuth 2.0 client information and **uas** service endpoints by creating a service key or binding. There are several options available to create service keys or bindings depending on the environment you use.
  - To create bindings in other environments, see [Consuming Services in Other Environments Using the SAP Service Manager Instances](#).

- To create a service key in the Cloud Foundry environment using the SAP BTP cockpit or the cf CLI, see [Creating Service Keys \[page 236\]](#).
  - To create credentials for calling the service and retrieving information in the Kyma environment, see [Using SAP BTP Services in the Kyma Environment \[page 1732\]](#).
3. Use `uaa_url`, `clientid`, and `clientsecret` to request an access token using the following commands:

#### Sample Code

For Windows OS (Password grant type):

```
curl -L -X POST "<uaa_url>/oauth/token" ^
-H "Content-Type: application/x-www-form-urlencoded" ^
-u "<clientid>:<clientsecret>" ^
-d "grant_type=password" ^
-d "username=<user_email>" ^
-d "password=<password>"
```

#### Sample Code

For Windows OS (Client Credentials grant type):

```
curl -L -X POST "<uaa_url>/oauth/token" ^
-H "Content-Type: application/x-www-form-urlencoded" ^
-u "<clientid>:<clientsecret>" ^
-d "grant_type=client_credentials" ^
```

#### Sample Code

For Mac OS (Password grant type):

```
curl -L -X POST '<uaa_url>/oauth/token' \
-H 'Content-Type: application/x-www-form-urlencoded' \
-u '<clientid>:<clientsecret>' \
-d 'grant_type=password' \
-d 'username=<user_email>' \
-d 'password=<password>'
```

#### Sample Code

For Mac OS (Client Credentials grant type):

```
curl -L -X POST '<uaa_url>/oauth/token' \
-H 'Content-Type: application/x-www-form-urlencoded' \
-u '<clientid>:<clientsecret>' \
-d 'grant_type=client_credentials' \
```

#### Note

The access token that you receive also contains the scopes that are granted for this access token. Therefore, only APIs that require one of these scopes can be used with this access token.

```
{
  "access_token": "<access_token>",
  "token_type": "bearer",
  "expires_in": 43199,
  "scope": "<xsappname>.UAS.reporting.GA_Admin"
}
```

4. Using the `<access_token>` that you received in the previous step you can call the [Resource Consumption APIs](#) using bearer authentication or you can try them directly in the SAP Business Accelerator Hub using the following steps:
  1. Got to [Resource Consumption APIs](#) in the SAP Business Accelerator Hub.
  2. Choose [Select Environment](#) and select the [Add New Environment](#) option
  3. In the [Authentication Type](#) field, select [OAuth 2.0 Application Flow](#).
  4. Provide the parameters that you have retrieved in the following fields: `clientId`, `clientsecret`, and `identityzone`.
  5. Save your changes.
5. Choose the API that you want to call, provide the relevant parameters, and choose [Run](#).

To learn more about the SAP Business Accelerator Hub, see [What Is the SAP API Business Hub?](#)

## Related Information

[Get Access to the APIs Using the apiaccess Service Plan \[page 2233\]](#)

### 6.1.4.2.2 Rate Limiting Rules

API requests to the SAP Usage Data Management service for SAP BTP are subject to rate limits.

Rate limits restrict the number of requests made by a caller within a defined time period. For authenticated requests, callers are identified by the authenticated user name, the tenant ID or the OAuth client ID. For non-authenticated requests, callers are identified by the originating IP address.

When you exceed the rate limit, you receive the HTTP response status code [429 Too Many Requests](#).

The rate limits are:

- The rate limit per authentication token or IP is 120 requests per second.
- The maximum payload body size per request is 80 MB.

#### ❁ Example

For example, if you try to perform more than 120 GET requests to the `/reports/v1/monthlyUsage` endpoint in less than 1 second, you receive the following error:

```
<html>
<head><title>429 Too Many Requests</title></head>
<body>
<center><h1>429 Too Many Requests</h1></center>
<hr><center>openresty</center>
</body>
</html>
```

## 6.1.4.2.3 SAP Usage Data Management Service - Service Plans

Describes the plans available for the SAP Usage Data Management service for SAP BTP.

### 📘 Note

The SAP Usage Data Management service APIs can be found in the [SAP Business Accelerator Hub](#).

Display Name	Technical Service Name	Service Plans	Scopes
Usage Data Management Service (UDM)	uas	<p>reporting-ga-admin: Service plan for using the SAP Usage Data Management service APIs.</p> <p>This microservice is used to generate reports based on resource and cost consumption of a global account.</p>	Reporting.GA_Admin

Display Name	Technical Service Name	Service Plans	Scopes
		<p>reporting-directory: Service plan for using the SAP Usage Data Management service APIs.</p> <p>This microservice is used to generate reports based on resource and cost consumption of a directory.</p> <p>When you create a service instance of this plan, you have to pass the directory ID in the following format:</p> <ul style="list-style-type: none"> <li>• { "directoryGuid" : "f4c920c1-efb7-4bda-8d0e-81616ab9a574" } - if you create the service instance using the SAP BTP cockpit</li> <li>• -c "{ \"directoryGuid\" : \"f4c920c1-efb7-4bda-8d0e-81616ab9a574\" }" - if you create the service instance using the cf CLI</li> </ul>	\$XSAPPNAME.reporting.Directory_Admin

**▲ Restriction**

The directory must be located under `globalAccount` and contain the subaccount from which you are creating the service instance.

User management must be enabled for the directory, see [Manage Users in Directories \[Feature Set B\] \[page 1973\]](#).

## Related Information

[Configuration for Using the Resource Consumption APIs in the SAP Business Accelerator Hub \[page 2223\]](#)

### 6.1.4.3 Accessing Administration Using APIs of the SAP Authorization and Trust Management Service

The REST services of the SAP Authorization and Trust Management service (XSUAA) provide APIs that enable you to manage entities, such as roles, shadow users, and access tokens in global accounts, directories, and multi-environment subaccounts.

#### Note

To manage Neo subaccounts, use the Neo APIs. For more information, see [Using Platform APIs](#).

## API Overview

The following table provides an overview of the APIs. For more information about the APIs and their API endpoints, see *SAP Business Accelerator Hub* in the related links.

APIs of SAP Authorization and Trust Management Service

API	Description
User Management (System for Cross-domain Identity Management (SCIM))	Provides functions to administrate the SAP Authorization and Trust Management service of the Cloud Foundry environment. Provision users from identity providers and manage roles and role collections. Use this API to manage shadow users; users the service provisions from your identity provider to the subaccount.  See <a href="#">SAP BTP XS Advanced UAA (Cloud Foundry)</a> for more information.
Authorization	Provides functions to administrate the SAP Authorization and Trust Management service of Cloud Foundry environment. Manage service instances of the SAP Authorization and Trust Management service. You can also manage roles, role templates, and role collections of your subaccount.
Identity Provider Management	Provides functions to manage identity providers in the Cloud Foundry environment.
Security Settings	Provides functions to manage the security settings of an account in Cloud Foundry environment. Use this API to manage access token validity and signing keys.

## Related Information

[APIs of SAP Authorization and Trust Management Service service on SAP Business Accelerator Hub](#)

[Using Platform APIs](#)

[Rate Limiting \[page 2812\]](#)

[Limits for Technical Artifacts of the SAP Authorization and Trust Management Service \[page 2817\]](#)

### 6.1.4.3.1 Get Access to the APIs

To enable programmatic access to the SAP Authorization and Trust Management service (XSUAA) in your global account, directory, or multi-environment subaccount, you need API credentials.

#### Context

To get access to the APIs of the SAP Authorization and Trust Management service, use the SAP BTP command-line interface (btp CLI) to create API credentials. You can get API credentials that apply for the global account, directory, or subaccount.

For more information, see [Managing API Credentials for Calling REST APIs of SAP Authorization and Trust Management Service \[page 2182\]](#).

#### Procedure

1. Log on to the SAP BTP CLI.
2. Enter the following command in the relevant global account, subaccount, or directory:

```
btp create security/api-credential --name my-credential
```

You get API credentials, which enable you to access the [REST APIs of the SAP Authorization and Trust Management service on Business Accelerator Hub](#).

The btp CLI shows the API credential as follows:

#### Output Code

```
Name: my-credential
Credential Type: binding-secret
Read-only: false
Client Secret: <secret>
Certificate: <null>
Client ID: sb-full-access!a76125
```

With the client ID and client secret, or certificate, you can request an access token for the APIs in the targeted global account, directory, or subaccount.

```
"scope": "xs_user.write uaa.resource xs_authorization.read
xs_idp.write xs_user.read xs_idp.read xs_authorization.write",
"jti": "be340353ac694b4cb504c6823f938647" }
```

2. To retrieve the token, use the following URL:

```
https://<subdomain>.authentication.<region>.hana.ondemand.com
```

### Note

To find the subdomain of the global account, directory, and subaccount, go to the SAP BTP cockpit and display the overview in the [Account Explorer](#).

When you have a token, you can use this token to call the APIs until its validity expires. In this case, simply get a new access token.

3. Use the value of the `access_token` property to make calls to the various API endpoints.
4. Call the endpoint of an API.

### Sample Code

In this example, we request the list of roles of from the authorization API. With the authorization header, use the access token you received in the prerequisites after the key word `bearer`.

```
curl --request GET \
  --url https://api.authentication.eu10.hana.ondemand.com/sap/rest/
  authorization/v2/roles \
  --header 'Accept: application/json' \
  --header 'Authorization: bearer eyJhbGciOiJSUzI1N...' 
```

## Results

The API returns the list of roles.

### Output Code

```
[
  {
    "roleTemplateName": "Viewer",
    "roleTemplateAppId": "myapp!t1111",
    "name": "Viewer",
    "attributeList": [],
    "roleCapabilityIDList": [],
    "description": "Default instance",
    "scopes": [
      {
        "description": "Display forecast",
        "name": "myapp!t1111.Tourist",
        "custom-granted-apps": [],
        "granted-apps": [],
        "grant-as-authority-to-apps": [],
        "custom-grant-as-authority-to-apps": []
      }
    ]
  }
]
```

## Related Information

[Authorization and Trust Management APIs on the SAP Business Accelerator Hub](#)   
[Implementing Custom Token Retrieval from SAP Authorization and Trust Management Service with mTLS](#)  
[page 492]

### 6.1.4.3.3 Get Access to the APIs Using the `apiaccess` Service Plan

To enable programmatic access to the SAP Authorization and Trust Management service (XSUAA) in your multi-environment subaccount, create a service instance with the `apiaccess` plan.

#### Prerequisites

- You have an org and a space where you can create a service instance.

#### Context

##### → Recommendation

Use the SAP BTP command-line interface (btp CLI) to create credentials. Using the btp CLI is easier and has fewer restrictions than using the `apiaccess` plan.

For more information, see [Get Access to the APIs](#) [page 2230].

One use case for this scenario is to use your own identity management system to integrate it with SAP BTP. The API is a RESTful API that includes access to authorization, user, group, and identity provider interfaces. The user, group, and identity provider interfaces use the System for Cross-domain Identity Management (SCIM) protocol.

For more information about the available APIs, see <https://api.sap.com/package/authtrustmgmt>  on SAP Business Accelerator Hub.

#### Procedure

1. Navigate, for example, to the space of your subaccount.

Enter the following command:

```
cf target -o <org_name> -s <space_name>
```

For example:

```
cf target -o my-org -s DEV
```

2. In your subaccount, create a service instance with the `apiaccess` plan.

Enter the following command:

```
cf create-service xsuaa apiaccess <access_name>
```

For example:

```
cf create-service xsuaa apiaccess my-access
```

This command creates an entry for the OAuth client in the database of the authorization server.

3. Create a service key.

Enter the following command:

```
cf create-service-key <access_name> <key_name>
```

For example:

```
cf create-service-key my-access my-access-key
```

The system creates the credentials for the OAuth client.

4. Get the credentials for the OAuth client.

Enter the following command:

```
cf service-key <access_name> <key_name>
```

For example:

```
cf service-key my-access my-access-key
```

The system answers similar to the following:

#### Output Code

```
Getting key my-access-key for service instance my-access as my-user...
{
  "apiurl": "https://api.authentication.eu10.hana.ondemand.com",
  "clientid": "aa-bb-cccc11c1-d222-333e-44f4-g5g55ggg555g!a6666",
  "clientsecret": "aA1B2CcCCC3dDd+ee444fFF5ggG=",
  "identityzone": "my-subdomain",
  "identityzoneid": "a11aaaa1-22b2-33c3-dd44-5555f5555f55",
  "sburl": "https://internal-xsuaa.authentication.eu10.hana.ondemand.com",
  "tenantid": "a11aaaa1-22b2-33c3-dd44-5555f5555f55",
  "tenantmode": "dedicated",
  "uaadomain": "authentication.eu10.hana.ondemand.com",
  "url": "https://my-subdomain.authentication.eu10.hana.ondemand.com",
  "verificationkey": "-----BEGIN PUBLIC KEY-----sadklfjdsaf1ja
  ...-----END PUBLIC KEY-----",
  "xsappname": "aa-bbbb11b1-c222-333d-44e4-f5f55fff555f!a6666"
}
```

With the URL, client ID, and client secret, you can request an access token. With the access token and the `apiurl`, you can access the API.

5. Configure or program your application to request a token from the OAuth authorization server.

## 6.1.5 Account Administration Using Infrastructure as Code

Infrastructure as Code (IaC) automates infrastructure provisioning and management using code. It helps ensure consistency, scalability, versioning, collaboration, and documentation. The Terraform Provider for SAP BTP allows you to provision and manage SAP BTP resources as code, with open-source support.

### What is Infrastructure as Code?

Infrastructure as Code (IaC) is an approach to managing and provisioning infrastructure resources as code, using machine-readable configuration files or scripts, instead of manually configuring them. Infrastructure configurations are written in a programming language and usually stored in version control systems, so they can easily be shared, reviewed, and modified, enabling collaboration and reproducibility.

The following are some benefits of the IaC approach:

- **Automation:** It allows for the automation of infrastructure provisioning and management processes. Infrastructure can be created, modified, and destroyed programmatically, reducing the need for manual intervention and minimizing human error.
- **Consistency:** By defining infrastructure as code, you can ensure that your infrastructure is consistently provisioned and configured across different environments, such as development, testing, and production. This helps in reducing configuration drift and improves reliability.
- **Scalability:** IaC enables the ability to scale infrastructure resources up or down based on demand. By defining infrastructure configurations in code, you can easily replicate and deploy infrastructure resources in a consistent and repeatable manner.
- **Versioning and Collaboration:** IaC configurations can be stored in version control systems, allowing you to track changes over time and roll back to previous versions if needed. It also enables collaboration among team members, as multiple people can work on the same infrastructure codebase simultaneously.
- **Documentation:** IaC serves as a form of documentation, providing a clear and concise representation of the desired infrastructure state. It helps in understanding the infrastructure architecture and facilitates knowledge sharing within the team.

Overall, Infrastructure as Code brings the principles and practices of software development to infrastructure management, with the goal of enabling organizations to achieve greater agility, scalability, and reliability in their infrastructure operations.

### Infrastructure as Code with the Terraform Provider for SAP BTP

There is an open-source solution for using IaC for SAP BTP: The **Terraform Provider for SAP BTP**. It focuses on administration capabilities within SAP BTP global accounts. For example, it lets you manage subaccounts and directories, entitlements, environment instances, subaccounts, service instances and bindings, users and role collections, and trust configurations to custom identity providers.

#### Where to Find the Terraform Provider for SAP BTP

- You find the Terraform Provider for SAP BTP in Hashicorp's Terraform registry, the central provider repository: <https://registry.terraform.io/providers/SAP/btp> .

- You find the source code and documentation in this GitHub repository: <https://github.com/SAP/terraform-provider-btp>

## Support

The Terraform Provider for SAP BTP was built by SAP as an open-source project under the [Apache 2.0 license](#). Note that this means that there is no official SAP support for the provider. Feedback, issues, pull requests, and feature requests are handled through the [open repository on github.com](#).

## Documentation

For a complete overview of the scope of the Terraform Provider for SAP BTP, see the documentation in Hashicorp's Terraform Registry: <https://registry.terraform.io/providers/SAP/btp/latest/docs>.

To learn how to get started, see the tutorial: [Get Started with the Terraform Provider for SAP BTP](#).

To check out different use cases and options, look at our samples: [Repository with Samples for the Terraform Provider for SAP BTP](#).

For blog posts in SAP Community, search for "infrastructure as code" in the [Technology Blogs by SAP](#).

## 6.2 Administration and Operations in the Cloud Foundry Environment

Learn about the different account administration and application operation tasks which you can perform in the Cloud Foundry environment.

## Related Information

[Cloud Foundry Environment \[page 44\]](#)

[Getting Started in the Cloud Foundry Environment \[page 129\]](#)

[Development in the Cloud Foundry Environment \[page 214\]](#)

## 6.2.1 Org Management Using the SAP BTP Command Line Interface (btp CLI) [Feature Set B]

The Cloud Foundry environment allows you to create polyglot cloud applications in Cloud Foundry. To manage the lifecycle of an org in the Cloud Foundry environment, use the `accounts/environment-instance` command in the btp CLI.

### Note

The content in this section is only relevant for cloud management tools feature set B. For more information, see [Cloud Management Tools - Feature Set Overview](#).

### Available Plans

To create a Cloud Foundry org in a subaccount, you use the Cloud Foundry Runtime service. The Cloud Foundry Runtime service offers the following plans for this purpose:

Plan Name	Description
<code>standard</code>	<p>This is an enterprise-grade plan that allows you to create an org in your Cloud Foundry environment to start developing polyglot cloud-native applications.</p> <p>By default, a Cloud Foundry org that is created with this plan does not have any application runtime. To assign application runtime, the global account admin must assign the Cloud Foundry Runtime service with the <code>MEMORY</code> plan to the subaccount so that the org has memory for its applications.</p>
<code>free</code>	<p>Use this plan to try out the Cloud Foundry environment without an additional charge before switching to the <code>standard</code> plan that supports enterprise-grade productivity.</p> <p>By default, a Cloud Foundry org that is created with this plan is given a fixed application-runtime quota. There is no need to assign the Cloud Foundry Runtime service with the <code>MEMORY</code> plan to the subaccount as it will have no effect on the org quota.</p> <p>For more information about the free tier model for SAP BTP and its availability, see <a href="#">Using Free Service Plans [page 72]</a>.</p>
<code>trial</code>	<p>Use this plan to utilize your trial period.</p> <div data-bbox="823 1783 1394 1899"><h3>Note</h3><p>Your subaccount's type must be trial to use this plan.</p></div>

For more information, about the features that each plan offers, see [Cloud Foundry Runtime](#) on SAP Discovery Center.

## Command Reference for CRUD Operations

The btp CLI offers the following environment instance command actions to manage Cloud Foundry orgs in SAP BTP:

Action	Command	Description	Parameters	Additional Info
list	<code>btp list accounts/ environment- instance -- subaccount &lt;SUBACCOUNT_ID&gt;</code>	List all the Cloud Foundry orgs and other environment instances in a subaccount.	SUBACCOUNT_ID: The ID of the subaccount.	
get	<code>btp get accounts/ environment- instance &lt;ID&gt; --subaccount &lt;SUBACCOUNT_ID&gt;</code>	Get the details of a specific Cloud Foundry org in a subaccount.	ID: The ID of the environment instance to view.  SUBACCOUNT_ID: The ID of the subaccount.	

Action	Command	Description	Parameters	Additional Info
create	<pre> <b>bt</b>p create accounts/ environment- instance -- subaccount &lt;SUBACCOUNT_ID&gt; --display-name &lt;DISPLAY_NAME&gt; --service &lt;SERVICE&gt; -- plan &lt;PLAN&gt; -- environment cloudfoundry -- parameters "{\"instance_name\": \"&lt;ORG_NAME&gt;\"}" </pre>	Create a Cloud Foundry org in a sub-account.	<p><b>SUBACCOUNT_ID:</b> The ID of the sub-account in which to create the Cloud Foundry org.</p> <p><b>DISPLAY_NAME:</b> The SAP BTP name of the environment instance.</p> <p><b>PLAN:</b> Specify either standard or free as the value.</p> <p><b>ORG_NAME:</b> The name of the org in the Cloud Foundry environment. Spaces are not allowed in the org name. Once the org is created, you cannot change its name.</p>	For examples that show how to pass JSON parameters in the command line with different operating systems and shells, see the <a href="#">Passing JSON Parameters on the Command Line [page 2144]</a> .
	<p><b>Note</b></p> <p>If the logged-in region has multiple landscapes, then you must specify the name of the landscape using the <code>--landscape</code> parameter in the command. You can obtain the valid values using the <code>bt</code>p list accounts/available-environment command.</p>			

Action	Command	Description	Parameters	Additional Info
update	<pre> btp update accounts/ environment- instance &lt;ID&gt; --subaccount &lt;SUBACCOUNT_ID&gt; --plan &lt;PLAN&gt; </pre>	Update an existing Cloud Foundry org in a subaccount.	<p>ID: The ID of the environment instance to update</p> <p>SUBACCOUNT_ID: The ID of the subaccount.</p> <p>PLAN: Specify either <code>standard</code> or <code>free</code> as the value.</p>	<p>For the Cloud Foundry environment, you can use this command to change only the plan of an existing Cloud Foundry environment instance. In other words, update an org created with the <code>free</code> plan of the Cloud Foundry Runtime to the <code>standard</code> plan (not vice versa).</p> <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p><b>Note</b></p> <p>Before updating the plan to <code>standard</code>, make sure that the <code>MEMORY</code> plan for the Cloud Foundry Runtime entitlement is assigned to your subaccount, and that you've assigned sufficient application runtime quota to cover the current workload in the subaccount.</p> </div>
delete	<pre> btp delete accounts/ environment- instance &lt;ID&gt; --subaccount &lt;SUBACCOUNT_ID&gt; </pre>	Delete a Cloud Foundry org created in a subaccount.	<p>ID: The ID of the environment instance to delete.</p> <p>SUBACCOUNT_ID: The ID of the subaccount where the environment instance exists.</p>	The Cloud Foundry org and all its data will be lost.

## Note

You can obtain the subaccount ID by running `btpt list accounts/subaccount`. You can also target the subaccount using `btpt target --subaccount <ID>`, and then omit the `subaccount` parameter from the rest of the commands.

## Adding and Removing Org Managers

You can also use the `btpt` CLI to add or remove org managers.

Action	Command	Description	Parameters	Additional Info
update	<pre>btpt update accounts/ environment- instance &lt;ID&gt; --subaccount &lt;SUBACCOUNT_ID&gt; --plan &lt;PLAN&gt; --parameters "{\"usersToAdd\": ": [ { \"id\": \"myUs erID\", \"email\": \"name@example .com\" } ] }</pre>	<p>Add one or more org managers to a Cloud Foundry org in a subaccount.</p> <p><code>usersToAdd</code> adds the OrgManager role to the user, and, if it doesn't exist yet, it creates the user in the org.</p>	<p>ID: The ID of the environment instance for which to add org managers.</p> <p>SUBACCOUNT_ID: The ID of the subaccount.</p> <p>PLAN: Specify either standard or free as the value.</p>	<p>For examples that show how to pass JSON parameters in the command line with different operating systems and shells, see the <a href="#">Passing JSON Parameters on the Command Line [page 2144]</a>.</p>
update	<pre>btpt update accounts/ environment- instance &lt;ID&gt; --subaccount &lt;SUBACCOUNT_ID&gt; --plan &lt;PLAN&gt; --parameters "{\"usersToRemove\": ": [ { \"id\": \"myUs erID\", \"email\": \"name@example .com\" } ] }</pre>	<p>Remove one or more org managers from a Cloud Foundry org in a subaccount.</p> <p><code>usersToRemove</code> removes the OrgManager role from the user, but it doesn't remove the user from the org.</p>	<p>ID: The ID of the environment instance for which to remove org managers.</p> <p>SUBACCOUNT_ID: The ID of the subaccount.</p> <p>PLAN: Specify either standard or free as the value.</p>	<p>To learn how to remove a user from the Cloud Foundry org and the subaccount, see <a href="#">About User Management in the Cloud Foundry Environment [page 2243]</a>.</p>

[About User Management in the Cloud Foundry Environment \[page 2243\]](#)

## 6.2.2 About User Management in the Cloud Foundry Environment

The Cloud Foundry environment has its own store for user data within SAP BTP. Understanding the relationship between SAP BTP and the Cloud Foundry environment is useful.

All users of Cloud Foundry and SAP BTP are stored in identity providers. Both require a local copy of the users so that you can assign authorizations to those users. When a user tries to log on, the user is forwarded to the identity provider to authenticate. When you add a user as a member to an org or space, there's no check, whether or not this user actually exists in the identity provider you specified.

Org members can only be added by an `Org Manager`. If you only have the `Space Manager` role, you can only add space members that are known to the org. To do that, you must first ask your `Org Manager` to add the users as org members with no roles.

### Note

All org members implicitly have the `Org User` role.

If you're the `Org Manager`, you don't need to first add the users as org members with no roles. You already have the authorizations to add users to the org. When you add a new user as a space member, that user is added automatically as part of the org as well.

## Cloud Foundry and Shadow Users

Whenever you add a user at the org or space level, SAP BTP creates the user at the global account and subaccount levels, also known as a shadow user. This is the case only when you use the SAP BTP cockpit, not on using the Cloud Foundry CLI or Cloud Foundry APIs.

### Remember

When you delete a user at the Cloud Foundry level, SAP BTP doesn't delete the corresponding shadow user at the subaccount level.

When you delete a user at the subaccount level, ensure that you delete the user at the Cloud Foundry level too. Otherwise, if the Cloud Foundry user logs on again, the system automatically creates the corresponding user at the subaccount level.

So ensure that you delete the shadow users on all levels.

For more information about shadow users, see [Working with Users \[page 2078\]](#).

[Add Space Members Using the Cloud Foundry Command Line Interface \[page 2291\]](#)

## 6.2.3 About Roles in the Cloud Foundry Environment

Roles determine which features users can view and access, and which actions they can initiate.

Cloud Foundry includes predefined roles that are specific to the navigation level in the SAP BTP cockpit; for example, the roles at the level of the organization differ from the ones for the space. Each role comes with a set of permissions. Roles apply to all operations that are associated with the organization or the space, irrespective of the tool used (Eclipse-based tools, SAP BTP cockpit, and cf CLI).

The following roles can be assigned to users in the Cloud Foundry environment on SAP BTP:

Level	Role	Role Description
Organization	Org Manager	Manages the organization.
	Org Auditor	Provides read-only access to user information and org quota usage information.
	Org User	Provides read-only access to the list of other organization users and their roles.
<div style="border: 1px solid #ccc; padding: 10px;"><p><b>Note</b></p><p>When creating a space member, the Org User role is always one of the assigned organization roles. When creating an organization member, you can choose one or more of the following roles:</p><ul style="list-style-type: none"><li>• Org Manager</li><li>• Org User</li><li>• Org Auditor</li></ul></div>		
Space	Space Manager	Manages a space within an organization.

Level	Role	Role Description
	Space Developer	<p>Manages applications, services, and space-scoped service brokers in a space.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p><b>⚠ Caution</b></p> <p>The Space Developer role has broad rights within Cloud Foundry and, in particular, has access to the credentials used in various services and app bindings as well as other sensitive data. For more information, see <a href="#">Giving Access Rights to Platform Users</a>.</p> </div>
	Space Auditor	Provides read-only access to a space.
	Space Supporter	<p>Allows you to troubleshoot and debug applications and service bindings in a space.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p><b>ℹ Note</b></p> <p>To add the Space Supporter role using the <code>set-space-role</code> command, you need to have installed version 8 of the Cloud Foundry Command Line Interface (cf CLI). See <a href="https://docs.cloudfoundry.org/cf-cli/install-go-cli.html">https://docs.cloudfoundry.org/cf-cli/install-go-cli.html</a>.</p> </div>

#### ℹ Note

Managing members and roles for an organization takes place on the navigation level of the subaccount to which the organization is assigned.

For more information about organization and space roles in Cloud Foundry, see <https://docs.cloudfoundry.org/concepts/roles.html>.

[Add Space Members Using the Cloud Foundry Command Line Interface \[page 2291\]](#)

## 6.2.4 Org Administration Using the Cockpit

In the Cloud Foundry environment, manage orgs, spaces and space quota plans using the SAP BTP cockpit.

In addition to global accounts and subaccounts, the Cloud Foundry environment includes another hierarchical level represented by orgs and spaces.

When you enable Cloud Foundry in a subaccount, you create a Cloud Foundry org in which you can then create multiple spaces. Each subaccount can contain only one Cloud Foundry org. There is no limit to how many spaces you can have within one org.

In the Cloud Foundry environment, you deploy applications and consume services at space level. Similar to subaccounts, spaces enable you to once again structure and sub-divide quota if you want to. You can do this by managing space quota plans.

- [Managing Orgs \[page 2247\]](#)
- [Managing Spaces \[page 2250\]](#)
- [Managing Space Quotas \[page 2254\]](#)

## 6.2.4.1 Navigate to Orgs and Spaces

To administer your Cloud Foundry environment, navigate to orgs, and spaces in the SAP BTP cockpit.

### Prerequisites

- Sign up for an enterprise or a trial account and receive your logon data.  
For more information, see [Get a Free Trial \[page 127\]](#) or [Sign up for a Customer Account \[page 128\]](#).
- Create the org or space to which you want to navigate.  
For more information, see [Create Orgs \[page 2247\]](#) and [Create Spaces \[page 2251\]](#).

### Procedure

Entity You'd Like to Navigate to	Navigation Path
Org	Navigate to the subaccount that contains the Cloud Foundry org. If you've already enabled the Cloud Foundry environment in your subaccount, you see the name of your organization, the number of its spaces and members, and its API endpoint on the <a href="#">Overview</a> page of your subaccount. If you haven't enabled Cloud Foundry yet, choose <a href="#">Enable Cloud Foundry</a> to create a Cloud Foundry org.

**Note**

Note that your subaccount and your org have a 1:1 relationship. They have the same name and therefore also the same navigation level in the cockpit.

Entity You'd Like to Navigate to	Navigation Path
Space	<p>Navigate to the subaccount that contains the space you'd like to navigate to.</p> <ol style="list-style-type: none"> <li>1. On the subaccount <i>Overview</i> page, you have table with all your spaces. Choose the space you want to navigate to.</li> <li>2. In the navigation area, choose ► <i>Cloud Foundry</i> ► <i>Spaces</i> ►.</li> </ol>

## Related Information

[Navigate in the Cockpit \[page 1938\]](#)

## 6.2.4.2 Managing Orgs

Learn how to create a Cloud Foundry org, add members to it and later delete it if needed.

- [Create Orgs \[page 2247\]](#)
- [Add Org Members Using the Cockpit \[page 2248\]](#)
- [Delete Orgs \[page 2250\]](#)

### Note

If you work with the Cloud Foundry CLI (cf CLI), be aware that you are responsible for all actions performed using the CLI. Also, you won't always be able to mirror the same data in the SAP BTP cockpit.

### 6.2.4.2.1 Create Orgs

To enable Cloud Foundry in your subaccount, you must create an org in order to use it.

#### Procedure

1. Navigate to your subaccount *Overview* page in the SAP BTP cockpit.
2. Choose *Enable Cloud Foundry*.

After you choose *Enable Cloud Foundry*, follow the steps provided by the wizard to complete the creation of your org.

3. Choose a plan from the drop-down list and enter a name for your org.

### Note

Once you've created the org, you can't change its name afterwards in the SAP BTP cockpit.

As an optional step, you can customize the instance name of your environment. Otherwise, the wizard uses the automatically generated instance name.

If you decide to enter an environment instance name of your choice, make sure that it's CLI-friendly. A CLI-friendly name is a string of up to 32 characters: alphanumeric (A-Z, a-z, 0-9), periods, underscores, and hyphens. Having a CLI-friendly name allows you to use it in `btp` CLI commands.

4. If the region you're working in has multiple landscapes, the *Landscape* option is displayed. Choose the landscape in which to create the org.
5. Choose *Create*.

## Related Information

[Navigate to Orgs and Spaces \[page 2246\]](#)

### 6.2.4.2.2 Add Org Members Using the Cockpit

Add users as org members and assign roles to grant the users access to information, such as user and quota information in a Cloud Foundry org.

## Prerequisites

- You have the Org Manager role for the org in question.

### Note

When you create an org, you have the Org Manager role in that org.

For more information, see [About Roles in the Cloud Foundry Environment \[page 2244\]](#).

- The users exist in a trusted platform identity provider.  
For more information, see [About User Management in the Cloud Foundry Environment \[page 2243\]](#).

## Procedure

1. Navigate to your subaccount. Make sure that Cloud Foundry is enabled. For more information, see [Navigate to Orgs and Spaces \[page 2246\]](#).
2. In the navigation area, choose **Cloud Foundry > Org Members**.  
The screen displays all members currently assigned to the org in a list.
3. Choose *Add Members*.

4. Enter one or more e-mail addresses.

Use commas ( , ), spaces ( ), semicolons ( ; ), or line breaks to separate members.

5. Enter the *Origin* for the identity provider, which hosts the members you just added.

The default identity provider is `sap.ids`.

For more information, see [Default Identity Provider \[page 2072\]](#).

If the new members are platform users from a custom identity provider, enter the origin.

- Feature Set A: Choose *Other* and then enter the corresponding origin of the Identity Authentication tenant.  
For more information about finding the origin, see [Establish Trust and Federation of Custom Identity Providers for Platform Users in Multi-Environment Subaccounts \[Feature Set A\] \[page 2050\]](#).
- Feature Set B: Select the corresponding origin of the Identity Authentication tenant.  
For more information about finding the origin, see [Establish Trust and Federation of Custom Identity Providers for Platform Users \[Feature Set B\] \[page 2053\]](#).

6. Select roles for the members and save your entries.

For more information, see [About Roles in the Cloud Foundry Environment \[page 2244\]](#).

## Next Steps

- To select or unselect roles for a member, choose  (*Edit*). The changes you make to the roles of a member take effect immediately.
- To remove all the roles of a member, choose  (*Delete*). This action removes the member from the organization and any spaces in the org.
- If the users need to view or manage applications in spaces, add the users to the relevant spaces, too.  
For more information, see [Add Space Members Using the Cockpit \[page 2252\]](#).

## Related Information

## 6.2.4.2.3 Delete Orgs

You can delete a Cloud Foundry org from a subaccount using the cockpit. Once the org is deleted, you can create a new one.

### Prerequisites

You are a global account administrator, as well as a member of the subaccount containing the org you want to delete.

#### Note

You can delete an org using only the cockpit or the `btp` CLI. You cannot use the Cloud Foundry CLI to perform this task.

### Procedure

1. Navigate to the subaccount containing the org.
2. Choose *Disable Cloud Foundry* and confirm the operation.

### Results

The org is deleted. All data in the org including spaces, applications, service instances, and member information is lost. You can now choose *Enable Cloud Foundry* to create a new org in the subaccount.

### Related Information

[Navigate to Orgs and Spaces \[page 2246\]](#)

Learn how to create and delete Cloud Foundry spaces, as well as how to add members to a space.

- [Create Spaces \[page 2251\]](#)
- [Add Space Members Using the Cockpit \[page 2252\]](#)
- [Delete Spaces \[page 2253\]](#)

## Related Information

[Managing Space Quotas \[page 2254\]](#)

### 6.2.4.3.1 Create Spaces

Create spaces in your Cloud Foundry organization using the SAP BTP cockpit.

## Prerequisites

You have a Cloud Foundry organization in your Cloud Foundry subaccount, and you have the Org Manager role in that organization.

See [Create Orgs \[page 2247\]](#).

## Procedure

1. Navigate to the subaccount that contains the Cloud Foundry organization in which you'd like to create a space.
2. On the subaccount *Overview* page, you have a *Spaces* table. Choose *Create Space* from the top right hand-side corner of that table.
3. Enter a space name and choose the permissions you'd like to assign to your ID, then choose *Save*.

## Next Steps

To assign quota to spaces, see [Edit Space Quotas \[page 2257\]](#).

You can change the name of a space by going to the [Cloud Foundry > Spaces](#) page from the left hand-side navigation and choosing  (Edit) on the tile of that space. You can also create additional spaces from there.

## Related Information

[Create Orgs \[page 2247\]](#)

[Create Spaces Using the Cloud Foundry Command Line Interface \[page 2289\]](#)

## 6.2.4.3.2 Add Space Members Using the Cockpit

You can add space members and assign roles to them at the space level in the cockpit.

### Prerequisites

- You have the Space Manager or Org Manager role.  
If you only have the Space Manager role, the users you want to add to the space must already be members of the org.  
For more information, see the [Context](#) section.
- The users exist in a trusted platform identity provider.  
For more information, see [About User Management in the Cloud Foundry Environment \[page 2243\]](#).

### Context

Space members are organization members who have specific roles in a space.

Org members can only be added by an Org Manager. This means that if you only have the Space Manager role, you can't add space members that aren't known to the org. To do that, you must first ask your Org Manager to add the users as org members with no roles. Once this is done, you can add them as space members following the steps below.

If you're the Org Manager, you don't need to first add the users as org members with no roles. Since you have the permissions necessary to add users to the org, when you add a new user as a space member, that user automatically becomes part of the org as well.

### Procedure

1. Navigate to the space to which you'd like to add members. For more information, see [Navigate to Orgs and Spaces \[page 2246\]](#).
2. Choose a space.
3. In the navigation area, choose [Members](#).  
The screen displays all members currently assigned to the org in a list.
4. Choose [Add Members](#).
5. Enter one or more e-mail addresses.  
  
Use commas ( , ), spaces ( ), semicolons ( ; ), or line breaks to separate members. The changes you make to the roles of a member take effect immediately.
6. Enter the [Origin](#) for the identity provider, which hosts the members you just added.  
  
The default identity provider is `sap.ids`.  
  
For more information, see [Default Identity Provider \[page 2072\]](#).

If the new members are platform users from a custom identity provider, enter the origin.

- Feature Set A: Choose *Other* and then enter the corresponding origin of the Identity Authentication tenant.  
For more information about finding the origin, see [Establish Trust and Federation of Custom Identity Providers for Platform Users in Multi-Environment Subaccounts \[Feature Set A\] \[page 2050\]](#).
- Feature Set B: Select the corresponding origin of the Identity Authentication tenant.  
For more information about finding the origin, see [Establish Trust and Federation of Custom Identity Providers for Platform Users \[Feature Set B\] \[page 2053\]](#).

7. Select the roles for the users and save your changes.

For more information, see [About Roles in the Cloud Foundry Environment \[page 2244\]](#).

## Next Steps

You also have the following options:

- To select or unselect roles for a member, choose  (*Edit*)
- To remove all the roles of a member, choose . This removes the member from the space.

## Related Information

[Cloud Management Tools — Feature Set Overview \[page 111\]](#)

[Add Org Members Using the Cockpit \[page 2248\]](#)

### 6.2.4.3.3 Delete Spaces

Delete spaces in your Cloud Foundry org using the SAP BTP cockpit.

## Prerequisites

- You have the Org Manager role in the org from which you want to delete a space. For more information about roles and permissions, see <https://docs.cloudfoundry.org/concepts/roles.html>.
- You've ensured that the data in the space you're going to delete is no longer needed.

### Caution

Please be aware that you won't be able to access your SAP HANA database system if you delete a space in an organization to which an SAP HANA database system is assigned.

## Procedure

1. Navigate to [Cloud Foundry > Spaces](#) in your Cloud Foundry subaccount and choose  (*Delete*) on the tile of the space you want to delete.
2. Confirm your change.

## Related Information

[Create Spaces \[page 2251\]](#)

### 6.2.4.4 Managing Space Quotas

Learn how to create, assign, and edit space quotas in the Cloud Foundry environment.

- [Create Space Quotas \[page 2254\]](#)

#### 6.2.4.4.1 Create Space Quotas

You can use the cockpit to create space quotas.

## Prerequisites

You have the Org Manager role for the org in which you want to create a space quota.

# Feature Set A

## Procedure

1. Navigate to the subaccount that contains the spaces to which you want to add quotas.
2. In the navigation menu, choose [Cloud Foundry](#) > [Quota Plans](#).
3. Choose [Create Quota Plan](#).
4. Enter a name for your quota plan and add limits for the following:
  - [Memory \(MB\)](#): Total amount of memory a space can have
  - (Optional) [Routes](#): Total number of routes
  - (Optional) [Services](#): Total number of service instances
  - (Optional) [Instance Memory \(MB\)](#): Maximum amount of memory an application instance can have (-1 represents an unlimited amount)
  - (Optional) [App Instances](#): Total number of application instances
  - (Optional) [Allow Paid Services](#): Select if you'd like to allow the provisioning of instances of paid service plans

### Note

The org quota limit is applicable for a resource if you don't enter a space quota limit. If the space quota limit for a resource exceeds the org quota limit, the org quota limit applies.

5. Choose [Create](#).

# Feature Set B

## Procedure

1. Navigate to the subaccount that contains the spaces to which you want to add quotas.
2. In the navigation menu, choose [Cloud Foundry](#) > [Space Quotas](#).
3. Choose [Create Space Quota](#).
4. Enter a name for your space quota and add limits for the following:
  - [Memory \(MB\)](#): Total amount of memory a space can have
  - [Routes](#): Total number of routes
  - [Services](#): Total number of service instances
  - [Instance Memory \(MB\)](#): Maximum amount of memory an application instance can have (-1 represents an unlimited amount)
  - [App Instances](#): Total number of application instances
  - (Optional) [Allow Paid Service](#): Switch on if you'd like to allow the provisioning of instances of paid service plans

#### Note

If the space quota limit for a resource exceeds the org quota limit, the org quota limit applies.

5. Choose *Create*.

## Related Information

[Entitlements and Quotas \[page 81\]](#)

### 6.2.4.4.2 Assign Space Quotas to Spaces

You can use the SAP BTP cockpit to assign space quotas to spaces.

#### Prerequisites

- You have the Org Manager role for the org in which you want to create and assign a space quota.
- You have at least one space quota. For more information, see [Create Space Quotas \[page 2254\]](#).

## Feature Set A

#### Procedure

1. Navigate to the subaccount that contains the spaces to which you want to assign space quotas.
2. In the navigation menu, choose  [Cloud Foundry](#)  [Quota Plans](#) .
3. In the *Plan Assignment* section, select a quota plan and assign it to a space from the drop-down list.

## Feature Set B

#### Procedure

1. Navigate to the subaccount that contains the spaces to which you want to assign space quotas.
2. In the navigation menu, choose  [Cloud Foundry](#)  [Space Quotas](#) .
3. Open the *Quota Assignments* tab.

4. Select one of the existing quota assignments and choose  (*Edit*) to make changes.
5. To keep the changes you've made, choose *Save*.

## Related Information

### 6.2.4.4.3 Edit Space Quotas

Edit space quotas in the Cloud Foundry environment using the SAP BTP cockpit.

## Prerequisites

You have the Org Manager role for the org in which you want to edit space quotas.

## Feature Set A

### Procedure

1. Choose the subaccount that contains the spaces for which you'd like to edit the space quota.
2. In the navigation menu, choose  *Cloud Foundry*  *Quota Plans* .
3. Choose  (*Edit*) for an existing quota plan.
4. Adjust the values in the text fields as needed.

For more information about the different values, see <https://docs.cloudfoundry.org/adminguide/quota-plans.html#space> .

5. To save your changes, choose *Create*.

## Feature Set B

### Procedure

1. Choose the subaccount that contains the spaces for which you'd like to edit the space quota.
2. In the navigation menu, choose  *Cloud Foundry*  *Space Quotas* .
3. Choose  (*Edit*) for an existing space quota.
4. Adjust the values in the text fields as needed.

For more information about the different values, see <https://docs.cloudfoundry.org/adminguide/quota-plans.html#space> .

5. Choose *Save*.

[CF CLI: Plug-ins \[page 2261\]](#)

### 6.2.5.1.1 Download and Install the Cloud Foundry Command Line Interface

Download and set up the Cloud Foundry Command Line Interface (cf CLI) to start working with the Cloud Foundry environment.

#### Procedure

1. Download the latest version of cf CLI from GitHub at the following URL: <https://github.com/cloudfoundry/cli#downloads>
  - For Microsoft Windows, download the Windows 64-bit installer.
  - For Mac OS, download the PKG file. You can use the [Homebrew](#) open source package management software to download the latest available version of the cf CLI.
2. Install the cf CLI:
  - For Microsoft Windows, unpack the ZIP file.
  - For Mac OS, proceed as follows:
    1. Open the PKG file.
    2. In the installation wizard, choose *Continue*, and then select the destination folder for the cf CLI installation.

3. Choose *Continue*, and when prompted, choose *Install*.

For more information, see <http://docs.cloudfoundry.org/devguide/installcf/install-go-cli.html> .

3. (Optional) If you have an HTTP proxy server, configure the proxy settings. For more information, see <http://docs.cloudfoundry.org/cf-cli/http-proxy.html> .

## 6.2.5.1.2 Log On to the Cloud Foundry Environment Using the Cloud Foundry Command Line Interface

Use the Cloud Foundry Command Line Interface (cf CLI) to log on to the Cloud Foundry space.

### Prerequisites

- The Cloud Foundry environment is enabled. You can enable it in the Cloud Platform Cockpit. For more information, see [Create a Subaccount \[page 1977\]](#).
- (Enterprise accounts only) You have created at least one subaccount and enabled the Cloud Foundry environment in this subaccount. For more information, see [Create a Subaccount \[page 1977\]](#).

#### Note

In a Cloud Foundry trial account, the Cloud Foundry environment has been activated for you automatically and a first space "dev" has been created for you.

- Download and install the cf CLI and log on to Cloud Foundry. For more information, see [Download and Install the Cloud Foundry Command Line Interface \[page 2259\]](#).

### Procedure

1. Open a command line.
2. Set the target API endpoint to the cloud controller.

#### Note

There is no specific endpoint for trial accounts. Both enterprise and trial accounts use the same API endpoints.

```
cf api https://api.cf.eu10.hana.ondemand.com
```

For more information, see [Regions and API Endpoints Available for the Cloud Foundry Environment \[page 20\]](#).

3. Log on to the Cloud Foundry environment:

```
cf login
```

### Note

- To log on with SAP Universal ID, use the option `--sso`. You need a browser in the logon process. For more information, see [Log On Manually With a Custom Identity Provider \[page 2066\]](#). Otherwise log on with the password associated with your account (S-user or P-user) in the default identity provider, SAP ID service.  
If you've forgotten this password and this user is associated with your SAP Universal ID user, reset your password.  
For more information, see SAP Note [3085908](#).
- To log on with a specific identity provider, use the option `--origin`.  
For more information, see [Log On as a Technical User With a Custom Identity Provider \[page 2068\]](#).

4. When prompted, enter your user credentials (email and password).
5. To view the help for the CLI, execute `cf help`, which lists the most common CLI commands with a short description, or `cf help -a`, which lists all commands. To get help for a specific command, execute `cf help <command>`.

## 6.2.5.1.3 CF CLI: Plug-ins

A list of additional commands that have been implemented as plug-ins to extend the base CF CLI client.

[Multitarget Application Commands for the Cloud Foundry Environment \[page 2263\]](#)

### 6.2.5.1.3.1 Multitarget Application Plug-In for the Cloud Foundry Command Line Interface

Use the Multitarget application plug-in for the Cloud Foundry command line interface to deploy, remove, and view MTAs, among other possible operations.

Before using the extended commands in the Cloud Foundry environment, you need to install the MTA plug-in in the Cloud Foundry environment as described in [Install the MultiApps CLI Plugin in the Cloud Foundry Environment \[page 2262\]](#).

## Related Information

[Multitarget Applications in the Cloud Foundry Environment \[page 536\]](#)

## 6.2.5.1.3.1.1 Install the MultiApps CLI Plugin in the Cloud Foundry Environment

The MultiApps command line interface plugin (formerly known as the MTA plugin) for the Cloud Foundry command line interface lets you deploy, remove, and view MTAs, among other possible operations, by extending Cloud Foundry commands.

### Prerequisites

You have installed the Cloud Foundry command line interface version 6.40 or higher. See [Download and Install the Cloud Foundry Command Line Interface \[page 2259\]](#).

### Procedure

1. Open the command line interface or terminal.
2. Check if a previous version is installed by using the command `cf plugins`. If the `MtaPlugin` is already installed, you have to uninstall it using the command `cf uninstall-plugin MtaPlugin`.

If you do not uninstall the previous version of the plugin and try to install a new one, you receive the following error:

#### Output Code

```
Plugin multiapps v<version> could not be installed as it contains commands with names and aliases that are already used:
bg-deploy, deploy, download-mta-op-logs, mta, mta-ops, mtas, purge-mta-config, undeploy, dmol
```

3. To install the latest available version of the plugin, proceed as follows:
  1. Make sure that you have the Cloud Foundry community repository in your Cloud Foundry command line interface. If it is not available there, add it by executing the following command:  
`cf add-plugin-repo CF-Community https://plugins.cloudfoundry.org`
  2. To install the plugin, enter the following command:  
`cf install-plugin multiapps -f`

#### Note

Alternatively, if you want to install a specific version of the plugin, proceed as follows:

1. Download the [preferred version](#) of the plugin that is compatible with your operating system.
2. Extract the downloaded archive if required.
3. To install the plugin, enter the following command:
  - Mac and Linux: `cf install-plugin<path to the downloaded plugin> -f`
  - Windows: `cf install-plugin<path to the downloaded plugin> -f`

4. Verify that the plugin has been installed successfully by entering `cf plugins`.

You see a list of plugins that now includes the MultiApps CLI Plugin for the Cloud Foundry command line interface. The output also displays commands that are specific to this plugin.

[Download and Install the Cloud Foundry Command Line Interface \[page 2259\]](#)

[MultiApps CLI Plugin](#) 

### 6.2.5.1.3.1.2 Multitarget Application Commands for the Cloud Foundry Environment

A list of additional commands to deploy multitarget applications (MTA) to the Cloud Foundry environment.

#### Note

The expiration time for all MTA operations in Cloud Foundry is 3 days. If an operation is still active when time limit is reached, it is automatically aborted.

#### Caution

Due to the missing shared domains in certain regions, as China (Shanghai), the URL of the SAP Cloud Deployment service should be specified by each multitarget application developer who uses MultiApps CF CLI plugin older than 3.0.0. If you are using MultiApps CF CLI plugin newer than 3.0.0, you don't need additional settings. You can do this by using the environment variable `MULTIAPPS_CONTROLLER_URL`, or the `-u` option specified in the commands listed below.

The URL of the deploy-service that needs to be set is in the following format: `deploy-service.cf.<domain>` The domain is derived from the Cloud Foundry API endpoint that you can find in the SAP BTP Cockpit in the Overview of your subaccount. For more information, see [Deploying Applications in Regions \[page 17\]](#) and [Regions and API Endpoints Available for the Cloud Foundry Environment \[page 20\]](#).

If you are using the `-u` option, make sure you have the MultiApps CLI Plugin version 2.1.3 or higher

If you are using region CN40 with API Endpoint `api.cf.cn40.platform.sapcloud.cn`, you need to specify the URL as follows: `export MULTIAPPS_CONTROLLER_URL=deploy-service.cf.cn40.platform.sapcloud.cn`

Commands for the Cloud Foundry Environment Overview

Command	Alias	Description
<code>deploy</code>		Deploy a new Multitarget Application (MTA) or synchronize changes to an existing MTA

Command	Alias	Description
<code>bg-deploy</code>		Deploy a Multitarget Application using "blue-green" (zero-downtime) deployment
<code>undeploy</code>		Undeploy a Multitarget Application (MTA)
<code>mta</code>		Display information about a deployed Multitarget Application (MTA)
<code>mtas</code>		List all deployed Multitarget Applications (MTA)
<code>mta-ops</code>		List all active operations for Multitarget Applications
<code>download-mta-ops-logs</code>	<code>dmo1</code>	Download the log files for one or more operations concerning Multitarget Applications
<code>purge-mta-config</code>		Purge all configuration entries and subscriptions, which are no longer valid

### Note

By default, large multitarget applications are not uploaded as a single unit, but are split up into smaller chunks of 45 MBs that are uploaded separately. Configure the chunk size as described in [Configuration](#).

## deploy

Deploy a new MTA or synchronize changes to an existing one. You have the following options for doing this:

### Usage

- **Deployment using a path to a directory**

You have the option to deploy or synchronize an MTA, the source of which is contained in a local directory:

```
cf deploy <MTA_ARCHIVE>|<DIRECTORY_PATH> [-e
<EXT_DESCRIPTOR_1>[,<EXT_DESCRIPTOR_2>]]
[-u <URL>] [-t <TIMEOUT>] [-v <VERSION_RULE>]
[--no-start] [--namespace]
[--delete-services] [--delete-service-keys] [--delete-service-brokers]
[ [--keep-files] [--no-restart-subscribed-apps] [--do-not-fail-on-missing-
permissions] [--skip-idle-start]
cf deploy ...[--retries <RETRIES>]
```

- **Deployment using an URL to the MTA archive**

You have the option to deploy or synchronize an MTA, the source of which is contained at a URL address. When you use this command, the request prompts the backend to download the archive and then deploy it:

### Caution

This option is currently experimental.

```
<write MTA archive URL to STDOUT> | cf deploy [-e
<EXT_DESCRIPTOR_1>[,<EXT_DESCRIPTOR_2>]]
[-u <MTA controller URL>] [-t <TIMEOUT>] [-v <VERSION_RULE>]
[--no-start] [--namespace]
```

```
[--delete-services] [--delete-service-keys] [--delete-service-brokers]
[ ][--keep-files] [--no-restart-subscribed-apps] [--do-not-fail-on-missing-
permissions] [--skip-idle-start]
cf deploy ...[--retries <RETRIES>]
```

### ⚠ Caution

There is no possibility for you to check if there are running ongoing operations on the MTA that you want to deploy using a URL.

### 📌 Note

- The URL to the MTA archive must include the `<https://>` prefix.
- You can use an locally present extension descriptor along with this deployment method.

### • Deployment from your current directory

You have the option to deploy the content of the directory you are currently in. The MultiApps CLI plugin packages the content in accordance with the deployment descriptor definition, so that the Cloud Deployment service can then upload and deploy the MTA.

```
cf deploy [-e <EXT_DESCRIPTOR_1>[, <EXT_DESCRIPTOR_2>]]
[-u <URL>] [-t <TIMEOUT>] [-v <VERSION_RULE>]
[--no-start] [--namespace]
[--delete-services] [--delete-service-keys] [--delete-service-brokers]
[ ][--keep-files] [--no-restart-subscribed-apps] [--do-not-fail-on-missing-
permissions] [--skip-idle-start]
cf deploy ...[--retries <RETRIES>]
```

In addition to deployment, you can also interact with an active MTA deploy operation, for example, by performing an action:

```
cf deploy [-i <OPERATION_ID>] [-a <ACTION>]
```

## Arguments

The Cloud Deployment service uses the content of the `mtad.yaml` descriptor, and based its contained info assembles an MTA archive in that directory before deploying it.

Command Arguments Overview

Argument	Description
<code>&lt;MTA_ARCHIVE&gt;</code>	The path to (and name of) the archive or the directory containing the Multitarget Application to deploy; the application archive must have the format (and file extension) <code>mtar</code> , for example, <code>MTApp1.mtar</code> . If the value of this argument is a directory, the checks if an <code>mtad.yaml</code> file exists in that directory, and based on it assembles an MTA archive before deploying it. If no argument exists, the current directory is used.
<code>&lt;DIRECTORY_PATH&gt;</code>	The Cloud Deployment service also accepts a path to a directory where an <code>mtad.yaml</code> is maintained with path elements, for example, <code>cf deploy ./</code> .
<code>&lt;--retries&gt;</code>	Retry the operation specified number of times in case a non-content error (default 3).

## Options

### Command Options Overview

Option	Description
-e <EXT_DESCRIPTOR_1>[ , <EXT_DESCRIPTOR_2> ]	Define one or more extensions to the deployment descriptors; multiple extension descriptors must be separated by commas.
-u <URL>	Specify the URL for the deployment-service end-point that is to be used for the deployment operation
-t <TIMEOUT>	Specify the maximum amount of time (in seconds) that the service must wait for before starting the deployed application
-v <VERSION_RULE>	Specify the rule to apply to determine how the application version number is used to trigger an application-update deployment operation, for example: "HIGHER", "SAME_HIGHER", or "ALL".
-i <OPERATION_ID>	Specify the ID of the deploy operation that you want to perform an action on
-a <ACTION>	Specify the action to perform on the deploy operation, for example, "abort", "retry", or "monitor", or "resume"
-f	Force deployment without requiring any confirmation about aborting any conflicting processes
	<b>Note</b> This option is not functional when deploying using a URL to an MTA archive.
--no-start	Do not start application after deployment
--delete-services	Re-create changed services and delete discontinued services
--delete-service-keys	Delete the existing service keys and apply the new ones
--delete-service-brokers	Delete discontinued service brokers
--keep-files	Keep the files used for deployment
--no-restart-subscribed-apps	Do not restart subscribed applications that are updated during the deployment
--do-not-fail-on-missing-permissions	Perform the deployment, even if required administrator permissions are missing for some operations (for example, the creation of service brokers).
--abort-on-error	If an operation fails, the corresponding process is automatically aborted and cannot be retried using the option -a retry. However, if you run a new operation for the same MTA, you will not receive an error message that there is an ongoing process for the MTA and ask you if you want to abort it.
-m <module name>	Deploy only the module with the specified name.
	<b>Note</b> It can be used multiple times.

Option	Description
<code>--all-modules</code>	<p>Deploy all modules.</p> <p><b>Note</b> Any <code>-m</code> options are ignored.</p>
<code>-r &lt;resource name&gt;</code>	<p>Deploy only the resource with the specified name</p> <p><b>Note</b> It can be used multiple times.</p>
<code>--all-resources</code>	<p>Deploy all resources.</p> <p><b>Note</b> Any <code>-r</code> options are ignored.</p>
<code>--strategy</code>	<p>Announce to the platform a special deployment approach, for example when performing a “blue-green” deployment. See <a href="#">Blue-Green Deployment Strategy [page 615]</a>.</p> <p>Using this option, you will not be asked to manually confirm the deletion of the older version of the MTA applications. This means that the deployment process is performed without any interruptions and you are not prompted to confirm the switch of routes to the new version of the MTA applications.</p>
<code>--skip-testing-phase</code>	<p>When using the <code>--strategy</code> option for “blue-green”, you can choose to skip the phase for testing and you will not be asked to manually confirm the deletion of the older version of the MTA applications. The deployment process is performed without any interruptions and you are not prompted to confirm the switch of routes to the new version of the MTA applications.</p> <p><b>Note</b> This option is equivalent to <code>--no-confirm</code> from “bg-deploy”.</p>
<code>--namespace</code>	<p>Namespace for the MTA. They are also applied to the application and service names. For more information, see <a href="#">(Experimental) Namespaces [page 618]</a>.</p> <p><b>Note</b> This option is currently experimental.</p>
<code>--skip-idle-start</code>	<p>When using the <code>--strategy</code> option for “blue-green”, you can choose to skip the starting of the newly deployed applications on idle routes. This means that the newly deployed applications will be mapped directly to live routes. Under the hood this option includes <code>--skip-testing-phase</code>.</p> <p><b>Note</b> This option is currently experimental.</p>

## ⓘ Note

- If any of the options `-m`, `--all-modules`, `-r`, `--all-resource` is used, only the specified modules and resources will be deployed. Otherwise, everything will be deployed by default.
- If the options for the module deploying (`-m`, `--all-modules`) are used, the modules need to contain a `path` element on an MTA module level, which points to the content of the module. In case the module has some `requires` dependency section to a resource that needs a configuration file, then the `requires` section should have a `path` parameter, which points to the configuration file.
- If the options for the resource deploying (`-r`, `--all-resource`) are used, then any resources that have some configuration files need to contain a `path` parameter in their parameters section, which points to the configuration file.
- The `path` element or parameter value should be relative to the MTA directory.

An example of an MTA deployment descriptor, containing all variants of the `path` elements and parameters can be found at [Defining Multitarget Application Deployment Descriptors for Cloud Foundry \[page 543\]](#).

## bg-deploy

Deploy a new Multitarget Application (MTA) using “blue-green” (zero-downtime) deployment.

## ⓘ Note

You can also perform this deployment type using the `deploy` command by using the experimental `--strategy blue-green` flag. See above for details.

“Blue-green” deployment is a release technique that reduces application downtime and the resulting risk by running two identical target deployment environments called “blue” and “green”. Only one of the two target environments is “live” at any point in time and it is much easier to roll back to a previous version after a failed (or undesired) deployment.

## Usage

Deploy a new Multitarget Application using “blue-green” deployment:

```
cf bg-deploy <MTA_ARCHIVE>
[-e <EXT_DESCRIPTOR_1>[,<EXT_DESCRIPTOR_2>]]
[-u <URL>] [-t <TIMEOUT>] [-v <VERSION_RULE>]
[--no-start] [--use-namespaces] [--no-namespaces-for-services]
[--delete-services] [--delete-service-keys] [--delete-service-brokers]
[--keep-files] [--no-restart-subscribed-apps] [--no-confirm] [--do-not-fail-on-
missing-permissions][--skip-idle-start]
cf deploy ...[--retries <RETRIES>]
```

Interact with an active MTA deploy operation, for example, by performing an action:

```
cf bg-deploy [-i <OPERATION_ID>] [-a <ACTION>]
```

## Arguments

Command Arguments Overview

Argument	Description
<code>&lt;MTA_ARCHIVE&gt;</code> or <code>&lt;DIRECTORY_PATH&gt;</code>	The path to (and name of) the archive or the path to the directory containing the Multitarget Application to deploy. The application archive must have the format (and file extension) <code>mta.r</code> , for example, <code>MTApp1.mta.r</code> ; the specified directory can be specified as a path (for example, <code>myApp/</code> or <code>.</code> (current directory)).
<code>&lt;--retries&gt;</code>	Retry the operation specified number of times in case a non-content error (default 3).

## Options

Command Options Overview

Option	Description
<code>-e</code> <code>&lt;EXT_DESCRIPTOR_1&gt;[ , &lt;EXT_DESCRIPTOR_2&gt; ]</code>	Define one or more extensions to the deployment descriptors; multiple extension descriptors must be separated by commas.
<code>-u &lt;URL&gt;</code>	Specify the URL for the deployment-service end-point that is to be used for the deployment operation
<code>-t &lt;TIMEOUT&gt;</code>	Specify the maximum amount of time (in seconds) that the service must wait for before starting the deployed application
<code>-v &lt;VERSION_RULE&gt;</code>	Specify the rule to apply to determine how the application version number is used to trigger an application-update deployment operation, for example: "HIGHER", "SAME_HIGHER", or "ALL".
<code>-i &lt;OPERATION_ID&gt;</code>	Specify the ID of the deploy operation that you want to perform an action on
<code>-a &lt;ACTION&gt;</code>	Specify the action to perform on the deploy operation, for example, "abort", "retry", or "monitor", or "resume"
<code>-f</code>	Force deploy without requiring any confirmation for aborting any conflicting processes
<code>--no-start</code>	Do not start application after deployment
<code>--use-namespaces</code>	Use namespaces in application (and service) names during application deployment
<code>--no-namespaces-for-services</code>	Do not use namespaces in service names
<code>--delete-services</code>	Re-create changed services and delete discontinued services
<code>--delete-service-keys</code>	Delete the existing service keys and apply the new ones
<code>--delete-service-brokers</code>	Delete discontinued service brokers
<code>--keep-files</code>	Keep the files used for deployment
<code>--no-restart-subscribed-apps</code>	Do not restart subscribed applications that are updated during the deployment

Option	Description
<code>--no-confirm</code>	Use this option to turn off the manual confirmation for deleting the older version of the MTA applications. Thus the deployment process is performed from start to finish uninterrupted, and you are not prompted to confirm the switch of routes to the new version of the MTA applications.
<code>--do-not-fail-on-missing-permissions</code>	Perform the deployment, even if required administrator permissions are missing for some operations (for example, the creation of service brokers).
<code>--abort-on-error</code>	If an operation fails, the corresponding process is automatically aborted and cannot be retried using the option <code>-a retry</code>
<code>-m &lt;module name&gt;</code> . However, if you run a new operation for the same MTA, you will not receive an error message that there is an ongoing process for the MTA and ask you if you want to abort it.	Deploy only the module with the specified name. <div style="background-color: #f0f0f0; padding: 5px; border: 1px solid #ccc;"> <p><b>Note</b> It can be used multiple times.</p> </div>
<code>--all-modules</code>	Deploy all modules. <div style="background-color: #f0f0f0; padding: 5px; border: 1px solid #ccc;"> <p><b>Note</b> Any <code>-m</code> options are ignored.</p> </div>
<code>-r &lt;resource name&gt;</code>	Deploy only the resource with the specified name <div style="background-color: #f0f0f0; padding: 5px; border: 1px solid #ccc;"> <p><b>Note</b> It can be used multiple times.</p> </div>
<code>--all-resources</code>	Deploy all resources. <div style="background-color: #f0f0f0; padding: 5px; border: 1px solid #ccc;"> <p><b>Note</b> Any <code>-r</code> options are ignored.</p> </div>
<code>--skip-idle-start</code>	You can choose to skip the starting of the newly deployed applications on idle routes. This means that the newly deployed applications will be mapped directly to live routes. Under the hood this option includes <code>--no-confirm</code> . <div style="background-color: #f0f0f0; padding: 5px; border: 1px solid #ccc;"> <p><b>Note</b> This option is currently experimental.</p> </div>
<p><b>Note</b></p> <ul style="list-style-type: none"> <li>If any of the options <code>-m</code>, <code>--all-modules</code>, <code>-r</code>, <code>--all-resource</code> is used, only the specified modules and resources will be deployed. Otherwise, everything will be deployed by default.</li> <li>If the options for the module deploying ( <code>-m</code>, <code>--all-modules</code>) are used, the modules need to contain a <code>path</code> element on an MTA module level, which points to the content of the module. In case the module has some <code>requires</code> dependency section to a resource that needs a configuration file, then the <code>requires</code> section should have a <code>path</code> parameter, which points to the configuration file.</li> </ul>	

- If the options for the resource deploying (`-r`, `--all-resource`) are used, then any resources that have some configuration files need to contain a `path` parameter in their parameters section, which points to the configuration file.
- The `path` element or parameter value should be relative to the MTA directory.

See the complete procedure in section [Legacy Blue-Green Deployment \[page 613\]](#).

An example of an MTA deployment descriptor, containing all variants of the `path` elements and parameters can be found at [Defining Multitarget Application Deployment Descriptors for Cloud Foundry \[page 543\]](#).

## undeploy

Undeploy a Multitarget Application (MTA), or interact with an undeploy MTA operation.

### Usage

Undeploy an MTA.

```
cf undeploy <MTA_ID>
[-u <URL>] [-f]
[--delete-services] [--delete-service-keys] [--delete-service-brokers] [--no-
restart-subscribed-apps]
[--do-not-fail-on-missing-permissions]
cf deploy ...[--retries <RETRIES>]
```

Interact with an undeploy MTA operation, for example, by performing an action.

```
cf undeploy [-i <UNDEPLOY_ID>] [-a <ACTION>]
```

### Arguments

Command Arguments Overview

Argument	Description
<code>&lt;MTA_ID&gt;</code>	The ID of the MTA you want to undeploy
<code>&lt;--retries&gt;</code>	Retry the operation specified number of times in case a non-content error (default 3).

### Options

Command Options Overview

Option	Description
<code>-u &lt;URL&gt;</code>	Specify the URL for the service end-point that is to be used for the undeployment operation
<code>-i &lt;OPERATION_ID&gt;</code>	Specify the ID of the undeploy operation that you want to perform an action on
<code>-a &lt;ACTION&gt;</code>	Specify the action to perform on the undeploy operation, for example, "abort", "retry", or "monitor"

Option	Description
-f	Force completion of the undeploy operation without any system prompt or confirmation
--delete-services	Delete any related services
--delete-service-brokers	Delete discontinued service brokers
--no-restart-subscribed-apps	Do not restart subscribed applications that are updated during the deployment
--do-not-fail-on-missing-permissions	Perform the deployment, even if required administrator permissions are missing for some operations (for example, the creation of service brokers).
--abort-on-error	If an operation fails, the corresponding process is automatically aborted and cannot be retried using the option -a retry. However, if you run a new operation for the same MTA, you will not receive an error message that there is an ongoing process for the MTA and ask you if you want to abort it.
--delete-service-keys	Delete the existing service keys

## mta

Display information about a Multitarget Application (MTA). The information displayed includes the requested state, the number of instances, information about allocated memory and disk space, as well as details regarding the bound service (and service plan).

## Usage

```
cf mta MTA_ID
[-u <URL>]
```

## Arguments

Command Arguments Overview

Argument	Description
<MTA_ID>	The ID of the MTA whose details you want to display

## Options

Command Options Overview

Option	Description
-u <URL>	Specify the URL for the deployment-service end-point to use to obtain details of the selected MTA

## mtas

Display information about all available Multitarget Applications (MTA).

### Usage

```
cf mtas [-u <URL>]
```

### Options

Command Options Overview

Option	Description
-u <URL>	Specify the URL for the deployment-service end-point to use to obtain details of the selected MTA

## mta-ops

Display information about all **active** operations for Multitarget Applications (MTA). The information includes the ID, type, status, the time the MTA-related operation started, as well as the name of the user that started the operation.

### Usage

```
cf mta-ops [--mta <MTA>] [-u <URL>] [--last <NUM>] [--all]
```

### Options

Command Options Overview

Option	Description
-u <URL>	Specify the URL for the deployment-service end-point to use to obtain details of the selected MTA operations
--last <NUM>	List the last <NUM> active MTA operations
--all	List all active MTA operations
- mta <MTA>	Specify the MTA whose operations you want to list.

## download-mta-op-logs

Download the log files for one or more operations concerning Multitarget Applications.

## Usage

You have the following usage options:

- `cf download-mta-op-logs -i <OPERATION_ID> [-u <URL>] [-d <DIRECTORY>]`
- `cf download-mta-op-logs --mta <MTA> [ --last <NUM>] [ -u <URL>] [ -d <DIRECTORY>]`

### → Tip

You can use the alias `dmo1` in place of the `download-mta-op-logs` command.

## Options

Command Options Overview

Option	Description
<code>-u &lt;URL&gt;</code>	Specify the URL for the deployment-service end-point to use to obtain details of the selected MTA operations
<code>-i &lt;OPERATION_ID&gt;</code>	Specify the identity (ID) of the MTA operation whose logs you want to download
<code>-d &lt;DIRECTORY&gt;</code>	Specify the path to the location where you want to save the downloaded MTA operation logs; by default, the location is <code>./mta-op-&lt;OPERATION_ID&gt;/</code>
<code>--mta &lt;MTA&gt;</code>	Specify the MTA whose logs you want to download.
<code>--last&lt;NUM&gt;</code>	Download the last <NUM> logs for the specified MTA.

### Note

This option is not compatible with the `-i` option.

## purge-mta-config

Purge all configuration entries and subscriptions, which are no longer valid.

## Usage

```
cf purge-mta-config  
[-u <URL>]
```

Invalid configuration entries are often produced when the application that is providing configuration entries is deleted by the user without using the `deploy-service`, for example, the `cf delete` command. In this case, the configuration remains in the `deploy-service` database even though the corresponding application is no longer available. This could lead to a failure during subsequent attempts to resolve the configuration entries.

## Options

Command Options Overview

Option	Description
<code>-u &lt;URL&gt;</code>	The URL of the deploy service

[Deploy an MTA archive referenced by a remote URL](#) 

### 6.2.5.1.3.1.2.1 Application Versions and Deployment Consistency

The SAP Cloud Deployment service follows the rules specified in the Semantic Versioning Specification (Semver) when comparing the versions of a deployed multitarget application (MTA) with the version that is to be deployed. If an MTA that is submitted for deployment has a version that is lower than or equal to an already deployed version of the same MTA, the deployment might fail if there is a conflict with the version rule specified in the deployment operation. The version rule is a parameter of the deployment process, which specifies which relationships to consider between the existing and the new version of an MTA before proceeding with the operation. The version rules supported by the deploy service are as follows:

- HIGHER - Only MTAs with versions that are bigger than the version of the currently deployed MTA, are accepted for deployment.
- SAME\_HIGHER - Only MTAs with versions that are higher than (or the same as) the version of the currently deployed MTA are accepted for deployment. This is the **default** setting for the version rule.
- ALL - All versions are accepted for deployment.

### 6.2.5.1.3.2 Service Fabrik Plugin in Cloud Foundry

Service Fabrik CF CLI plugin is used for performing various backup and restore operations on service-instances in Cloud Foundry, such as starting/aborting a backup, listing all backups, removing backups, starting/aborting a restore, etc.

This CF CLI plugin is only available for ServiceFabrik broker, so it can only be used with CF installations in which this service broker is available. You can also list all available commands and their usage with 'cf backup'. You can now manage your backups of service instance and restore them using the backup and restore functionality.

To use the functionality, use the SAP BTP cockpit or the extended Cloud Foundry commands in the command line interface.

## 6.2.5.1.3.2.1 Install the Service Fabrik Plugin

The Service Fabrik plugin lets you manage backups of a service instance by extending Cloud Foundry commands.

### Prerequisites

You need to have Cloud Foundry Command Line Interface (CF CLI) installed for the plugin to work since it is built on CF CLI. The installation instructions for CF CLI can be found [here](#) . The minimum version of CF CLI, on which the plugin has been tested successfully is v6.20.

### Procedure

1. Download the latest version of the plugin that is compatible with your operating system. On the Web page, you will find the plugin under the **SAP Cloud Platform Cloud Foundry CLI Plugins** section with the name **Service Fabrik based B&R**.
2. Untar or unzip the downloaded archive.
3. Open the command line interface or terminal.
4. To install the plugin, enter the following command:
  - Mac and Linux: `cf install-plugin <path to the downloaded folder></service-fabrik-cli-plugin [Linux/Mac]>`
  - Windows: `cf install-plugin <path to the downloaded folder><\service-fabrik-cli-plugin.exe [Windows]>`

#### Note

If you are reinstalling the plugin, first uninstall the previous version using: `cf uninstall-plugin ServiceFabrikPlugin`

5. Verify that the plugin has been installed successfully by entering `cf plugins`.

You see a list of plugins that now includes Service Fabrik. The output also displays commands that are specific to the Service Fabrik plugin.

## 6.2.5.1.3.2.2 Extended Cloud Foundry Commands of Service Fabrik

The Service Fabrik plugin provides commands that support backup and restore operations.

The various commands described in the table below are functionalities that facilitate these operations:

Usage	Description	Common Error Scenarios
<code>cf list-backup</code>	Shows a list of all the service instance backups. These backups are specific to the space you are logged on to. If you have permission to access multiple spaces and need to view backups for a specific space, log on to that space in Cloud Foundry.	<b>Unauthorized Access:</b> if you do not have permission to access the space containing the service instance or the service instance itself. Verify that you have the required permission.
<code>cf list-backup &lt;service_instance_name&gt;</code>	Shows a list of backups that are specific to the service instance within a space.	<b>Unauthorized Access:</b> if you do not have permission to access the space containing the service instance or the service instance itself. Verify that you have the required permission.
<code>cf backup &lt;backup_id&gt;</code>	Provides additional information about a specific backup such as the service instance name for which backup was taken, the org and the space name to which the backup belongs, the type of backup, the status of backup, the start and finish time of backup, and so on.	none
<code>cf list-backup --guid &lt;service_instance_guid&gt;</code>	Shows the list of all backups for the given service-fabrik service instance. The argument has to be the guid of the service instance. (Works even for a deleted instance.)	<b>Unauthorized Access:</b> if you do not have permission to access the space containing the service instance or the service instance itself. Verify that you have the required permission.
<code>cf list-backup &lt;service_instance_name&gt; --deleted</code>	Shows the list of all backups for a deleted service-fabrik service instance. (Works only for a deleted service-instance.)	<p><b>Unauthorized Access:</b> if you do not have permission to access the space containing the service instance or the service instance itself. Verify that you have the required permission.</p> <p><b>Deleted instance not found error:</b> If the deleted instance name is incorrect.</p> <p><b>Multiple Guid for a deleted service instance error:</b> When plugin encounters multiple instance Guid's associated with the given instance name</p>

Usage	Description	Common Error Scenarios
<pre>cf start-restore &lt;service_instance_name&gt; &lt;backup_id&gt;</pre>	<p>Restores a service instance from the specified instance name and backup ID. Before providing a restore command, ensure that the backup is available for the service instance. You can verify the state of the restore process using <code>cf restore &lt;service_instance_name&gt;</code>.</p>	<p><b>Unauthorized Access:</b> if you do not have permission to access the space containing the service instance or the service instance itself. Verify that you have the required permission.</p> <p><b>Another concurrent access:</b> if another operation is already in progress for the service instance. You might need to try again after the current operation is completed.</p>
<pre>cf abort-restore &lt;service_instance_name&gt;</pre>	<p>Aborts an ongoing restore operation of the specified service instance. You can verify the state of the abort process using <code>cf restore &lt;service_instance_name&gt;</code>.</p>	<p><b>No restore in progress:</b> if no restore operation is currently in progress for the specified service instance. The restore activity might have completed or you might not have initiated a restore.</p> <p><b>Unauthorized Access:</b> if you do not have permission to access the space containing the service instance or the service instance itself. Verify that you have the required permission.</p>
<pre>cf instance-events -- delete</pre>	<p>List all delete service instance events in the space.</p>	<p><b>Unauthorized Access:</b> if you do not have permission to access the space containing the service instance or the service instance itself. Verify that you have the required permission.</p>
<pre>cf restore&lt;service_instance_name&gt; &gt;</pre>	<p>Check the progress of the last restore operation triggered on the specified instance name. Provides additional information about the restore operation such as the service instance name for which restore was taken, the org and the space name to which the instance belongs, the status of restore, the start and finish time of restore, and so on.</p>	<p><b>No restore in progress:</b> if no restore operation is currently in progress for the specified service instance. The restore activity might have completed or you might not have initiated a restore.</p> <p><b>Unauthorized Access:</b> if you do not have permission to access the space containing the service instance or the service instance itself. Verify that you have the required permission.</p>

## 6.2.5.1.3.3 Custom Domain Plugin for the Cloud Foundry Environment

The Custom Domain CLI plugin provides functions for creating private keys and certificate signing requests, as well as additional commands for managing your custom domains.

To use the functionality of the Custom Domain plugin, use the extended Cloud Foundry commands in the command-line interface.

### Related Information

[Install the Custom Domain Plugin \[page 2279\]](#)

[Extended Cloud Foundry Commands of Custom Domains \[page 2281\]](#)

[Configuring Custom Domains](#)

### 6.2.5.1.3.3.1 Install the Custom Domain Plugin

Use the Custom Domain CLI plugin to configure and manage your custom domains.

### Prerequisites

Install the Cloud Foundry command-line interface (CLI) for the plugin to work. You can find the installation instructions here: [Download and Install the Cloud Foundry Command Line Interface \[page 2259\]](#).

### Procedure

1. Download the latest version of the plugin that is compatible with your operating system. On the [Web page](#), you'll find the plugin under the **SAP BTP Cloud Foundry CLI plugins** section with the name Custom Domain.
2. Untar or unzip the downloaded archive.
3. Open the command-line interface or terminal.
4. To install the plugin, enter the following command:

- Mac and Linux:

```
cf install-plugin <path to the downloaded folder>/custom-domain-cli
```

- Windows:

```
cf install-plugin <path to the downloaded folder>\custom-domain-cli.exe
```

### Note

If you are reinstalling the plugin, first uninstall the previous version using: `cf uninstall-plugin "Custom Domain"`

5. Verify that the plugin has been installed successfully by entering:

```
cf plugins
```

You see a list of plugins that now includes Custom Domain. The output also displays commands that are specific to the Custom Domain plugin.

## Results

You have installed the Custom Domain plugin for the Cloud Foundry CLI and can now use the extended commands that are available from the Custom Domain service.

## Related Information

[Download and Install the Cloud Foundry Command Line Interface \[page 2259\]](#)  
[Configuring Custom Domains](#)

## 6.2.5.1.3.3.2 Extended Cloud Foundry Commands of Custom Domains

The Custom Domain plugin includes commands that you can use to configure and manage your custom domains.

Commands for the Custom Domain CLI Plugin

Command	Alias	Usage	Options	Description
<code>cf custom-domain-create-key</code>	<code>cdck</code>	<code>cf custom-domain-create-key KEY SUBJECT DOMAIN [DOMAIN ...] [options]</code>	<hr/> <code>-ski</code> Do not attempt to validate SSL certificate. <hr/> <code>-verbose</code> Show verbose information. <hr/> <code>-force</code> Force key creation without confirmation. <hr/>	Generate a new private and public key pair.
<code>cf custom-domain-get-csr</code>	<code>cdgc</code>	<code>cf custom-domain-get-csr KEY [FILE] [options]</code>	<hr/> <code>-ski</code> Do not attempt to validate SSL certificate. <hr/> <code>-verbose</code> Show verbose information. <hr/>	Download the certificate signing request corresponding to a new key.

Command	Alias	Usage	Options	Description
cf custom-domain-upload-certificate-chain	cducc	cf custom-domain-upload-certificate-chain KEY FILE [options]	<hr/> -ski Do not attempt to validate SSL certificate. <hr/> -verbose Show verbose information. <hr/> -force Force uploading the certificate chain without confirmation. <hr/>	Upload a certificate chain for a given key.
cf custom-domain-activate	cda	cf custom-domain-activate KEY DOMAIN [DOMAIN ...] [options]	<hr/> -ski Do not attempt to validate SSL certificate. <hr/> -verbose Show verbose information. <hr/>	Activate the server certificate for specified domains.

Command	Alias	Usage	Options	Description
<code>cf custom-domain-list</code>	<code>cdl</code>	<code>cf custom-domain-list</code>	<p><code>-skip-attempt-to-validate SSL certificate.</code></p> <hr/> <p><code>-verbose</code> Show verbose information.</p>	List domains and their configuration status.
<code>cf custom-domain-show-certificates</code>	<code>cdsc</code>	<code>cf custom-domain-show-certificates KEY [FILE] [options]</code>	<p><code>-dump</code> Dump the certificates in PEM format.</p> <hr/> <p><code>-skip-attempt-to-validate SSL certificate.</code></p> <hr/> <p><code>-verbose</code> Show verbose information.</p>	Show certificates for a specified key.

Command	Alias	Usage	Options	Description
cf custom-domain-enable-client-authentication	cdeca	cf custom-domain-enable-client-authentication FILE DOMAIN [DOMAIN ...] [options]	-ski Do not p-at- ssl-tempt vali-to vali- dati-date on SSL certificate. <hr/> -ver Show bose ver- bose infor- mat- ion.	Activate client authentication for specified domains.
cf custom-domain-disable-client-authentication	cddca	cf custom-domain-disable-client-authentication DOMAIN [options]	-ski Do not p-at- ssl-tempt vali-to vali- dati-date on SSL certificate. <hr/> -ver Show bose ver- bose infor- mat- ion. <hr/> -for Force ce deac- tiva- tion of client au- thenti- cation with- out confir- mat- ion.	Disable client authentication for a domain.

Command	Alias	Usage	Options	Description
cf custom-domain-show-trusted-certificates	cdstc	cf custom-domain-show-trusted-certificates DOMAIN [FILE] [options]	<p>-dum p Dump the certificates in PEM format.</p> <hr/> <p>-skip-ssl-validation Do not attempt to validate SSL certificate.</p> <hr/> <p>-verbose Show verbose information.</p>	Show the trusted certificates for a domain.
cf custom-domain-deactivate	cdd	cf custom-domain-deactivate DOMAIN [options]	<p>-skip-ssl-validation Do not attempt to validate SSL certificate.</p> <hr/> <p>-verbose Show verbose information.</p> <hr/> <p>-force Force deactivation without confirmation.</p>	Deactivate the certificate for a specified domain.

Command	Alias	Usage	Options	Description
cf custom-domain-delete-key	cddk	cf custom-domain-delete-key KEY [options]	<p>-ski Do not attempt to validate SSL certificate.</p> <hr/> <p>-verbose Show verbose information.</p> <hr/> <p>-force Force key deletion without confirmation.</p>	Delete the private key and its certificates.
cf custom-domain-version	cdv	cf custom-domain-version	<p>-ski Do not attempt to validate SSL certificate.</p> <hr/> <p>-verbose Show verbose information.</p>	Show the Custom Domain plugin version.

Command	Alias	Usage	Options	Description
cf custom-domain-map-route	cdmr	cf custom-domain-map-route STANDARD_ROUTE CUSTOM_ROUTE	-skip-ssl-validation  -verbose	Map a custom domain route to a SaaS application.  Do not attempt to validate SSL certificate.  Show verbose information.
cf custom-domain-unmap-route	cdur	cf custom-domain-unmap-route CUSTOM_ROUTE	-skip-ssl-validation  -verbose	Unmap a custom domain route from a SaaS application.  Do not attempt to validate SSL certificate.  Show verbose information.
cf custom-domain-routes	cdr	cf custom-domain-routes	-skip-ssl-validation  -verbose	List all configured routes of SaaS applications with custom domains.  Do not attempt to validate SSL certificate.  Show verbose information.

### 6.2.5.2 Add Organization Members Using the Cloud Foundry Command Line Interface

You can use the Cloud Foundry Command Line Interface (cf CLI) to add organization members and assign roles to them.

#### Prerequisites

- The Cloud Foundry environment is enabled.  
Enable it in the SAP BTP cockpit. For more information, see [Create a Subaccount \[page 1977\]](#).
- The Org Manager role for the org in question.

#### Note

You automatically have the Org Manager role in an org that you created.

- The user exists in the UAA.  
All users are stored in identity providers, either in the default or in a custom identity provider. Cloud Foundry needs a copy of the user, sometimes called a shadow user. To create the shadow user, choose one of the following options:
  - The user has been added from the cockpit.  
For more information, see [Add Org Members Using the Cockpit \[page 2248\]](#).
  - The user has already logged on to the Cloud Foundry environment.  
For example: `cf login -a https://api.cf.eu20.hana.ondemand.com`

#### Note

The landscape the user logs on to must be the same as the landscape where the subaccount is located. See the overview page of your subaccount for the API endpoint.

- You have the e-mail addresses of the members that you want to add.  
The user must already exist in the connected identity provider. For more information, see [Trust and Federation with Identity Providers \[page 2014\]](#).
- Download and install the cf CLI and log on to Cloud Foundry. For more information, see [Download and Install the Cloud Foundry Command Line Interface \[page 2259\]](#) and [Log On to the Cloud Foundry Environment Using the Cloud Foundry Command Line Interface \[page 2260\]](#).

## Context

This task is meant for the `OrgManager` and `OrgAuditor` roles. To add members with the `OrgUser` role, follow the procedure described in [Add Space Members Using the Cloud Foundry Command Line Interface \[page 2291\]](#).

## Procedure

Enter the following command, specifying the user name, the name of the organization, and the role:

```
cf set-org-role <USERNAME> <ORG> <ROLE>
```

```
cf set-org-role julie.armstrong@example.com account_subaccount-47v2w8dj  
OrgAuditor
```

## Next Steps

To remove an org role from a user, enter the following string, specifying the user name, the name of the organization, and the role:

```
cf unset-org-role <USERNAME> <ORG> <ROLE>
```

## Related Information

[Supported Tools and Services When Using Custom Identity Providers for Platform Users \[page 2062\]](#)  
[About Roles in the Cloud Foundry Environment \[page 2244\]](#)

## 6.2.5.3 Create Spaces Using the Cloud Foundry Command Line Interface

Use the `cf create-space` command to create spaces in your Cloud Foundry organization using the Cloud Foundry Command Line Interface (cf CLI).

## Prerequisites

- (Enterprise accounts only) Create at least one subaccount and enable the Cloud Foundry environment in this subaccount. For more information, see [Create a Subaccount \[page 1977\]](#) and [Create Orgs \[page 2247\]](#).

### Note

In a trial account, the Cloud Foundry environment is automatically activated, and a first space named *dev* is created.

- You have the Org Manager role in the organization in which you want to create a space. For more information about roles and permissions, see <https://docs.cloudfoundry.org/concepts/roles.html>.
- Download and install the cf CLI and log on to Cloud Foundry. For more information, see [Download and Install the Cloud Foundry Command Line Interface \[page 2259\]](#) and [Log On to the Cloud Foundry Environment Using the Cloud Foundry Command Line Interface \[page 2260\]](#).

## Procedure

1. Make sure that you are in the Cloud Foundry organization you want to add a space to.

```
cf target -o ORG
```

To get a list of your organizations, call `cf orgs`.

2. Enter the following string, specifying a name for the new space, the name of the organization, and the quota you'd like to assign to it:

```
cf create-space SPACE [-o ORG] [-q SPACE_QUOTA]
```

3. (Optional) Set this space as target by executing: `cf target -o ORG -s SPACE`

### Note

If you are assigned to only one Cloud Foundry organization and space, the system automatically targets you to the relevant Cloud Foundry organization and space when you log on.

## Related Information

[Delete Spaces Using the Cloud Foundry Command Line Interface \[page 2294\]](#)

## 6.2.5.4 Add Space Members Using the Cloud Foundry Command Line Interface

You can use the Cloud Foundry Command Line Interface (cf CLI) to add space members and assign roles to them.

### Prerequisites

- The Space Manager role for the space.
- The users exist in a trusted platform identity provider.  
All users of Cloud Foundry UAA are stored in identity providers, either in the default or in a custom identity provider. UAA needs a copy of the user, sometimes called a shadow user. You assign the shadow user authorizations to access resources in UAA. When a user authenticates, UAA forwards the request to the identity provider.  
To specify which identity provider hosts the user, use the `--origin` option. For more information about finding the origin key, see the trust configuration documentation.  
For more information, see [Trust and Federation with Identity Providers \[page 2014\]](#).
- Download and install the cf CLI and log on to Cloud Foundry. For more information, see [Download and Install the Cloud Foundry Command Line Interface \[page 2259\]](#) and [Log On to the Cloud Foundry Environment Using the Cloud Foundry Command Line Interface \[page 2260\]](#).

### Context

Space members are organization members who have specific roles in a space.

Org members can only be added by an Org Manager. This means that if you only have the Space Manager role, you can't add space members that aren't known to the org. To do that, you must first ask your Org Manager to add the users as org members with no roles. Once this is done, you can add them as space members following the steps below.

If you're the Org Manager, you don't need to first add the users as org members with no roles. Since you have the permissions necessary to add users to the org, when you add a new user as a space member, that user automatically becomes part of the org as well.

### Procedure

Enter the following string, specifying the user name, the name of the organization, the name of the space, and the role:

```
cf set-space-role USERNAME ORG SPACE ROLE
```

## Next Steps

To remove a space role from a user, enter the following string, specifying the user name, the name of the organization, the name of the space, and the role:

```
cf unset-space-role USERNAME ORG SPACE ROLE
```

## Related Information

[Supported Tools and Services When Using Custom Identity Providers for Platform Users \[page 2062\]](#)

## 6.2.5.5 Create Space Quota Plans Using the Cloud Foundry Command Line Interface

You can use the Cloud Foundry Command Line Interface to create space quota plans.

## Prerequisites

- The Org Manager role for the org that contains the spaces to which you want to assign quotas.
- Download and install the cf CLI and log on to Cloud Foundry. For more information, see [Download and Install the Cloud Foundry Command Line Interface \[page 2259\]](#) and [Log On to the Cloud Foundry Environment Using the Cloud Foundry Command Line Interface \[page 2260\]](#).

## Procedure

Open a command line and enter the following string, replacing `QUOTA` with the name for your space quota plan:

```
cf create-space-quota QUOTA [-i INSTANCE_MEMORY] [-m MEMORY] [-r ROUTES] [-s SERVICE_INSTANCES] [--allow-paid-service-plan | --disallow-paid-service-plans]
```

Specify the following parameters:

- `-i`: Maximum amount of memory an application instance can have (`-1` represents an unlimited amount)
- `-m`: Total amount of memory a space can have
- `-r`: Total number of routes
- `-s`: Total number of service instances
- `--allow-paid-service-plans`: Can provision instances of paid service plans
- `--disallow-paid-service-plans`: Can not provision instances of paid service plans

## 6.2.5.6 Assign Quota Plans to Spaces Using the Cloud Foundry Command Line Interface

You use the Cloud Foundry Command Line Interface to assign the quotas available in your global account to your subaccounts.

### Prerequisites

- The Org Manager role for the org that contains the spaces to which you want to assign quotas.
- Download and install the cf CLI and log on to Cloud Foundry. For more information, see [Download and Install the Cloud Foundry Command Line Interface \[page 2259\]](#) and [Log On to the Cloud Foundry Environment Using the Cloud Foundry Command Line Interface \[page 2260\]](#).
- A space quota plan. For more information, see [Create Space Quota Plans Using the Cloud Foundry Command Line Interface \[page 2292\]](#).

### Procedure

Open a command line and enter the following string:

```
cf set-space-quota SPACE_NAME SPACE_QUOTA_NAME
```

## 6.2.5.7 Change Space Quota Plans Using the Command Line Interface

Change space quota plans in the Cloud Foundry environment using the Cloud Foundry command line interface (cf CLI).

### Prerequisites

- You have the Org Manager role in the organization in which you'd like to change space quota plans. For more information about roles and permissions, see <https://docs.cloudfoundry.org/concepts/roles.html>.
- Download and install the cf CLI and log on to your Cloud Foundry instance. For more information, see [Download and Install Cloud Foundry Command Line Interface](#) and [Log On to the Cloud Foundry Environment Using the Cloud Foundry Command Line Interface \[page 2260\]](#).

## Procedure

1. (Optional) Enter the following string to identify the names of all space quota plans available in your org:

```
cf space-quotas
```

2. To modify a quota plan, enter the following string:

```
cf update-space-quota SPACE-QUOTA-NAME [-i MAX-INSTANCE-MEMORY] [-m MEMORY]
[-n NEW_NAME] [-r ROUTES] [-s SERVICES] [--allow-paid-service-plans | --
disallow-paid-service-plans]
```

### Note

For more information about managing space quota plans, see <https://docs.cloudfoundry.org/adminguide/quota-plans.html#space>.

## Related Information

## 6.2.5.8 Delete Spaces Using the Cloud Foundry Command Line Interface

Use the `cf delete-space` command to delete spaces in your Cloud Foundry organization using the Cloud Foundry Command Line Interface (cf CLI).

## Prerequisites

- You have the Org Manager role in the organization from which you want to delete a space. For more information about roles and permissions, see <https://docs.cloudfoundry.org/concepts/roles.html>.
- Download and install the cf CLI and log on to Cloud Foundry. For more information, see [Download and Install the Cloud Foundry Command Line Interface \[page 2259\]](#) and [Log On to the Cloud Foundry Environment Using the Cloud Foundry Command Line Interface \[page 2260\]](#).

## Procedure

1. Make sure that you are in the Cloud Foundry organization you want to delete a space in.

```
cf target -o ORG
```

To get a list of your organizations, call `cf orgs`.

2. Enter the following string, specifying a name for the space, and the name of the organization:

```
cf delete-space SPACE [-o ORG] [-f]
```

To get the list of your spaces, call `cf spaces`.

## Related Information

## 6.2.6 Application Operations in the Cloud Foundry Environment

Learn more about the different application operations that you can perform in the Cloud Foundry environment.

- [Deploy an Application \[page 2295\]](#)
- [Start, Stop and Restart Applications \[page 2297\]](#)
- [Add or Remove Application Instances \[page 2298\]](#)
- [Configuring Application URLs in the Cloud Foundry CLI \[page 2299\]](#)
  - [About Routes in the Cockpit \[page 2300\]](#)
  - [Create Routes \[page 2300\]](#)
  - [Map Routes to Applications \[page 2302\]](#)
  - [Using Custom Domains \[page 2302\]](#)

### 6.2.6.1 Deploy an Application

You can use the cockpit to deploy a new application in the Cloud Foundry environment.

## Procedure

1. In your Cloud Foundry subaccount, navigate to the space where you would like to deploy your application.

2. On the *Applications* page, choose *Deploy Application*.
3. Choose the location of the file which contains your application.
4. (Optional) If you would like to use a manifest, choose the location of your `manifest.yml` file.

#### Note

To avoid any unexpected behavior, specify the attributes of your choice and their respective values in the `manifest.yml` file. For reference, see <https://docs.cloudfoundry.org/devguide/deploy-apps/manifest-attributes.html>.

5. (Optional) If you don't want to use a manifest, untick the *Use Manifest* box and enter the application details.
  - a. Enter a name for your application.
  - b. (Optional) Edit the amount of memory and disk space available to each instance of your app, as well as the number of instances.

The amount of memory per instance that you assign, in this step or in the `manifest.yml` file during deployment, is the value that is metered when using the Cloud Foundry runtime service. For more information, see the examples in [Monitoring and Troubleshooting](#).

#### Note

By default, each instance of a new app is assigned 1024 MB of memory and 512 MB of disk space, and each app starts with 1 instance. If you require more or less resources, edit the prefilled fields in the form to suit your needs.

- c. (Optional) If you don't need a route for your app, tick the *No Route* box.
- d. (Optional) If you would like to create a route for your app, leave the *No Route* box unticked and choose a host name (if different than your app name) and a domain for your app.

#### Note

When you enter an app name, the *Host* field is automatically filled with the same name. You can make changes to it or leave it as is. After deciding on a host and domain, you can see a preview of your final application route at the bottom of the form.

6. Choose *Deploy*.

## Results

The file containing your new application is uploaded and your application is deployed.

## Related Information

[About Routes in the Cockpit \[page 2300\]](#)

[Create Routes \[page 2300\]](#)

## 6.2.6.2 Start, Stop and Restart Applications

You can start and stop applications in the Cloud Foundry environment to control whether they can be accessed by end users.

### Prerequisites

You have deployed an app in your Cloud Foundry space.

### Context

A user can only reach your application if the application is started. The application routes do not work when the application is stopped.

The first start of the application occurs when you deploy the app, if enough quota is available in the space.

### Procedure

1. Navigate to the [Applications](#) page in your space.
2. You can perform these actions either directly from the [Applications](#) page, or by navigating into your application, to the [Overview](#) page:

Page	Actions
<a href="#">Applications page</a>	<p>For the application that you'd like to start or stop, choose the respective icon from the <a href="#">Actions</a> column:</p> <ul style="list-style-type: none"><li>•  (<a href="#">Start</a>) - This starts the first instance of your application and makes it available to users.</li><li>•  (<a href="#">Stop</a>) - This stops all running instances of the application.</li></ul> <p>You cannot directly restart an application from this page.</p> <div data-bbox="414 1635 1394 1859"><p><b>Note</b></p><p>When you start or stop an application from this page, the state shown in the table changes. However, this is not the actual state of the application, but the state that has been requested through your action. To check the actual state of the application, navigate into it by choosing the application name from the table.</p></div>
<a href="#">Overview page of your application</a>	<p>Choose the button corresponding to the desired action:</p> <ul style="list-style-type: none"><li>• <a href="#">Start</a> - This starts the first instance of your application and makes it available to users.</li><li>• <a href="#">Stop</a> - This stops all running instances of the application.</li></ul>

- *Restart* - This restarts the application.

#### Note

The Cloud Foundry restage action cannot be performed from the cockpit. If you'd like to restage your application, you must use the CF CLI.

To learn more about restarting and restaging applications in Cloud Foundry, see <https://docs.cloudfoundry.org/devguide/deploy-apps/start-restart-restage.html>.

## Related Information

[Deploy an Application \[page 2295\]](#)

### 6.2.6.3 Add or Remove Application Instances

To increase the availability of your Cloud Foundry application, you can run multiple instances of it.

## Prerequisites

You must have one application deployed in your Cloud Foundry space.

## Procedure

1. Navigate to the *Applications* page in your Cloud Foundry space.
2. Choose the application for which you want to add or remove application instances.
3. In the *Overview* page of your application choose:
  -  *Instance* to start an additional instance of your application
  -  *Instance* to remove one of the running instances of your application.

## Related Information

[Deploy an Application \[page 2295\]](#)

## 6.2.6.4 Configuring Application URLs in the Cloud Foundry CLI

By default, all applications running on SAP BTP are accessed on the **default landscape** domain. According to your needs, you can change the default application URL by configuring additional application domains.

The URL for an application deployed on SAP BTP in the Cloud Foundry environment is `https://<application>.cfapps.<region>.hana.ondemand.com`. The domain depends on your location, in the European region, for example, the domain is `cfapps.eu10.hana.ondemand.com`. So, if you're deploying an application with the name "myapp", the default application URL is `https://myapp.cfapps.eu10.hana.ondemand.com`.

Running on the China (Shanghai) region:

There's no default URL available in China, therefore you can't deploy an application without configuring a custom domain first. Please refer to the related information link on how to use custom domains.

### Note

To check what domains are available in your Cloud Foundry organization, use the command `cf domains`.

## Custom Domains

Use custom domains to reach your applications on your own domain instead of the default domain, for example, `https://myapp.mydomain.com` instead of `https://myapp.cfapps.eu10.hana.ondemand.com`. When you use a custom domain, both the domain name and the TLS/SSL certificate of the server are owned by the customer.

You can configure custom domains using the Cloud Foundry command-line interface with the plugin for custom domains.

For more information, read the [Custom Domain service user guide](#).

## Application Routes

If you want to make your application reachable on another route, you can add additional routes using the Cloud Foundry CLI. If your application is available under the route `https://myapp.cfapps.eu10.hana.ondemand.com`, you could add a route that reads `https://expenses.cfapps.eu10.hana.ondemand.com` that leads to the same application.

## Related Information

[Using Custom Domains \[page 2302\]](#)

[About Routes in the Cockpit \[page 2300\]](#)

## 6.2.6.5 About Routes in the Cockpit

Routes are the URLs that enable your end users to reach your application.

The Router component in Cloud Foundry is responsible for routing routes. It maintains a list of mapped applications and compares each request with the list to find the best match. Based on this comparison, it then routes requests to the appropriate application instance.

Routes belong to a space, and therefore are managed at space level. Currently, you can create, map, and delete HTTP routes. An HTTP route includes a domain, a host name (or subdomain), and an optional path. You can only map a route to an application that belongs to the same space.

It is possible to map a single route to multiple applications, as well as multiple routes to a single application.

The number of routes you can create in a space depends on your subaccount entitlements and quotas, or on the quota plan assigned to that space (if such a quota plan exists). The maximum number of routes is determined through the Application Runtime quota: 1 GB of Application Runtime comes with 10 routes.

### Related Information

[Create Routes \[page 2300\]](#)

[Map Routes to Applications \[page 2302\]](#)

[Create Space Quotas \[page 2254\]](#)

### 6.2.6.5.1 Create Routes

You can configure the URLs through which end users can reach your applications.

#### Context

Routes belong to a space but they're globally unique, regardless of the organization that controls a space. If a route with a URL exists, you can't create a route with the same URL.

The following steps guide you through the procedure of creating routes by using the SAP BTP cockpit, but you can also create routes by using the CF CLI. For more information, see <https://cli.cloudfoundry.org/en-US/cf/create-route.html> .

## Procedure

1. Navigate to your Cloud Foundry space.
2. Choose *Routes* from the left hand-side navigation.
3. Choose *New Route* to create a route.
4. In the dialog, enter the following parameters:

Parameter	Details
<b>Domain</b>	<p>From the dropdown menu, you can choose either a shared domain (for example, the default <code>cfapps.&lt;region&gt;.hana.ondemand.com</code>) or a private domain that you've previously created using the CF CLI.</p> <p>From the dropdown menu, you can choose either a shared domain or a private domain that you've previously created using the CF CLI.</p> <p>For more information on private domains, see <a href="https://docs.cloudfoundry.org/devguide/deploy-apps/routes-domains.html#private-domains">https://docs.cloudfoundry.org/devguide/deploy-apps/routes-domains.html#private-domains</a>.</p>
<b>Host Name</b>	<p>The host name is your desired subdomain. In the URL, it's added before the selected domain, as follows:</p> <pre>https://&lt;host name&gt;.&lt;domain&gt;</pre> <p>The host name can contain up to 63 characters.</p>
<b>Path</b>	<p>In addition to the domain and subdomain, you can also add a path. You can use paths if you want to create routes for multiple applications available for the same host name and domain. The path becomes part of the URL as follows:</p> <pre>https://&lt;host name&gt;.&lt;domain&gt;/&lt;path&gt;</pre>

You can see the preview of your route at the bottom of the dialog.

5. When you're happy with your route, choose *Save*.

## Next Steps

Once you've created a route, you must map it to your application. Additionally, you also have the option to bind it to a route service instance, by choosing  (Bind Route Service) from the *Actions* column.

## Related Information

[Map Routes to Applications \[page 2302\]](#)

[Create Space Quotas \[page 2254\]](#)

## 6.2.6.5.2 Map Routes to Applications

Once a route has been created, you can map it to an application to make this application reachable for end users.

### Prerequisites

You have at least one route and one deployed application in the same Cloud Foundry space.

### Procedure

1. Navigate to the [Routes](#) page in your Cloud Foundry space in the cockpit.
2. For the route that you wish to map to an application, choose  (Map Route) from the [Actions](#) column and select the application you want to map it to.

### Results

Your application can now be accessed via the route mapped to it. You can launch your mapped route from 2 different places in the cockpit:

- [Routes](#) page:  
Choose  (Launch Route) from the [Actions](#) column.
- [Overview](#) page of the mapped application:  
Choose the URL from the [Application Routes](#) section.

### Related Information

[Create Routes \[page 2300\]](#)

## 6.2.6.6 Using Custom Domains

SAP BTP allows subaccount owners to make their SAP BTP applications reachable and secure via a custom domain that is different from the default domain – for example, **subdomain.mydomain.com**.

See the documentation for the [Custom Domain service](#) for more information about configuring and managing custom domains.

## 6.2.7 Audit Logging in the Cloud Foundry Environment

In this section, you can find information for audit log functionalities in the Cloud Foundry environment.

SAP Audit Log is a core, security, and compliance-based SAP BTP service to provide means for audit purposes. The following features of Audit Log Service are available for SAP BTP Applications and Services:

- With the default features, you have:
  - Written compliance audit data from SAP BTP services and applications, through oAuth2 service plan.
  - Audit data securely stored for a default retention time of 90 days with no additional costs applied.
  - Retrieval of audit data within the default retention period ensured as part of the Auditlog Management Service.
- With the advanced features you can:
  - Write audit data from your owned BTP applications.
  - Configure the retention period.

The advanced features enable you to comply with the SAP Product Standards and Business Industry regulations you're subject to. To enable the advanced features, you need to enable the premium edition service plan, where additional costs are applied based on the consumed volumes.

Audit logs are a special type of logs. They represent security-relevant chronological records that provide documentary evidence for an event or activity. The following table gives you a better understanding what is the difference between audit logs, activity logs, and application logs. The SAP Audit Log service only stores audit logs written by SAP BTP services, when you take action over your account data.

	 Audit logs	 Activity logs	 Application logs
Scope	Evidence	History	Fix Issues
Used by	 Auditor	 User	 Developer
Tamper proof	✓		
UI performance		✓	
Frequent data access		✓	
Long data retention	✓		
Secure low cost architecture	✓		

The SAP Audit Log service stores audit logs representing different actions taken over your account and/or data. There are predefined audit categories, which represent such kinds of actions:

- Data protection and privacy related

- [audit.data-access](#) read-access logging records for access to sensitive personal data;
- [audit.data-modification](#) data modification logging records for sensitive personal data.

Security related

- [audit.security-events](#) logging of general security events like login, logout, and other;
- [audit.configuration](#) logging of security critical configuration changes.

See [Change Logging and Read-Access Logging \[page 2842\]](#).

If your subaccount audit logs contain other log types or information, create a support ticket with component BC-CP-CF-SEC-AUDITLG.

## Related Information

[Audit Log Retrieval API Usage for Subaccounts in the Cloud Foundry Environment \[page 2304\]](#)

[Audit Log Retention for the Cloud Foundry Environment \[page 2316\]](#)

[Audit Log Viewer for the Cloud Foundry Environment \[page 2327\]](#)

### 6.2.7.1 Audit Log Retrieval API Usage for Subaccounts in the Cloud Foundry Environment

The audit log retrieval API allows you to retrieve the audit logs for your SAP BTP Cloud Foundry environment subaccount.

#### Note

After the audit logs are generated and sent to the Audit Log service, the logs are not immediately accessible for retrieval.

Retrieving of audit logs via the Audit Log Retrieval API is limited to the size of the audit logs generated for the subaccount. The audit log results are provided as a collection of JSON entities. The possible request rate is now limited to:

- 4 requests per second per auth-token/tenant on CF-EU11, CF-EU30, CF-US20, CF-US21, CF-JP10, CF-JP20, CF-BR10. There is also a burst queue that can temporarily allow up to 20 requests per second.
- 8 requests per second per auth-token/tenant on CF-EU10, CF-EU20, CF-US10, CF-US30. There is also a burst queue that can temporarily allow up to 40 requests per second.

The API returns a HTTP 429 response code when the limits are exceeded.

The audit log retrieval API is protected by OAuth. To consume the audit log retrieval API, you need your system to generate and use a valid OAuth.

## Prerequisites

To execute the procedure, you need to have the `Space Developer` role for the corresponding Space.

### Note

For security reasons, we recommend you to re-create the `auditlog-management` Service-Instance bindings and service keys at least every 90 days.

## Create Instance of the `auditlog-management` Service

1. Create a Cloud Foundry Org and Space, in case you don't have any. See [Create Spaces \[page 2251\]](#).
2. Log in the Cloud Foundry landscape using the corresponding Cloud Foundry API (Infrastructure/Landscape Overview).

```
cf login -a <API_URL> -o <ORG> -s <SPACE> -u <USER>
```

3. Create a service instance of the service `auditlog-management`.

### Note

For security reasons, we strongly recommend you to adopt the provided mutual TLS authentication (mTLS). The mTLS authentication relies on X.509 certificates for the verification of the parties in the network connection. Create the `auditlog-management` service instances with the additional parameters, as explained in the following mTLS points.

- (Recommended) For mTLS authentication using X.509 certificates, use:

```
cf create-service auditlog-management default <SERVICE_INSTANCE> -c '{
  "xs-security": {
    "xsappname": "auditlog",
    "oauth2-configuration": {
      "credential-types": [
        "x509"
      ],
      "grant-types": [
        "client_credentials"
      ]
    }
  }
}'
```

### Note

The `xsappname` attribute from the service parameters JSON needs to have unique instance for each service. The `xsappname` attribute can hold an arbitrary string as value, which is not required to be `auditlog`. The code block serves only as example.

- For non-mTLS authentication, use

```
cf create-service auditlog-management default <SERVICE_INSTANCE>
```

### Note

If there's a previously created `auditlog-management` service instance without the security parameters for mTLS, we recommend you to delete that instance and create a new instance with mTLS authentication using the parameters from the previous (recommended) scenario.

4. Create a key for the service instance:

- For service instances with mTLS, use:

```
cf create-service-key <SERVICE_INSTANCE> <SERVICE_KEY> -c '{
  "xsuaa": {
    "credential-type": "x509",
    "x509": {
      "key-length": 2048,
      "validity": 1,
      "validity-type": "DAYS"
    }
  }
}'
```

### Note

You can specify the validity period of the service key for each use case. To use the service instance, once the key validity expires, create a new key. By default and for security reasons, the key from this code example is created with a validity of 1 day.

- For service instances without mTLS, use:

```
cf create-service-key <SERVICE_INSTANCE> <SERVICE_KEY>
```

5. List the key of the service instance:

```
cf service-key <SERVICE_INSTANCE> <SERVICE_KEY>
```

6. Extract data from the service key.

- For mTLS scenario:
  - Extract the values for `uaa.clientid` and `uaa.certurl` of the key of the service instance for access token creation.
  - Extract the value for `url` and use it for later request to retrieve audit logs.
  - Extract the value for `uaa.certificate`, remove all `\n` entries from the X.509 certificate, and save it as a file in the `.pem` format.
  - Extract the value for `uaa.key`, remove all `\n` entries from the RSA private key, and save it as a file in the `.pem` format.

### Note

To extract of the values and avoid errors while copying or removing characters, you can use the `sed` and `jq` tools:

```
cf service-key <SERVICE_INSTANCE> <SERVICE_KEY> | sed '/Getting key/d'
| jq --raw-output .uaa.certurl
cf service-key <SERVICE_INSTANCE> <SERVICE_KEY> | sed '/Getting key/d'
| jq --raw-output .uaa.clientid
cf service-key <SERVICE_INSTANCE> <SERVICE_KEY> | sed '/Getting key/d'
| jq --raw-output .url
# the following two commands save the output to .pem files on the
location, where the command is executed
cf service-key <SERVICE_INSTANCE> <SERVICE_KEY> | sed '/Getting key/d'
| jq --raw-output .uaa.certificate > mtls-certificate.pem
cf service-key <SERVICE_INSTANCE> <SERVICE_KEY> | sed '/Getting key/d'
| jq --raw-output .uaa.key > mtls-private-key.pem
```

- For non-mTLS scenario:

Extract values for `uaa.url`, `uaa.clientid` and `uaa.clientsecret` of the key of the service instance for access token creation. Extract the `url` to be used for later request to retrieve audit logs.

## Create an OAuth Access Token

### 1. Request an OAuth access token

- For mTLS scenario

To request the OAuth access token via the mTLS extracted X.509 certificates and RSA private key flow, execute an HTTP POST request with the following parameters:

```
URL: <value of "uaa.certurl"/>/oauth/token?
grant_type=client_credentials&client_id=<value of "uaa.clientid">
Method: POST
Authentication Method: Client Certificates
Certificate: <Value of "uaa.certificate">
Key: <Value of "uaa.key">
grant_type: client_credentials
client_id: <Value of "uaa.clientid">
```

Example:

```
curl --cert <path to certificate.pem> --key <path to key.pem>
--request POST https://<value of "uaa.certurl"/>/oauth/token -d
'grant_type=client_credentials&client_id=<Value of "uaa.clientid">'
```

- For non-mTLS scenario

Request the OAuth access token via the OAuth client credentials flow, by executing an HTTP POST request with the following parameters:

```
URL: <value of "uaa.url"/>/oauth/token?grant_type=client_credentials
Method: POST
Authentication Method: Basic Authentication
Username: <Value of "uaa.clientid">
Password: <Value of "uaa.clientsecret">
```

### 2. Extract the value of the `access_token` attribute from the JSON response.

This token grants access to the audit logs of the subaccount on the landscape where the service instance is created.

#### Note

The token is valid for 1 hour.

#### Note

This token grants access to the audit logs of the subaccount on the landscape. The content of the access token can be displayed using a standard JWT decoder.

## Audit Log Retrieval

The Audit Log Retrieval API incorporates server-side paging to address the efficient handling of queries producing substantial result sets.

#### Note

The logs are not immediately accessible for retrieval.

In instances where the query produces a result with significant size, the API systematically partitions the output into manageable chunks. The response includes an HTTP header featuring a handle, designed to facilitate the retrieval of subsequent result segments. To obtain additional portions of the result, pass the handle as a URL parameter in the subsequent retrieval request. The size of each chunk is predetermined, with a page size fixed at 500.

Supported request parameters:

- `time_from` and `time_to` – if no time filter is specified the default timeframe of 30 days back is returned. Use the following format: YYYY-MM-DDTHH:MM:SS, for example 2018-05-11T10:42:00. The time is in UTC.
- `handle` – in case the result set is too large, it's chunked, and a handle is returned for reading the next chunk. The handle is returned as a Response Header in the form: `Paging: handle=<value>`. Then you can provide `handle=<value>` as a request parameter in the subsequent retrieval request.

### Example: Get audit logs for the last 30 days

Execute the following HTTP GET request:

```
<url_from_service_key>/auditlog/v2/auditlogrecords
```

Provide the OAuth access token as an "Authorization" header: "Authorization: Bearer <access\_token>"

The response is in JSON format, containing the audit log entries, split on pages if needed.

### Example: Get audit logs filtering by time

Execute the following HTTP GET request:

```
<url_from_service_key>/auditlog/v2/auditlogrecords?  
time_from=2018-05-10T10:42:00&time_to=2018-05-11T10:46:00
```

### Example: Get audit logs next chunk determined by the server-side paging

Execute the following HTTP GET request:

```
<url_from_service_key>/auditlog/v2/auditlogrecords?  
handle=2018-06-14T10:11:18.968<4f932695-8616-4e1f-  
ac9a-1cdfb758f01d<2018-06-14T10:11:00.000  
  
<url_from_service_key>/auditlog/v2/auditlogrecords?handle=<handle value>
```

Response codes:

HTTP Codes

HTTP 200 OK

HTTP 204 NO\_CONTENT

HTTP 401 UNAUTHORIZED

HTTP 400 BAD\_REQUEST

HTTP 403 FORBIDDEN

HTTP 429 Too Many Requests

Predefined audit log message categories:

```
'audit.security-events'  
  
'audit.configuration'  
  
'audit.data-access'  
  
'audit.data-modification'
```

## Results

```

## Related Information

[Audit Log Retrieval API for the Cloud Foundry Environment](#)

[API Documentation](#)

## 6.2.7.2 Audit Log Retrieval API for Global Accounts in the Cloud Foundry Environment

### Note

The following procedure is applicable only for Feature Set B Global Accounts. To retrieve audit logs for Feature Set A Global Accounts, contact SAP support and include in your request: Global Account ID, recipient email, timeframe, and reason for the request. For more information about feature sets, see [Cloud Management Tools — Feature Set Overview \[page 111\]](#)

On Central regions, Audit Log Retrieval API allows you to retrieve audit logs written on behalf of your SAP BTP Global Account.

Your central region is the eu10 Europe (Frankfurt) region, unless your global account is located in the China (Shanghai) and Government Cloud (US) regions. Then use the landscape domain of your central region.

Audit Log Retrieval API is protected by OAuth, and to consume it, you need your system to generate and use a valid OAuth.

### Note

After the audit logs are generated and sent to the Audit Log service, the logs are not immediately accessible for retrieval.

Retrieving of audit logs via Audit Log Retrieval API is limited to the size of the audit logs written on behalf of the global account. The possible request rate is now limited to:

- 4 requests per second per auth-token/tenant on CF-EU11, CF-EU30, CF-US20, CF-US21, CF-JP10, CF-JP20, CF-BR10. There is also a burst queue that can temporarily allow up to 20 requests per second.
- 8 requests per second per auth-token/tenant on CF-EU10, CF-EU20, CF-US10, CF-US30. There is also a burst queue that can temporarily allow up to 40 requests per second.

The API returns a HTTP 429 response code when the limit is exceeded.

## Prerequisites

You do this procedure through Cloud Foundry Environment, which is part of a subaccount. To enable Audit Log Retrieval API for Global Account (Feature Set B), you must perform the following steps as a global account administrator:

1. You need to have one or more subaccounts in the Central region<sup>(1)</sup>. Create one if needed.

### Note

ALL space developer users can access the service instance in the subaccount where it's entitled. To restrict access to your global account audit logs we recommend, you create a new subaccount in the Central regions<sup>(1)</sup> and add only users eligible to read global account audit logs to it.

2. Follow the steps to entitle one or more of your subaccounts with the central plan of service Auditlog Management:

1. Navigate to your global account.
2. Choose **Entitlements** > **Entity Assignments** from the left-hand side menu.
3. In the pop-up window, select all the subaccounts for which you would like to configure or display entitlements.
4. Choose **Select** to apply the filter.  
You get a table for each of the subaccounts you selected, which displays the current entitlement and quota assignments.
5. Choose **Configure Entitlements** to start editing entitlements for a particular subaccount. You can now edit the entitlements table.

#### Note

You can edit entitlements for only one subaccount at a time.

6. Choose **Add Service Plans**.
  7. Select **Auditlog Management** from the list on the left-hand side.
  8. Choose the checkbox of central plan on the right-hand side.
  9. Choose **Add 1 Service Plan**.
  10. Choose **Save** and exit edit mode for that subaccount.
3. To execute the procedure, you need to have the `Space Developer` role for the corresponding Space.

#### Note

For security reasons, we strongly recommend you to re-create the `auditlog-management` Service-Instance bindings and service keys at least every 90 days.

## Create Instance of the `auditlog-management` Service

1. Create a Cloud Foundry Org and Space, in case you don't have any. See [Create Spaces \[page 2251\]](#).
2. Log in the Cloud Foundry landscape using the corresponding Cloud Foundry API (Infrastructure/Landscape Overview).

```
cf login -a <API_URL> -o <ORG> -s <SPACE> -u <USER>
```

3. Create a service instance of the service `auditlog-management`:

#### Note

For security reasons, we strongly recommend you to adopt the provided mutual TLS authentication (mTLS). The mTLS authentication relies on X.509 certificates for the verification of the parties in the network connection. Create the `auditlog-management` service instances with the additional parameters, as explained in the following mTLS points.

- (Recommended) For mTLS authentication using X.509 certificates, use:

```
cf create-service auditlog-management central <SERVICE_INSTANCE> -c '{
  "xs-security": {
    "xsappname": "auditlog",
    "oauth2-configuration": {
      "credential-types": [
        "x509"
      ]
    }
  }
}
```

## Note

To extract the values and avoid errors while copying or removing characters, you can use the `sed` and `jq` tools:

```
cf service-key <SERVICE_INSTANCE> <SERVICE_KEY> | sed '/Getting key/d'
| jq --raw-output .uaa.certurl
cf service-key <SERVICE_INSTANCE> <SERVICE_KEY> | sed '/Getting key/d'
| jq --raw-output .uaa.clientid
cf service-key <SERVICE_INSTANCE> <SERVICE_KEY> | sed '/Getting key/d'
| jq --raw-output .url
# the following two commands save the output to .pem files on the
location, where the command is executed
cf service-key <SERVICE_INSTANCE> <SERVICE_KEY> | sed '/Getting key/d'
| jq --raw-output .uaa.certificate > mtls-certificate.pem
cf service-key <SERVICE_INSTANCE> <SERVICE_KEY> | sed '/Getting key/d'
| jq --raw-output .uaa.key > mtls-private-key.pem
```

- For non-mTLS scenario:

Extract values for `uaa.url`, `uaa.clientid` and `uaa.clientsecret` of the key of the service instance for access token creation. Extract the `url` to be used for later request to retrieve audit logs.

## Create an OAuth Access Token

### 1. Request an OAuth access token

- For mTLS scenario

To request the OAuth access token via the mTLS extracted X.509 certificates and RSA private key flow, execute an HTTP POST request with the following parameters:

```
URL: <value of "uaa.certurl"/>/oauth/token?
grant_type=client_credentials&client_id=<value of "uaa.clientid">
Method: POST
Authentication Method: Client Certificates
Certificate: <Value of "uaa.certificate">
Key: <Value of "uaa.key">
grant_type: client_credentials
client_id: <Value of "uaa.clientid">
```

Example:

```
curl --cert <path to certificate.pem> --key <path to key.pem>
--request POST https://<value of "uaa.certurl"/>/oauth/token -d
'grant_type=client_credentials&client_id=<Value of "uaa.clientid">'
```

- For non-mTLS scenario

Request the OAuth access token via the OAuth client credentials flow, by executing an HTTP POST request with the following parameters:

```
URL: <value of "uaa.url"/>/oauth/token?grant_type=client_credentials
Method: POST
Authentication Method: Basic Authentication
Username: <Value of "uaa.clientid">
Password: <Value of "uaa.clientsecret">
```

### 2. Extract the value of the `access_token` attribute from the JSON response.

This token grants access to the audit logs of the subaccount on the landscape where the service instance is created.

### Note

The token is valid for 12 hours.

### Note

The content of the access token can be displayed using a standard JWT decoder

## Audit Log Retrieval

The Audit Log Retrieval API incorporates server-side paging to address the efficient handling of queries producing substantial result sets.

### Note

The logs are not immediately accessible for retrieval

In instances where the query produces a result with significant size, the API systematically partitions the output into manageable chunks. The response includes an HTTP header featuring a handle, designed to facilitate the retrieval of subsequent result segments. To obtain additional portions of the result, pass the handle as a URL parameter in the subsequent retrieval request. The size of each chunk is predetermined, with a page size fixed at 500.

Supported request parameters:

- `time_from` and `time_to` – if no time filter is specified the default timeframe of 30 days back is returned. Use the following format: 2018-05-11T10:42:00. The time is in UTC.
- `handle` – in case the result set is too large, it's chunked, and a handle is returned for reading the next chunk. The handle is returned as a Response Header in the form: `Paging: handle=<value>`. Then you can provide `handle=<value>` as a request parameter in the subsequent retrieval request.

### Note

The `handle` parameter is a base 64 encoded string. Don't attempt to decode it. Send the `handle` in the subsequent request exactly as received in the previous one, without any modification.

### Example: Get audit logs for the last 30 days

Execute the following HTTP GET request:

```
<url_from_service_key>/auditlog/v2/auditlogrecords
```

Provide the OAuth access token as an "Authorization" header: "Authorization: Bearer <access\_token>"

The response is in JSON format, containing the audit log entries, split on pages if needed.

### Example: Get audit logs filtering by time

Execute the following HTTP GET request:

```
<url_from_service_key>/auditlog/v2/auditlogrecords?  
time_from=2018-05-10T10:42:00&time_to=2018-05-11T10:46:00
```

## Example: Get audit logs next chunk determined by the server-side paging

Execute the following HTTP GET request:

```
<url_from_service_key>/auditlog/v2/auditlogrecords?  
time_from=2018-05-10T10:42:00&time_to=2018-05-11T10:46:00&handle= <handle value>
```

Response codes:

HTTP Codes

HTTP 200 OK

HTTP 204 NO\_CONTENT

HTTP 401 UNAUTHORIZED

HTTP 400 BAD\_REQUEST

HTTP 403 FORBIDDEN

HTTP 429 Too Many Requests

Predefined audit log message categories:

'audit.security-events'

'audit.configuration'

'audit.data-access'

'audit.data-modification'

## Results

## 6.2.7.3 Audit Log Retention for the Cloud Foundry Environment

The audit log data is stored on a subaccount level. The access to the stored audit log data is strictly restricted - only authorized stakeholders can preview, retrieve, and download their audit log data.

For more information, see [Audit Log Retrieval API Usage for Subaccounts in the Cloud Foundry Environment \[page 2304\]](#).

### Retention of Audit Data written from SAP BTP Applications and Services

#### Free retention period

The securely stored audit log data for your account, which is written from SAP BTP Applications and Services, is retained for 90 days for free, after which it's deleted. Within this free default retention period, the authorized stakeholders can retrieve the audit data to store it in their own persistent storage.

#### Configurable retention period

To be in compliance with the Industry and Business Regulations requirements for a longer retention and storage, you can enable the Audit Log service, premium edition service plan, and be able to configure a flexible retention period, longer than the free 90 days.

When you enable the Audit Log service, premium edition service plan, you can create a support ticket with component BC-CP-CF-SEC-AUDITLG to the Audit Log service to configure a flexible retention period for storing your audit data. The premium edition with its advanced functionalities is a commercialized consumption based service plan, which prices per GB you can check at [SAP Discovery Center](#).

### Retention of Audit Data written from Customer BTP Applications

There is no free retention period for any audit data written from customer applications that are built on top of the BTP. When you enable the Audit Log service, premium edition service plan, you can create a support ticket with component BC-CP-CF-SEC-AUDITLG to the Audit Log service to configure a flexible retention period for storing your audit data. The premium edition with its advanced functionalities is a commercialized consumption based service plan, which prices per GB you can check at [SAP Discovery Center](#).

## 6.2.7.4 Audit Log Write API for Customers

The SAP Audit Log service provides an Audit Log Write API for customers, which enables the recording of audit relevant events.

### Categories of Audit Relevant Events

There are four categories of audit relevant events:

Category	Description	Examples
Log read access to sensitive personal data	Use a data-accesses audit log record for the cases where an access to personal data is executed. The audit log contains information on the accessed personal data, as well as the full information of the user that is accessing the personal data, the owner of the personal data (the Data Subject), and the identifier of the place where the access to the personal data have been executed (the Object).	Examples of personal data access events are all the read accesses sensitive personal data, which means information on racial or ethnic origin, political opinions, religious or philosophical beliefs, trade-union membership, health or sex life, bank account and credit card data, genetic data and biometric data for the purpose of uniquely identifying a natural person.
Log changes to personal data	Use a data-modification audit log record for the events that are related to modification of personal data. The audit log contains information on the modified personal data, as well as the full information of the user that is accessing the personal data, the owner of the personal data (the Data Subject), and the identifier of the place where the access to the personal data have been executed (the Object).	Examples of personal data modification events are writing, deleting, or changes on an address, e-mail address, phone number, and any other data that can lead to a persona identification.
Security event log	Log security data for all events that might have an impact over the system security.	Examples for such events are successful and non-successful login and log-out events, changes in access control permissions, changes in credentials, changes in sensitive configurations, and so on.
Configuration change log	Use the configuration change audit log events for various changes in configurations. The audit log contains the changed configuration parts with old and new value. Log only the changed parts with the old and new value. If old or new value doesn't exist in case of adding a new property or deleting one respectively, skip the missing values or set them as null.	Examples of configuration change events are creation/deletion of service instances, binding/unbinding service instances, software update, changes in configurations, and so on.

## Prerequisites for Using the Audit Log Write API for Customers

### Do the Enablement and Entitlements

As a first step to use the Audit Log Write API, make sure that the service is enabled for your subaccount and that there is an entitlement for the premium plan of the service.

If the *Audit Log Service* of plan *premium* is not visible from the account cockpit service marketplace for your subaccount, do the following to entitle the service:

- To add entitlements on subaccount level, navigate to the subaccount via the account cockpit and choose [▶ Entitlements ▶ Configure Entitlements ▶](#)
- To add entitlements on global account level via the account cockpit, navigate to the account cockpit global account view and choose [▶ Entitlements ▶ Service Assignments ▶](#)
- To add entitlements for a global account via the SAP BTP Control Center, choose the global account and go to [▶ Edit ▶ Assign Services ▶](#). To select the Auditlog Service checkbox choose [▶ Next ▶ Set Entitlements ▶ Select Auditlog Service ▶](#) and ensure that there is quota for the “premium” plan of the service in the desired region(s).

### Create a Service Instance

The *premium* plan of the auditlog service uses mTLS authentication via X.509 certificates. To create a service instance via the account cockpit, do the following:

1. Select the *premium* plan for the service instance creation from the Service Marketplace inside the SAP BTP Cockpit.
2. Choose a runtime and a name for the service instance.
3. Specify a unique *xsappname* per subaccount for each instance and provide the x509 authentication parameters during service instance creation.

You can also create a service instance via the CF client with the following sequence of commands:

```
cf api <cf-domain>
cf login
cf target -o <desired-org> -s <desired-space>
cf create-service auditlog premium <my-service-instance> -c '{
  "xs-security": {"xsappname": "<some-unique-name>",
    "oauth2-configuration": {
      "credential-types": ["x509"],
      "grant-types": ["client_credentials"]
    }
  }
}'
```

#### 📌 Note

Deleting the service instance doesn't delete the customer audit data already stored in the Audit Log Viewer. For more information, see [Audit Log Retention for the Cloud Foundry Environment \[page 2316\]](#)

### Create a Service Key

The service keys provide credentials and URLs for interacting with your service instance. You can create a service key in one of the following ways: from the account cockpit or via CF command.

- From your account cockpit, select the created *premium* service instance from the *Instances and Subscriptions* section. Depending on the chosen runtime environment, you can see a *Create* button for

either a service key or a service binding. In the service key/binding creation box, specify the validity of the X.509 certificates used for authentication.

- In the CF client, use the following command. The example parameters sets the certificate credentials validity to 30 days. After that period, the credentials expire and need to be rotated. For more information about the rotation, see the [Credentials rotation](#) section.

```
cf create-service-key <my-service> <my-key> -c '{
  "xsuaa": {
    "credential-type": "x509",
    "x509": {
      "key-length": 2048,
      "validity": 30,
      "validity-type": "DAYS"
    }
  }
}'
```

## Create a Service Binding

Like service keys, the classical service bindings provide credentials and endpoints for using a service instance and are mainly intended to be used with Cloud Foundry applications. You can bind a CF application to one or more service instances. As a result, in the VCAP\_SERVICES application environment variable there is a dedicated JSON object for each service binding.

You can perform the binding operation directly from the account cockpit settings of the application, via the CF client, or via the application deployment manifest. Specifically for the Audit Log Write API “premium” plan, it is important to provide the credentials parameter to enable the provisioning of X.509 certificates. Examples:

- Create a service binding via the CF client:

```
cf bind-service <sample-application> <auditlog-premium-service-instance> -c '{
  "xsuaa": {
    "credential-type": "x509",
    "x509": {
      "key-length": 2048,
      "validity": 30,
      "validity-type": "DAYS"
    }
  }
}'
```

- Create a service binding through a simple deployment manifest:

```
---
applications:
- name: java-auditlog-sample
  memory: 512M
  instances: 1
  path: target/java-auditlog-sample.war
  env:
    TARGET_RUNTIME: tomcat
  services:
  - name: "<auditlog-premium-service-instance-name>"
    parameters:
      xsuaa:
        credential-type: "x509"
        x509:
          key-length: 2048
          validity: 30
          validity-type: "DAYS"
```

- Create a service binding through an MTA deployment manifest:

```
modules:
- name: <module using the Audit Log Service>
  requires:
  - name: <Audit Log Service Premium Instance Name>
    parameters:
    config:
    xsuaa:
    credential-type: x509
    x509:
    key-length: 2048
    validity: 2
    validity-type: MONTHS
  - name: <other modules>
resources:
- name: <Audit Log Service Premium Instance Name>
  type: org.cloudfoundry.managed-service
  parameters:
  service: auditlog
  service-plan: premium
```

## Obtain Credentials for Authentication and Authorization

This section describes the approach to obtain credentials for authentication and authorization towards the Audit Log Write API.

- Retrieving service key information

When you create a service key or binding, do one of the following:

- Download the service key data from the account cockpit - select the three dots next to the service key/binding and then [Download](#).
- Use the following CF command extract the data from the service key:

```
cf service-key <my-service> <my-key>
```

Example of a sample service key or binding object:

```
{
  "uaa": {
    "apiurl": "https://api.authentication.<cf_domain>",
    "certificate": "<x509_certificate>",
    "certificate-pinning": true,
    "certurl": "https://<subdomain>.authentication.cert.<cf_domain>",
    "clientid": "<client_id>",
    "clientx509enabled": true,
    "credential-type": "x509",
    "identityzone": "<identity_zone>",
    "identityzoneid": "<identity_zone_id>",
    "key": "<private_key>",
    "sburl": "https://internal-xsuaa.authentication.<cf_domain>",
    "subaccountid": "<subaccount_id>",
    "tenantid": "<tenant_id>",
    "tenantmode": "dedicated",
    "uaadomain": "authentication.<cf_domain>",
    "url": "https://<subdomain>.authentication.<cf_domain>",
    "verificationkey": "<verification_key>",
    "xsappname": "<xsappname>",
    "zoneid": "<zone_id>"
  },
  "url": "https://api.auditlog.<cf_domain>:6081",
  "vendor": "SAP"
}
```

- Obtaining credentials for using the Audit Log Write API

The service key/binding information you retrieve in the previous step, contains the issued client certificates for authentication and the URLs to query the service. You need to use those certificate credentials to issue a JWT token for authentication towards the Write API.

To prepare a request for issuing a JWT token, extract the PEM certificates and the relevant service data.

Extract `clientid`, `certurl`, `certificate` and `key` from the credentials for the audit log service instance. Save the extracted certificate and key to files in `.pem` format by removing all `\n` entries.

You can use the following example, considering that the service key/binding information is saved to a json file and use the `cat` and `jq` commands can be used for parsing the file:

```
cat customer-write-api-demo-sk.json | jq --raw-output .uaa.certurl
cat customer-write-api-demo-sk.json | jq --raw-output .uaa.clientid
cat customer-write-api-demo-sk.json | jq --raw-output .url
cat customer-write-api-demo-sk.json | jq --raw-output .uaa.certificate > mtls-
certificate.pem
cat customer-write-api-demo-sk.json | jq --raw-output .uaa.key > mtls-private-
key.pem
```

Then execute a POST request to `<uaa.certurl>oauth/token` using the client certificates. Use the following parameters in the request:

```
URL: <value of "uaa.certurl">/oauth/token?
grant_type=client_credentials&client_id=<value of "uaa.clientid">
Method: POST
Authentication Method: Client Certificates
Certificate: <Value of "uaa.certificate">
Key: <Value of "uaa.key">
grant_type: client_credentials
client_id: <Value of "uaa.clientid">
```

Example of such a request using `curl`:

```
curl --cert <path to certificate.pem> --key <path to key.pem>
--request POST https://<value of "uaa.certurl">/oauth/token -d
'grant_type=client_credentials&client_id=<Value of "uaa.clientid">'
```

You can also execute the JWT token request via REST client, like Postman. In such case, make sure to configure the certificates in the Postman settings as described at <https://learning.postman.com/docs/sending-requests/certificates/>.

Pass the issued JWT token in the Authorization header when calling the Audit Log Server Write REST API: `Authorization: Bearer <token-value>`. Example:

```
curl --location --request POST 'https://api.auditlog.<url-host>:6081/audit-
log/oauth2/v2/configuration-changes' \
--header 'Content-Type: application/json' \
--header 'Authorization: Bearer <token>' \
--data-raw '{message-content}'
```

For more examples, see section [Example requests for the Audit Log Write API](#).

The JWT token has a limited validity. When the token validity expires, you can issue a new one with the same set of certificate credentials.

## Rotate credentials

Once the validity of the certificate credentials from the service key and service binding expire, the credentials for using the Audit Log service become invalid until the certificates are rotated. Make sure to properly rotate the credentials before they expire to avoid issues using the Audit Log service.

- For the case of CF apps with service bindings, do the credentials rotation by recreating the service binding with the auditlog service instance (`cf unbind-service; cf bind-service`). On each bind operation a new set of x509 certificates is generated.
- For the case of apps using auditlog credentials from an auditlog service key, rotate the credentials by creating a new service key and extracting the certificates and private key from the newly created key.

For security reasons, don't use very long validity period for the mTLS credentials and rotate the certificates as frequently as possible (depending on the use case and application lifecycle).

## Audit Log Write REST API specifics

### Endpoints

The endpoints exposed for the *premium* service plan for the 4 types of audit log categories are the following, where the <host> can be obtained from the service key/service binding:

- `https://api.auditlog.<host>:6081/audit-log/oauth2/v2/security-events`
- `https://api.auditlog.<host>:6081/audit-log/oauth2/v2/configuration-changes`
- `https://api.auditlog.<host>:6081/audit-log/oauth2/v2/data-accesses`
- `https://api.auditlog.<host>:6081/audit-log/oauth2/v2/data-modifications`

### Response Status Codes

The following response status codes can be returned from the Audit Log Write API:

Code	Description
201 (Created)	Audit log successfully created.
400 (Bad Request)	Bad request for one of the following reasons: <ul style="list-style-type: none"> <li>• URI syntax error</li> <li>• Invalid attributes</li> <li>• Cannot parse the received audit log message</li> <li>• Connection shutdown</li> </ul>
401 (Unauthorized)	Missing or invalid <i>Authorization</i> header.
413 (Payload Too Large)	The Audit log message size exceeds 10KB.
429 (Too Many Requests)	Rate limit per tenant (provider_tenant, org, space) is hit.
500 (Internal Server Error)	An unexpected exception occurred.
502 (Bad Gateway)	Load balancer issue.
503 (Service Unavailable)	Global rate limit is hit.
504 (Gateway Timeout)	Load balancer issue.

## Audit Log Message Format

The audit log record contains the following two main parts - the first one is filled in by the user of the audit log service and the second one, mainly in the metadata part of the message, is filled in by the audit logging framework.

- **Filled by the audit log user**

Field	Semantics
<code>uuid</code>	Unique identifier of the message.
<code>time</code>	The time when the auditable event has been executed.
<code>user</code>	The user that is logged in and performs the auditable action. To let the server-side extract the user from the JWT token, set the "\$USER" string, or set a custom user and set a custom field.
<code>data_subject</code>	The persona that is the owner of the personal data, which is being accessed or modified in Log read access to sensitive personal data events and Log changes to personal data.
<code>object</code>	The unique identifier for the location of the personal data that is being accessed or modified in case of Log read access to sensitive personal data events and Log changes to personal data, as well as the unique identifier of the location and configuration that is being changed.
<code>attributes</code>	The list of attributes that are either added, deleted, or modified. There are three scenarios, for example: <ol style="list-style-type: none"><li>1. a new address is added - only fill in the new value for the attribute with the newly written value (skip the old value);</li><li>2. an existing address is modified – add the changed value as new and the previous value as old;</li><li>3. an existing address is deleted - fill in only the deleted value as the old value for the attribute (skip the new value field).</li></ol>
<code>attachment</code>	The list of attachments that contain a personal data and has been opened for reading by a user, and which must be reflected in an audit log entry.
<code>ip</code>	The IP where the audited security-relevant event is executed (only available for security audit log events).
<code>data</code>	The message that contains the needed information for the logged security event (only available for security audit log events).
<code>tenant</code>	The identifier of the owner of the audit log message. Each audit log entry can have only single tenant equal to the zone ID, which determines the subaccount that is the owner of the message. The message is visible only for users in a role that has permissions to read the audit logs for this subaccount. The retention of the audit log message is determined based on the setup retention for this subaccount. For the premium plan, set the string "\$PROVIDER", which lets the servers extract the tenant zone ID automatically from the used JWT token.
<code>success</code>	The field is used for transactional messages only. When you mean to log the action as intention, skip the success field. If with the audit log message you mean to confirm the success of the action execution or to state that it was not successful, add the "success" field with values TRUE or FALSE.

- **Filled by the framework**

Field	Semantics
<code>service_instance_id</code>	The GUID of the audit log instance that is used to write audit logs.

Field	Semantics
platform	The platform identifier together with the region information from where the audit log is written.
org_name	Empty in the newest version for security reasons.
org_guid	The organization GUID of the component that is using the audit log service to write audit logs.
space_name	Empty in the newest version for security reasons.
space_guid	The space GUID of the component that is using the audit log service to write audit logs.
app_name	Empty in the newest version for security reasons.
app_guid	The GUID of the application that is using the audit log service to write audit logs.
category	Message category is set implicitly by the framework.

## Example Requests for the Audit Log Write API

This section contains examples for writing audit log events using `curl` demo purposes. You can use any other client, the examples serve to demonstrate the structure of the required payload per each audit log type.

### Writing a Security Event

Mandatory fields: `uuid`, `user`, `tenant`, `time`, `data`, `tenant`.

```
curl --location --request POST 'https://api.auditlog.cf.<host>:6081/audit-log/oauth2/v2/security-events' \
--header 'Content-Type: application/json' \
--header 'Authorization: Bearer <JWT-token-value>' \
--data-raw '{
  "uuid": "<uuid-value>",
  "user": "$USER",
  "time": "2023-06-30T00:00:00.000Z",
  "ip": "127.0.0.1",
  "data": "Demo security event message.",
  "tenant": "$PROVIDER"
}'
```

### Writing a Configuration Change Event

Mandatory fields: `object_id`, `uuid`, `user`, `tenant`, `time`, `attributes`.

```
curl --location --request POST 'https://api.auditlog.cf.<host>:6081/audit-log/oauth2/v2/configuration-changes' \
--header 'Content-Type: application/json' \
--header 'Authorization: Bearer <JWT-token-value>' \
--data-raw '{
  "uuid": "<uuid-value>",
  "user": "test-als-user@sap.com",
  "time": "2023-06-30T00:00:00.000Z",
  "id": "<id-value>",
  "tenant": "$PROVIDER",
  "object": {
    "type": "name of an attribute",
    "id": {
      "key1": "value1",
      "key2": "value2"
    }
  }
}'
```

```

    },
    "attributes": [
      {
        "name": "cfg attribute 1",
        "old": "old cfg attribute 1 value",
        "new": "new cfg attribute 1 value"
      },
      {
        "name": "cfg attribute 2",
        "old": "old cfg attribute 2 value",
        "new": "new cfg attribute 2 value"
      }
    ],
    "category": "audit.configuration",
    "customDetails": {
      "customKey": "customValue",
      "arbitraryKey": "arbitraryValue",
      "customJson": {
        "testString1": "testValue1",
        "testString2": "testValue2"
      }
    }
  }
}'

```

## Writing a Data Modification Event

Mandatory fields: object\_id, user, tenant, time, attributes.

```

curl --location --request POST 'https://api.auditlog.cf.<host>:6081/audit-log/oauth2/v2/data-accesses' \
--header 'Content-Type: application/json' \
--header 'Authorization: Bearer <JWT-token-value>' \
--data-raw '{
  "uuid": "<uuid-value>",
  "user": "some-user-id",

## Getting Support

If you need support for Audit Log Write API, open a SNOW support ticket to the component BC-CP-CF-SEC-AUDITLG. For more information, see Related information.

## Related Information

[Getting Support \[page 2863\]](#)

### 6.2.7.5 Audit Log Viewer for the Cloud Foundry Environment

The SAP Audit Log Viewer service displays the audit logs for your Cloud Foundry account, produced by SAP applications and services you've subscribed to.

The UI allows you to:

- read the audit logs written for your account in selected time frame. The SAP Audit Log Viewer service displays 500 audit log records per request. If you want to view more audit log records, specify a shorter time frame.
- display more detailed information on each single audit log record.
- filter the retrieved client-side chunk for certain strings.
- download the audit logs in the selected time frame.

The default displayed columns are:

- User - the person that has executed the event reflected in the written audit log.
- Time - creation time for the audit log message.
- Message - summary of the audit log message that is written.
- Category - audit log message category. The four-supported audit log message categories are:
  - `audit.security-events`
  - `audit.configuration`
  - `audit.data-access`
  - `audit.data-modification`

The appearance of the UI can be modified by selecting the rows to be displayed on a single page, as well as the columns that you want to be visible.

## SAP Audit Log Viewer service Subscription

### Prerequisites

Before subscribing to the Audit Log Viewer service, you need to configure the relevant entitlement in your Global Account. For more information, see **Related Information**.

### Subscribe to Audit Log Viewer service

To use the SAP Audit Log Viewer service, subscribe to it using the SAP BTP cockpit in the [Services > Instances and Subscriptions > Subscriptions](#) tab of your subaccount. Once you're subscribed, select [Go to Application](#) to open the SAP Audit Log Viewer service and log in there.

## SAP Audit Log Viewer service Access

To retrieve the audit logs for your subaccount using the SAP Audit Log Viewer service, you need to have proper authorizations. See <https://docs.cloudfoundry.org/concepts/roles.html#permissionsInformation> , published on a non-SAP site.

1. Create a `RoleCollection`.
2. Search for roles with the name "Auditlog\_Auditor" and select both entries with the following application identifiers:
  - `auditlog-management!b*`
  - `auditlog-viewer!t*`
3. Assign the role to a user or create a rule to assign it to users based on the SAML Assertion coming from the IDP.

### Note

Only account members with the `Security Administrator` role are authorized to edit application authorizations.

## Related Information

### 6.2.7.5.1 Accessibility Features in Audit Log Viewer

To optimize your experience of Audit Log Viewer, SAP Business Technology Platform (SAP BTP) provides features and settings that help you use the software efficiently.

### Note

Audit Log Viewer is based on SAPUI5. For this reason, accessibility features for SAPUI5 also apply. See the accessibility documentation for SAPUI5 on SAP Help Portal at [Accessibility for End Users](#).

### 6.2.7.6 Security Events Logged by the CF Services

This document contains a list of the CF services that log security events. The logged events are service specific and determined by the service itself. The Audit Log service does not know what security events the services log, it only provides the infrastructure for services to write the logs, and for customers to read them by using the Audit Log Retrieval API and the Audit Log Viewer. For more information about the security events logged by a service, follow the corresponding link in the table.

## 6.2.7.7 How to Use Audit Log to Check Who Started an Application or a Service Instance

You can use audit logging functionality to find out which user activated a specific application or a service instance.

The following scenarios are possible:

The screenshot displays the SAP BTP Cockpit interface. The left sidebar shows navigation options like Overview, Services, Cloud Foundry, and Security. The main content area is titled 'Subaccount: TEST - Instances and Subscriptions'. It features a search bar and filters for 'All Services', 'All Plans', and 'All Statuses'. Below this, there are two main sections:

- Applications to which your subaccount is currently subscribed:** This section is titled 'Information from Audit Log' and contains a table with the following data:

Application	Plan	Created On	Changed On	Status	
Audit Log Viewer Service	free	15 Mar 2023	15 Mar 2023	Subscribed	...
SAP Business Application Studio	trial	16 Mar 2023	16 Mar 2023	Subscribed	...
- Instances (6):** This section is titled 'Information from CF Log (Audit Events)' and contains a table with the following data:

Instance	Service	Plan	Runtime Environment	Scope	Credentials	Status	
alernotificationinstance	Alert Notification	standard	Cloud Foundry	Test Space		Created	...
application_logging_servic...	Application Logging Service	lite	Cloud Foundry	Test Space		Created	...
auditlogmanagement	Audit Log Management Service	default	Cloud Foundry	Test Space	1 key	Created	...
auditserviceapi	Audit Log Service API	default	Cloud Foundry	Test Space	1 key	Created	...
connectivity	Connectivity Service	lite	Cloud Foundry	Test Space		Created	...
hanacloudinstance	SAP HANA Cloud	hana	Cloud Foundry	Test Space		Created	...

- [Audit Log for Applications \[page 2331\]](#)
- (Only for Cloud Foundry subaccounts) [Cloud Foundry Audit Events for Service Instances \[page 2333\]](#)

### 6.2.7.7.1 Audit Log for Applications

Creating an application is logged by Audit Log Service. This information can be displayed in the Audit Log Viewer or retrieved with the Audit Log API.

Audit Log Viewer example: SAP Business Application Studio created by <user\_email> on 16.03.2023 08:44:06.

## 6.2.7.7.2 Cloud Foundry Audit Events for Service Instances

The following steps can help you get information about who started a service instance. These steps are valid only for Cloud Foundry subaccounts.

To get the instance information, you can use the [Cloud Foundry API](#), which is available for all CF subaccounts. The following steps describe a path of API calls. Combining all information from the three steps, you can have a list of all services created by a specific user at a specific time.

1. Get list of all audit events from type "audit.service\_instance.create".

Trial Audit Log API / GET CF Audit Events

GET https://api.cf.us10-001.hana.ondemand.com/v3/audit\_events?page=1&per\_page=50&types=audit.service\_instance.create

## 6.3 Administration and Operations in the ABAP Environment

As an administrator in the ABAP environment, you have different tools and features available that support you in your daily work.

### Task Examples

As an administrator in the ABAP environment, you focus on administration and operational tasks that aren't managed by SAP. Such tasks can include, for example:

- Account and organization management, including identity and access management for your users
- Monitoring of performance issues and exceptions in your own applications  
Such a monitoring includes response times of application-related communication endpoints, SQL statements issued by the application, application jobs, or ABAP runtime errors originating from custom code.
- System sizing, including a regular review of the overall resource utilization  
Such a system sizing can include a daily check of resource utilization peaks and a monthly check of resource utilization trends.
- Software lifecycle of custom applications (add-on updates or custom transports)
- Tenant management if you manage multi-tenant custom applications
- Monitoring of integrations with other cloud or on-premise based services

### Tools, Apps, and Functions: Overview

Here's an overview of tools, apps, and functions that are available to you to perform administration and operations tasks, such as the following:

Task	Tools, Apps, or Functions
Managing accounts and organizations	<p>As an administrator in the ABAP environment, you can create additional accounts for users. In addition, you can manage orgs, spaces, and space quota plans to organize your subaccount into smaller units. You use the tools for account and org administration from the Cloud Foundry environment for this purpose.</p> <p>For more information, see the following:</p> <ul style="list-style-type: none"><li>• <a href="#">Account Administration in the Cockpit</a></li><li>• <a href="#">Org Administration Using the Cockpit</a></li><li>• <a href="#">Org Administration Using the Cloud Foundry CLI</a></li></ul>

Task	Tools, Apps, or Functions
	For more information about business roles in the ABAP environment, see <a href="#">Business Catalogs and Business Roles [page 2338]</a> .
Performing administration tasks, such as identity and access management, business configuration, communication management, and more	In the Fiori launchpad, you can find apps that support you as an administrator or developer with various operational tasks. For more information, see <a href="#">SAP Fiori Apps in the ABAP Environment [page 2337]</a> .
Performing technical operations, such as monitoring the performance of your systems as well as the exhaustion of your purchased service volume	You can use tools such as the technical monitoring cockpit, health monitoring, and more. There's also guidance available for the most common tasks in technical operations and for system sizing. For more information, see <a href="#">Technical Operations [page 2680]</a> .
Operating communications when you integrate your system or solution with other systems to enable data exchange in your ABAP environment	For more information, see <a href="#">Communication Operations [page 2617]</a> .
Performing lifecycle management operations and system administration tasks such as <ul style="list-style-type: none"> <li>• stopping currently unused systems and scheduling (regularly recurring) stop/starts for a system to save resource usage.</li> <li>• restoring recently deleted tenants that are still in retention time.</li> <li>• monitoring operations.</li> </ul>	The <a href="#">Landscape Portal [page 1302]</a> functions as a central tool for providers to perform lifecycle management operations and system administration tasks, see <a href="#">Manage System Hibernation [page 1311]</a> , <a href="#">Restore Consumer Tenants [page 1316]</a> , <a href="#">Operations Dashboard [page 1340]</a> .
Getting notifications about planned maintenance events and about unplanned service outages	Register for the Cloud Availability Center. For more information, see the information about the <a href="#">Cloud Availability Center</a>  on SAP Support Portal.
Operating cloud-centric SAP solution landscapes	SAP Cloud ALM is the central entry point to operate cloud-centric SAP solution landscapes. You can use it for the following: <ul style="list-style-type: none"> <li>• Central monitoring of service level indicators (real user monitoring, job monitoring, exception monitoring)</li> <li>• Central monitoring of key performance indicators for system and applications (health monitoring)</li> <li>• Alert notifications (currently limited to SAP-defined metrics of the health monitoring framework)</li> </ul> For more information about the available metrics for health monitoring, see <a href="#">Central Health Monitoring Using SAP Focused Run and SAP Cloud ALM [page 2712]</a> .

## 6.3.1 SAP Fiori Apps in the ABAP Environment

In the SAP Fiori launchpad for the ABAP environment, you can use apps to help you with your tasks as administrator and developer.

Apps for the ABAP environment help you with the following, for example:

- Manage lifecycle maintenance of business users
- Maintain certificate trust lists
- Integrate your systems in the ABAP environment with other systems to enable data exchange
- Manage software components in your system landscape

### Prerequisites

To be able to view and use the apps in the SAP Fiori launchpad, you need a business role with specific business catalogs. You can either use the business roles that are available with the ABAP environment or you can create business roles that include the relevant business catalogs. For more information about the business catalogs and business roles, see [Business Catalogs and Business Roles \[page 2338\]](#). For more information about creating business roles from available business role templates in the ABAP environment, see also [How to Create a Business Role from a Template \[page 2455\]](#).

## 6.3.1.1.2 Business Catalogs for Development Tasks

Get an overview of available business catalogs for development tasks and their restrictions.

You assign business catalogs to business roles that are assigned to business users. Business catalogs contain authorizations that define what a business user with a certain business role is allowed to do.

Certain business catalogs are only available in development systems (see [Creating an ABAP System \[page 163\]](#)).

Business Catalogs for Development Tasks

Business Catalog	Authorizations	Restrictions	Availability
<i>Development - ABAP Development Tools</i> SAP_A4C_BC_DEV_PC	ADT Development	No transport request management (transport tasks only)	In development systems only
<i>Development - Analysis and Support</i> SAP_A4C_BC_DEV_SUP_PC	Troubleshooting tools such as logs, traces, and the debugger.	-	In all systems
<div style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 10px;"> <p><b>Note</b></p> <p>To enable debugging authorization, set the access category Write, Read, Value Help to <i>Unrestricted</i>. Upon creation of the business role, the value is set by default to <i>No Access</i>. See <a href="#">How to Define Authorizations Based on Restrictions [page 2459]</a>.</p> </div>			
<i>Development - API Test</i> SAP_A4C_BC_DEV_TST_PC	Testing ABAP-based APIs released by SAP	-	In development systems only
<i>Development - Class Runner Execution</i> SAP_A4C_BC_DEV_CLA_RUN_PC	Executing class runners in ABAP Development Tools	-	In all systems
<i>Development - Data Preview - Released Objects</i> SAP_A4C_BC_DEV_DAT_PREVIEW_PC	Using data preview in ABAP Development Tools	-	In all systems

<b>Business Catalog</b>	<b>Authorizations</b>	<b>Restrictions</b>	<b>Availability</b>
<i>Development - Development Objects Display</i> SAP_A4C_BC_DEV_OBJ_DIS_PC	Viewing (read-only) development objects in ABAP Development Tools	-	In all systems
<i>Development - Transport Management</i> SAP_A4C_BC_TRN_MNG_PC	ADT Transport Management	No release of transport requests and no customizing requests	In development systems only
<i>Development - Transport Release Management</i> SAP_A4C_BC_TRN_REL_PC	ADT Transport Release Management	No customizing requests	In development systems only
<i>Development - UI Deployment</i> SAP_A4C_BC_DEV_UID_PC	Deployment of UIs into the ABAP system repository	-	In development systems only
<i>Development Support - Data Preview - Business Data</i> SAP_A4C_BC_DAT_PRV_DFT_PC	Usage of the data preview in ABAP Development Tools for objects that are considered to contain business data: <ul style="list-style-type: none"> <li>• CDS views in language version 5</li> <li>• Client-dependent tables in language version 5 with delivery class A and L</li> </ul> Data of CDS views can be viewed with or without application of the DCL.	-	In all systems
<i>Development Support - Data Preview - Cross-Client and Customizing Data</i> SAP_A4C_BC_DAT_PRV_RDO_PC	Usage of the data preview in ABAP Development Tools for objects that are considered to contain customizing and cross-client data: <ul style="list-style-type: none"> <li>• Client-independent tables in language version 5 with delivery class A and L</li> <li>• Tables in language version 5 with delivery class S, E, and W (metadata)</li> <li>• Tables in language version 5 with delivery class C and G (customizing)</li> </ul>	-	In all systems

Business Catalog	Authorizations	Restrictions	Availability
<i>Extensibility - Custom Apps and Services</i> SAP_CORE_BC_EXT_TST	<ul style="list-style-type: none"> <li>• Previewing UIs in SAP Business Application Studio and Microsoft Visual Studio Code</li> <li>• Previewing service bindings</li> <li>• Testing custom apps and custom services</li> </ul>	Only services that have their original in the current system	In development systems only

### 6.3.1.1.3 Business Catalog for Key User Tasks

Get an overview of available business role catalogs and their restrictions.

You assign business catalogs to business roles that are assigned to business users. Business catalogs contain authorizations that define what a business user with a certain business role is allowed to do.

Business Catalogs for Key User Tasks

Business Catalog	Authorizations	Restrictions
<i>Extensibility - Custom Apps and Services</i> SAP_CORE_BC_EXT_TST	Testing of custom apps and custom services	Only services that have their original in the current system
<i>Extensibility - Key User Adaptation</i> SAP_CORE_BC_EXT_FLEX	Key user adaptation

[Repair CDS Views \[page 2350\]](#)

[Manage Database Cache Configuration \[page 2351\]](#)

#### 6.3.1.2.1 Repair CDS Views

With this app you can view and repair the CDS views that are in inconsistent state.

## Key Features

You can use this app to:

- **View** the details of the inconsistent CDS views such as the application component, the error category, the person who is responsible, and the package details
- **Search** for a specific view based on the view name or filter the views based on the error category
- **Repair** the inconsistent views

In addition, the app allows you to export the CDS views to spreadsheets.

## Supported Device Types

- Desktop

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-DWB-DIC`.

## 6.3.1.2.2 Manage Database Cache Configuration

With this app you can view and manage the database cache configurations.

## Key Features

a) You can use this app to:

- View the list of caches in the system.
- Search for a particular cache based on the name or the data source.
- View the cache-specific information such as total number of records cached and size available for consumption.
- Create or drop a cache by choosing *Create* or *Drop* respectively.

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-DWB-DIC.

### 6.3.1.3 ABAP Test Cockpit

[ABAP Test Cockpit Configurator \[page 2352\]](#)

SAP Fiori app for editing ATC configurations.

[Approve ATC Exemptions \[page 2354\]](#)

[Manage API Snapshots \[page 2355\]](#)

[Glossary \[page 2358\]](#)

#### 6.3.1.3.1 ABAP Test Cockpit Configurator

SAP Fiori app for editing ATC configurations.

### Purpose

The *ABAP Test Cockpit Configurator* enables you to maintain ATC configurations using SAP Fiori launchpad.

#### Note

The *ATC Configurator* app enables you to maintain multiple configurations. Edits done in transactions `ATC` and `SCI` only affect the **active** configuration.

### Key Features

1. Assign a check variant.
2. Change priorities.
3. Set priority levels that block or interrupt transport releases.
4. Set a default configuration.
5. Set handling of pseudo comments and pragmas.

## Access Information

For more information about how to provide access to users and how to implement this app, see [Enable Usage of the ABAP Test Cockpit Configurator App \[page 2353\]](#).

## Component for Customer Incidents

BC-DWB-TOO-ATF

## Supported Device Types

- Desktop

## Related Information

[Enable Usage of the ABAP Test Cockpit Configurator App \[page 2353\]](#)

### 6.3.1.3.1.1 Enable Usage of the ABAP Test Cockpit Configurator App

## Prerequisites

- Access to SAP Fiori launchpad with administrator authorization

## Overview

1. Create a business role either from a template or from scratch.
  - To use a template, see [How to Create a Business Role from a Template \[page 2455\]](#). Choose the template `SAP_BR_ADMINISTRATOR_SW_DEV`.
  - To create a role from scratch, see [How to Create a New Business Role \[page 2454\]](#). Choose `ABAP Test Cockpit Configuration` (business catalog ID: `SAP_CORE_BC_ATC_CONFIG`) as catalog for this role (step 3).

2. Assign the business role you created to a business user.  
(See also: [How to Maintain Business Users \[page 2445\]](#).)

When you log on to SAP Fiori launchpad with the assigned business user, the tile **ABAP Test Cockpit Configurator** will be available.

## 6.3.1.3.2 Approve ATC Exemptions

With this app you can approve or reject ATC exemptions via the SAP Fiori launchpad.

### Key Features

With this app you can:

- Approve exemption requests.
- Reject exemption requests.
- See a list of exemptions of all states.
- Apply filters to the list of exemptions, such as exemption state, processor and requester.
- See a justification for an exemption request.
- Add or remove columns to or from the list of exemptions to customize.
- See the scope the requester would like their exemption request to be valid for through the object scope (finding, object, sub-object and all objects of a package) (granularity).
- See the scope the requester would like their exemption request to be valid for through the check scope (finding, check message, check) (validity).
- See the system group for which an exemption would be valid for.
- See the expiry date of an exemption.
- Give an assessment for an exemption request.

### Supported Device Types

- Desktop
- Tablet
- Smartphone

### Component for Customer Incidents

If you need support or experience issues, please report an incident under component **BC-DWB-TOO-ATF**.

## 6.3.1.3.2.1 Enable Usage of the Approve ATC Exemptions App

### Prerequisites

You have access to the SAP Fiori launchpad with a quality manager authorization and you've configured the ATC Developer Scenario. For more information, see [Using an SAP BTP System as ATC Central Check System](#).

### Procedure

1. Create a business role either from a template or from scratch.
  - To use a template, see [How to Create a Business Role from a Template \[page 2455\]](#). Choose the template `SAP_BR_QUALITY_MNGR_SW_DEV`.
  - To create a role from scratch, see [How to Create a New Business Role \[page 2454\]](#). Choose `Approve ATC Exemptions` (business catalog ID: `SAP_A4C_BC_DEV_XMPT_APR_PC`) as catalog for this role (step 3).
2. Assign the business role you created to a business user.  
(See also: [How to Maintain Business Users \[page 2445\]](#).)

When you now log on to the SAP Fiori launchpad with the assigned business user, the tile [Approve ATC Exemptions](#) will be available.

### Related Information

[Approve ATC Exemptions \[page 2354\]](#)

## 6.3.1.3.3 Manage API Snapshots

With this app you can create API snapshots of your components. An API snapshot is a snapshot of the external interface of all released objects within a software component. This snapshot should be taken when the released objects within the software component must be kept stable. API snapshots allow you to run compatibility checks for your released objects using the ATC check `API_COMPATIBILITY`.

## Key Features

You can use this app to:

- Create API snapshots to be able to use them in compatibility checks
- Regenerate failed APIs
- Set APIs for check relevance to check their content
- Overwrite your API snapshots to recreate already existing snapshots
- Display the changes made to your API snapshots
- Display extracted APIs

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-EXT-REL`.

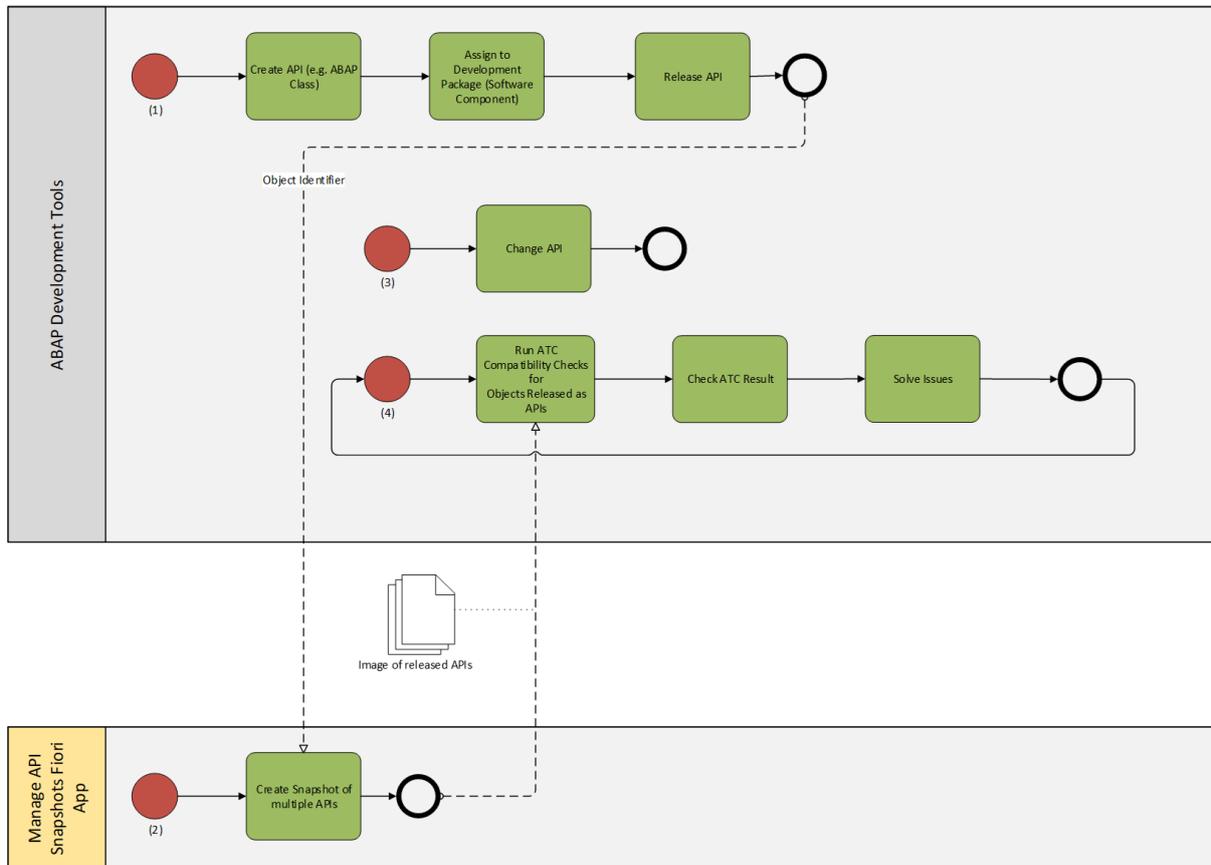

### 6.3.1.3.3.1 Creating API Snapshots

Find out how to create API snapshots using the [Manage API Snapshots](#) app.

## Context

To be able to run compatibility checks for your released objects using the ATC check `API_COMPATIBILITY`, you need to create API snapshots of your application components beforehand. This app allows you to generate and manage your API snapshots.

The *Manage API Snapshots* app is part of the business process that helps you to ensure the stability of your released APIs. This overview contains all steps that need to be considered when developing, releasing and reworking APIs for use by others:

Business Process Description of Compatibility Checks for Released APIs

## Procedure

1. Open the *Manage API Snapshots* app.
2. Click *Create*. Choose a *Name* for your snapshot and select the snapshot component from the value help.
3. Click *Create* again to create your API snapshot, or select *Create and Generate* to generate a snapshot. The generation process will be shown on the UI. Once the snapshot generation has finished, the action status will change to *Completed*. You can view the snapshot details by selecting the snapshot.

### Note

If you release your object and a snapshot doesn't exist already, it's automatically created. This default snapshot appears in your list of snapshots as *SAP Default*. An SAP default snapshot has limited use: you can't regenerate or delete this snapshot, but you can regenerate single APIs of the SAP default snapshot in the *APIs* tab, however. You can set the check relevance of the snapshot as usual. Mind that if at the time of its creation, the SAP default snapshot is the only available snapshot in the respective software component, or if no other snapshot of the respective software component is set to check-relevant, it'll be set to check-relevant automatically.

4. In the *Snapshot API Details*, you can choose to maintain your snapshot in the following way:

- a. Change the name of your snapshot by clicking *Edit* in the top right corner of your screen in the *General Information* tab.
- b. Regenerate the extracted APIs of your snapshot in the *Extracted APIs* tab. To regenerate your APIs, select the ones in question and click *Regenerate*. Remember that the regeneration of APIs is irreversible.
- c. Create a note for other people to view by selecting the *Notes* tab and posting a note.
- d. View the change history of your snapshot by selecting the *Change History* tab.
- e. View your error logs in the *Generation Log* tab.
- f. Regenerate your API snapshot by selecting *Regenerate* in the top right corner of your screen.
- g. Set your API snapshot to check relevant or not check relevant by selecting *Set Check Relevance*.

#### 📌 Note

Only one snapshot per software component can be set as check-relevant.

- h. Delete your snapshot by selecting *Delete*.

You've now created a snapshot that you can use for your compatibility check.

## 6.3.1.3.4 Glossary

Term	Description
Central Check System	Backend system that provides and performs the SAP S/4HANA custom code checks for one or multiple SAP systems remotely.
Checked System	Represents a test or development system that includes the custom code to be checked.
Check Variant	A check variant consists of one or several check categories, which, in turn, consist of one or several individual checks. A check variant also includes the configuration of the checks.
CVA License	Remote security checks are only available for SAP customers with a Code Vulnerability Analyzer (CVA) license, that is, license for <i>SAP Code Vulnerability Analyzer</i> as a separate, fee-based product.
Exemption	If the checked code is not supposed to be corrected, the developer can request an exemption for a check, or an individual check message, for a single finding, or a number of findings within the same package or development object. Once approved by a quality manager, the finding does no longer appear as an open issue in the new ATC results.
Object Provider	An object provider defines the connection between the checked system and the central check system. While an ATC check run is executed, the ATC runtime uses this RFC connection to the checked system to extract a model from the custom code.
Remote-enabled ATC Check	Remote-enabled ATC checks can be run when a remote analysis is being performed in the central check system.

Term	Description
Remote-enabled Check Variant	The check variant is classified as remote-enabled if it consists of remote ATC checks only.
Remote Stubs (RFC Stubs)	<i>Remote Stubs</i> serve as an interface between the <i>Central Check System</i> and the <i>Checked Systems</i> . <i>Remote Stubs</i> extract a model from the custom code, which is used by the ATC check in the <i>Central Check System</i> to analyze the source code of the <i>Checked Systems</i> .
System Group	<p>A system group subsumes multiple SAP systems (typically, the productive system, the test system(s), and the development system(s)), which all represent a part of a system landscape of one and the same SAP release</p> <p>In central check systems, ATC exemptions are no more valid for all checks executed in the system, but for a <i>System Group</i> only:</p> <ul style="list-style-type: none"> <li>• Therefore, every <i>Object Provider</i> must be assigned to a <i>System Group</i>.</li> <li>• All checks executed on base of <i>Object Providers</i> that are assigned to the same <i>System Group</i> share the exemptions available for this group.</li> </ul>

## 6.3.1.4 Additional Software

[Install Additional Software \[page 2359\]](#)

### 6.3.1.4.1 Install Additional Software

With this app you can only display the list of the apps that are available for download. This helps you to better integrate your apps with other programs you need for your daily business.

#### Key Features

You can use this app to:

- Download the current version of the SAP Cloud Print Manager

#### → Tip

For more information, see the [SAP Cloud Print Manager Quick Guide](#) that you can call up directly in the application by clicking [Help](#). This document is only available if you have installed SAP Cloud Print Manager.

- Download the current version of ABAP Development Tools

## Supported Device Types

- Desktop

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-CCM-PRN-OM.

### 6.3.1.5 Application Jobs

Find out more about application jobs in SAP and how they can be helpful.

Many business activities have to be run periodically. To avoid starting these activities manually each time, you can create application job templates and schedule them as application jobs in the [Application Jobs](#) app.

An application job template can be scheduled as an application job. In the scheduling dialog, you as a business user can determine a periodic start condition (such as every first Monday of the month at 1:00), and you can set appropriate parameter values for the application job execution. The application job will then be run automatically without further manual interaction, whenever the start condition is fulfilled.

SAP also offers the [Application Job Templates](#) app. In this app, you can create new templates by saving an existing template with new parameter values. You can also connect existing templates to multistep templates. Running a multistep template means running all steps sequentially.

[Application Jobs \[page 2360\]](#)

[Application Job Templates \[page 2365\]](#)

[Maintain Job Users \[page 2368\]](#)

#### 6.3.1.5.1 Application Jobs

You can use this app to monitor all application jobs from all specialized application jobs apps (example: Schedule Overhead Accounting Jobs,...) that business users have scheduled. You can also cancel application jobs.

### Key Features

#### Note

You can use the scheduling, copying and restarting features in the [Application Jobs](#) app only if you have been granted the necessary authorization via a business role. For more information on how to get the necessary authorizations for this app, see [Maintaining Authorizations \[page 2364\]](#).

You can use this app to:

- Schedule jobs based on a job template: Select a job template, define the description, start date, start time and recurrence of the job, and enter job-specific selection criteria and parameters
- Work with personalized job templates: Create and personalize a job template, save personalized job template for later use, and share personalized template

#### Note

The parameters under *Scheduling Information* can't be saved as a part of a template.

- Schedule jobs with a custom factory calendar: In the *Application Jobs* app, define the scheduling information, change an existing calendar, create a new one, and define execution days
- Arrange job series that take different time zones into account
- Monitor jobs
- Display logs and results: You can navigate to application job logs and application job results by clicking on the icon in the *Log* or the *Results* column. The icon can be either an error icon, a success icon, or an info icon. Selecting the icon, you'll navigate to the specific logs or the specific results of the selected job.
- Copy a job
- Cancel a job
- Restart Job Chains

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-SRV-APS-APJ.

### 6.3.1.5.1.1 Creating an Application Job

Find out how to create your own application jobs in the *Application Jobs* app.

## Context

You can use the *Application Jobs* app to schedule and monitor application-related jobs. If you have manual activities that you often need to do at a specific time, the app can reduce your workload by running these tasks smoothly in the background. You can plan regular jobs which allows you to concentrate on other tasks.

## Procedure

1. Open the [Application Jobs](#) app.
2. Choose [Create](#) to create a new application job.
3. Select a job template and enter a job name.
4. Specify your preferred scheduling options. You can define the recurrence of your job by selecting [Define Recurrence Pattern](#).
5. In the next step, you can adjust the parameters of your application job.
6. You can choose to let the system check if your entries are consistent. If possible, the system fills in default values for the parameters. To choose this option, click [Check](#).
7. You can choose to save the application job as a template, or manage your templates. To do so, select [Template](#).
8. Finally, to schedule your application job, select [Schedule](#).

### 6.3.1.5.1.2 Job Cancellation

Job cancellation details

A job can be canceled either by the system or by a user. If a job is canceled by the system, it gets the status [Failed](#). If you want to cancel a job, please keep in mind that the system behavior depends on what exactly you want to cancel:

- If you cancel a single job with the status [Scheduled](#), this job will be canceled and removed from the job list.
- If you cancel a single job with the status [In Process](#), this job will be canceled, will get the status [Canceled](#) and will remain in the job list.
- If you cancel a job that has the status [Scheduled](#) and is a part of a job series, all jobs with the status [Scheduled](#) will be canceled and removed from the job list. All jobs with other statuses will remain in the list and won't be canceled.
- If you cancel a job that has the status [In Process](#) and is a part of a job series, a job with the status [In Process](#) will be canceled and will get the status [Canceled](#). All other jobs of the series with other statuses will remain in the list.

To cancel a job, please select the job to be removed and choose [Cancel](#) from the main toolbar.

#### Note

Please note that the jobs with the status [Finished](#) cannot be canceled because they have already been run.

## Related Information

[Application Jobs \[page 2360\]](#)

### 6.3.1.5.1.3 Regular Job Deletion

Get an overview of the regular job deletion

All jobs that are not removed by a user remain in the system until a technical cleaning job runs. The time when this job is run by the system depends on the periodic granularity of the jobs that should be deleted. Currently, the following timeframes apply:

Regular Job Deletion

Periodic Granularity of the Job to Be Deleted	Job is Automatically Deleted After
Not periodic	14 days
Minutes	7 days
Hours	14 days
Days	Periodic value*24 days
Weeks	Periodic value*7*24 days
Months	Periodic value*31*24 days
Every X week in every Y month	Periodic value*31*24 days

#### Example

You have scheduled a job that runs every two weeks and ends after 20 runs. The first run starts in the calendar week 2 and ends in the calendar week 40. Each job run stays in the system for the certain retention time. Retention period is always set to 24 runs. Retention time=periodic value \* retention periods \* weekdays [days] = 2 \* 24 \* 7 [days] = 336 [days] = 48 [weeks]. The first job run will be deleted a day after 48 weeks since this job run took place.

#### Note

This is the default behaviour. If the application chooses to have different schemes, this is documented in the application-specific documentation.

### 6.3.1.5.1.4 Restart Job Chains

Find out how to restart job chains.

When an application job or a chain of application jobs consisting of one or more steps has the status *Failed*, *Canceled* or *User Error*, you can restart it. To do so, select the job and choose one of the following options from the drop-down menu:

- From Error Step: All steps before the error step will be skipped and all other steps (including the error step) will be executed.
- After Error Step: All steps before the error step including the error step will be skipped and all other steps after the error step will be executed. This option is not available for single step jobs.

The new job will be executed immediately with the original job user.

#### Note

You can't change the starting or application parameters.

## Related Information

[Application Jobs \[page 2360\]](#)

### 6.3.1.5.1.5 Maintaining Authorizations

Find out which authorizations you need to maintain in order to use the [Application Jobs](#) app.

## Context

To change access to the objects of other users used in the [Application Jobs](#) app, create a new business role assigning the business catalog `SAP_CORE_BC_APJ_JCE` to it. You can modify the provided restriction types according to your needs.

## Procedure

1. Create a new business role assigning the business catalog `SAP_CORE_BC_APJ_JCE` to it. The restriction type `Job Catalog Entry/Application Job Part` contains the two fields `Application Job Catalog Entry` and `Application Job Part`. For more information, see [Maintain Business Roles \[page 2472\]](#).

#### Note

With this restriction type, you'll be able to provide the necessary authorizations for certain actions on the application jobs of other users that are based on a specified job catalog entry. You can display the result lists of these application jobs.

Alternatively, you can also create a display only-role using this restriction type.

2. Next, define your business role with the restriction fields `Application Job Catalog Entry` and `Application Job Part` mentioned above. To do so, select [Maintain Restrictions](#). In the `Application`

Job Catalog Entry field, you can choose the job catalog entries, and in the Application Job Part field, you can choose for which job part access should be granted. You can choose the values JOB (Job Details), SPOOL (Result List), and APPLLOG (Log) by clicking the *Edit* icon next to the fields.

3. If you want to have different business users for the job owner and the job user, the job owner needs the authorization to schedule the application job for the job user. In this case, the job owner needs the restriction type `Create Application Jobs for Other Users`.
4. Go back and select *Save*. Now, you've maintained your business role, and you can assign the role to a business user. For more information on authorizations, see [3028505](#).

#### Note

The private templates of other users aren't shown in the *Application Jobs* app, even if the authorization to view these private templates was granted via `SAP_CORE_BC_APJ_TPL`. You can view the private templates of other users only in the *Application Job Templates* app. For more information, see [Application Job Templates \[page 2365\]](#).

## Related Information

[Maintain Business Users \[page 2444\]](#)

[Maintain Business Roles \[page 2472\]](#)

## 6.3.1.5.2 Application Job Templates

You can use this app to create your own application job templates. The application job templates consist of a set of parameters that you can set for the assigned job catalog entry. This app is mandatory to create multi-step templates which can then be submitted via the *Application Jobs* app.

## Key Features

You can use this app to:

- Create and customize a job template
- Create multi-step templates
- Change the template parameters
- Transport job templates, if supported: For more information, see [2999966](#).
- Display a list of templates you have read access to
- Display the layer code of the template:
  - *Global*: a template with this layer code is predelivered by SAP and therefore can't be edited or deleted
  - *Private*: a template with this layer code is visible for all users within the *Application Job Templates* and the *Application Jobs* apps, but only the author can edit or delete the template

### Note

With the new restriction type, you can define a full authorization for job templates, such that a system administrator can display, change or delete private templates of other users

- *Shared*: a template with this layer code is visible to all users that have the required authorizations to use the *Application Job Templates* and the *Application Jobs* apps
- *Reference*: a template with this layer code is visible for all users within the *Application Job Templates* and the *Application Jobs* apps, but only the author can edit or delete the template. It can't be scheduled in the *Application Jobs* app. It can be used as a copy pattern to create other templates.
- Delete a job template

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-SRV-APS-APJ.

## Related Information

[Creating an Application Job Template \[page 2366\]](#)

### 6.3.1.5.2.1 Creating an Application Job Template

Find out how to create your own application job templates in the *Application Job Templates* app.

## Context

You can use the *Application Job Templates* app to create a job template for a specific business purpose so that you can schedule concrete jobs by reusing the job template.

## Procedure

1. Open the [Application Job Templates](#) app.
2. Choose [Create](#) to create a new job template.
3. Enter a name and specify your preferred scheduling options.
4. Tick the [Shared Template](#) checkbox if you want other users to be able to view or edit the job template. If you share the template, all users who have access to the [Application Job Templates](#) app, and who have the appropriate authorizations, can make the same changes as you.
5. Select [Maintain Steps](#) and choose [Add](#) to define your job template content. This step can be repeated many times to create a multi-step template.
6. Click [Save Job Template](#). Now, you can view each parameter of your selected templates in the [Parameter Section](#) and edit the values according to your needs.
7. If you are done editing, you can now choose whether to check your parameters, or display, save, or cancel your job template.

### Note

If you want to schedule multistep templates with the [Application Jobs](#) app, you'll need the appropriate authorizations for all steps.

## 6.3.1.5.2 Maintaining Authorizations

Find out which authorizations you need to maintain in order to use the [Application Job Templates](#) app.

## Context

In order to grant access and authorizations to the [Application Job Templates](#) app, create a new business role assigning the business catalog `SAP_CORE_BC_APJ_TPL` to it.

## Procedure

1. Create a new business role assigning the business catalog `SAP_CORE_BC_APJ_TPL` to it. For more information, see [Maintain Business Roles](#) linked below.
2. Next, select [Maintain Restrictions](#) to provide [Write](#), [Read](#), or [No Access](#) to templates using the restriction type `APPLICATION JOB TEMPLATE LAYER`.
3. Go back to [Save](#) your template.

### Note

You will always be able to see your own templates and the templates delivered by your software provider without having to maintain further authorizations.

#### 📘 Note

The possible values for the layer field are *Global*, *Shared*, and *Private*. These are described in [Application Job Templates](#) linked below. The restriction type *Global* is predelivered by SAP and therefore can't be edited or deleted, but you can modify the restriction types *Shared* and *Private* to your needs.

#### 📘 Note

If you want to schedule multistep templates with the [Application Jobs](#) app, you'll need the appropriate authorizations for all steps.

## Related Information

[Maintain Business Users \[page 2444\]](#)

[Maintain Business Roles \(Deprecated\) \[page 2452\]](#)

[Application Job Templates \[page 2365\]](#)

## 6.3.1.5.3 Maintain Job Users

With this app, you can change the owner and the user of application jobs that you've created from a job template. This can be helpful if, for example, a person changes the department within a company or leaves the company, and the corresponding business user has to be deleted.

## Key Features

You can use this app to:

- Change either the job owner or the job user of an application job, or change both
- Delete an application job

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-SRV-APS-APJ.

### 6.3.1.5.3.1 Editing Job Users

Find out how to change the user of your application job, or delete your job.

#### Prerequisite

Before changing the user of a job, ensure that the target user has the correct authorizations to run the job. Otherwise, the job will fail.

To be able to see the app, make sure that the target user is assigned to a business role that has the business catalog SAP\_CORE\_BC\_APJ\_USR\_PC included.

#### Procedure

1. Open the *Maintain Job Users* app.
2. Select the scheduled jobs that you want to work with, and choose one of the following actions:
  - *Change Job Owner* to change the owner of your application job
  - *Change Job User* to change the business user of your application job
  - *Change Job Owner and User* to change both the owner and the user of your application job
  - *Delete* to delete your application job

When clicking on an application job, you'll be navigated to the *Details* page of the *Application Jobs* app.

3. If you've decided to change the owner or the user of your application job, or if you want to change both, a dialog opens. Enter the new job owner and user by selecting them from the value help. Mind that in case of a job user change, you can only select users that have the appropriate start authorization for a job. Job owners don't need this authorization, but they need the restriction type `Create Application Jobs for Other Users` instead. For more information, see **Maintaining Authorizations** of the *Application Jobs* documentation. App-specific authorizations are not checked. You can choose to only display these users by filtering for *Only Valid*.

#### Note

If a job owner is a communication user, the owner can't be changed, since the connection to the corresponding communication arrangement of the type SAP\_COM\_0064 would be broken.

4. You can change multiple application job owners and users at the same time. To do this, select all users you want to change and choose *Change Job Owner and User*. If the job owner differs from the job user, the job owner must have the appropriate authorization given by the restriction type `Create Application Jobs for Other Users` of business catalog SAP\_CORE\_BC\_APJ\_JCE.

5. You can choose to display the change history of your application job by selecting [Change History](#). All changes that were made to the owner and user in the past are shown in the change history. The change history shows the user type, and the new and old user IDs. You can view who changed the user, and when it was changed. The type of change is shown, too.
6. You can delete multiple application jobs at the same time. To do this, select all jobs you want to delete and choose [Delete](#).

You've now maintained your job user.

## Related Information

[Application Jobs \[page 2360\]](#)

[Maintaining Authorizations \[page 2364\]](#)

### 6.3.1.6 Business Configuration

Find out which lifecycle management tasks a business process configuration expert (business role `SAP_BPC_EXPERT`) needs to perform for the administration of business configurations.

#### Context

Business configuration is the customization of business applications. In enterprise software, business configuration refers to a predefined set of configuration options that affect its functionality and behavior. You can maintain custom business configuration content in your `SAP BTP ABAP Environment` to enrich your extensibility scenarios. This includes both functionalities provided by SAP and custom business configuration objects developed using `ABAP Development Tools (ADT)`.

If you're looking for more information on how to implement custom business configuration objects, please refer to [Custom Business Configurations App \[page 2373\]](#).

#### Requirements

The administration of your business configuration has the following requirements:

- The business configuration is client-dependent. After import, it's only available in the client where the import took place. In contrast, development objects are not client-dependent.
- Business configuration content is usually not directly maintained in a productive system, but created in a development system, and then transported to the test system and productive system. For more information on how to set up your system landscape, please refer to the scenarios described in [Setting Up and Working with Your Landscape](#).
- Changes to business configuration content are recorded onto transport requests of the type `Customizing`. They can be released in the source system and imported in any target system. For more

information on how to set up a suitable software component for transport, please refer to [Software Components](#).

## Procedure

You as a business process configuration expert are responsible for the lifecycle management of business configuration content. First, you need to create transport requests of the type `Customizing` that contain corresponding transport tasks. Once a suitable transport task has been assigned, you can proceed with the creation and adjustment of content. When the content is ready, the transport tasks and the transport requests can be released. The changes will be written to the remote repository corresponding to the software component that was used for transport. The content can then be imported into target systems simply by pulling the changes for the software component that was used. This procedure is valid regardless of the specific landscape setup or whether software components of the type `Development` or `Business Configuration` are used.

### Note

It's possible to maintain local business configuration changes which can't be transported to other systems. If no software component of the type `Business Configuration` is cloned in the source system, you can still create a customizing transport request in the [Export Customizing Transports](#) app. This request will have no target. It can be used to record business configuration changes, but its release will have no effect.

The following sections will introduce the applications needed for both the maintenance and lifecycle management of business configuration content.

### 6.3.1.6.1 Business Configuration Change Logs

With this app, business process configuration experts can keep track of content changes in your business configuration tables. Table data change logs can be used to check when data was changed, which kind of data was changed, or by whom. This is made visible in a table.

## Access Information

To access the app, you need to have the following business catalog assigned to your user:  
`SAP_CORE_BC_BCT_LOG_PC` - Business Configuration - Change Logs.

This business catalog is available in the business role template: `SAP_BR_BPC_EXPERT`.

To display the change logs for tables, users must have the authorization for the object `S_TABU_NAM` with `Display Change Documents` for `ACTVT` and the name of the table for `TABLE`.

## Key Features

You can use this app to:

- Display which changes were made to the records of your business configuration tables.
- Display when changes were made to the records of your business configuration tables.
- Display who made changes to the records of your business configurations tables.

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-CUS-TOI-ALO`.

### 6.3.1.6.1.1 Displaying a Change Log

#### Prerequisites

The [Log Changes](#) checkbox has to be enabled in the technical settings for the table:

- For tables delivered by SAP: SAP defines whether change logging is enabled.
- For tables you have created: You need to enable change logging.

#### Note

[Log Changes](#) checkbox can be enabled or disabled in the [Technical Table Settings](#) ADT editor by expanding the entry of your table in the project explorer.

#### Context

Find out how to display the change log of your business configuration tables.

#### Procedure

1. Open the [Business Configuration Change Logs](#) app.
2. Use the search bar to find a configuration table. You can search based on the table name or a specified date range.

3. Select a configuration table to see its change log details.
4. You can filter the change log details based on criteria such as field name, changed date, changed by, and more.

## 6.3.1.6.2 Custom Business Configurations App

Find out how to use the *Custom Business Configurations* app.

### Purpose

The *Custom Business Configurations* app serves as an entry point to the [Business Configuration Maintenance Object \[page 830\]](#) provided by the custom applications or partners. You can use the app to adjust these configuration objects to change and influence the system behavior. For more information, see also [Creating Business Configuration Apps with ABAP RESTful Application Programming Model and Custom Business Configurations App \[page 828\]](#).

### Access Information

The following business catalog needs to be assigned to your user to access the app:

SAP\_CORE\_BC\_BCT\_MBC\_PC.

The business catalog is contained in the business role template: SAP\_BR\_BPC\_EXPERT.

For a business configuration maintenance object to be listed in the *Custom Business Configurations* app, you require the necessary authorizations regarding the service of the business configuration: [Business Configuration Maintenance Object \[page 830\]](#) > **Provide Authorizations for a Business Configuration**.

### Procedure

1. Open the *Custom Business Configurations* app.
2. You'll see a list of all business configurations that can be adapted.
3. Use the *Search* bar to find a certain business configuration or select the one you would like to work on from the list.

#### Note

Depending on your respective role and access rights, you may only be able to edit certain business configurations.

4. You can now adjust the business configuration you have selected. Simply add, update, or delete entries.

## Intent Navigation

You can use the parameter `TechnicalIdentifier` for the semantic object `BusinessConfiguration` with the action `maintain`. Intent navigation can be used to directly navigate to the maintenance view of the business configuration specified with the parameter `TechnicalIdentifier`. The attribute `TechnicalIdentifier` is available as a column in the list report of the *Custom Business Configurations* app.

## Display Change Logs

For a selected business configuration, the action *Display Change Logs* is available in the header section if

- for at least one database table of the RAP BO of the `Business Configuration Maintenance Object Table Logging` is active
- the *Business Configuration Change Logs* app is configured as a valid navigation target for the user for the given device

With this action, you can navigate to the *Business Configuration Change Logs* app.

## Show Documentation

For a selected business configuration, the action *Show Documentation* is available in the header section if a knowledge transfer document exists for the business configuration maintenance object. With this action the content of the knowledge transfer document is displayed. For more information, see [Documentation of Business Configuration Maintenance Objects](#).

To provide context-sensitive in-app help you can use [SAP Companion](#) .

## Grouping

In the table view settings dialog you can group the business configuration maintenance objects by their attribute `Configuration Group`. This allows the list to be structured in a simple hierarchical manner. If this attribute is not maintained for a business configuration maintenance object, it will be part of a generic group with the header *Not assigned*.

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-CUS-TOL-MBC`. If you experience issues updating a specific business configuration, please use the component that is displayed in the error message.

## 6.3.1.6.3 Manage Number Range Intervals

You can use this app to get an overview of number range objects and maintain number range intervals.

### Key Features

You can use this app to:

- Display properties of number range objects
- Display, create, change and delete number range intervals
- Change the number range status of a number range interval
- Display the change history

### Supported Device Type

- Desktop

### Prerequisites

To access the *Manage Number Range Intervals* app, assign the `SAP_CA_BC_IC_LND_NUM_PC` (Number Range Management – Configuration) business catalog to a proper business role and - if required - restrict it to specific number range objects.

To maintain number range intervals and to create transport requests, assign business role `BR_BPC_EXPERT`.

For more information, see:

- [Maintaining Number Range Intervals \[page 2376\]](#)
- [Changing the Number Range Status \[page 2377\]](#)
- [Checking Properties of a Number Range Object \[page 2375\]](#)

### 6.3.1.6.3.1 Checking Properties of a Number Range Object

To check the properties of a number range object, proceed as follows:

1. Start the *Manage Number Range Intervals* app from the *Business Configuration* app group on the Fiori launchpad.
2. Choose a number range object from the list and click the arrow-button on the right-hand side of the entry. The *Properties* section is displayed.

### Note

You can only display properties. You don't have the option of changing them.

The following parameters are displayed:

- Subobject exists: The number range object distinguishes between further subobjects. For more information, see <https://help.sap.com/viewer/5db4c2a406234b6995553939c79da063/7.5.18/en-US/996c7a939f5c488aaebc91665e673d95.html>
- Year-Dependent: This parameter is set to **Yes** if the number range intervals are distinguished according to to-fiscals.
- Subobject as Prefix: This parameter is set to **Yes** if determined numbers consist of the prefix (name of subobject) and the numbers.
- Number of Digits: This parameter determines the length of an interval.
- Rolling: This parameter is set to **No** to prevent the number range object intervals from starting from the upper limit automatically.
- Buffering Type: This parameter shows whether main memory, parallel, or no buffering is supported.
- Number: In case of parallel and main memory, this parameter determines how many numbers are reserved in the buffer for the intervals.
- Warning at Remaining: This parameter displays the percentage of numbers remaining in a number range. When reaching the percentage in number assignment, a warning is given. Assuming an interval from 1 to 1000 and a percentage of 10 (%) is used, a notification will be triggered if number 900 has been reached.

You can maintain number range objects using the ABAP Development Tool (ADT) or APIs. For more information, see

- ADT:  
[Working with Number Range Objects](#)
- API:  
[Maintaining Number Range Objects](#)

## 6.3.1.6.3.2 Maintaining Number Range Intervals

You can structure the defined character set of a number range object in intervals. For more information on intervals, see [Intervals](#).

To maintain a number range interval, proceed as follows:

1. Start the *Manage Number Range Intervals* app from the *Business Configuration* app group on the fiori launchpad.
2. Choose a number range object from the list and click the arrow-button on the right-hand side of the entry. The *Properties* section is displayed.
3. In the *Number Ranges* section, press *Create* to create a new interval. Assign a two-character ID as interval number and a lower and upper limit. If the current number range object supports subtypes or is year-dependent, assign a subtype and a year accordingly.

### Note

Don't set the *External Interval* flag if you want to use an internal number assignment. That means that during number determination within an application program using that interval, the number range

framework automatically assigns a number from the associated number range object to the data record created by the user. Only digits are assigned from internal intervals of the number range object.

For an external number assignment, an application selects a number for a new data record by their own. This can be useful if you want more information to be included in the structure of the number. The number range framework then checks whether the selected number is in an interval of the number range object that is defined as external. However, it does not check whether this number has already been used. Digits and also letters and special characters are assigned from external intervals of a number range object.

4. Press [Save](#) to save the new interval.

If you want to delete an interval mark it by using the radio button and press [Delete](#).

If you want to change an interval, open it by clicking the arrow-button on the right-hand side of the entry. Then press [Edit](#) if you want to change the limits or the external flag.

### 6.3.1.6.3.3 Changing the Number Range Status

The [Number Range Status](#) or [Number Range Level](#) is the last number used by an interval.

#### ⓘ Note

Only change this number in case of inconsistencies.

To change the number range status, proceed as follows:

1. Start the [Manage Number Range Intervals](#) app from the [Business Configuration](#) app group on the Fiori launchpad.
2. Choose a number range object from the list and click the arrow-button on the right-hand side of the entry. The [Properties](#) section is displayed.
3. Choose a number range interval from the list and click the arrow-button on the right-hand side of the entry.
4. Click the [Change Number Range Status](#) button. In the pop-up, enter a new interval level and press [Change Number Range Status](#).

## 6.3.1.6.4 Upload Business Configuration

### Context

You want to maintain Business Configuration data in the cloud system. However, you do not want to manually maintain it, for instance, due to data volume. You may have already maintained your own configuration tables in the backend of your ERP system and now simply want to import the configuration content from a file into the corresponding tables in your system.

## Purpose

The **Upload Business Configuration** app offers an easy way to import the configuration content via “.xlsx” file upload. Such a file may have been generated from a leading ERP system.

## Access Information

The following business catalogue needs to be assigned to your user to access and use the app:

- SAP\_CA\_BC\_IC\_LND\_PC - Business Configuration – Customizing

In addition, you need an open customizing transport, which can be created by a user who has the following business catalogues assigned to them:

- SAP\_CORE\_BC\_BCT\_TRN\_MNG\_PC (Business Configuration - Transport Management) – Assigned to new role SAP\_BCR\_CORE\_BCT\_TRN\_MNG\_PC
- 2. SAP\_CORE\_BC\_BCT\_TRN\_REL\_PC (Business Configuration - Transport Release Management) – Assigned to new role SAP\_BCR\_CORE\_BCT\_TRN\_REL\_PC

All of these business catalogs are contained in the business role template SAP\_BR\_BPC\_EXPERT.

## Prerequisites

**Use case 1:** Export content from an SAP system on-premise, e.g. SAP S/4HANA, and import it using this app.

- The file to be uploaded via the *Upload Business Configuration* app is available in an external format. Here's how you can generate such a file from SAP systems based on the ABAP platform:
  - The configuration content of the maintenance object is exported via transaction *SM30* > *Table View* > *Export (Spreadsheet)* in “.xlsx” file format. If the *Export (Spreadsheet)* menu is not available, you can export the configuration content using *Print*. (*SM30* > *Table View* > *Print* > *Local File* > *Save List in File*).
  - Text tables can be exported via transaction *SE16* > *Spreadsheet*. Keep in mind that the *client (MANDT)* field needs to be removed from the exported spreadsheet.

**Use case 2:** Import content for your custom C tables using this app.

- Create a spreadsheet with table fields as column headers, excluding the field of type “client”.
- To upload the content to objects which are in a customer namespace, you need to have the authority for authorization object *S\_TABU\_NAM*. *TABLE* = <Table Name> *ACTVT* = '02'. Please contact your administrator or IAM expert.

### Note

The *Upload Business Configuration* app only accepts files with the extension “.xlsx”. The uploaded file can contain a maximum of 5000 rows. If there are more rows in the exported file, it needs to be split as per the

5000 row limitation. Apart from explicitly enabled SAP namespace objects, the app only allows uploads for customer namespace tables that have delivery class "C", i.e. "customizing".

#### Note

Business Configurations for tables with field types `STRING` or `XSTRING` are not supported and therefore can't be uploaded.

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-CUS-TOL-BCD.

### 6.3.1.6.4.1 How to Upload Business Configurations

You want to import your configuration content via ".xlsx" file upload.

1. Open the [Upload Business Configuration](#) app.
2. In the [Select Object](#) step, open the value help to select the [Object Name](#) from the allowed list of objects.
3. Select one of the following operations from the drop-down menu:
  - [Upsert \(Update or/and Insert\)](#): Updates existing entries and inserts new entries.
  - [Insert \(Insert Only\)](#): Inserts new entries but doesn't overwrite/update existing entries.
  - [Replace \(Replace Existing Records\)](#): Replaces any existing entries with the new list of entries. Keep in mind that existing entries will be deleted. This action cannot be undone.

Click [Step 2](#) to continue.

4. Select [Download File Template](#) to download the file with a templated example of the object selected. See the [Download File Template](#) section below for details.
5. Upload the adjusted downloaded file which contains the configuration content for the selected object. Once you uploaded it, select [Step 3](#).
6. In the [Select Configuration Data](#) step, the configuration content from the file you uploaded is displayed. You can unselect the rows you don't want upload and click on [Review](#) to continue.
7. Review the information. If everything is correct, select [Deploy](#).
8. Based on the system and object settings, you may get a pop-up with a defaulted transport request or no pop-up appears. You can change the transport request by selecting another one from the list. For more informations see [Transport Request](#) section below.
9. Select your transport request and confirm it with the OK button. The changes will be sent for deployment to be captured in the provided transport request.

## Transport Request

The transfer request pop-up is based on the system and object settings. If a transport request is mandatory for the selected object and the transport is not hidden, then the transport request which is selected by default

is either the *Open Default Customizing/Cross-Client Customizing Request* in the *Export Customizing Transports* app or the task which was last used by the current user. If no pop-up appears, the default request was selected and you'll get a confirmation message.

In case there is no available transport request in the transport dialog, or you want to create a new request, select *Create* in the transport dialog. You'll then be redirected to the *Export Customizing Transports* app in a new tab. Once redirected, you can then create a new request.

After creating a new transport request in the *Export Customizing Transports* app, you can find it in the *Upload Business Configuration* app by using the value help.

## Download File Template

By selecting *Download File Template* a pop-up will appear.

**Choose Required File Template Option**

**i** Files downloaded with all fields can't be used for upload

Download with

Fields allowed for upload

All Fields

Data

Continue Cancel

There are two options to download the file

1. *Fields allowed for upload* downloads the file which can be used for uploading configuration content. You can always adjust the content according to your requirements before uploading it.
2. *All Fields* provides the additional capability to download the file with all the fields of the selected object, including read-only field

If the *Data* option is selected the file will be downloaded with the current configuration. If this option is deselected a blank file will be downloaded.

### 6.3.1.6.5 Export Customizing Transports

With this app, business process configuration experts can manage business configuration changes recorded in requests.

Business configuration changes are recorded in requests, depending on the category to which the customizing objects belong. Unlike ABAP repository objects, customizing objects recorded in a request are accessible to other business users.

## Access Information

The following business catalogs are available to manage the customizing requests:

- Display/Edit/Delete: `SAP_CORE_BC_BCT_TRN_MNG_PC` - Business Configuration - Transport Management
- Display/Edit/Delete/Release: `SAP_CORE_BC_BCT_TRN_REL_PC` - Business Configuration - Transport Release Management

These business catalogs are contained in the business role template: `SAP_BR_BPC_EXPERT`.

## Key Features

You can use this app to:

- Display a list of customizing requests
- Create new customizing transport requests
- Display the customizing tasks, objects, attributes, notes and logs of a customizing transport request
- Display the objects recorded in a customizing task
- Display the table keys recorded for an object
- Add notes to a customizing request
- Check customizing transport requests
- Release customizing transport requests
- Assign a transport request to your user
- Create tasks for other users
- Change the transport category
- Take over tasks and transports from other users and assign them to your user
- Check the consistency of all open requests

## Default Customizing Request

Since configuration changes recorded in requests of the type `Customizing Request` are not lockable, it might happen that several business users record their configuration changes in different requests.

Recording the configuration changes in different requests might create dependencies between these requests, however to avoid such dependencies, a new transport category is introduced.

Any new request created from this app is categorized as *Default*: In a client, there can be only one open default request of the type `Customizing Request`.

Business users can record their configuration changes to this default request to avoid any dependencies.

If you need to perform an emergency fix, record the configuration changes in a request which is not categorized as *Default*. Default requests are listed in the column *Transport Category*.

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-CUS-TOL-CTO.

### 6.3.1.6.5.1 Working in the Export Customizing Transports App

Find out how to create, release, or merge customizing requests using the *Export Customizing Transports* app.

- If a software component of the type `Business Configuration` is available in the system, the created request will target this software component. If no such software component is available, the request will be created without any target.

#### Changing Client-Specific Business Configurations

The client settings determine whether changes to business configurations are allowed or recorded automatically in a request.

If the automatic recording for the client is activated, you have to select a request number for the recording whenever you save changed client-specific configurations. If there is no request number selected, the configurations can't be saved.

If the automatic recording for the client is not allowed, you can save changed client-specific configurations without selecting a request number.

#### Display Request

1. Navigate to a request's object page to display its tasks, objects, attributes, notes and logs.
2. Select a customizing task to display the objects recorded in it.
3. Select an object to display the table keys recorded in it.

#### Create Request

1. Open the *Export Customizing Transports* app. A list of customizing requests is displayed, with the latest request shown first at the top.
2. Use the search bar to filter for specific requests based on search criteria like the *Request No*, the *Owner*, or the *Status*.
3. Click *Create* to create a new request.

##### Note

Note that there can only be one default customizing request.

4. (Optional) Add business configurations to this request by, for instance, using the *Upload Business Configurations* app or the *Manage Number Range Intervals* app.

## Check All

1. Open the *Export Customizing Transports* app. A list of customizing requests is displayed, with the latest request shown first at the top.
2. You may put a filter on *Status* for modifiable and checking status. Additionally you can sort the transports in ascending order to see the current status of those transports sequentially.
3. Select *Check All > Start* to trigger consistency check for all open transports.
4. To check remaining open transports for which the consistency checks are yet to be performed, select *Check All > Show Progress*.

### Note

Consistency check gets triggered in the background and the UI shows the latest transport request status as soon as *Check All* is triggered. The UI gets refreshed everytime after certain interval showing the latest status. The transport with status *Checking* shows the request currently being processed.

As soon as the consistency check is complete, a momentarily message gets displayed at the bottom.

If the *Check all* is already running, you can't trigger another and it will give you an error message

## Release Request

1. Release any tasks belonging to your transport request. A request can't be released until all its tasks have been released.
2. Check the consistency of your request by triggering a release simulation: Select the request and click *Release > Check*.
3. You can also release your request directly without triggering a simulation: Select the request and click *Release > Execute*.
4. To refresh the status of a released or simulated request: Select the request with the status *Checking* or *Release Started* and click *Refresh*.

Request No	Description	Type	Owner	Status	Transport Category
<input checked="" type="radio"/> ETOK901795	Business Configuration Project Implementation - Phase 1	Customizing Request	Example Configuration Expert - Business Process	 <i>Checking</i>	Default

Request No	Description	Type	Owner	Status	Transport Category
<input checked="" type="radio"/> ETOK901795	Business Configuration Project Implementation - Phase 1	Customizing Request	Example Configuration Expert - Business Process	 <i>Release Started</i>	Default

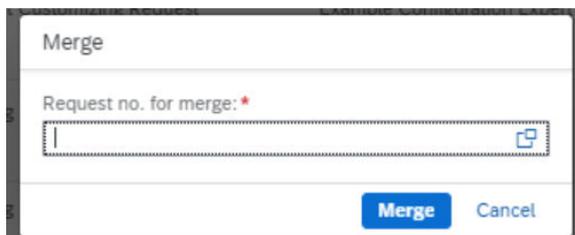

5. View the results of the simulation or direct release in the *Logs* tab.

## Merge Request

If there are dependencies between different requests or several business users have recorded their configuration changes in different requests, you can choose to merge these different requests into one.

1. Select the request you want to merge.
2. Select *Merge*.

3. In the selection dialog, enter the target request number to which the selected request should be merged, and click [Merge](#).

#### ⓘ Note

The configuration changes recorded in the request you selected to merge are copied to the target request. After merging, the previously selected request will be deleted.

## Create Copy

It can happen that for technical reasons, it's necessary for you to create a copy of an exported request. This can be the case if, for example, your exported request containing the business configurations didn't synchronize to the Git Repository. In order to synchronize these business configurations with the Git Repository again, a copy is needed.

1. Select the request you want to copy.
2. Click on [Create Copy](#).

## Repository Id

You can export the business configuration recorded in a request to a specific software component by assigning the [Repository Id](#) when creating a request.

1. Select [Create](#) to create a new request.
2. Using the value help, check the allowed repository ids which can be assigned to the request.
3. Select the suitable repository id and save the changes.

## 6.3.1.6.6 Maintain Customizing Translations

The *Maintain Customizing Translations* app provides an easy way to translate customizing extensions into other languages.

### Context

You've built a customizing extension and would now like to translate it into other languages. The *Maintain Customizing Translations* app allows you to select your text sources and generate an XLIFF (1.2) file containing the translatable texts as well as useful notes on them. XLIFF (XML Localization Interchange File Format) is a standard used in localization. The XLIFF file can then be forwarded to a dedicated translator or translation agency. Once the XLIFF file has been translated, you can use the *Maintain Customizing Translations* app to upload it and publish the translated texts into your system.

### Key Features

You can use this app to:

- generate an XLIFF file of the texts that need to be translated.
- publish the translated texts to the system.

#### Note

If you want to have your texts translated by SAP, you can use the [SAP Translation Hub](#). For more information, see

[SAP Translation Hub](#).

### Supported Device Types

- Desktop

### Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-DOC-TTL-MTR`.

## 6.3.1.6.6.1 Create a Translation Project

### Context

You want to translate your customizing extension. Before you can select your text sources and target languages, you need to create a translation project.

#### Note

Please assign the business catalog `SAP_CORE_BC_BCT_TRN_MNG_PC` to ensure that changes can be recorded on transport requests.

### Procedure

1. Open the *Maintain Customizing Translations* app.
2. Click + (Create) to create a new translation project. Choose a project type from the dropdown.
3. Fill in an identifier for your project, a name, and a description.
4. Click *Create* at the bottom right of your screen.
5. You now need to add your translation project to a transport. You can create a customizing transport request by using the *Export Customizing Transports* app. For more information, see [Export Customizing Transports \[page 2380\]](#).

### Results

Your project has now been created and added to the overview list.

### Related Information

[Select Your Text Sources \[page 2387\]](#)

## 6.3.1.6.2 Select Your Text Sources

### Context

Select the text sources that you want to have translated.

### Procedure

1. In the [Maintain Customizing Translations](#) app, open the project you want to add text sources to.
2. Scroll down to [Text Sources](#) and click [Add](#).
3. Here you can select which text source types to add. The following text source types are supported:
  - UI runtime adaptations

#### Note

Mind that only the translation of those UI runtime adaptations which have been recorded on a Customizing transport request are supported. UI runtime adaptations which have not been recorded at all or have been recorded on a workbench request will not be considered

For more information on how to work with UI runtime adaptations, see [Adapting SAP Fiori UIs at Runtime - Key User Adaptation](#)

- SAP Fiori launchpad Pages
- SAP Fiori launchpad Spaces

#### Note

For more information on how to manage launchpad pages and spaces, see [Manage Launchpad Pages](#) and [Manage Launchpad Spaces](#).

- Text tables

#### Note

A database table needs to fulfill the following requirements to be considered a text table by the app:

- The delivery class of the text table has to be C
- There must be exactly one language key field
- Every character-like, non key field with a length greater than one will be treated as a text attribute
- The translation of text tables that contain key fields of type p (packed number), i (integer) or x (byte field) is not supported. That includes any kind of UUID and raw types, such as SYSUUID\_X16.

4. Select *Add* to open the *Add Text Source* dialog which displays all text sources that can be added to the translation project. By filtering the type and name, you can choose the text sources you want to add. Select *Add* to add the text sources you selected to your translation project.

## Related Information

[Select Your Source and Target Language \[page 2388\]](#)

### 6.3.1.6.6.3 Select Your Source and Target Language

## Context

Select your source language as well as the languages you want to translate your texts into.

## Procedure

1. In the *Maintain Customizing Translations* app, open the project for which you want to create a translation from a source language to a target language. You can choose to select either a single language or more than one language.
2. Scroll down to *Translations* and click *Create*.
3. Select a *Source Language* and *Target Language* from the dropdown menus and confirm with *Create*.

#### Note

You can select from all of the languages that are installed in the system. For a given text source, it's only possible to maintain translations for languages other than the original language.

Note that deleting a previously created translation entry for a given source and target language pair will only delete the corresponding entry in the translation project. Already published texts for the target language of the translation will not be deleted from the system.

4. A new entry has now been added to the list.
5. Repeat these steps for all source and target languages.

## 6.3.1.6.4 Generate and Download the XLIFF File

### Context

You can generate an XLIFF file for your source and target language(s) that you can download and send to your dedicated translator or translation agency.

### Procedure

1. In the *Maintain Customizing Translations* app, open the project you want to have translated and scroll down to *Translations*.
2. Select the entry for the source and target language for which you want to generate the XLIFF file.
3. Navigate to *Download*. Here you can select whether the XLIFF file should contain all texts (*All Texts*) or only those texts that were changed since you last published a translated XLIFF file in these languages (*Changed Texts*). If this is the first time you are generating an XLIFF file for the project for the given source and target language, choose *All Texts*.

The XLIFF file will now be downloaded to your computer. You can send it to your dedicated translator or translation agency to be translated.

### Related Information

[Upload and Publish the Translated XLIFF File to the System \[page 2390\]](#)

## 6.3.1.6.6.5 Upload and Publish the Translated XLIFF File to the System

### Context

Your texts have been translated and a new XLIFF file has been sent back to you. You can now upload and publish the translated texts into the system. Here's how:

### Procedure

1. In the *Maintain Customizing Translations* app, open your project and scroll down to *Translations*.
2. Select the entry for the source and target language for which you want to upload and publish the translated XLIFF file.
3. Click *Upload*.
4. Search for the translated file and confirm with *Upload*.
5. Now the translations have been uploaded to the system. They still need to be published, however. Select the entry and click *Publish*.
6. Select a transport to which you want to add the corresponding language (LANG) transport entries and click *Select*.  
Your translations have now been published.

## 6.3.1.7 Communication Management

The communication management apps allow you to integrate your system or solution with other systems to enable data exchange.

### Prerequisites

- Predefined communication scenarios are available for different use cases, for example the integration for employee data. Decide which scenario you are going to use to create a communication arrangement.

### Process Overview

The communication management apps allow you to establish secure communication between your solution and other systems. The best practice to organize efficient data exchange is to proceed as follows:

1. Create communication user for inbound communication according to your needs using the [Maintain Communication Users](#) app.
2. Create communication system using the [Communication Systems](#) app that represents the system you want to communicate with. If the selected scenario contains inbound services, you select the user for inbound communication that you have created earlier.
3. Create a communication arrangement using the [Communication Arrangements](#) app. You select the communication system that you have created earlier. The information about the user for inbound communication will be populated automatically. If several users for inbound communication exist for the system, you can select the appropriate one. Otherwise the first user in the list will be selected automatically. If the selected scenario contains outbound services, you have to enter the outbound user information manually.
4. Select [Save](#) to activate the communication arrangement.

#### Note

A communication scenario is a design-time description of how two communication partners communicate with each other. It consists of inbound and/or outbound services as well as supported authentication methods. It provides technical information, such as the used inbound and outbound services and their service type, for example OData or SOAP, and the number of allowed communication arrangement instances. If the scenario exposes inbound services, it specifies the authorizations that are required to execute the services. The following types of communication scenarios are available:

- [Managed by SAP](#), where SAP provides a ready-to-use communication scenario and you create and maintain a communication arrangement.
- [Managed by Customer](#), where you develop a communication scenario and create and maintain a communication arrangement.

## Related Information

[Maintain Communication Users \[page 2391\]](#)

[Communication Systems \[page 2397\]](#)

[IAM Information System \[page 2506\]](#)

### 6.3.1.7.1 Maintain Communication Users

You can use this app to create and edit communication users. Communication users are used by solutions to authenticate themselves to be able to post data.

With this app you can manage communication users for different integration scenarios with other solutions. A communication user enables the integration with other solutions. To be able to post data, the solutions have to authenticate themselves with the user and password you create here. The communication users are assigned to the communication system you want to use.

## Key Features

You can use this app to:

- Create a user
- Edit a user
- Lock or unlock a user
- Delete a user
- Display communication systems that use the selected communication user
- Display communication arrangements for the systems that use the selected communication user
- Download a list of all communication users to a spreadsheet

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-COM`.

## Related Information

[Communication Systems \[page 2397\]](#)

[How to Create Communication Users \[page 2393\]](#)

## 6.3.1.7.1.1 How to Create Communication Users

### Context

To create a new communication user, perform the following steps:

### Procedure

1. On the initial screen select *New*.
2. Enter a valid user name and description.
3. Either provide a password (basic authentication) or upload certificates for certificate-based authentication.

#### Note

We recommend that you use certificate-based authentication.

1. Configure password-based authentication

#### Note

We recommend that you use the *Propose Password* button.

#### Note

Passwords for communication users need to comply with the following requirements: the password length must be at least 20 characters, the password must contain at least one special character. The user will be locked after three unsuccessful login attempts.

2. Configure certificate-based authentication by uploading a X.509 client certificate.  
The customer system must use a client certificate signed by an appropriate certification authority (CA). A list of all root CAs approved by SAP Global Security is available in SAP Note [2801396](#) (SAP Global Trust List).
4. Select *Create* to save the user.

You can now assign the created user to a communication system. Use the *Communication Systems* app for this purpose.

### Related Information

[Maintain Communication Users \[page 2391\]](#)

[Communication Systems \[page 2397\]](#)

## 6.3.1.7.2 Display Communication Scenarios

You can use this app to get an overview of available communication scenarios.

With this app you can display communication scenarios used for integrations, and the scenario status.

### Key Features

You can use this app to:

- Display all available communication scenarios
- Display scenario details and properties
- Display supported inbound authentication methods and inbound services used in a communication scenario
- Display supported outbound authentication methods, certificates, and outbound services used in a communication scenario
- Download certificates for specific purposes
- Display communication arrangements in which a communication scenario is used
- Create a new communication arrangement based on a communication scenario
- Display scope items: check which scope items the communication scenarios depend on. Communication scenarios that do not depend on any scope items are always visible in the system. For these communication scenarios, *Scope Items (0)* is displayed on the relevant tab and the following message appears in the table: *The communication scenario is not scope-dependent.*
- Display component: check under which component you can create an incident if required.

### Supported Device Types

- Desktop
- Tablet

### Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-SRV-APS-COM.

## 6.3.1.7.3 Communication Arrangements

With this app you can create and edit communication arrangements that your company has set up with a communication partner. The system provides communication scenarios for inbound and outbound communication that you can use to create communication arrangements. Inbound communication defines

how business documents are received from a communication partner, whereas outbound communication defines how business documents are sent to a communication partner. The communication scenario determines the authorizations, inbound and outbound services and the supported authentications methods, that are required for the communication.

## Key Features

You can use this app to:

- Display all existing communication arrangements
- Display detailed information for the selected communication arrangement
- Create new communication arrangements
- Maintain general information
- Select the required communication system. The user information and authentication method are filled in automatically after you have selected a communication system.
- Delete communication arrangements that you have created earlier

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-COM`.

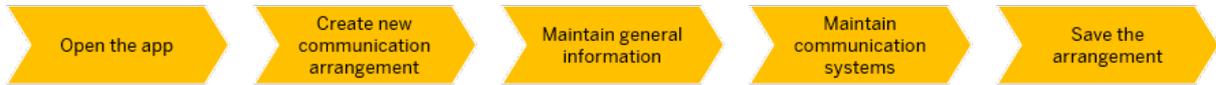

### 6.3.1.7.3.1 How to Create a Communication Arrangement

#### Prerequisites

- You have already created a communication system with inbound and outbound users.
- You have already created a communication user with a supported authentication type that is defined in the selected communication scenario.

## Context

### Process Steps

To create a communication arrangement, proceed as follows:

### Procedure

1. Open the *Communication Arrangements* app from the SAP Fiori Launchpad. Already existing communication arrangements are listed on the initial screen.
2. Select *New*. In the *New Communication Arrangement* window, select a communication scenario and define the arrangement name. Select *Create*.
3. The new *Communication Arrangements* screen is now open. In the *Communication System* field under *Common Data*, select a communication system that you want your system to connect to. Alternatively, you can click *New* to create a new communication system.
4. Depending on the underlying communication scenario, maintain the *Additional Properties*.
5. If the communication scenario provides inbound services, you have to select the desired communication user and authentication method from the assigned communication system. The defined communication user then has the authorization to call these services. In the *Inbound Services* section, the URLs to the service endpoints are displayed. Depending on the underlying scenario, maintain the required inbound parameters.  
**Note:** Always use the API hostname of your tenant including the "-api" suffix. Don't use the UI hostname without the "-api".
6. If the communication scenario provides outbound services, you have to select the desired outbound user and authentication method from the assigned communication system. In the *Outbound Services* section, the URL path and port need to be defined. Depending on the underlying scenario, maintain the required outbound parameters and job execution details.
7. Save the arrangement.

### Related Information

[Maintain Communication Users \[page 2391\]](#)

[Communication Systems \[page 2397\]](#)

## 6.3.1.7.4 Communication Systems

You can use this app to create communication systems. Communication systems are created to enable the communication among different systems.

With this app you can create new communication systems that you can later use to establish communication arrangements. To enable communication between different systems you have to register these systems in the [Communication Systems](#) app. The communication system represents the communication partner within a communication. For inbound communication, this is the system that calls services provided by your system. For outbound communication, this is the system that provides services called by your system.

### Key Features

You can use this app to:

- Create communication systems
- Display detailed information about the already existing communication systems
- Delete communication systems

### Supported Device Types

- Desktop
- Tablet

### Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-SRV-APS-COM.

### Related Information

[Maintain Communication Users \[page 2391\]](#)

## 6.3.1.7.4.1 How to Create Communication Systems

### Context

To create a communication system perform the following steps:

### Procedure

1. On the initial screen of the *Communication Systems* app, select *New*.
2. In the *New Communication System* dialog define an ID and a name of the new system.
3. Fill in the required fields under:
  - *General Data*  
Enter system ID and system name.
  - *Contact Information*  
Enter name, email or phone number of a contact person.
  - *Technical Data*  
*General*  
If you want your communication system to be used for a communication arrangement based on a communication scenario that only contains inbound services, we recommend that you select the *Inbound Only* checkbox. If this checkbox is selected, the input fields that are only required for outbound communication disappear.  
If your communication system is intended for outbound communication, host, port, user and authentication method are used as specified in the destination service.
  - *Destination Service* (Only for Outbound Communication)  
Because SAP BTP for the ABAP environment uses destination services of SAP BTP for outbound communication, you need to enter the name of the required destination service. For more information, see [Set Up the Destination Service](#). You also need to select the instance the destination service is based on. For more information, see [Creating the Service Instance for the ABAP Environment](#).

#### Note

A predefined instance is selected by default. If you want to add your own instance, deselect this instance.

- *Cloud Connector* switch  
Indicates that SAP Cloud Platform Cloud Connector is used for communication with this system.  
*SSC Location ID*: Enter the SAP Cloud Platform Cloud Connector ID  
If your scenario is uses RFC modules, and SAP Cloud Platform Cloud Connector is not activated, the system uses WebSocket RFC. Therefore the remote system needs to support WebSocket RFC and you need to specify the client in the *RFC Settings* section.
- *RFC Settings*  
Define additional settings needed for RFC communication.

- [OAuth 2.0 Settings](#)  
Define additional settings if oAuth 2.0 is used for outbound communication.

#### Note

The propagation of technical users from the cloud application towards on-premise systems can be enabled in the [Communication Systems](#) app. To propagate the technical user, you have to select the [Cloud Conn. Technical User Propagation](#) checkbox in the [OAuth 2.0 Settings](#) area (the checkbox is only active if the [Cloud Connector](#) switch is on). This is similar to principal propagation, but in this case, a technical user is propagated instead of a business user.

- [OAuth 2.0 Identity Provider](#) switch  
Before you can authenticate and get an access token to access resources using an OAuth 2.0 client, you have to configure a trusted relationship to the required [SAML Identity Provider](#) (token issuer). Upload the signing certificate of the trusted provider and define the provider name. Define the [User ID Mapping Mode](#) if you don't use e-mail addresses, but either logon name or global user ID.  
The [User ID Mapping Mode](#) is required when the [SAML Identity Provider](#) is creating SAML assertions with the [NameIdentifierFormat unspecified](#).  
This setting is ignored when the SAML assertion is using the [NameIdentifierFormat emailAddress](#). Please note that the required authorization for calling the service is granted to the business user and not to the technical user. When you set up a communication arrangement using oAuth, you can click [OAuth 2.0 Details](#), select the scope and click [Granted by Business Catalogs](#) to find the necessary details. This way you can retrieve the business catalogs that are required for calling the service.
- [SAML Bearer Assertion Provider](#)  
Before you can authenticate using SAML2 Bearer assertions transmitted via the authorization header, you have to configure a trusted relationship to the required [SAML Identity Provider](#) (token issuer). Upload the signing certificate of the trusted provider and define the provider name. Define the required [User ID Mapping Mode](#) if it is unspecified and you don't use e-mail addresses, but either logon name or global user ID.  
The [User ID Mapping Mode](#) is required when the [SAML Identity Provider](#) is creating SAML assertions with the [NameIdentifierFormat unspecified](#).  
This setting is ignored when the SAML assertion is using the [NameIdentifierFormat emailAddress](#).
- [OpenID Connect](#) switch  
Before you can authenticate using OpenID Connect, you have to configure a trusted [OpenID Connect Provider](#).  
Define the required [User ID Mapping Mode](#), the [OIDC Token Issuer](#) and [Client ID](#). Click [Import Metadata](#). This is necessary to ensure that the configuration is validated and complete.  
If the automatic configuration fails, you can configure the OpenID Connect settings manually. For more information, see [Manual Configuration - OpenID Connect \(OIDC\) Provider](#) in the [Related Information](#) section.

#### Note

You can select the [User Mapping Claim](#) to define the authorization attributes that are used by the identity provider. The default selection is [sub](#).

4. Add technical users for inbound communication. You can either select a user from the list or create a new user. If you decide to create a new user, you will be redirected to the [Maintain Communication User](#) app.

### Note

Inbound users are communication users provided by your system and are used by the communication system to call the inbound services.

5. Save the changes.

You can now establish a communication arrangement with the created system. Use the *Communication Arrangements* app for this purpose.

## Related Information

[Communication Systems \[page 2397\]](#)

[How to Create Communication Users \[page 2393\]](#)

[Manual Configuration - OpenID Connect \(OIDC\) Provider \[page 2401\]](#)

## 6.3.1.7.4.2 Authentication Methods for Outbound Users

You can define how your solution authenticates itself when it sends business documents to the external system. For security reasons, we recommend the use of certificate-based authentication.

You can choose between the following authentication methods:

- User name and password
- SSL Client Certificate
- OAuth 1.0
- OAuth 2.0

You can choose between the following authentication methods:

- Basic  
If you use this method, you need to enter a client secret.
- mTLS  
If you use this method, you need to select a client certificate.
- JWT  
You can use JWT (JSON Web Tokens) to authenticate an OAuth client at the token endpoint of an OAuth authorization server (instead of using a client ID and a client secret).  
If you use this method, you need to download the corresponding certificate to your local device.
- None

If you want to use a SSL Client Certificate, you can either use the default certificate of your solution or a client certificate you have defined in the *Maintain Client Certificates* app.

## Related Information

*Maintain Client Certificates*

### 6.3.1.7.4.3 Enabling Public OAuth Clients (PKCE) for Inbound Communication Scenarios

#### Context

Communication scenarios that support OAuth 2.0 as authentication method for inbound communication can now be consumed by public OAuth clients using PKCE (Proof Key for Code Exchange). This allows desktop applications (acting as OAuth Clients) to consume OAuth-protected OData services with the identity of a business user. The business user will be prompted for providing consent to this action once (a web browser is required for this).

To enable consumption by public OAuth clients using PKCE, proceed as follows:

#### Procedure

1. In the *Communication Systems* app, enter the *Client Redirect URI* under Inbound OAuth 2.0 Client Settings. Thereby you define the URL to which the client will redirect the browser after authorization has been granted by the user.
2. Under *Users for Inbound Communication*, click Add.
3. In the *New User for Inbound Communication* pop-up that appears, select *OAuth 2.0* in the *Authentication Method* dropdown list, enter the *OAuth 2.0 Client ID* and click *OK*.

#### Related Information

[How to Create a Communication Arrangement \[page 2395\]](#)

### 6.3.1.7.4.4 Manual Configuration - OpenID Connect (OIDC) Provider

When you have made the required settings under *OpenID Connect (OIDC) Provider – Basic Configuration* in the *Edit* mode of the communication system, the system attempts to automatically configure OpenID Connect for the provider you have defined. If the provider does not convey the required information, you receive an error message. In this case, you can use manual configuration as a fallback. Activate the *Manual Configuration* switch if this is required.

As a first step, you can download web keys from the provider. Should this fail too, you can directly enter the web keys as defined in your OpenID Connect specification.

## Related Information

### 6.3.1.7.5 Maintain Extensions on SAP BTP

You can use this app to create *SAP Business Technology Platform (SAP BTP)* extensions to build extension applications.

With this app you can create SAP BTP extensions for your SAP S/4HANA Cloud system. These automatically connect the two systems and enable you to build extension applications for SAP S/4HANA Cloud on SAP BTP.

## Key Features

You can use this app to:

- Create new SAP BTP extensions
- Temporarily disable SAP BTP extensions

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-COM`.

## Related Links

- [Trigger the Registration in the SAP S/4HANA Cloud Tenant](#)

## 6.3.1.7.6 Display Inbound Services

With this app you can display all available inbound services defined by you or delivered by SAP. You can also display further information about the services, such as if and where a deprecated inbound service is used and a list of its successors. You can also check whether the service is deprecated system-wide or only in a scenario.

### Key Features

You can use this app to:

- Display documentation for the service
- Display authorization objects (this is only relevant in the custom communication scenarios environment)
- Display successors
- Display all communication scenarios that use this service

### Supported Device Types

- Desktop
- Tablet

### Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-COM`.

## 6.3.1.7.7 Display Outbound Services

With this app you can display all available outbound services defined by you or delivered by SAP. You can also display further information about the services, such as if and where a deprecated outbound service is used and a list of its successors. You can also check whether the service is deprecated system-wide or only in a scenario.

### Key Features

You can use this app to:

- Display documentation for the service
- Display successors

- Display all communication scenarios that use this service

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-COM`.

### 6.3.1.7.8 Business Catalogs for Communication Management

You assign business catalogs to business roles that are assigned to business users. Business catalogs contain authorizations that define what a business user with a certain business role is allowed to do.

Business Catalogs for Communication Management Apps

Business Role Catalog	Authorizations	Restrictions
<i>Communication Management</i> SAP_CORE_BC_COM	All authorizations for the COM apps	None

### 6.3.1.7.9 Glossary for Communication Management

Overview of terminology used for communication management

Terminology Overview

Term	Description
Communication arrangement	A communication arrangement describes a communication scenario with a remote system during configuration time. It provides the necessary meta-data for service configuration.

Term	Description
Communication system	A communication system represents the communication partner with all technical information that is required for communication, that is hostname, identity, user information, certificates, etc.
Communication user	A communication user is a special type of technical users that is assigned to a communication system. You create a communication user for particular communication scenarios.
Communication scenario	A communication scenario defines the communication between external systems and your own SAP cloud system. It bundles inbound and outbound services and additional properties that are required for configuration settings.

### 6.3.1.7.10 Display Connectivity Trace

With this app you can analyze inbound connectivity issues, such as failed SSL handshakes, malformed HTTP requests or failed log-in.

#### Key Features

You can use this app to:

- Display connectivity trace details
- Cross-navigate to the [Maintain Business Users](#) app and the [Maintain Communication Users](#) app.
- Maintain trace criteria

#### Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-COM`.

### 6.3.1.7.10.1 How to Create a Trace

#### Context

In order to start a trace, you need to define the trace criteria.

#### Procedure

1. Select the *Display Connectivity Trace* tile on the SAP Fiori Launchpad to open the app. On the initial screen, click *Define Trace Criteria* in the top-right corner.
2. Click *Create*.
3. Enter a description if required. We recommend using a description that is easily identifiable in the filter.
4. Change the validity if required. The default setting is *10 Minutes*. Unlike a log, a trace is only available for a limited time frame.
5. Change the *Request Method* if required. The default setting is *All*.
6. Click *Save*.

#### Results

The trace is now activated for the defined criteria. You can filter for it in the *Trace Criterion* dropdown list. Please note that there might be a time delay until the activation takes effect because all the affected components need to be notified.

### 6.3.1.7.11 Monitor bgRFC Queues

With this app you can monitor the bgRFC (background RFC) queues together with the associated units and inbound destinations. As well as displaying queues and units that belong to a destination, the app provides you with functions that let you intervene in their processing, such as *Stop*, *Start*, or *Delete*.

## Key Features

You can use this app to:

- Stop and start destinations, queues, units
- Delete queues and units if they are no longer needed
- Check for errors
- Display the first function module for each unit
- Navigate to Message Monitoring to view more details if required

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-COM`.

## Related Information

### 6.3.1.7.11.1 Monitor bgRFC Queues: Further Information

Please note the following when using the *Monitor bgRFC Queues* app.

- Deleting a queue or unit can be risky. If you delete a queue, the included units are automatically removed. This can cause issues in the processing because dependencies between units and queues might exist.
- Queues and units can be stopped from the monitor. This function is only intended for analysis and not for regular operations, because it has consequences for runtime. If a queue is to be stopped, this also refers to the top unit that uses this queue. As soon as the unit is restarted, the queue is released again.
- Transactional (*T-Type*) units can be displayed to check whether any errors occurred. They are listed below the *BGPF* (Background Processing Framework) *Inbound Destination*. To call them up, you need to click the *Standard* list entry of the relevant queue.

## 6.3.1.8 Custom Code Migration

### Purpose

The Custom Code Migration app enables you to create three different kinds of projects:

1. SAP S/4HANA Migration Project:  
Analyze custom code that shall be migrated from an existing product like SAP Business Suite to a new product such as SAP S/4HANA 2020. To evaluate the custom objects to be adapted, it performs the SAP S/4HANA custom code checks.
2. SAP BTP Analysis Project:  
Analyze custom code for readiness to run in SAP BTP, ABAP environment.
3. Custom Code Analysis Project:  
Analyze custom code with arbitrary ATC check variants.

In addition, this app supports you with identifying unused custom code based on your collected usage data. This enables you to remove unused custom code during a system conversion to SAP S/4HANA.

### Key Features

Analysis of custom code:

- Graphical representation of custom code analysis results
- Results can be filtered by various categories, such as quick fix availability, scope and usage data

Scoping:

- Based on usage data, you can define which ABAP custom code needs to be migrated to SAP S/4HANA
- This app creates a deletion transport in order to delete unused ABAP source code during the system conversion to SAP S/4HANA

### Access Information

For more information how to provide access to users and how to implement this app, see [Enable Usage of the Custom Code Migration App \[page 2409\]](#)

### Component for Customer Incidents

BC-DWB-CEX

## Supported Device Types

- Desktop

### 6.3.1.8.1 Enable Usage of the Custom Code Migration App

#### Prerequisites

- Your company has a global account for *SAP Business Technology Platform*.
- You need permission to access the *Cloud Connector*.

#### Procedure

##### Maintain Business Role

To enable business users to access the Custom Code Migration app, create the Project Manager - IT business role and assign one or more business user(s) to it. To do this, proceed as follows:

1. From the SAP Fiori launchpad of your ABAP environment, open the *Maintain Business Role* tile.
2. Create the Project Manager - IT business role using the SAP\_BR\_IT\_PROJECT\_MANAGER template. For more information see, [How to Create a Business Role from a Template](#).
3. Maintain the restrictions of the business role.

##### Note

To enable write access for this business role, ensure that it is set to *Unrestricted*.

4. Open the new business role and add the *Assigned Business Users*.
5. *Save* the changes.

##### Maintain Communication Arrangement

To enable communication from your ABAP environment to your on-premise systems using Remote Function Calls (RFC), you need to create the communication arrangement SAP Custom Code Migration Integration (SAP\_COM\_0464) in your ABAP environment.

To set up the connection from the ABAP system in the ABAP environment to your on-premise system, proceed as follows:

1. Log on to the *SAP Fiori launchpad* of your ABAP environment.
2. In the *Communication Management* section, select the *Communication Arrangement* tile.
3. Create a new communication arrangement using the SAP\_COM\_0464 scenario.
4. If not yet available or defined, create a communication system for the communication arrangement to define an endpoint for your checked system.

1. For the *Communication System*, choose *New*.
  2. In the *New Communication System* dialog, enter the *System ID* and *System Name* of the checked system.
  3. Choose *Create*.
  4. In the *Technical Data* tab under *General*, enter the virtual host as specified in your *Cloud Connector* as *Host Name*. The field *Port* has already been filled in automatically with the default *443*.
  5. Switch on the slider for *Cloud Connector*.
  6. Filling in the field *SCC Location ID* is optional.
  7. Under *RFC Settings*, fill in the fields *Client*, *Instance Number* and *Target Host* as specified as virtual host in your *Cloud Connector*.
  8. Under *User for Outbound Communication*, choose *+* to assign the RFC user you created in the checked system to the communication system.
  9. Choose *Create* and then *Save* to save the communication system and to be navigated back to the Communication Arrangement creation page.
  10. Confirm with *Save*.
5. Under *Additional Properties*, fill out the fields *Object Provider* and *System Group*. An object provider defines the RFC connection to be used for analysis in a remote SAP system and must be assigned to a system group. This is the name you then select as your *Object Provider to Remote System* for your custom code migration project in the Custom Code Migration app.  
A system group subsumes multiple SAP systems (typically, the productive system, the test system(s), and the development system(s)), which all represent a part of a system landscape of one and the same SAP release.
  6. Under **▶ Outbound Services ▶ Retrieve Custom Code ▶**, ensure that the *Service Status* is set to *Active*.
  7. Choose *Save* to save the communication arrangement. A message should now pop up at the bottom of the screen informing you that the activation was successful.

You can now select the communication arrangement in the *Object Provider to Remote System* field in the Custom Code Migration app to establish the connection to your on-premise system.

## On-Premise System: Install Remote Stubs

To analyze your custom code in your on-premise system using the Custom Code Migration app, see SAP Note [2599695](#)  Custom Code Migration Fiori App: Remote Stubs for the Checked System.

## Related Information

[SAP Note 2436688](#) 

[Custom Code Migration Guide for SAP S/4HANA](#)

[How to check your custom ABAP code for SAP BTP, ABAP environment](#) 

## 6.3.1.8.1.1 Configuration

You can perform remote code analysis in ATC which allows to analyze custom code remotely with the latest checks.

When using SAP BTP ABAP environment as central check system, you will use the `Custom Code Migration` app to scope and analyze custom code in an on-premise SAP system for SAP S/4HANA Cloud.

To use this SAP Fiori app, your SAP administrator must enable the app provide access for the relevant users. In addition, you also need to establish an RFC connection for the Cloud Connector. This enables you to access the on-premise system as checked system from the ABAP environment as central check system remotely.

To find out more about this configuration, see [Configuring Remote ATC Using a Central Check System](#).

## 6.3.1.8.1.2 Administrating User Assignments

The user assignment describes the relevant roles that a user requires to access SAP BTP ABAP environment using the `Custom Code Migration` app.

### Context

You want to enable business users to access the `Custom Code Migration` app.

For more information see, [How to Create a Business Role from a Template](#).

#### Note

If you use `Prepare an Account for ABAP Development` booster, you can skip this step. The booster will perform this task.

### Procedure

1. In the SAP Fiori launchpad, navigate to the *Identity and Access Management* section and open the `Maintain Business Roles` app.
2. On the initial screen, select *Create from Template* from the bottom of the page.  
The *Create Business Role from Template* wizard is opened.
3. Use the value help to choose `SAP_BR_IT_PROJECT_MANAGER` as the underlying *Template*.
4. Enter `BR_IT_PROJECT_MANAGER` as the name of the *New Business Role ID*.
5. Enter a *New Business Role Description*.
6. The checkbox *Create and Assign Spaces Based on SAP-Delivered Spaces* provides you with the following two options:
  - a. **Mark** the checkbox to create a new space for the `Custom Code Migration` app in your subaccount. Define and enter a *New Space ID*.

- b. **Unmark** the checkbox to use an existing space for the CCM app. Consequently, you must allocate the `Custom Code Migration` app to the existing space and page in your subaccount. For more information, see [Working with Predefined Spaces and Pages](#).
7. Confirm the creation with *OK*.  
The new business role is created and opened in the *Maintain Business Role* page.
8. Select *Maintain Restrictions* from the title toolbar.  
The relevant subpage is opened.
9. In the *Write, Read, Value Help* tab, choose *Unrestricted* from the drop-down list to enable write access for this business role.
10. Navigate back to the main page of your new business role.
11. Open the *Assigned Business Users* tab and add the relevant users using the *Search* field or the *Add* button.
12. *Save* the changes from the bottom.

## Results

The business role is created and added. The assigned users now have access to the `Custom Code Migration` app.

### 6.3.1.8.2 Custom Code Analysis

This guide describes how to perform remote custom code analysis using the `Custom Code Migration` app.

The `Custom Code Migration` app in the SAP BTP ABAP environment can act as ABAP Test Cockpit (ATC), a central check system analyzing the ABAP source code located in your on-premise system. It enables you to identify functional or security vulnerabilities in your ABAP source code. This includes security checks performed by the SAP Code Vulnerability Analyzer (CVA).

In the following chapters, you will learn how to create a custom code analysis project, analyze the findings, and, in addition, perform dependency and complexity analyses.

## Related Information

[Code Vulnerability Analyzer Checks](#) 

### 6.3.1.8.2.1 Performing an Analysis

This chapter focuses on creating a custom code analysis project, analyzing the findings and how to perform a dependency and complexity analysis.

## 6.3.1.8.2.1.1 Creating a Custom Code Analysis Project

With a custom code analysis project, you can analyze custom code with arbitrary ATC check variants.

### Procedure

1. Start the tile *Custom Code Migration* from the SAP Fiori launchpad.
2. Choose *Create*, then choose *Custom Code Analysis Project*.
3. Fill in the fields under *Project Data* for your new project.
  - a. *Project Description*: Provide further details about your custom code migration project.
  - b. *Check Variant*: Use the value help to select a check variant available in your system.
  - c. *Location of Custom Code*: Use the dropdown menu to specify the system in which the custom code to be analyzed is located.
  - d. *Connection to Remote System*: Specify the SAP system that contains your custom code and needs to be analyzed.

#### Note

If you collected usage data, choose the *Add* button to add usage data to your custom code migration project.

Under *Advanced Configuration*, you can limit your custom code analysis by specifying the packages you want to analyze. This can be helpful to save time and resources.

These steps are optional.

4. To confirm your input, choose *Create*.

## 6.3.1.8.2.1.2 Analyzing the Findings

When you create a custom code analysis project, the custom code analysis is performed automatically. The *Custom Code Migration* app then provides you with an analytical representation of the findings.

### Procedure

1. Choose *Analysis* to get an overview of the results, as soon as the first analysis has been finished.
2. Choose *Analyze Findings* to get a detailed analysis.
3. In the *Custom Code Migration - Analysis - Findings* view, you can specify various filters, such as:
  - *Quick Fix Availability*: Analyze which findings can be solved by a Quick Fix and which findings have to be solved manually.
  - *Scope Information*: Filter the results to only show findings for objects that are in scope.
4. Choose  in the *Findings* section to change the settings for the chart.

For example, to show the Quick Fix availability per Check Message, you need to specify the following settings for the chart in the *Chart* tab under *Dimensions*:

- Check Title (as Category)
- Check Message (as Category)
- Quick Fix Availability (as Series)

## Results

You now have a graphical and tabular representation of findings and can take action to resolve these findings in your development environment.

### 6.3.1.8.2.1.3 Dependency Analysis

In this topic, you will learn more about dependency analysis in the *Custom Code Migration* app.

## Purpose

You can utilize dependency analysis to identify dependencies from your custom code to the SAP standard and thus which part of your custom code can be transformed to the SAP BTP ABAP Environment. To do this, you can use the Scoping app within the *Custom Code Migration* app. This app provides you with a set of measures that analyze how likely it is that you can transform your code to the SAP BTP ABAP Environment.

In the Scoping app within the *Custom Code Migration* app, select the *Settings* (⚙️) button. Under *Measures*, choose the metrics for the chart axes. This way you can set up your own individualized chart to perform dependency analysis of your custom code with SAP standard. You can determine, for example, how often your custom code calls SAP application APIs or uses DB accesses to SAP application tables such as the *MARA* table. The following measures are available:

The measures and their meanings

Measure	Explanation
Number of Changes	Number of changes per object within the last year
Number of application API usages	All usages of application APIs such as classes, interfaces, and function modules
Number of application DB API usages	All database operations on database tables or views; i.e., only the number of different database tables and views are counted, not the overall number of accesses
Number of distinct app. DB APIs used	Database operations on distinct database tables or views

Measure	Explanation
Number of distinct application APIs used*	Distinct usages of application APIs; i.e., only the number of different APIs are counted, not the overall number of accesses
Number of objects in package	Overall number of custom code objects within a package or request entry point
Number of objects using appl. DB APIs	Number of objects within a package or request entry point accessing application-specific database tables or views
Number of objects using application APIs	Number of objects within a package or request entry point using application APIs
Proportion of objects using app. APIs	Ratio between objects using application APIs and all objects within the package/request entry point
Proportion of objects using app. DB APIs	Ratio between objects using application-specific database tables or views and all objects within the package/request entry point

\*With this measure, for example, you can check how many dependencies to different APIs your code has. In the best case, both this number and the number of locations where you are accessing those APIs are small.

After adjusting your settings, your chart could look as follows:

You can then also save your individual settings as your own view. This way, you won't have to adjust your settings again the next time you want to use the chart.

## Related Information

[Custom Code Migration \[page 2408\]](#)

[Complexity Analysis \[page 2416\]](#)

### 6.3.1.8.2.1.4 Complexity Analysis

In this topic, you will learn more about complexity analysis in the `Custom Code Migration` app.

#### Purpose

Sometimes, your ABAP code can contain complex objects that very often also experience the most frequent changes. With the `Custom Code Migration` app it is possible to identify the most complex objects via complexity analysis and help you decide whether you want to redesign and therefore simplify them.

##### Note

Please be aware that, in this topic, the focus is on reducing the complexity of packages only. Nevertheless, generally, what applies to packages also applies to request entry points.

In your `Custom Code Migration` project, choose the bubble chart to display all packages that contain custom code. With this chart, you can also display the Halstead difficulty of a package. The Halstead complexity measures are software metrics that describe the effort to develop and understand the complexity of a program.

The chart enables you to identify packages that contain complex coding and have often been changed in the last year, for example.

The default representation of the chart displays the following information:

The X axis indicates the complexity/difficulty of the custom code within a package. The higher the number signifies the complexity. The app calculates the complexity based on the Halstead complexity measures. For packages, the Halstead difficulty is aggregated using an H-index algorithm.

##### Note

Only if you have multiple complex objects in your code does the H-index rise.

An H-index of 42 means that the package contains 42 procedures with a Halstead difficulty of 42 or higher.

An H-index of 80 means that the package contains 80 procedures with a Halstead difficulty of 80 or higher.

The Y axis displays how many changes – based on transport requests – you have made to the objects of a package.

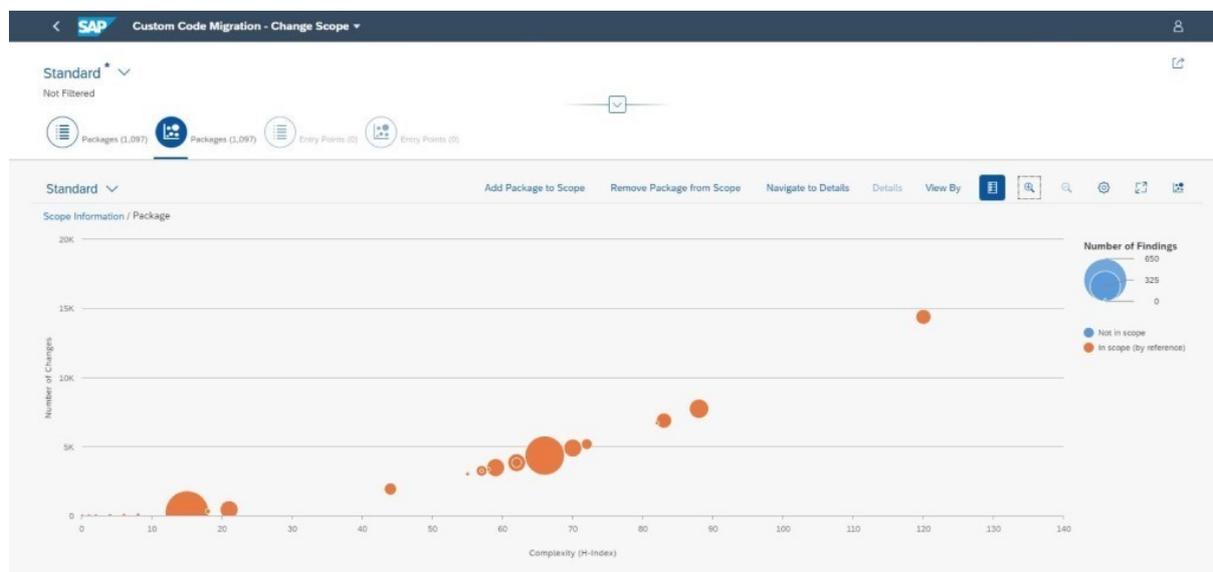

##### → Recommendation

SAP recommends you have a closer look at packages that appear in the top-right corner of this chart, as those are the packages that are very complex and have often been changed.

The size of the bubbles indicates the number of findings. Hence, the bigger the bubble, the higher the number of findings.

You can change the default representation of the chart by choosing the chart preferences (⚙️).

Your chart could now look as follows:

Now that you are aware of the complexity of your code, it is time to take action and reduce said complexity. There is no standard solution for fixing complex code, however, SAP can provide you with suggestions as to how to start this process:

- Check whether you can replace your code with SAP standard functionalities.
- Check whether there are smaller units in your code that you can reuse.
- Check out the [Clean ABAP](#) style guide to learn more about clean code.

## 6.3.1.9 Development

[SQL Trace Analysis \[page 2418\]](#)

[Display Publishing Processes \[page 2418\]](#)

## 6.3.1.9.1 SQL Trace Analysis

With this app you can access and analyze SQL trace records after you have used the SQL trace function of the ABAP performance trace in the ABAP Development Tools (ADT).

### Key Features

This app provides the following key features:

- Display of all SQL traces that are available under your user name
- View of the SQL trace entries in chronological order, together with information about the ABAP source code location, duration of the execution, and the number of accessed records
- View and recalculation of the prepared and executed access plan
- Display of the origin of SQL statements in the source code

### Supported Device Types

- Desktop
- Tablet

### Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-OP-MON`.

## 6.3.1.9.2 Display Publishing Processes

With this app you can monitor publishing processes for custom communication scenarios and business catalog extensions.

### Key Features

You can use this app to:

- Filter for a certain status, such as *Successful*
- Filter for a certain object type, such as *Custom Communication Scenario*
- View details of the publishing process

- Restart a publishing process if required

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-IAM`.

## 6.3.1.10 Employee Master Data

[Business User Management \[page 2419\]](#)

Business User Management enables and supports the lifecycle maintenance of business users.

[Maintain Employees \[page 2419\]](#)

### 6.3.1.10.1 Business User Management

Business User Management enables and supports the lifecycle maintenance of business users.

### 6.3.1.10.2 Maintain Employees

With this app, you can create employees and modify employee information.

## Key Features

You can use this app to:

- Create employees directly in the app or with CSV file import
- Edit employee information
- Retrieve the change log to view modified employee data

- Select employees for archiving
- Export employee data

In addition, the app supports the following technical features and options:

Navigate to [Maintain Business User](#)

## Supported Device Types

- Desktop
- Tablet
- Smartphone

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component CA-GTF-BUM.

### 6.3.1.10.2.1 How to Select an Employee for Archiving

#### Context

You can't delete an employee in the [Maintain Employees](#) app. You can only select an employee for archiving. This is contrary to the [Maintain Business Users](#) app, where the user is physically deleted.

#### Note

It's not possible to select an employee for archiving in the [Maintain Employees](#) app if the employee has a user assigned to it. In this case, you have to delete the user in the [Maintain Business Users](#) app first.

The employee consists of a business partner in the role category BUP003 (Employee), a workplace address, and a user. An employee cannot be deleted immediately and in one step for business process reasons. If you need to permanently delete an employee, you have to delete the user first. Afterwards, you're able to delete the business partner, which also contains the workplace address. Therefore, to physically delete an employee you need to refer to your Information Lifecycle Management (ILM) apps.

In the [Maintain Employees](#) app, the [Select for Archiving](#) filter is set to *No* by default. This means, only employees that are not selected for archiving are displayed. Choose the arrow icon (∨) to expand the header and see all filter options. If you want to see employees that are selected for archiving choose *Yes* from the dropdown and *Go*. To see both, select the empty field from the dropdown.

This is how you can select an employee for archiving:

### Prerequisite:

The employee doesn't have a user assigned.

## Procedure

1. Open the *Maintain Employees* app and select the respective employee from the list.
2. Choose *Edit*.
3. On the *General Information* tab, in the *Validity Period* section, mark the *Selected for Archiving* checkbox.
4. Choose *Save*.

Alternatively, choose the *Select for Archiving* button.

You've selected the employee for archiving, you're now able to continue in your Information Lifecycle Management (ILM) apps.

## 6.3.1.11 Extensibility

[Custom Logic \[page 2421\]](#)

[Custom Logic \(Deprecated\) \[page 2428\]](#)

[Configure Predefined Custom Fields \[page 2433\]](#)

### 6.3.1.11.1 Custom Logic

With this app, you can implement BADIs that have been released by SAP partners.

#### ⚠ Caution

The management of data in an extension scenario deviates from the management of data in the standard scenarios. You are responsible for ensuring that the data used in an extension scenario is managed in accordance with any applicable legal requirements or business needs, such as data protection legislation or data life cycle requirements. The extensibility framework should not be used for the processing of personal data if this processing falls under any applicable data protection legislation.

## Key Features

You can use this app to do the following:

- Create your own implementation
  - Specify filter conditions to define when an implementation is executed
- Publish your implementation to your test system
- Write custom code by using ABAP for key users
  - Test your code with predefined test variants, for example
  - Compare your code with older code versions
- Edit filter conditions of existing implementations
- Delete implementations

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-EXT-BL`.

## Related Information

[Creating Implementations \[page 2422\]](#)

[Creating Custom Code \[page 2423\]](#)

### 6.3.1.11.1 Creating Implementations

Get an overview of how to create and publish your implementations.

## Process Steps

This is a generic description about how to create implementations. For specific documentation, refer to the individual extension point documentation in the *Custom Logic* app.

1. To create a new implementation, open the [Custom Logic](#) app and click [Create](#).
2. Select the extension point (BApI) that you want to implement. Perform a free text search by using the search field. The extension point descriptions, IDs and documentation will be searched. To view the documentation of an extension point, click [View Documentation](#). When you have selected an extension point, click [Step 2](#).
3. Depending on the extension point you've selected, you can enter the implementation attributes next. Open the [Edit Filter Condition](#) dialog by clicking [Add](#).
4. All BApI filter conditions added in the dialog are connected with AND. Click [Save](#) to add the filter condition to the list of filters. You can add more rows to the filter list by opening the dialog again. The filter list rows are connected with OR. Click [Step 3](#) once you've maintained the filters.
5. Enter the implementation description and the ID. The description must start with a non-whitespace character. The ID starts with a fixed prefix and its total length must not exceed 30 characters. Click [Review](#) once you've maintained valid values.
6. Review the data you entered. If you want to make changes, click [Edit](#) in the respective section. Once you're finished, click [Create](#). The creation process starts in the background and you're taken to the implementation detail page.
7. Once the implementation is created, the status will change from [Creating](#) to [Created](#). You can now edit the implementation attributes if your implementation has any, or publish your implementation to start writing code. After publishing, click [Open Code Editor](#) to write custom code.

## 6.3.1.11.1.2 Creating Custom Code

With the [ABAP Cloud Editor](#), you can write your own code using ABAP for key users.

The editor is divided into three tabs that focus on different aspects of dealing with code: [Develop](#), [Test](#), and [Compare](#).

### Develop

On the [Develop](#) tab, you can write, save, and publish ABAP code. Saving means writing a draft version of the code that only you can see. Once you publish your code, it'll be available in the system and visible for all users. Depending on the method you're implementing, there is a button [Show Sample Code](#). Click this button to open a dialog that shows the sample code provided by SAP. Click [Expand](#) to increase the vertical space for the code.

The method signature on the right provides information about the method's parameters.

Put the cursor on a class, interface, or parameter to view the documentation displayed in the element information at the bottom of the page.

In edit mode, you can add prebuilt code blocks by selecting [Insert Code Snippet](#). For more information, see [Inserting Code Snippets \[page 2424\]](#).

You can use keyboard shortcuts while working with the ABAP Cloud editor. You can view a list of all possible shortcuts by clicking [Show Keyboard Shortcuts](#).

### Note

Do not use the `return` statement in your code because it can affect the framework logic. It can result in missing custom logic trace entries or unexpected code behavior.

## Test

On the [Test](#) tab, you can test your code with different parameter values. Use the parameter kind dropdown to navigate to **importing**, **exporting**, **changing**, and **returning** parameters, depending on what the method offers. Use the input fields in the table rows to enter parameter values. For table parameters, click [Add](#) to add a new table row or [Delete](#) to delete a table row.

On the right, you can choose what code version will be tested: either [Draft](#) or [Latest Published](#). Click [Test](#) to run the test. If the test was successful, a toast will appear. You can then view the outcome in the different parameter tables.

If you want to save the test data you entered, click [Save As](#), enter a test variant name, and click [Save](#). If you have already selected an existing test variant, just click [Save](#). Use [Manage](#) to delete saved test variants.

## Compare

On the [Compare](#) tab, you can compare different code versions. If you have a draft, it can be selected on the left. This is useful if you want to copy parts from older code versions to a new draft, for example. On the [Compare](#) tab, you can only save code but not publish it. Use the [Develop](#) tab for all code editing features.

### Note

Please make sure that your draft logic is syntactically correct and tested. Otherwise, the draft logic might be lost when your system is upgraded to another release.

## 6.3.1.11.1.2.1 Inserting Code Snippets

Find out how to insert predefined or custom code snippets into your code.

Code snippets are small blocks of source code for recurring coding tasks such as calling a method of a custom reuse library. Some code snippets offer parameters for filling in placeholders in the code. There are two kinds of code snippets: Predefined code snippets and custom code snippets. The predefined code snippets are provided by SAP, while the custom code snippets depend on the custom entities you have created in your system.

## Predefined Code Snippets

Predefined code snippets are calls to the custom business objects Write API. These code snippets will only be shown if the method you are implementing has the Write API as a parameter.

### Procedure

1. Select a code snippet from the list.
2. Fill in the placeholders by maintaining the parameters on the [Details](#) page.

#### Note

The parameters are not mandatory. You can also insert the code snippet with placeholders, but then syntax errors will appear.

3. Select [Insert Code Snippet](#) to insert the code snippet into your code at the last cursor position.

## Custom Code Snippets

Custom code snippets are calls to the methods of your custom reuse libraries. The parameters of the method call are prefilled with sample data.

### 6.3.1.11.1.3 Statements in ABAP for Key Users

This topic provides you with an overview of ABAP keywords and ABAP system fields that are available with the ABAP version for key users.

You can search the tables for specific ABAP keywords and system fields that are available with the ABAP version for key users. If you need more information and examples about how to use the ABAP version for key users, you can refer to our tutorial blog linked under [Related Information](#)

### 6.3.1.11.1.4 Keyboard Shortcuts in Web-Based Editor

You can use keyboard shortcuts while working in the web-based editor.

The following key combinations are provided in the web-based editor:

Key Combination	What Is It Used for?
<code>Ctrl</code> + <code>Space</code>	To turn on code completion
<code>Ctrl</code> + <code>/</code>	To uncomment or comment out a code block
<code>Ctrl</code> + <code>#</code>	
<code>Shift</code> + <code>F1</code>	To use pretty printer

### 6.3.1.11.2 Custom Logic (Deprecated)

With this app you can write your own implementations to extend SAP partner code.

#### Caution

The management of data in an extension scenario deviates from the management of data in the standard scenarios. You are responsible for ensuring that the data used in an extension scenario is managed in accordance with any applicable legal requirements or business needs, such as data protection legislation or data life cycle requirements. Please note that the extensibility framework is currently not integrated in the privacy-by-default functionality. Therefore, the extensibility framework should not be used for the processing of personal data if this processing falls under any applicable data protection legislation.

## Key Features

You can use this app to:

- Create your own implementation by using ABAP for key users
  - Implement your custom logic
  - Test your custom logic, for example with predefined test variants
  - Create filter conditions to define when an implementation is executed
- Publish implementation to your test system
- Edit implementation descriptions that have already been published
- Delete implementations

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-EXT-BL`.

### 6.3.1.11.2.1 Creating Custom Logic

Get an overview of how to create custom logic, and how to publish your custom logic.

## Business Benefit

This app enables you to create and maintain custom logic for business add-ins (BAIs) that have been released by SAP partners.

## Process Steps

This is a generic description about how to implement custom logic.

1. To find a Cloud BAI, open the *Custom Logic* app.
2. Click **+** (*Create*). Select a BAI Description of the delivered BAI you want to implement. Add an implementation description and an implementation ID.

3. Choose *Create*.
4. Now you can modify and test the draft logic using ABAP for key users in a web-based editor. You can click on *Example* to see a sample implementation of the BAdI. Choose the fields for testing on the *Available Fields* tab, enter the test data and click *Test* to check if your custom logic is working as expected.

#### Note

Please make sure that any of your draft logic is syntactically correct and tested. Otherwise, the draft logic might be lost when your system is upgraded to another Cloud release.

5. To activate your BAdI implementation, choose *Publish*.

### 6.3.1.11.2.3 Keyboard Shortcuts in Web-Based Editor

You can use keyboard shortcuts while working in the web-based editor.

The following key combinations are provided in the web-based editor:

Key Combination	What Is It Used for?
<code>Ctrl</code> + <code>Space</code>	To turn on code completion
<code>Ctrl</code> + <code>/</code>	To uncomment or comment out a code block
<code>Ctrl</code> + <code>#</code>	
<code>Shift</code> + <code>F1</code>	To use pretty printer

### 6.3.1.11.3 Configure Predefined Custom Fields

You, as a system administrator can use this app to configure your predefined custom fields to customize applications and their UIs.

Different companies and business processes require different document layouts or application functionalities. To address these specific needs, you can adapt predelivered fields accordingly. This app offers the option to configure predelivered custom fields in your apps to your needs.

## Key Features

You can use this app to:

- Configure a predefined field
- Provide UI texts in other languages
- Enable field usage

- Edit fields that have already been published
- Discard changes you have done to a field that was already published, and thus reset all modifications to get back to the state of the last published version of a field with one click
- Delete new fields or fields that have already been published

#### Note

The provided functionality of predefined custom fields does not provide the technical capabilities to support the collection, processing, and storage of personal data.

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-EXT-FLD`.

## Related Information

[Configuring Predefined Custom Fields \[page 2434\]](#)

### 6.3.1.11.3.1 Configuring Predefined Custom Fields

Get an overview of how to configure predefined custom fields, and how to publish your configured custom fields.

## Context

This process enables you to configure custom fields that were predefined by your application provider. They can be used to enhance applications which contain APIs and data sources that have been released by your software provider to configure custom fields.

## Procedure

1. Open the *Configure Predefined Custom Fields* app. You can open the app either directly from the SAP Fiori launchpad, or from an extensible application by clicking **+** (*Add Custom Field*) in the UI adaptation mode of an application.

### Note

To use new fields from a predefined custom field in an SAP Fiori app, you have to restart the app and the UI adaptation mode. For more information about how to adapt SAP Fiori UIs during runtime, see [Adapting SAP Fiori UIs at Runtime](#)

2. Create a new predefined custom field configuration in the business process where it is needed. To do so, select a business object, a business object node, and the technical type of the configuration. Complete this step by selecting the basic properties of this type. For example, if you selected the technical type `Character`, you need to choose one of the available field lengths your application provider has predefined for you.
3. Next, you can adapt further properties of your custom field. Enter a label and a tooltip, and choose a semantic type for your field. For example, if you selected the semantic type `Email Address`, you will be able to open your email client directly from the link.

### Caution

Once created, the semantic type of the custom field can't be changed anymore.

You can translate your field label and your field tooltip. To do so, select *Translation* in your custom field. Now, you can proceed to making your custom field available in other languages.

### Note

If your field is of type `Code List`, you can also translate the individual list value descriptions that belong to that field.

4. Finally, you can decide whether you want to create and publish your configured field directly, or if you want to create and edit your custom field. By selecting *Create and Edit*, you will be able to define where and how your configured field should appear in the app before publishing it.
5. You can decide which code values to enable for your custom field by using the toggles displayed in the table. Also, you can choose whether you want to make your new fields visible to the UI and app services. After you have finished editing your custom field, select *Publish*.

### Caution

Once published, you won't be able to delete the code values from the type `Code List` anymore. However, you can still enable or disable your code values.

### Note

If a change is made to the custom field after publishing, the status of the custom field will change to *Revised*. The changes in your custom field will only be visible in the system after selecting *Publish* once more.

You can only *Discard Changes* if the revised custom field hasn't been published yet. After publishing, you can still enable or disable specific code values in your custom field as described in step 5.

If a custom field is published or deleted, the extended application has to restart. This may result in a prolonged loading time of the extended application when it is launched for the first time.

#### ⚠ Caution

When you publish a field with a certain length, you can't decrease the field length later on.

Your configured custom fields will now appear in your applications and their UIs.

### 6.3.1.12 Factory Calendar

You can create and maintain holiday and factory calendars using the following apps:

- [Maintain Holidays \[page 2436\]](#)
- [Maintain Holiday Calendars \[page 2438\]](#)
- [Maintain Factory Calendars \[page 2440\]](#)

#### 6.3.1.12.1 Maintain Holidays

You can use this app to display and maintain holidays according to your location, industry, or other requirements.

### Key Features

You can use this app to:

- display existing holidays.
- edit existing holidays.
- create new holidays.
- delete holidays.

To maintain holidays, log on to the SAP Fiori launchpad in the *SAP Business Technology Platform (SAP BTP)* system and open the *Maintain Holidays* app.

### Note

To start the Fiori apps, you must have the `SAP_BR_BPC_EXPERT` business role containing the `SAP_CA_BC_IC_LND_CAL_CA1_PC` business catalog assigned.

### Caution

The following HANA SQL functions are currently not supported:

- `ADD_WORKINGDAYS`
- `WORKDAYS_BETWEEN`

## Displaying Existing Holidays

If you want to display existing holidays, choose one of the following options:

- Enter your search criteria in the header section and press [Go](#) to display a specific holiday.
- Choose a status from the [Editing Status](#) drop-down menu and press [Go](#) to display a list of holidays.

Click a holiday from the list. The holiday details screen opens.

## Creating a New Holiday

You can create a new holiday. To do so, proceed as follows:

1. Press [Create](#). The [Create](#) dialog box opens.
2. Enter a unique holiday ID and choose one of the following holiday types from the drop-down list:
  - Fixed date: make entries in the [Month](#) and [Day](#) fields.
  - Floating dates: press [Create](#) and choose a date from the drop-down list.
  - Distance to easter: make an entry for the [Distance to Easter Sunday](#) field.
  - Fixed day from date: make entries in the [Month](#), [Day](#) and [Weekday](#) fields.
3. Fill all mandatory fields and press [Create](#).

## Editing Existing Holidays

You can edit an existing holiday. To do so, proceed as follows:

1. Press [Go](#) to display the list of existing holidays.
2. Click a holiday from the list. The holiday details screen opens.
3. Click [Edit](#) and make your changes in the relevant sections.
4. Press [Save](#) to save your entries.

## Deleting Holidays

You can delete a holiday. To do so, proceed as follows:

1. Press [Go](#) to display the list of existing holidays.
2. Choose a holiday from the list by checking the checkbox next to the holiday calendar ID.
3. Press [Delete](#).
4. In the [Delete](#) dialog box, press [Delete](#).

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-ASF-CAL`.

### 6.3.1.12.2 Maintain Holiday Calendars

You can use this app to display and maintain holiday calendars according to your location, industry, or other requirements.

## Key Features

You can use this app to:

- display existing holiday calendars.
- edit existing holiday calendars.
- create new holiday calendars.
- delete holiday calendars.

To maintain holiday calendars, log on to the SAP Fiori launchpad in the [SAP Business Technology Platform \(SAP BTP\)](#) system and open the [Maintain Holiday Calendars](#) app.

#### Note

To start the Fiori apps, you must have the `SAP_BR_BPC_EXPERT` business role containing the `SAP_CA_BC_IC_LND_CAL_CA1_PC` business catalog assigned.

### ⚠ Caution

The following HANA SQL functions are currently not supported:

- `ADD_WORKINGDAYS`
- `WORKDAYS_BETWEEN`

## Displaying Existing Holiday Calendars

If you want to display existing holiday calendars, choose one of the following options:

- Enter your search criteria in the header section and press [Go](#) to display a specific calendar.
- Choose a status from the [Editing Status](#) drop-down menu and press [Go](#) to display a list of calendars.

Click a holiday calendar from the list to find more information, such as:

- Details
- Assignments
- Holiday Calendar Texts

## Creating a New Holiday Calendar

You can create a new holiday calendar. To do so, proceed as follows:

1. Press [Create](#). The [Create](#) dialog box opens.
2. Enter a unique holiday calendar ID ([Holiday. Cal. ID](#)) and press [Continue](#).
3. Enter values for the [Valid from](#) and [Valid to](#) fields.
4. Add an assignment and a holiday calendar text. To do so, proceed as follows:
  1. To add an assignment in the [Assignment](#) section, press [Create](#). Choose a holiday from the drop-down list and press [Continue](#). Enter a [Valid To](#) date and press [Continue](#). Enter a [Valid From](#) date and press [Continue](#). Press [Apply](#).
  2. To add a text in the [Holiday Calendar Texts](#) section, press [Create](#). Choose a language key from the drop-down list and press [Continue](#). Enter a description in the [Description Text](#) field and press [Apply](#).
5. Press [Save](#).

## Editing Existing Holiday Calendars

You can edit an existing holiday calendar. To do so, proceed as follows:

1. Press [Go](#) to display the list of existing holiday calendars.
2. Click a holiday calendar from the list. The holiday calendar overview screen opens and the [Details](#), [Assignments](#), and [Holiday Calendar Texts](#) sections are displayed.
3. Click [Edit](#) and make your changes in the relevant sections.

4. Press [Save](#) to save your entries.

## Deleting a Holiday Calendar

You can delete a holiday calendar. To do so, proceed as follows:

1. Press [Go](#) to display the list of existing holiday calendars.
2. Choose a holiday calendar from the list by checking the checkbox next to the holiday calendar ID.
3. Press [Delete](#).
4. In the [Delete](#) dialog box, press [Delete](#).

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-ASF-CAL`.

### 6.3.1.12.3 Maintain Factory Calendars

You can use this app to display and maintain factory calendars according to your location, industry, or other requirements.

## Key Features

You can use this app to:

- display existing factory calendars.
- edit existing factory calendars.
- create new factory calendars.
- delete factory calendars.

To maintain factory calendars, log on to the SAP Fiori launchpad in the [SAP Business Technology Platform \(SAP BTP\)](#) system and open the [Maintain Factory Calendars](#) app.

### Note

The business catalog `SAP_CA_BC_IC_LND_CAL_CA1_PC` - Factory Calendar - Configuration needs to be assigned to your user to access and use the app.

The business catalog is included in the business role template `SAP_BR_BPC_EXPERT`.

### Caution

The following HANA SQL functions are currently not supported:

- `ADD_WORKINGDAYS`
- `WORKDAYS_BETWEEN`

## Displaying Existing Factory Calendars

If you want to display existing factory calendars, choose one of the following options:

- Enter your search criteria in the header section and press [Go](#) to display a specific calendar.
- Choose a status from the [Editing Status](#) drop-down menu and press [Go](#) to display a list of calendars.

Click a factory calendar from the list to find more information, such as:

- Details
- Exception Rules
- Factory Calendar Texts

## Creating a New Factory Calendar

You can create a new factory calendar. To do so, proceed as follows:

1. Press [Create](#). The [Create](#) dialog box opens.
2. Enter a unique factory calendar ID (*Fac. Cal. ID*) and press [Continue](#).
3. Enter values for the [Valid from](#) and [Valid to](#) fields.
4. Press [Save](#).

## Editing Existing Factory Calendars

You can edit an existing factory calendar. To do so, proceed as follows:

1. Press [Go](#) to display the list of existing factory calendars.
2. Click a factory calendar from the list. The factory calendar overview screen opens and the [Details](#), [Exception Rules](#), and [Factory Calendar Texts](#) sections are displayed.
3. Click [Edit](#).

1. To add a factory exception rule in the *Exception Rule* section, press *Create*. Choose a language key from the drop-down list and press *Continue*. Enter a description in the *Description Text* field and press *Apply*.
2. To add a new text in the *Factory Calendar Texts* section, press *Create*. Choose a language key from the drop-down list and press *Continue*. Enter a description in the *Description Text* field and press *Apply*.
4. Press *Save* to save your entries.

## Deleting a Factory Calendar

You can delete a factory calendar. To do so, proceed as follows:

1. Press *Go* to display the list of existing factory calendars.
2. Choose a factory calendar from the list by checking the checkbox next to the factory calendar ID.
3. Press *Delete*.
4. In the *Delete* dialog box, press *Delete*.

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-SRV-ASF-CAL.

### 6.3.1.13 i18N Services

[Language Configuration \[page 2442\]](#)

#### 6.3.1.13.1 Language Configuration

With this app you can configure the languages within a system.

## Key Features

The available language set is divided into two parts, active languages and inactive languages:

- Active languages  
This list defines those languages, which are currently available to be selected by the users.
- Inactive languages  
This list defines the set of languages, which exist in the system but are currently not offered to the users.

## Activities

If the list is displayed empty after starting the app, click button [Go](#) to refresh the view.

The first tab shows all currently active languages. You can remove one or more languages from this list by selecting them and then clicking the [inactivate](#) button.

The second tab shows all currently inactive languages. You can add one or more languages from this list to the list of active languages by selecting them and then clicking the [activate](#) button.

On both tabs you can use the fulltext [Search](#) function to find one or more languages in the list.

On both tabs you can filter the displayed languages by language code. To refresh the tabs display click button [Go](#).

## Supported Device Types

- Desktop
- Tablet
- Smartphone

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-I18`.

### 6.3.1.14.1 Maintain Business Users

You use this app to provide business users with access rights and to maintain business user settings.

Business users gain access to Fiori apps through business roles. A business role can comprise one or several business catalogs which in turn comprise several apps.

#### Key Features

You can use this app to:

- Edit business user data
- Assign business roles to a user and remove existing assignments
- Update user role assignments
- Lock users so that they cannot log on to the system
- Unlock users
- Download list of users
- Set the language of the user interface for each business user

#### Supported Device Types

- Desktop
- Tablet

#### Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-IAM`.

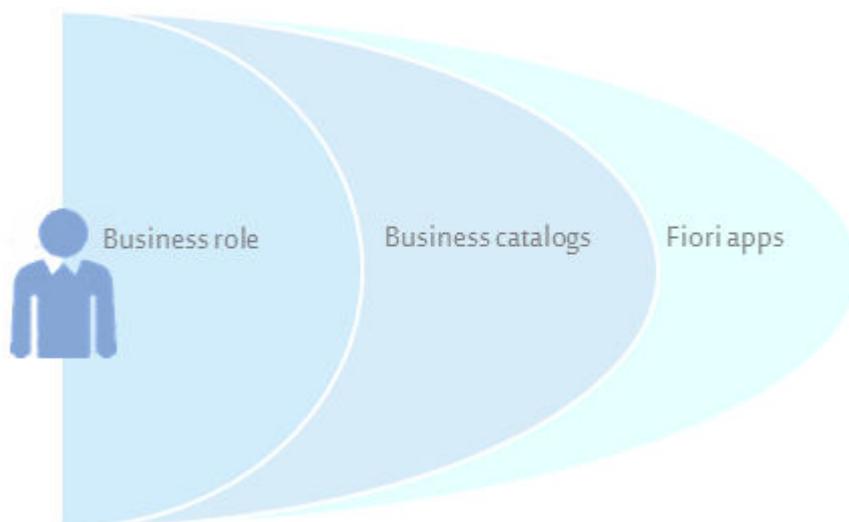

## Related Information

[Business Catalogs for Identity and Access Management Apps \[page 2510\]](#)

### 6.3.1.14.1.1 How to Maintain Business Users

#### Context

Business users are replicated from your central HR system. You can change user data (for example, the user name) and regional settings (for example, the date and time format).

How users get access to SAP Fiori apps

#### Procedure

- **Creating New Business Users**
- To create a new business user, proceed as follows:
  - a. Choose *Create* on the main screen of the app.
  - b. Select the employee you want to create the user for, and fill in the required fields.

For *User Name*, enter a name or ID that is identical with the login name of the same user in the on-premise identity provider.

The name the user enters to log on to the SAP Fiori launchpad. The user name can only contain uppercase letters, numbers, and underscores. It must have a maximum length of 40 characters and must not start with an underscore, or with SAP.

- **Assigning Roles to Business Users**

- To grant users access to applications, you assign the respective business roles to them.
  - a. Select the required user.
  - b. Click [Add Business Roles](#).
  - c. Search for the required roles and select them.
  - d. Click [Apply](#) and [Save](#).

You can navigate from the Maintain Business Users app to the Maintain Business Roles app by choosing a business role ID in the list of assigned business roles.

The user then sees the respective app tiles in the tile catalogs.

- **Removing Role Assignments from Business Users**

- To remove a role assignment from a user, proceed as follows:
  - a. Select the business user and then the assigned business role.
  - b. Choose [Remove](#) above the list or [Remove Business Roles](#) at the bottom of the screen.

- **Updating User Role Assignments**

- To update the assignments of roles to a user individually, edit the affected business user.
- To mass update user role assignments, upload a csv file.

### Note

The CSV file needs to be UTF-8-encoded and must comply with the following pattern:

User Name	User ID (Optional)	Role ID
<User name 1>	<Business user ID 1>	<Business role ID 1>
<User name 2>	<Business user ID 2>	<Business role ID 2>
<User name 3>	<Business user ID 3>	<Business role ID 3>
<User name n>	<Business user ID n>	<Business role ID n>

In the app, you are provided with a csv template that you can download and use for filling in the user role assignments. When uploading the csv file, you can decide if you want to add the role assignments to a user, or if you want to overwrite them completely.

You can find the CSV template as follows: Click the [Upload](#) button, then click [Upload User Role Assignments](#) in the menu that appears. This opens a dialog box containing the [Download CSV Template](#) link that you can use to download the template.

The user ID is optional. Only if the user name is not unique, the user ID has to be maintained.

- **Downloading User Lists**

- To download a list of all users with an email address as csv files for upload to [SAP Cloud Identity Services - Identity Authentication](#), proceed as follows:
  - a. To open the file, you have to set the list separator to comma by setting the format in the regional settings of your operating system to [English \(United States\)](#).
  - b. Open the [Administration Console for SAP Cloud Identity Services – Identity Authentication](#).
  - c. To upload the csv file, go to [User Management](#) > [Import Users](#) .

### Note

Make sure that the csv file is not opened with any program before the upload.

- Changing the Default Settings for a Business User  
To change the default settings for a business user, select it for editing and adjust the values as required. If you create a new business user, the following fields in the *User Data* area and the *Regional Settings* area are automatically filled with default values. You can adjust them if necessary.

Default Values

Field	Default Value
<i>Valid From</i>	01/01/1901
<i>Valid To</i>	12/31/9999
<i>Decimal Format</i>	This default value is derived from the standard setting that is valid in the country of the workplace address. If the workplace address is not maintained, the value is derived from the business user's private address.
<i>Date Format</i>	
<i>Time Format</i>	
<i>Time Zone</i>	
<i>Language</i>	

•

## Related Information

[Defaulting of User Attributes](#)

### 6.3.1.14.1.2 How to Lock Unused Business Users

Lock inactive business users

## Context

You can schedule a job to automatically lock business users who haven't logged on for a certain number of days.

### Note

To schedule this job, you can either use the *Application Jobs* app as described below or you can add the *Schedule Lock for Unused Business Users* tile your SAP Fiori Launchpad using *Edit Homepage* if you want to access the respective scheduling screen directly.

## Procedure

1. Open the [Application Jobs](#) app.
2. Under [Job Templates](#), select [Lock Unused Business Users](#) and click [Step 2](#).
3. Define the recurrence pattern of your job and click [Step 3](#).
4. Under [Parameters](#), enter the required number of days since the last logon you want to use for the automatic lock.
5. Add the business users you want to exclude.

Optional:

Open the value help if you want to define further conditions.

Go to the [Define Conditions](#) tab. Here you can define single users or whole user areas you want to exclude from the selection. You can enter multiple users at once by using copy and paste, for example to transfer users from lists.

Please note that you can also restrict the list of users that should be processed by this job.

6. Click [Schedule](#).

## 6.3.1.14.1.3 How to Make Mass Changes to Business Users

### Context

You can use the mass change wizard to change multiple business users at once. This is helpful, for example, if you want to apply the same validity period to more than one business user.

### Procedure

1. Select the business users you want to change and click [Mass Change](#). The [Mass Change Wizard](#) appears. It has the following pattern:
2. Select the required attributes. You can make the following changes:

Area	Attributes
User Data	Select one or more attributes (such as timezone or language) you want to change in all selected business users.
Role Assignment	Add Business Roles Remove Business Roles

3. Apply the required attributes to your business users.
4. Review and confirm your changes.

## 6.3.1.14.2 Maintain Business User Groups

With this app you can create business user groups and assign multiple business users to them. This helps you to organize your area and easily search for all business users of a certain category (for example to assign them to business roles). Grouping also facilitates maintenance of authorizations. If you are the super administrator for all areas, you can delegate this task to administrators for the relevant areas, such as Financials. In this case, you would create a business user group for Financials.

Please note that the name of business user group is created automatically in namespace [ZCB](#).

### Key Features

You can use this app to:

- Create business user groups and assign the required business users to them
- Reassign/remove business users to/from business user groups  
Note: You can also use drag and drop to move business users from one group to another.
- Upload business user assignments
- Add business user groups to transports
- Export business user groups to a spreadsheet (including description and number of business users)

### Prerequisites

The following restriction types (in the following business catalogs) are required for maintaining business role groups and business user groups:

Business Catalogs	Restriction Types
SAP_CORE_BC_IAM_RM	<i>Business Role</i> (S_BRL)
SAP_CORE_BC_IAM_UM	<i>Business User</i> (CLASS)
SAP_CORE_BC_IAM_RA	<i>Business Role</i> (S_BRL) <i>Business User</i> (CLASS)
SAP_CORE_BC_IAM_RM_DISP_PC	<i>Business Role</i> (ROLE_GROUP)
SAP_CORE_BC_IAM_UM_DISP_PC	<i>Business User</i> (CLASS)

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-IAM`.

### 6.3.1.14.2.1 How to Transport Business User Groups

#### Context

You can export business user groups from your quality system to your productive system using customizing transports.

#### Procedure

1. In the *Business User Groups* overview screen of the *Maintain Business User Groups* app, select one or more business user groups.
2. Click *Add to Transport*. A list of available customizing transports appears.

#### Note

The default transport is always displayed as well as your own transports. If no transport exists, a confirmation dialog is shown. If you confirm, a new transport is created.

3. Select the required transport and click *OK*. The selected business user groups are then added to the transport.
4. Open the *Export Customizing Transports* app and release your request. For more information, see [Export Customizing Transports \[page 2380\]](#).
5. Import your business user groups to the target system:
  - a. Open the *Manage Software Components* app.
  - b. Select *Business Configuration* in the *Type* dropdown and click *Go*.
  - c. Select the component to which the relevant configuration was exported.
  - d. In the detail view of the component, check out the change that contains your business user group(s). For more information, see [How to Work with Branches](#).

#### Note

If you want to delete a business user group that was previously transported or is currently included in an open transport request, the system offers you to add it directly to an available transport.

If the business user group was previously transported and there is currently no transport available, a confirmation dialog is shown. If you confirm, a new transport is created.

## 6.3.1.14.3 Maintain Deleted Business Users

With this app you can display details of deleted business users, such as the retention period, and allow or block their re-creation.

### Key Features

You can use this app to:

- Display a list of all deleted users including deletion time, end of re-creation period and re-creation status
- Resolve the identity of deleted business users by displaying contact details such as email address or phone number
- Change the re-creation status from *Allowed* to *Not Allowed* or the other way round.
- View system deletion checks to find out if a user can be permanently deleted or if it is still used or to check why blocked user data wasn't destroyed.

#### Note

To access the *Maintain Deleted Business Users* app, you need to assign the `SAP_CORE_BC_IAM_UMD` business catalog to the particular business role.

### Supported Device Types

- Desktop
- Tablet
- Smartphone

### Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-IAM`.

## 6.3.1.14.3.1 How to Enable the Recreation of Blocked Business Users

Sometimes the person with whom a deleted business user was associated must access the system again.

### Context

The system protects users in the blocking area from being recreated. The system prevents blocked business users from being recreated to prevent inconsistencies in the user data. You don't want the same business user associated with two different people. But there are cases where you want to recreate business users, which have been deleted. Perhaps a person who left your organization has come back.

#### Note

If you have the authorization to allow the recreation of users and you are recreating a blocked user, the recreation is automatically allowed.

### Procedure

1. In the app *Maintain Deleted Business Users*, select the business user you want to recreate.
2. Click *Allow Re-creation*.

### Results

Use your standard processes for creating this business user again in the system. When the business user is recreated, the system removes the business user entry from the app *Maintain Deleted Business Users*.

#### Note

The system does not transfer the address data from the app *Maintain Deleted Business Users*. Reenter the address information in your process for business user creation.

## 6.3.1.14.4 Maintain Business Roles (Deprecated)

You can use this app to create and edit business roles, add business catalogs to the roles, and maintain access restrictions.

With the *Maintain Business Roles* app you define business roles by combining predefined business catalogs and, if necessary, define value help, read and write access by maintaining the allowed values for fields.

You use business roles to control the access to your applications. The predefined catalogs contain the actual authorizations that allow users to access apps and allow to define instance-based restrictions where necessary. Business catalogs bundle authorizations for a specific business area. Once you have created a business role, you can assign it to multiple business users who perform similar business tasks.

### Note

This app is deprecated as of SAP S/4HANA Cloud 2308. Please use the successor app [Maintain Business Roles](#) in the future. For more information about this app, see the [Related Information](#) section in this document.

You can still use the old [Maintain/Display Restrictions](#) view until the deprecated app will be removed from the system. You can directly navigate to this view from the successor app.

## Key Features

You can use this app to:

- Create business roles from scratch (based on selected business catalogs)
- Create business roles from a template delivered by SAP
- Download business roles from the test system and then upload them to the productive system per `XML` file
- Assign one or more business roles to a business user
- Copy business roles
- Delete business roles

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-IAM`.

## 6.3.1.14.4.1 How to Create a New Business Role

Get an overview of how to create a new business role from scratch based on selected business catalogs.

### Context

You use business roles to control the access to your applications. To create a business role, you add one or multiple business catalogs to it. These predefined catalogs contain the actual authorizations that allow users to access apps and allow to define instance based restrictions where necessary. Business catalogs bundle authorizations for a specific business area. Once you have created a business role, you can assign it to multiple business users who perform similar business tasks.

#### Note

Please note that this document describes how to create a business role without a template. For more information on how to create a business role from a template, see the [Related information](#) section.

### Process Steps

### Procedure

1. Select the tile of the Maintain Business Roles app on the SAP Fiori Launchpad to open the app. On the initial screen, select [New](#).
2. Add general role details, such as business role name, ID and description.
3. On the [Assigned Business Catalogs](#) tab, select [Add](#) to add the required business catalogs. Select the catalogs according to the business activities that the users with this role need to perform. Select [Apply](#).

#### Note

Some business catalogs require additional dependent catalogs to be assigned to enable access to associated master data information (for example, for business partners or customers). These additionally required catalogs ensure access to all business objects used with the SAP Fiori apps of the main catalog. When you select the business catalogs you want to add to the business role and click [Add](#), a list of dependent business catalogs is displayed. You can then select all the dependencies you want to add.

4. By default, the value help and read access for each business catalog is set to unrestricted and there is no write access. If you want to change these restrictions, select [Maintain Restrictions](#).
5. Maintain instance-based restrictions for all required business objects (following the requirements of your local authorization concept).
6. If required, click [Manage Launchpad Space](#) to create a new space or use an existing space. For more information, see the [Related information](#) section below.

### Note

The group-based home page is deprecated. It will be removed in a future version. For new systems (starting with SAP S/4HANA Cloud 2302), the group-based home page is no longer available. It will be replaced with the spaces and pages mode. Therefore, a warning message is shown. It appears when you save a business role without an assigned space. It reminds you that you need to assign a space to make the tiles visible for the users when you have already switched to the spaces and pages mode.

For more information, see SAP Note [2970113](#).

7. On the *Assigned Business Users* tab, you can assign the business users to your new business role. These users will receive the authorizations as defined in the business role.
8. Save the business role to activate it.

### Note

If you go back to the business roles overview **without saving** the business role, the business role will automatically be saved in a draft status. You can access it again and edit it from the business roles overview.

## Related Information

[How to Create a Business Role from a Template \[page 2455\]](#)

## 6.3.1.14.4.2 How to Create a Business Role from a Template

Get an overview of how to create a business role from a template.

### Context

Instead of creating a business role from scratch, you can also create it from a business role template.

### Note

A business role template is defined by SAP to make it easier for you to find the business catalogs that might be relevant for the corresponding role in your company. Usually, the business role templates have a very broad job profile to show all options. SAP does not recommend using them in their full scope because the business catalogs might conflict with the roles in your company. Instead, adjust them to the tasks of the role in your company by choosing only the relevant business catalogs. We also recommend that you only use business role templates for testing and not for generating productive roles.

If changes to the template were included in an upgrade, the *Business Role Templates* app informs you about these changes and how they affect your business roles. For more information, see *Business Role Templates* (Related Information).

When you create a role based on a template, as a default the read and value help access are unrestricted, and write access is not granted. You can change this and define for each field to which a catalog provides access what a user is allowed to see and to edit. This allows you to shape your business roles in a very detailed way. For example, you can create two roles that comprise the same catalogs, but role 1 is restricted to work with data for the US, and role 2 is restricted to work only with data for Germany.

## Process Steps

## Procedure

1. Select the tile of the *Maintain Business Roles* app on the SAP Fiori launchpad to open the app. On the initial screen select *Create From Template*.
2. Select the required template. Define the ID and the name of the new business role. If required, go to the *Assigned Launchpad Spaces* tab, click *Add*, select *Use Predefined Space*, select the required launchpad space and click *Assign Space* (for more information, see the *Related Information* section below). Click *OK*.
3. A template already contains one or more business catalogs that the business role will be assigned to. Adjust the displayed template to your requirements, for example, change the general role details, and add or delete catalogs.
4. By default, the value help and read access for each business catalog is set to unrestricted and there is no write access. If you want to change these restrictions, select *Maintain Restrictions*.
5. Maintain instance-based restrictions for all required business objects (following the requirements of your local authorization concept).
6. On the *Assigned Business Users* tab, you can assign the business users to your new business role. These users will receive the authorizations as defined in the business role.
7. Save the business role to activate it.

### Note

If you go back to the business roles overview **without saving** the business role, the business role is automatically saved in a draft status. You can access it again and edit it from the business roles overview.

## 6.3.1.14.4.3 How to Create a Business Role for the Administrator

Get an overview of how to create a business role for the administrator if you haven't used the system before.

### Context

If you as an administrator haven't used the Fiori apps before, you have to create an administrator business role first. Otherwise the app tiles are not visible on the Fiori Launchpad. With this role, you can create all other business roles according to the needs of your company.

#### ⚠ Caution

The SAP\_BR\_ADMINISTRATOR role is pre-defined by SAP and only intended for the initial set-up of a system. Please create your own business roles based on the required business role template for productive use.

To create a business role for the administrator, proceed as follows:

### Process Steps

### Procedure

1. Use the initial credentials that you have received separately e.g. via email, to log in to the system. On the SAP Fiori Launchpad select the tile *Maintain Business Roles* to open the app.
2. Select *Create From Template*. The *Create Business Role from Template* window opens. In the field *Template*, search for SAP\_BR\_ADMINISTRATOR. Define the ID and the name of the new business role.
3. A predelivered template contains a number of catalogs that in this case an administrator could need to perform tasks. These catalogs are displayed on the *Assigned Business Catalogs* tab. By default for each catalog the read access is unrestricted and there is no write access. If you want to change the restrictions, for example, to allow unrestricted write access for all catalogs, proceed as follows:
  - a. Select *Maintain Restrictions*.
  - b. On the new screen, select the restriction you would like to change. Under *Write*, select *Unrestricted*.
  - c. Select *Back to Main Page* to save the changes.
4. On the *Assigned Business Users* tab, all users that are assigned to the selected catalogs are listed. To add a business user, proceed as follows:
  - a. Select *Add*.
  - b. In the *Add Business Users* window, search for your own business user and select *Apply*.

5. Save the business role to activate it.

#### Note

If you go back to the business roles overview **without saving** the business role, the business role will automatically be saved in a draft status. You can access it again and edit it from the business roles overview.

You can now log out from the system and log in with your own credentials and proceed creating further business roles according to the needs of your company

## 6.3.1.14.4.4 How to Edit Active Business Roles

### Context

The editing of an active business role takes place in a draft version of this business role. This draft version is created by the system once you enter the edit mode of the active business role. Proceed as follows to edit an active business role:

Select the tile of the Maintain Business Roles app on the SAP Fiori Launchpad to open the app. On the initial screen, select

### Procedure

1. Select the tile of the *Maintain Business Roles* app on the SAP Fiori Launchpad to open the app.
2. On the initial screen, open the business role you need to edit by clicking on it in the *Business Roles* list. Alternatively, you can either use the *Search* or filter for the business role ID, for example.
3. To enter the edit mode, click *Edit*.

A draft version of the business role is created in which the editing takes place. The active business role remains.

4. Make the required changes to the business role.
5. Save the business role.

Once the changes are saved, they are written into the active business role and the draft version disappears. **If the dialog for editing a business role is left without saving the business role**, the active business role as well as the draft version of the business role will be available in the business roles overview. In this case, you can continue editing the draft version later.

## 6.3.1.14.4.5 How to Define Authorizations Based on Restrictions

### Context

The authorization concept for business roles is based on the concept of granting authorizations (as opposed to denying them). By adding business catalogs to a business role and assigning the business role to a business user, you can control which applications the business user is authorized to carry out. As a next step, you define how the customer data can be accessed. You do this by adding authorization values to the restriction fields. Restriction fields are organized in restriction types. Restriction types that contain general organizational restriction fields can be found in the top section called *General*. These restriction types contain only one restriction field. The settings you make for the single restriction types sum up to the authorization that is granted to the business role and therefore to the assigned business users.

#### ⚠ Caution

Please note that assigning multiple business roles to a business user increases the risk of overriding existing authorizations.

For example, you have created the business roles 1 and 2 that both include the business catalog A. In business role 1, you restricted the access rights for sales organization to A. In business role 2, you allowed to work with data for all sales organizations. The business user to whom you assign both roles will then have full access to the data for all sales organizations.

This overriding effect can also be caused if one restriction type is used in different assigned business roles of different business catalogs.

Using the *Maintain Business Roles* app, you have the following options for maintaining restrictions:

### Procedure

- On the *Maintain Restrictions* tab, you can maintain restrictions for business roles. These restrictions are the basis of authorizations that are granted to the business users who are assigned to this business role. The business catalog defines which access categories are available for maintaining and for which fields restriction values can be maintained.

The following access categories are available:

- *Write, Read, Value Help* (write access)
- *Read, Value Help* (read access)
- *Value Help* (value help access)

The business role aggregates the authorizations of the assigned catalogs.

The available restriction fields represent the authorization-relevant attributes of the business objects that are used in a role. Authorization for these fields can be granted on write, read or value help level (for example for a particular sales area).

You can select or enter single values (pre-defined by SAP or customer-specific configuration) and ranges. For more information, see [Display Restriction Types](#) (Related Information).

#### Note

When you set an access category to *Restricted* you can define the data access for each restriction type and restriction field according to your process requirements. You can do this on *Read*, *Write* and *Value Help* level.

- **Write**

- The default value access category when a role is created is *No Access*. This means that this business role has no write authorizations at all (display only). You can add specific authorizations (*Restricted*) or in cases where you want to grant full access for all restriction types and restriction fields, you can choose *Unrestricted* (\*').

Switching the write access to *Restricted* allows you to define which data can be edited by the users assigned to this business role.

- In the *Restrictions and Values* section, you can define the authorization values for the desired restriction fields.

If you don't want to grant access to a restriction field on purpose, you can choose the status *Not maintained*.

- Every authorization you define in the *Write* access category is inherited to the *Read* and *Value Help* access category.

- **Read**

- The default status of the access category *Read* is *Unrestricted*.

Switching the read access to *Restricted* allows you to define which data can be seen by the users assigned to this business role.

In the *Restrictions and Values* section, you can define the instance-based restrictions for the desired restriction fields used for value helps.

For more information about the *Restriction and Values* area, please refer to the *Write* section above.

- Every authorization you define in the *Read* access category is inherited to the *Value Help* access category.

- **Value Help**

- You can define authorizations for value helps that are used in a business role. These value help authorizations will not influence the defined restrictions for read access.

In the context of a business role, you can authorize the value help access, for example to business partners that belong to certain authorization groups.

- *Leading Restriction*

- In this section, we will describe how you can reduce the maintenance effort of restriction fields that are used in multiple restriction types of an access category.
- Restriction types that contain general organizational restriction fields can be found in the top section called *General*. These restriction types contain only one restriction field.

The status of the restriction fields that belong to this section can be changed to *Leading Restriction*. You can do this by selecting the required field under **Restrictions and Values > General**, clicking the pencil icon, activating the *Leading Restriction* switch, and then clicking *OK*. This status is visible through the *Leading Restriction* symbol in front of the restriction field. The respective symbol looks like this:

That means the value in this field is automatically inherited to other restriction types the field is used in as well.

You want to, for example, define that the values for the country templates for Austria and Switzerland are applied in all restriction types the *Company Code* field is used in. So you select the values **AU01** (for Austria) and **CH01** (for Switzerland) and switch *Leading Restriction* on. Then these values are automatically inherited to all occurrences of the *Company Code* field.

#### *Default Values from Business Catalogs*

Business catalogs can contain default values. In rare cases, these might overwrite the values defined by you in the Restrictions and Values section. The system then displays a message listing the default values that are added from the business catalog. To avoid this, you then need to remove the respective business catalog from the business role. The respective symbol looks like this:

## Related Information

[Display Restriction Types \[page 2490\]](#)

[Maintain Restrictions in Business Role](#)

## 6.3.1.14.4.6 How to Download and Upload Business Roles

Download business roles from the source system and then upload them to the target system to make them available there.

### Context

You can download one or more business roles from the source system and then upload them to the target system using an XML file.

### Procedure

1. To download the required business roles, go to your source system and select them.
2. Click [Download](#) and save the XML file on your hard drive.
3. To upload the required business roles, go to your target system and click [Upload](#).
4. Browse for the XML file and click [OK](#).

#### ⚠ Caution

Please do not modify the XML file on your hard drive before uploading it to the target system. This can lead to technical issues.

#### ℹ Note

Some business catalogs with tenant-specific functions might not be in scope in all target tenants. For example, the business catalog [Extensibility - Transport Management - Export \(SAP\\_CORE\\_BC\\_SL\\_EXP\)](#) provides authorizations for exporting key user extensibility. As you can't export key user extensibility transports from the production system (but only import them), the business catalog may not be available in your production system.

## 6.3.1.14.4.7 How to Create Leading and Derived Business Roles

### Context

If you need to create several business roles with common characteristics, you can define one business leading role and then derive other business roles from it. This leading role contains the basic settings such as access

restrictions, the assigned business catalogs and common restrictions, such as *General Accountant* or *General Planner*. The values defined in the leading business role can't be changed in the derived business role. You can, however, define additional values for the derived role.

## Procedure

1. Open the business role you want to define as master business role and click *Edit*.
2. Select the *Is Leading Business Role* checkbox and click *Save*. The business role now has a *LEADING BUSINESS ROLE* label.
3. Go back to the list view, select this master business role and click *Create Derived Business Role*.
4. The system suggests a business role ID you can enhance.
5. Enter a role description and click *OK*. The system displays the business role maintenance screen. The business role has a *DERIVED BUSINESS ROLE* label.
6. Add further values to the derived business role as required.
7. Save your entries.

## 6.3.1.14.4.8 How to Compare Business Roles

### Context

To display the common features and the differences between business roles, you can compare them in the *Maintain Business Roles* app. On the *Compare Business Roles* screen, you can display the restrictions, business users, business catalogs and launchpad spaces, which the business roles have in common, or those that the business roles don't have in common. You can only compare a maximum of two business roles. They can be active or in draft mode.

### Procedure

1. On the *Maintain Business Roles* initial screen, select the two business roles you want to compare.
2. Click *Compare*. The system displays the *Compare Business Roles* screen for these two business roles including information about the assigned restrictions, business users, business catalogs and launchpad spaces.

If the *Write*, *Read* or *Value Help* access category is restricted in both roles, you can navigate further to display the assigned restriction types for that access category.

### Restrictions

You have the following options for comparing restrictions:

*Display All*

Display all restriction types assigned to one of the roles or to both.

*Display Same Restriction Types with Same Values*

Display the restriction types that are assigned to both roles and have the same values in both roles.

*Display Same Restriction Types with Different Values*

Display the restriction types that are assigned to both roles and have different values in each role.

*Display only Differences*

Display only the differences between the two roles, for example if a restriction type is only assigned to one role but not to the other role.

The restriction types are coloured as follows:

Colour	Explanation
Green	The restriction type is assigned to both roles and in both roles, the values are the same.
Orange	The restriction type is assigned to both roles but the values are different.
Red	The restriction type is only assigned to one role but not to the other.

If the restriction types are colored in green or orange, you can navigate further and display more details.

The system displays the restriction types assigned to the roles you want to compare next to each other. If there are differences between the two roles, the order of the instances reflects the degree of similarity. You can use drag and drop if you want to compare two other restriction types than the ones suggested by the system.

### **Business Users, Business Catalogs and Launchpad Spaces**

You have the following options for comparing business users, business catalogs and launchpad spaces:

*Display All*

Display all business users, business catalogs and launchpad spaces that are assigned to one of the roles or both.

*Display Only Common Business Users / Display Only Common Business Catalogs / Display Only Common Launchpad Spaces*

Display only the business users, business catalogs or launchpad spaces the two business roles have in common or that are assigned to both.

*Display only Different Business Users / Display only Different Business Catalogs / Display Only Different Launchpad Spaces*

Display only the business users, business catalogs or launchpad spaces that differ from one business role to the other or that are assigned to one business role but not to the other.

## 6.3.1.14.4.9 How to Create Spaces and Pages for a Business Role

### Context

When creating a new business role, you can create a new launchpad space, use an existing launchpad space or launchpad spaces based on a predefined space. If required, you can add multiple spaces to the role by clicking [Add](#) on the [Assigned Launchpad Spaces](#) tab. If a launchpad space is no longer relevant for a role, you can click [Remove](#). Please note that you can assign an existing launchpad space to several business roles at once. For more information, see the [Related Information](#) section.

#### Note

The group-based home page is deprecated. It will be removed in a future version. For new systems (starting with SAP S/4HANA Cloud 2302), the group-based home page is no longer available. It will be replaced with the spaces and pages mode. Therefore, a warning message is shown. It appears when you save a business role without an assigned space. It reminds you that you need to assign a space to make the tiles visible for the users when you have already switched to the spaces and pages mode.

For more information, see SAP Note [2970113](#) .

### Related Information

[How to Make Mass Changes to Business Roles \[page 2468\]](#)

## 6.3.1.14.4.10 How to Transport Business Roles

### Context

You can export business roles from your quality system to your productive system using customizing transports.

#### Note

- Once you have transported a business role, no change documents will be written for this business role in the productive system. Change documents for transported business roles are only available in the quality system.

- If you transport a derived business role, the leading business role and all other derived business roles need to be added as dependencies to the transport request as well. If you transport a leading business role, all derived business roles need to be added as dependencies to the transport request as well.
- Please note that business roles that are pre-delivered by SAP (business roles whose ID starts with SAP\*) cannot be transported.

## Procedure

1. In the *Business Roles* overview screen of the *Maintain Business Roles* app, select one or more business roles.
2. Click *Add to Transport*. A list of available customizing transports appears.

### Note

The default transport is always displayed as well as your own transports. If no transport exists, a confirmation dialog is shown. If you confirm, a new transport is created.

3. Select the required transport and click *OK*. The selected business roles are then added to the transport.
4. Open the *Export Customizing Transports* app and release your request. For more information, see [Export Customizing Transports \[page 2380\]](#).
5. Import your business role to the target system:
  - a. Open the *Manage Software Components* app.
  - b. Select *Business Configuration* in the *Type* dropdown and click *Go*.
  - c. Select the component to which the relevant configuration was exported.
  - d. In the detail view of the component, check out the change that contains your business role(s). For more information, see [How to Work with Branches](#).

### Note

If you want to delete a business role that was previously transported or is currently included in an open transport request, the system offers you to add it directly to an available transport.

If the business role was previously transported and there is currently no transport available, a confirmation dialog is shown. If you confirm, a new transport is created.

## Related Information

[Working in the Export Customizing Transports App \[page 2382\]](#)

[Manage Software Components](#)

[How to Delete Previously Transported Business Roles \[page 2467\]](#)

## 6.3.1.14.4.10.1 How to Delete Previously Transported Business Roles

### Context

If you want to delete a business role that was previously transported or is currently included in an open transport request, the system offers you to write it directly to an available transport.

### Procedure

1. In the *Business Roles* overview screen of the *Maintain Business Roles* app, select one or more business roles you want to delete.
2. Click *Delete* and confirm the dialog. A list of available customizing transports appears.

#### Note

The default transport is always displayed as well as your own transports. If no transport exists, a confirmation dialog is shown. If you confirm, a new transport is created.

3. Select the required transport and click *OK*. The deletion of the selected business roles is then added to the transport and the selected roles will be deleted.

#### Note

Your selection may contain business roles that were not previously deleted. These will be deleted directly without a transport. The system also offers you to delete the business role without transporting the deletion. The role will not be deleted in the target system in this case.

4. Open the *Export Customizing Transports* app and release your request. For more information, see [Export Customizing Transports \[page 2380\]](#).
5. Import your business role to the target system:
  - a. Open the *Manage Software Components* app.
  - b. Select *Business Configuration* in the *Type* dropdown and click *Go*.
  - c. Select the component to which the relevant configuration was exported.
  - d. In the detail view of the component, check out the change that contains your business role(s). For more information, see [How to Work with Branches](#).

### Related Information

[Working in the Export Customizing Transports App \[page 2382\]](#)  
[Manage Software Components](#)

## 6.3.1.14.4.11 How to Make Mass Changes to Business Roles

### Context

You can use the mass change wizard to change multiple business roles at once. This is helpful, for example, if you have switched from using custom spaces to predefined spaces or if you start using spaces. In that case, you can select all affected business roles and click [Assign Predefined Spaces](#). The system then automatically assigns predefined spaces to all of the business roles in question. If you click [Remove Launchpad Spaces Already Assigned](#), the custom spaces that were assigned to the business roles previously are automatically removed.

#### Note

Please note that SAP-defined business roles can only be modified for business user assignment in the initial set-up. Apart from this, they can be updated by SAP only. We recommend that you create your own business roles from templates so that you can modify them as required.

Select the business roles you want to change and click [Mass Change](#). The [Mass Change Wizard](#) appears. It has the following pattern:

### Procedure

1. Select the required attributes. You can make the following changes:

Area	Attributes
Business Role Data	Role Group
	Expose to SAP BTP
	Inherit Spaces in Derived Business Roles
Business User Assignment	Add Business Users
	Remove Business Users
Business Catalog Assignment	Add Business Catalogs
	Remove Business Catalogs
Launchpad Space Assignment	Add Launchpad Spaces
	Remove Launchpad Spaces

Area	Attributes
<b>Assign Predefined Spaces</b>	<p>Assign predefined spaces your business roles</p> <p>You see the results and can filter for error or success statuses in the <a href="#">Mass Change Overview</a>.</p> <div style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 10px; margin-top: 10px;"> <p><b>Note</b></p> <p>Please note that this option is only relevant for business roles that were created from business role templates.</p> </div>
<b>Access Categories</b>	Change access categories as required.
<b>Restrictions</b>	Select the required access category, such as <a href="#">Value Help</a> and select the required restriction change, such as <a href="#">Add Restrictions</a> .
<b>Copy Restrictions</b>	<ol style="list-style-type: none"> <li>1. Click <a href="#">Add Restrictions</a> or <a href="#">Remove Restrictions</a>.</li> <li>2. Copy the required restrictions using the <a href="#">Copy Restriction Values From</a> and the <a href="#">Copy Restriction Values To</a> value help.</li> <li>3. Select additional access categories if needed.</li> </ol> <div style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 10px; margin-top: 10px;"> <p><b>Note</b></p> <p>You can use this option in case a restriction type is deprecated to copy restrictions from the deprecated restriction type to the successor restriction type(s). You can either add the copied restriction values in the fields to existing ones or remove all and replace them with the copied restrictions.</p> </div>

2. Apply the required attributes to your business roles.
3. Review and confirm your changes.

Please note that some attributes might not be changeable if you have selected a combination of leading, non-leading and derived business roles. If you only select leading roles, all of the listed attributes are changeable.

## Related Information

[Assigning Spaces to Several Business Roles at Once](#)

[How to Maintain Restrictions Using the Mass Change Wizard \[page 2489\]](#)

### 6.3.1.14.5 Maintain Business Role Groups

With this app you can create business role groups and assign multiple business roles to them. This helps you to organize your area and easily search for all business roles of a certain category (for example to assign business

users to them). Grouping also facilitates maintenance of authorizations. If you are the super administrator for all areas, you can delegate this task to administrators for the relevant areas, such as Financials. In this case, you would create a business role group for Financials and allow to assign these business roles only to particular user groups.

Please note that the name of business role group is created automatically in namespace [ZCB](#).

## Key Features

You can use this app to:

- Create business role groups and assign the required business roles to them
- Reassign/remove business roles to/from business role groups  
Note: You can also use drag and drop to move business roles from one group to another.
- Upload business role assignments
- Add business role groups to transports
- Export business role groups to a spreadsheet (including description and number of business roles)

## Prerequisites

The following restriction types (in the following business catalogs) are required for maintaining business role groups and business user groups:

Business Catalogs	Restriction Types
SAP_CORE_BC_IAM_RM	<i>Business Role</i> (S_BRL)
SAP_CORE_BC_IAM_UM	<i>Business User</i> (CLASS)
SAP_CORE_BC_IAM_RA	<i>Business Role</i> (S_BRL) <i>Business User</i> (CLASS)
SAP_CORE_BC_IAM_RM_DISP_PC	<i>Business Role</i> (ROLE_GROUP)
SAP_CORE_BC_IAM_UM_DISP_PC	<i>Business User</i> (CLASS)

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-IAM`.

### 6.3.1.14.5.1 How to Transport Business Role Groups

#### Context

You can export business role groups from your quality system to your productive system using customizing transports.

#### Procedure

1. In the *Business Role Groups* overview screen of the *Maintain Business Role Groups* app, select one or more business role groups.
2. Click *Add to Transport*. A list of available customizing transports appears.

##### Note

The default transport is always displayed as well as your own transports. If no transport exists, a confirmation dialog is shown. If you confirm, a new transport is created.

3. Select the required transport and click *OK*. The selected business role groups are then added to the transport.
4. Open the *Export Customizing Transports* app and release your request. For more information, see [Export Customizing Transports \[page 2380\]](#).
5. Import your business role groups to the target system:
  - a. Open the *Manage Software Components* app.
  - b. Select *Business Configuration* in the *Type* dropdown and click *Go*.
  - c. Select the component to which the relevant configuration was exported.
  - d. In the detail view of the component, check out the change that contains your business role group(s). For more information, see [How to Work with Branches](#).

##### Note

If you want to delete a business role group that was previously transported or is currently included in an open transport request, the system offers you to add it directly to an available transport.

If the business role group was previously transported and there is currently no transport available, a confirmation dialog is shown. If you confirm, a new transport is created.

## 6.3.1.14.6 Maintain Business Roles

With this app you can access the maintenance UI for restrictions as well as the [Restrictions Overview](#).

With the [Maintain Business Roles](#) app, you can also define business roles by combining predefined business catalogs. You use business roles to control the access to your applications. The predefined catalogs contain the actual authorizations that allow users to access apps and allow to define instance-based restrictions where necessary. Business catalogs bundle authorizations for a specific business area. Once you have created a business role, you can assign it to multiple business users who perform similar business tasks.

### Note

This app is the successor of the [Maintain Business Roles \(Deprecated\)](#) app. We recommend that you switch to the successor app as soon as possible.

You can still use the old [Maintain/Display Restrictions](#) view until the deprecated app will be removed from the system. You can directly navigate to this view from the successor app.

## Key Features

You can use this app to:

- Display the [Restrictions Overview](#)
- Maintain restrictions in a new UI
- Create business roles from scratch (based on selected business catalogs)
- Create business roles from a template delivered by SAP
- Download business roles from the test system and then upload them to the productive system per `XML` file
- Assign one or more business roles to a business user
- Copy business roles
- Delete business roles

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-IAM`.

## Related Information

[Maintain Restrictions UI \[page 2480\]](#)

[Restrictions Overview \[page 2482\]](#)

### 6.3.1.14.6.1 How to Create a New Business Role

Get an overview of how to create a new business role from scratch based on selected business catalogs.

#### Context

You use business roles to control the access to your applications. To create a business role, you add one or multiple business catalogs to it. These predefined catalogs contain the actual authorizations that allow users to access apps and allow to define instance based restrictions where necessary. Business catalogs bundle authorizations for a specific business area. Once you have created a business role, you can assign it to multiple business users who perform similar business tasks.

#### Note

Please note that this document describes how to create a business role without a template. For more information on how to create a business role from a template, see the [Related information](#) section.

#### Process Steps

#### Procedure

1. Select the tile of the Maintain Business Roles app on the SAP Fiori Launchpad to open the app. On the initial screen, select [New](#).
2. Add general role details, such as business role name, ID and description.
3. On the [Assigned Business Catalogs](#) tab, select [Add](#) to add the required business catalogs. Select the catalogs according to the business activities that the users with this role need to perform. Select [Apply](#).

#### Note

Some business catalogs require additional dependent catalogs to be assigned to enable access to associated master data information (for example, for business partners or customers). These additionally required catalogs ensure access to all business objects used with the SAP Fiori apps of the main catalog. When you select the business catalogs you want to add to the business role and click

*Add*, a list of dependent business catalogs is displayed. You can then select all the dependencies you want to add.

4. By default, the value help and read access for each business catalog is set to unrestricted and there is no write access. If you want to change these restrictions, select *Maintain Restrictions*.
5. Maintain instance-based restrictions for all required business objects (following the requirements of your local authorization concept).
6. If required, click *Manage Launchpad Space* to create a new space or use an existing space. For more information, see the *Related information* section below.

#### Note

The group-based home page is deprecated. It will be removed in a future version. For new systems (starting with SAP S/4HANA Cloud 2302), the group-based home page is no longer available. It will be replaced with the spaces and pages mode. Therefore, a warning message is shown. It appears when you save a business role without an assigned space. It reminds you that you need to assign a space to make the tiles visible for the users when you have already switched to the spaces and pages mode.

For more information, see SAP Note [2970113](#).

7. On the *Assigned Business Users* tab, you can assign the business users to your new business role. These users will receive the authorizations as defined in the business role.
8. Save the business role to activate it.

#### Note

If you go back to the business roles overview **without saving** the business role, the business role will automatically be saved in a draft status. You can access it again and edit it from the business roles overview.

## Related Information

[How to Create a Business Role from a Template \[page 2455\]](#)

### 6.3.1.14.6.2 How to Create a Business Role from a Template

Get an overview of how to create a business role from a template.

## Context

Instead of creating a business role from scratch, you can also create it from a business role template.

## Note

A business role template is defined by SAP to make it easier for you to find the business catalogs that might be relevant for the corresponding role in your company. Usually, the business role templates have a very broad job profile to show all options. SAP does not recommend using them in their full scope because the business catalogs might conflict with the roles in your company. Instead, adjust them to the tasks of the role in your company by choosing only the relevant business catalogs. We also recommend that you only use business role templates for testing and not for generating productive roles.

If changes to the template were included in an upgrade, the *Business Role Templates* app informs you about these changes and how they affect your business roles. For more information, see *Business Role Templates* (Related Information).

When you create a role based on a template, as a default the read and value help access are unrestricted, and write access is not granted. You can change this and define for each field to which a catalog provides access what a user is allowed to see and to edit. This allows you to shape your business roles in a very detailed way. For example, you can create two roles that comprise the same catalogs, but role 1 is restricted to work with data for the US, and role 2 is restricted to work only with data for Germany.

## Process Steps

## Procedure

1. Select the tile of the *Maintain Business Roles* app on the SAP Fiori launchpad to open the app. On the initial screen select *Create From Template*.
2. Select the required template. Define the ID and the name of the new business role. If required, go to the *Assigned Launchpad Spaces* tab, click *Add*, select *Use Predefined Space*, select the required launchpad space and click *Assign Space* (for more information, see the *Related Information* section below). Click *OK*.
3. A template already contains one or more business catalogs that the business role will be assigned to. Adjust the displayed template to your requirements, for example, change the general role details, and add or delete catalogs.
4. By default, the value help and read access for each business catalog is set to unrestricted and there is no write access. If you want to change these restrictions, select *Maintain Restrictions*.
5. Maintain instance-based restrictions for all required business objects (following the requirements of your local authorization concept).
6. On the *Assigned Business Users* tab, you can assign the business users to your new business role. These users will receive the authorizations as defined in the business role.
7. Save the business role to activate it.

## Note

If you go back to the business roles overview **without saving** the business role, the business role is automatically saved in a draft status. You can access it again and edit it from the business roles overview.

### 6.3.1.14.6.3 How to Create a Business Role for the Administrator

Get an overview of how to create a business role for the administrator if you haven't used the system before.

#### Context

If you as an administrator haven't used the Fiori apps before, you have to create an administrator business role first. Otherwise the app tiles are not visible on the Fiori Launchpad. With this role, you can create all other business roles according to the needs of your company.

#### ⚠ Caution

The SAP\_BR\_ADMINISTRATOR role is pre-defined by SAP and only intended for the initial set-up of a system. Please create your own business roles based on the required business role template for productive use.

To create a business role for the administrator, proceed as follows:

#### Process Steps

#### Procedure

1. Use the initial credentials that you have received separately e.g. via email, to log in to the system. On the SAP Fiori Launchpad select the tile *Maintain Business Roles* to open the app.
2. Select *Create From Template*. The *Create Business Role from Template* window opens. In the field *Template*, search for SAP\_BR\_ADMINISTRATOR. Define the ID and the name of the new business role.
3. A predelivered template contains a number of catalogs that in this case an administrator could need to perform tasks. These catalogs are displayed on the *Assigned Business Catalogs* tab. By default for each catalog the read access is unrestricted and there is no write access. If you want to change the restrictions, for example, to allow unrestricted write access for all catalogs, proceed as follows:
  - a. Select *Maintain Restrictions*.

- b. On the new screen, select the restriction you would like to change.  
Under *Write*, select *Unrestricted*.
  - c. Select *Back to Main Page* to save the changes.
4. On the *Assigned Business Users* tab, all users that are assigned to the selected catalogs are listed. To add a business user, proceed as follows:
  - a. Select *Add*.
  - b. In the *Add Business Users* window, search for your own business user and select *Apply*.
5. Save the business role to activate it.

#### Note

If you go back to the business roles overview **without saving** the business role, the business role will automatically be saved in a draft status. You can access it again and edit it from the business roles overview.

You can now log out from the system and log in with your own credentials and proceed creating further business roles according to the needs of your company

## 6.3.1.14.6.4 How to Edit Active Business Roles

### Context

The editing of an active business role takes place in a draft version of this business role. This draft version is created by the system once you enter the edit mode of the active business role. Proceed as follows to edit an active business role:

Select the tile of the Maintain Business Roles app on the SAP Fiori Launchpad to open the app. On the initial screen, select

### Procedure

1. Select the tile of the *Maintain Business Roles* app on the SAP Fiori Launchpad to open the app.
2. On the initial screen, open the business role you need to edit by clicking on it in the *Business Roles* list. Alternatively, you can either use the *Search* or filter for the business role ID, for example.
3. To enter the edit mode, click *Edit*.

A draft version of the business role is created in which the editing takes place. The active business role remains.

4. Make the required changes to the business role.
5. Save the business role.

Once the changes are saved, they are written into the active business role and the draft version disappears.

**If the dialog for editing a business role is left without saving the business role**, the active business role

as well as the draft version of the business role will be available in the business roles overview. In this case, you can continue editing the draft version later.

## 6.3.1.14.6.5 How to Define Authorizations Based on Restrictions

### Context

The authorization concept for business roles is based on the concept of granting authorizations (as opposed to denying them). By adding business catalogs to a business role and assigning the business role to a business user, you can control which applications the business user is authorized to carry out. As a next step, you define how the customer data can be accessed. You do this by adding authorization values to the restriction fields. Restriction fields are organized in restriction types. Restriction types that contain general organizational restriction fields can be found in the top section called *General*. These restriction types contain only one restriction field. The settings you make for the single restriction types sum up to the authorization that is granted to the business role and therefore to the assigned business users.

#### ⚠ Caution

Please note that assigning multiple business roles to a business user increases the risk of overriding existing authorizations.

For example, you have created the business roles 1 and 2 that both include the business catalog A. In business role 1, you restricted the access rights for sales organization to A. In business role 2, you allowed to work with data for all sales organizations. The business user to whom you assign both roles will then have full access to the data for all sales organizations.

This overriding effect can also be caused if one restriction type is used in different assigned business roles of different business catalogs.

Using the *Maintain Business Roles* app, you have the following options for maintaining restrictions:

### Procedure

- In the *Maintain Restrictions* UI, you can maintain restrictions for business roles. These restrictions are the basis of authorizations that are granted to the business users who are assigned to this business role. The business catalog defines which access categories are available for maintaining and for which fields restriction values can be maintained.

The following access categories are available:

- *Write, Read, Value Help* (write access)
- *Read, Value Help* (read access)

- [Value Help](#) (value help access)

The business role aggregates the authorizations of the assigned catalogs.

The available restriction fields represent the authorization-relevant attributes of the business objects that are used in a role. Authorization for these fields can be granted on write, read or value help level (for example for a particular sales area).

You can select or enter single values (pre-defined by SAP or customer-specific configuration) and ranges.

For more information, see [Display Restriction Types](#) (Related Information).

### Note

When you set an access category to [Restricted](#) you can define the data access for each restriction type and restriction field according to your process requirements. You can do this on [Read](#), [Write](#) and [Value Help](#) level.

#### Write

- The default value access category when a role is created is [No Access](#). This means that this business role has no write authorizations at all (display only). You can add specific authorizations ([Restricted](#)) or in cases where you want to grant full access for all restriction types and restriction fields, you can choose [Unrestricted](#) (\*').

Switching the write access to [Restricted](#) allows you to define which data can be edited by the users assigned to this business role.

- In the [Values](#) area, you can define the authorization values for the desired restriction fields.

If you don't want to grant access to a restriction field on purpose, you can choose the status [Not maintained](#).

- Every authorization you define in the [Write](#) access category is inherited to the [Read](#) and [Value Help](#) access category.

#### Read

- The default status of the access category [Read](#) is [Unrestricted](#).

Switching the read access to [Restricted](#) allows you to define which data can be seen by the users assigned to this business role.

In the [Values](#) section, you can define the instance-based restrictions for the desired restriction fields used for value helps.

For more information about the [Values](#) area, please refer to the [Write](#) section above.

- Every authorization you define in the [Read](#) access category is inherited to the [Value Help](#) access category.

#### Value Help

- You can define authorizations for value helps that are used in a business role. These value help authorizations will not influence the defined restrictions for read access.

In the context of a business role, you can authorize the value help access, for example to business partners that belong to certain authorization groups.

#### Leading Restriction

- In this section, we will describe how you can reduce the maintenance effort of restriction fields that are used in multiple restriction types of an access category.
- Restriction types that contain general organizational restriction fields can be found in the top section called [General](#). These restriction types contain only one restriction field.

The status of the restriction fields that belong to this section can be changed to *Leading Restriction*. You can do this by selecting the *Leading Restriction* checkbox. This status is visible through the *Leading Restriction* symbol in the *Restrictions Overview*. The respective symbol looks like this:

That means the value in this field is automatically inherited to other restriction types the field is used in as well.

You want to, for example, define that the values for the country templates for Austria and Switzerland are applied in all restriction types the *Company Code* field is used in. So you select the values **AU01** (for Austria) and **CH01** (for Switzerland) and switch *Leading Restriction* on. Then these values are automatically inherited to all occurrences of the *Company Code* field.

#### *Default Values from Business Catalogs*

Business catalogs can contain default values. In rare cases, these might overwrite the values defined by you in the Restrictions and Values section. The system then displays a message listing the default values that are added from the business catalog. To avoid this, you then need to remove the respective business catalog from the business role. The respective symbol that is visible in the *Restrictions Overview* looks like this:

## Related Information

[Display Restriction Types \[page 2490\]](#)

[Maintain Restrictions in Business Role](#)

## 6.3.1.14.6.5.1 Maintain Restrictions UI

### Maintain Restrictions

The *Maintain Restrictions UI* combines all restrictions of a restriction type of all access categories per business role in one place. It includes a main view showing all access categories and assigned restriction types and a detail view where you can change the assigned restrictions and values if required.

#### Main View

At the top of the main view, name and ID of the business role and the defined settings of the access categories are displayed. You can change these if required in the dropdown lists shown directly below. Underneath, the assigned restriction types are listed.

The *More Actions* area in the header includes the following options:

- *Maintain Empty Restrictions*  
When you are in the edit mode you can apply the selected field settings to all empty restrictions of a selected access category.
- *Display Restrictions Overview*  
You can navigate to the *Restrictions Overview* from here and from the object view in both edit and display mode

The following colour scheme of the assigned restriction types helps you to organize your work:

- Green: all restrictions of this type have been processed (either maintained with values or set to *Not Maintained* intentionally)
- Orange: at least one field is still empty

The restriction type you're currently working on is displayed under focus.

### Detail Area

The detail area consists of the following three tabs:

- Values
- Description (if available)
- Business Catalogs

You can carry out the following activities in the detail view:

- Display all restrictions and values of the restriction type that is currently under focus.
- Edit restrictions and values by clicking the pencil icon when you are in edit mode.
  - Maintain the field settings *Restricted*, *Unrestricted Access* or *Not maintained* by selecting the radio buttons. The option *Maintained in Derived Role* is only available if the business role you're currently editing is a leading business role.
  - Select and deselect values from the value help list
  - Add number ranges if number ranges are supported  
Edit or paste multiple values in a comma-separated form in the text area

#### ⓘ Note

Please note that any change in the text area will be processed once you leave the text area.

- Display an overview of all assigned values

#### ⓘ Note

Mass maintenance is supported as well. You do this by selecting multiple restrictions and then clicking on one of the following buttons in the header of the restrictions list:

*Unrestricted Access*

*Not maintained*

*Maintained in derived role* (this option is only available for leading business roles)

- Easily change the access category of a restriction by selecting the following radio buttons: *Write*, *Read*, *Value Help*, *Read*, *Value Help*, or *Value Help*.

- Add other instances of this restriction type of the highest access category (which is automatically selected) by pressing the the [Add](#) button in the header of the restrictions list.
- Define a restriction of the [General type](#) as leading by selecting the [Leading Restriction](#) checkbox.
- Remove restrictions if required by selecting the restrictions and clicking the the [Remove button](#) in the header of the restrictions list.
- Hide fields you have set as [Unrestricted](#). This makes it easier for you to gain an overview of all restrictions. You can do this clicking [Hide Unrestricted](#) in the very top right corner of the screen.

## 6.3.1.14.6.5.2 Restrictions Overview

### Restrictions Overview

You can use the [Restrictions Overview](#) to display all restrictions of different access categories and values that are maintained for the business role. The following filtering options are available:

- [Restriction Field](#)
- [Restriction Type](#)
- [Restriction Type ID](#)
- [Access Category](#)
- [Field Settings](#)

Clicking on a restriction leads you directly to the maintenance screen where you can make adjustments if required. You can also open the maintenance screen by clicking [Maintain Restrictions](#) in the top right corner of the screen.

## 6.3.1.14.6.6 How to Download and Upload Business Roles

Download business roles from the source system and then upload them to the target system to make them available there.

### Context

You can download one or more business roles from the source system and then upload them to the target system using an XML file.

## Procedure

1. To download the required business roles, go to your source system and select them.
2. Click [Download](#) and save the XML file on your hard drive.
3. To upload the required business roles, go to your target system and click [Upload](#).
4. Browse for the XML file and click [OK](#).

### ⚠ Caution

Please do not modify the XML file on your hard drive before uploading it to the target system. This can lead to technical issues.

### 📌 Note

Some business catalogs with tenant-specific functions might not be in scope in all target tenants. For example, the business catalog *Extensibility - Transport Management - Export (SAP\_CORE\_BC\_SL\_EXP)* provides authorizations for exporting key user extensibility. As you can't export key user extensibility transports from the production system (but only import them), the business catalog may not be available in your production system.

## 6.3.14.6.7 How to Create Leading and Derived Business Roles

### Context

If you need to create several business roles with common characteristics, you can define one business leading role and then derive other business roles from it. This leading role contains the basic settings such as access restrictions, the assigned business catalogs and common restrictions, such as [General Accountant](#) or [General Planner](#). The values defined in the leading business role can't be changed in the derived business role. You can, however, define additional values for the derived role.

### Procedure

1. Open the business role you want to define as master business role and click [Edit](#).
2. Select the [Is Leading Business Role](#) checkbox and click [Save](#). The business role now has a **LEADING BUSINESS ROLE** label.
3. Go back to the list view, select this master business role and click [Create Derived Business Role](#).
4. The system suggests a business role ID you can enhance.

5. Enter a role description and click *OK*. The system displays the business role maintenance screen. The business role has a *DERIVED BUSINESS ROLE* label.
6. Add further values to the derived business role as required.
7. Save your entries.

## 6.3.1.14.6.8 How to Compare Business Roles

### Context

To display the common features and the differences between business roles, you can compare them in the *Maintain Business Roles* app. On the *Compare Business Roles* screen, you can display the restrictions, business users, business catalogs and launchpad spaces, which the business roles have in common, or those that the business roles don't have in common. You can only compare a maximum of two business roles. They can be active or in draft mode.

### Procedure

1. On the *Maintain Business Roles* initial screen, select the two business roles you want to compare.
2. Click *Compare*. The system displays the *Compare Business Roles* screen for these two business roles including information about the assigned restrictions, business users, business catalogs and launchpad spaces.

If the *Write*, *Read* or *Value Help* access category is restricted in both roles, you can navigate further to display the assigned restriction types for that access category.

#### Restrictions

You have the following options for comparing restrictions:

##### *Display All*

Display all restriction types assigned to one of the roles or to both.

##### *Display Same Restriction Types with Same Values*

Display the restriction types that are assigned to both roles and have the same values in both roles.

##### *Display Same Restriction Types with Different Values*

Display the restriction types that are assigned to both roles and have different values in each role.

##### *Display only Differences*

Display only the differences between the two roles, for example if a restriction type is only assigned to one role but not to the other role.

The restriction types are coloured as follows:

Colour	Explanation
Green	The restriction type is assigned to both roles and in both roles, the values are the same.
Orange	The restriction type is assigned to both roles but the values are different.
Red	The restriction type is only assigned to one role but not to the other.

If the restriction types are colored in green or orange, you can navigate further and display more details.

The system displays the restriction types assigned to the roles you want to compare next to each other. If there are differences between the two roles, the order of the instances reflects the degree of similarity. You can use drag and drop if you want to compare two other restriction types than the ones suggested by the system.

### **Business Users, Business Catalogs and Launchpad Spaces**

You have the following options for comparing business users, business catalogs and launchpad spaces:

#### *Display All*

Display all business users, business catalogs and launchpad spaces that are assigned to one of the roles or both.

#### *Display Only Common Business Users / Display Only Common Business Catalogs / Display Only Common Launchpad Spaces*

Display only the business users, business catalogs or launchpad spaces the two business roles have in common or that are assigned to both.

#### *Display only Different Business Users / Display only Different Business Catalogs / Display Only Different Launchpad Spaces*

Display only the business users, business catalogs or launchpad spaces that differ from one business role to the other or that are assigned to one business role but not to the other.

## **6.3.1.14.6.9 How to Create Spaces and Pages for a Business Role**

### **Context**

When creating a new business role, you can create a new launchpad space, use an existing launchpad space or launchpad spaces based on a predefined space. If required, you can add multiple spaces to the role by clicking [Add](#) on the *Assigned Launchpad Spaces* tab. If a launchpad space is no longer relevant for a role, you can click [Remove](#). Please note that you can assign an existing launchpad space to several business roles at once. For more information, see the [Related Information](#) section.

### 📘 Note

The group-based home page is deprecated. It will be removed in a future version. For new systems (starting with SAP S/4HANA Cloud 2302), the group-based home page is no longer available. It will be replaced with the spaces and pages mode. Therefore, a warning message is shown. It appears when you save a business role without an assigned space. It reminds you that you need to assign a space to make the tiles visible for the users when you have already switched to the spaces and pages mode.

For more information, see SAP Note [2970113](#).

## Related Information

[Step by Step: Create a New Space and Page for a Business Role](#)

[How to Make Mass Changes to Business Roles \[page 2468\]](#)

## 6.3.1.14.6.10 How to Transport Business Roles

### Context

You can export business roles from your quality system to your productive system using customizing transports.

### 📘 Note

- Once you have transported a business role, no change documents will be written for this business role in the productive system. Change documents for transported business roles are only available in the quality system.
- If you transport a derived business role, the leading business role and all other derived business roles need to be added as dependencies to the transport request as well.  
If you transport a leading business role, all derived business roles need to be added as dependencies to the transport request as well.
- Please note that business roles that are pre-delivered by SAP (business roles whose ID starts with SAP\*) cannot be transported.

### Procedure

1. In the *Business Roles* overview screen of the *Maintain Business Roles* app, select one or more business roles.

2. Click [Add to Transport](#). A list of available customizing transports appears.

#### Note

The default transport is always displayed as well as your own transports. If no transport exists, a confirmation dialog is shown. If you confirm, a new transport is created.

3. Select the required transport and click *OK*. The selected business roles are then added to the transport.
4. Open the [Export Customizing Transports](#) app and release your request. For more information, see [Export Customizing Transports \[page 2380\]](#).
5. Import your business role to the target system:
  - a. Open the [Manage Software Components](#) app.
  - b. Select [Business Configuration](#) in the *Type* dropdown and click *Go*.
  - c. Select the component to which the relevant configuration was exported.
  - d. In the detail view of the component, check out the change that contains your business role(s). For more information, see [How to Work with Branches](#).

#### Note

If you want to delete a business role that was previously transported or is currently included in an open transport request, the system offers you to add it directly to an available transport.

If the business role was previously transported and there is currently no transport available, a confirmation dialog is shown. If you confirm, a new transport is created.

## Related Information

[Working in the Export Customizing Transports App \[page 2382\]](#)

[Manage Software Components](#)

[How to Delete Previously Transported Business Roles \[page 2467\]](#)

## 6.3.1.14.6.11 How to Make Mass Changes to Business Roles

### Context

You can use the mass change wizard to change multiple business roles at once. This is helpful, for example, if you have switched from using custom spaces to predefined spaces or if you start using spaces. In that case, you can select all affected business roles and click [Assign Predefined Spaces](#). The system then automatically assigns predefined spaces to all of the business roles in question. If you click [Remove Launchpad Spaces Already Assigned](#), the custom spaces that were assigned to the business roles previously are automatically removed.

### Note

Please note that SAP-defined business roles can only be modified for business user assignment in the initial set-up. Apart from this, they can be updated by SAP only. We recommend that you create your own business roles from templates so that you can modify them as required.

Select the business roles you want to change and click [Mass Change](#). The [Mass Change Wizard](#) appears. It has the following pattern:

## Procedure

1. Select the required attributes. You can make the following changes:

Area	Attributes
<b>Business Role Data</b>	Role Group
	Expose to SAP BTP
	Inherit Spaces in Derived Business Roles
<b>Business User Assignment</b>	Add Business Users
	Remove Business Users
<b>Business Catalog Assignment</b>	Add Business Catalogs
	Remove Business Catalogs
<b>Launchpad Space Assignment</b>	Add Launchpad Spaces
	Remove Launchpad Spaces
<b>Assign Predefined Spaces</b>	Assign predefined spaces your business roles
	You see the results and can filter for error or success statuses in the <a href="#">Mass Change Overview</a> .
<b>Access Categories</b>	Change access categories as required.
<b>Restrictions</b>	Select the required access category, such as <a href="#">Value Help</a> and select the required restriction change, such as <a href="#">Add Restrictions</a> .
<b>Copy Restrictions</b>	1. Click <a href="#">Add Restrictions</a> or <a href="#">Remove Restrictions</a> .

### Note

Please note that this option is only relevant for business roles that were created from business role templates.

Area	Attributes
	<ol style="list-style-type: none"> <li>2. Copy the required restrictions using the <i>Copy Restriction Values From</i> and the <i>Copy Restriction Values To</i> value help.</li> <li>3. Select additional access categories if needed.</li> </ol> <div style="border: 1px solid #ccc; background-color: #f0f0f0; padding: 10px; margin-top: 10px;"> <p><b>Note</b></p> <p>You can use this option in case a restriction type is deprecated to copy restrictions from the deprecated restriction type to the successor restriction type(s). You can either add the copied restriction values in the fields to existing ones or remove all and replace them with the copied restrictions.</p> </div>

2. Apply the required attributes to your business roles.
3. Review and confirm your changes.

Please note that some attributes might not be changeable if you have selected a combination of leading, non-leading and derived business roles. If you only select leading roles, all of the listed attributes are changeable.

### 6.3.1.14.6.12 How to Maintain Restrictions Using the Mass Change Wizard

#### Context

You can use the *Mass Change Wizard* to maintain restrictions for multiple business roles at once.

#### Procedure

1. Select the required business roles and click *Mass Change*.
2. Under *Access Categories*, select one of the following options:

- [Write, Read, Value Help](#)
  - [Read, Value Help](#)
  - [Value Help](#)
3. Under [Restriction Change](#), select one of the following options:
- [Change General Restriction Values](#)  
You can define new values that should be added to an existing restriction field. If the value was set to [Unrestricted](#) before, this will be removed and replaced with the newly defined values.
  - [Replace General Restriction Values](#)  
You can replace existing values with new values, for example if you want to change the company code from **1000** to **2000**.
  - [Remove General Restriction Values](#)  
You can remove single values if required.
  - [Add Restrictions](#)  
You can add new restrictions of a particular restriction type if required.
  - [Remove Restrictions](#)  
You can remove all restrictions of a particular restriction type.
  - [Change Restriction Values](#)  
You can change the values of all restrictions of a particular restriction type.
  - [Replace Restriction Values](#)  
You can replace the values of all restrictions of a particular restriction type.
  - [Remove Restriction Values](#)  
You can remove the values of all restrictions of a particular restriction type.

## Related Information

### 6.3.1.14.7 Display Restriction Types

You can use this app to display restriction types and their validity.

With this app you can display restriction types, the assigned fields, and in which business catalog the restriction type is used.

## Key Features

You can use this app to:

- Display all available restriction types and their fields.
- Check whether the restriction fields support number ranges.
- Display how these restriction types can be used in which business catalogs.

- Display component: check under which component you can create an incident if required.

Restriction types bundle one or more restriction fields. The restriction type *Organizational Area*, for example, contains the following fields: *Purchasing Group*, *Purchasing Organization*, *Division*, *Sales Organization*, *Distribution Channel*.

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-SRV-APS-IAM.

## 6.3.1.14.8 Manage Business Role Changes After Upgrade

With this app you can display all relevant changes to business catalogs and restriction types after an upgrade. If a new restriction type was added to a business catalog for example, you can maintain the corresponding restrictions using this app.

## Key Features

You can use this app to:

- Display a list of changed restriction types
- Display details of the change
- Filter for certain change types (such as *Added* or *Removed*)
- Display the affected business catalogs and their dependencies
- Display deprecated business catalogs, their successors and adopt the respective changes
- Display the number of affected business roles
- Cross-navigate to the affected business roles in the *Maintain Business Roles* app to view further details
- Mass-maintain restrictions of the same access categories

## Supported Device Types

- Desktop

- Tablet
- Smartphone

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-SRV-APS-IAM.

[How to Manage Changed Restriction Types After an Upgrade \[page 2493\]](#)

[How to Manage Changed Business Catalog Dependencies After an Upgrade \[page 2494\]](#)

[How to Manage Deprecated Business Catalogs After an Upgrade \[page 2495\]](#)

### 6.3.1.14.8.1 Manage Business Role Changes After Upgrade: Background

It is important for you to know how the quarterly release changes impact your productive business roles.

Business role changes often have the technical reason that new developments may require changes to existing applications, business catalogs, restriction types and/or restriction fields. The affected business roles need to be adapted accordingly to ensure that existing apps behave consistently before and after the upgrade.

The following typical changes might occur:

- Business catalogs were deprecated or split, or have new dependencies so new business catalogs need to be assigned.
- New apps were added to existing business catalogs.
- New restriction types were added, removed, or access categories were changed.

### 6.3.1.14.8.2 Best Practices for Managing Business Role Changes After an Upgrade

We recommend downloading a list of all the changes that have taken place after an upgrade before you adjust your business roles using the *Manage Business Roles After an Upgrade* app. You can do this by clicking *Download* (csv format is supported). This helps you to keep an overview of what has changed. Once you have modified your business roles, the respective changed objects disappear from the list in the app. It is therefore advisable to keep a separate worklist on your local machine.

We also recommend adjusting your business roles using the [Manage Business Roles After an Upgrade](#) app only if one change applies to one business role. If there is more than one change, we recommend making the required changes manually in the [Maintain Business Roles](#) app.

#### **Restriction Types / Business Catalog Dependencies**

An affected business role is no longer shown in the list once the business role has been saved the first time after the upgrade/update.

The change itself will no longer be visible in the app after all listed affected business roles have been saved the first time after the upgrade/update.

#### **Deprecated Business Catalogs / Business Role Template**

An affected business role is no longer shown in the list once the respective change has been incorporated in the business role.

The change itself will no longer be visible in the app after the respective change has been incorporated in all affected business roles.

## **6.3.1.14.8.3 How to Manage Changed Restriction Types After an Upgrade**

### **Context**

If you want to have transparency over all of the changes to restriction types after an upgrade, and you want to maintain the corresponding restrictions in your business roles, proceed as follows:

### **Procedure**

1. Select the [Manage Business Role Changes After Upgrade](#) tile on the SAP Fiori Launchpad to open the app. On the initial screen, view the [Restriction Types](#) area to get an overview of what has changed with the last upgrade. Filter for certain change types if required, for example if you only want to see the removed or the added restriction types.
2. Download a csv file containing all recently changed restriction types if required.
3. Click on the required restriction type to check how the changed restriction types affect your business roles. The business roles affected by the changes to this restriction type are displayed in a list. By clicking on the restriction type [Name](#) above the list, you can view a description of the restriction and a list of business catalogs in which this restriction type has been changed (for example added or removed). Please note that any derived roles will be filtered out from the list of the affected business roles to allow for synchronization with the master role.
4. To find more information about the affected business roles or to make further changes, you can cross-navigate to the [Maintain Business Roles](#) app by clicking on the link listed in the [Business Role ID](#) column.

When you click on the *Information* pushbutton next to the link, a list of all other changes that have affected the business role after the upgrade and that might be relevant for you as well is displayed.

5. To make the necessary changes in your business roles, select the required business role and click *Maintain (Write, Read, Value Help) Restrictions*. Restrictions can be mass-maintained for multiple business roles if the roles have the same access categories. If they have different access categories, the pushbutton is disabled. On the *Maintain Restrictions* screen, you can also view the related business catalogs and the business roles selected on the previous screen. You see the restriction fields of the restriction you are currently maintaining. To see other restrictions these business roles might include, click the glasses icon (*Display Restrictions*) to cross-navigate to the *Maintain Business Roles* app.
6. Click the *Edit* icon and assign the required values or ranges. Click *Not maintained* if you want to make clear that you have not maintained a field on purpose and not by accident.
7. Click *Apply*.

## Results

The system displays the results of the update in a pop-up. If the update has been successful, a green icon is visible. If issues occurred, a warning message is displayed.

When you close the pop-up, you will be directed to the main view again.

## 6.3.1.14.8.4 How to Manage Changed Business Catalog Dependencies After an Upgrade

### Context

If you want to have transparency over all the changes to business catalog dependencies after an upgrade, proceed as follows:

### Procedure

1. Select the *Manage Business Role Changes After Upgrade* tile on the SAP Fiori Launchpad to open the app. On the initial screen, view the *Business Catalog Dependencies* area to get an overview of what has changed with the last upgrade. Filter for certain change types if required, for example if you only want to see the removed or the added dependencies.
2. Download a csv file containing all recently changed business catalog dependencies if required.
3. Click on the required business catalog dependency to check how the changed dependency affects your business roles. The business roles affected by the changes to this dependency are displayed in a list. By clicking on the business catalog *Name* above the list, you can view a description of the business catalog and its newly added dependencies or recently removed dependencies after an upgrade.

4. To find more information about the affected business roles or to make further changes, you can cross-navigate to the *Maintain Business Roles* app by clicking on the link listed in the *Business Role ID* column.

## 6.3.1.14.8.5 How to Manage Deprecated Business Catalogs After an Upgrade

### Context

If you want to view all deprecated business catalogs after an upgrade, you want to assign the successor business catalogs and adopt the relevant changes in your business roles, proceed as follows:

### Procedure

1. Select the *Manage Business Role Changes After Upgrade* tile on the SAP Fiori Launchpad to open the app. On the initial screen, view the *Deprecated Business Catalogs* area to get an overview of what has changed with the last upgrade.
2. Download a csv file containing all recently deprecated business catalogs if required.
3. Click on the required business catalog to check how the deprecation affects your business roles. The business roles affected by the deprecated business catalog are displayed in a list. By clicking on the business catalog *Name* above the list, you can view a description of the deprecated business catalog and the successor business catalog.
4. Select the required business role and click *Adopt Changes* if you want to take over the changes to your business roles. Please note that you might lose your maintained restrictions by doing this. We recommend that you validate the business role after the automatic adoption. By adopting the changes, you add all the successors business catalogs to the selected roles. The deprecated catalog will be removed.

#### Note

If the deprecated business catalogs contain extensions and you click *Adopt Changes*, the included extensions will be removed. If you want to keep these extensions, you need to re-assign them.

5. Select the *Add the dependent business catalogs of the successor business catalogs* checkbox if required.
6. Click *OK*. The system displays a progress bar and a list of change results when it is done.
7. Click *Close* to return to the *Deprecated Business Catalogs* area.

## 6.3.1.14.8.6 How to Manage Business Role Template Changes After an Upgrade

### Context

To get an overview of changes in the business role template area since the last upgrade, you can display any differences between business role and business role template in the [How to Manage Business Role Changes After an Upgrade](#) app. Either the template or the role that was based on the template might have changed. For example, business catalogs might have been added or removed. To apply these changes in a detailed maintenance screen, you can cross-navigate to the [Business Role Templates](#) app.

### Procedure

1. Select the [Manage Business Role Changes After Upgrade](#) tile on the SAP Fiori Launchpad to open the app. On the initial screen, the [Business Role Templates](#) area provides an overview of what has changed with the latest upgrade.
2. Download a csv file containing all recently changed business templates if required.
3. Click on the required business role template for details of the changes. The type of change (for example [Different from Business Roles](#)) is already displayed on the initial screen.
4. To display a detailed comparison, select one or more affected business roles and click [Compare with Business Role Template](#). This takes you to the [Business Role Templates](#) app.
5. All deviations of the business roles from the business role templates are displayed in a table. You can click [Apply All](#) if you want to take over all of the changes. Alternatively, you can go through the list and select deviations you would like to apply.

You can define one role as leading and all changes you make to this role will be automatically transferred to the roles you selected in the [Deviations](#) table.

6. Click [Save](#) when you're done.

Please note that you can also adjust your business roles directly in the [Business Role Templates](#) app.

### Related Information

[Business Role Templates \[page 2507\]](#)

## 6.3.1.14.8.7 Phase-In / Phase-Out Status

If a restriction is in status *Phase-In*, the values have no effect in the system at the moment. Therefore, you can prepare your system for new restrictions that will be active in the next release.

The *Phase-Out* status denotes that the restriction will be removed in the next release.

## 6.3.1.14.9 Display Technical Users

This app shows all technical users that exist in the system. To call the app, log on to your SAP Fiori Launchpad and go to ► [Identity and Access Management](#) ► [Display Technical Users](#) ►.

### Purpose

This app has two tabs:

- Technical User
- SAP Support User Request Log

In the *Technical User* tab, you can display technical users that can be services that are used to automate technical tasks in the system, for example, a print queue user who pulls print jobs remotely. In addition, the service and support users of the software provider or hosting provider are technical users.

In the *SAP Support User Request Log* tab, you can display more information about when and why SAP support users accessed your customer system in the past 12 months. For each support user, the relevant incident ID, access level, access category, customer user, request date and validity date is displayed when you click on the required entry in the *Users* list. SAP support user IDs are pseudonymized to respect the data subject rights of SAP employees according to GDPR.

### Key Features

You can use this app to:

- Lock or unlock the following types of technical users: Print users and communication users
- Change the user name and password of some types of technical users
- Display details of which support users were created for the system
- Display all technical users in the system
- Export user data (such as *User ID* or *User Group*) to a spreadsheet if required

#### ⓘ Note

To lock and unlock communication users, use the [Maintain Communication Users](#) app. See section Related Information.

All users are assigned to one of the following user groups:

#### User Groups

Group	Explanation
<b>SAP Technical Users</b>	<p>These users are predefined by SAP to run tasks in the system for cloud operation activities and automated processes. SAP technical users are also required for customer-specific tasks, such as running and scheduling jobs. The required job template contains the SAP technical user needed to run the job by default.</p>
<b>Communication Users</b>	<p>In this group, all communication users used in communication arrangements that are managed by customers are displayed.</p> <p>Communication users are technical users required for communication between your system and any integrated system. The following types of communication users are available:</p> <ul style="list-style-type: none"><li>• SAP communication users: Predefined by SAP</li><li>• Communication users: Created by customers</li></ul> <p>Custom communication users are created in the <a href="#">Maintain Communication Users</a> app and are assigned to systems for inbound and outbound communication. These technical users either use basic authentication or certificates to communicate between your system and the integrated system. The communication system, together with a communication scenario, is assigned to a communication arrangement. Thus, all communication scenario roles are assigned to the communication user which provides this user with all permission required for the connection between your system and the integrated system.</p>
<b>Support Users</b>	<p>SAP uses support users to provide customers with support if issues occur in the system. These users only exist temporarily and are deleted by SAP after the support process is completed.</p>

## Supported Device Types

- Desktop
- Tablet

## SAP Technical Users

SAP*	This user has always been used in on-premise systems to log on to newly created tenants. This user is locked in your tenant and it's not used for any system operation.
SAP_CUST_BUS	This user is a reference user assigned to all customer business users and SAP support users. General authorizations required for basic system access are assigned through this reference (for example to access Fiori Launchpad). The user can't be used by itself. It's locked and has no logon credentials.
SAP_LMADM	This user is used for system internal, automated software lifecycle management across all tenants. It's used in processes that need to update tenant-specific data after changes to tenant-independent data. This user is unlocked. External system logon isn't possible.
SAP_SMTP_IN	This user is used as the SMTP mail server user.
SAP_SPC	This user is used for SAP-internal automated system operation.
SAP_SYSTEM	This user is the default user to run system-internal technical jobs.
SAP_WFRT	This user is used by Business Workflow for the automated background processing of work items.
SAP_WSRT	This user is used for system internal processing in the Web service runtime.

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-IAM`.

### 6.3.1.14.9.1 SAP Support User Request Log

In the *Display Technical Users* app, you can display more information about when and why SAP support users accessed your customer system in the past 12 months. For each support user, the relevant incident ID, access level, access category, customer user, request date and validity date is displayed when you click on the required entry in the *Users* list. SAP support user IDs are pseudomized to respect the data subject rights of SAP employees according to GDPR.

## Related Information

[Access Levels \[page 2500\]](#)

[Access Categories \[page 2502\]](#)

### 6.3.1.14.9.1.1 Access Levels

Authorizations of SAP support users

Access levels define the authorizations of SAP support users when accessing customer systems.

Access Levels

Name	Use
<i>SUPPORT_DEFAULT</i> (Platform Analysis, Display Configuration, No Business Authorization)	The <i>SUPPORT_DEFAULT</i> access level provides display access to ABAP Platform transactions, display of Customizing tables and views, display of system tables with content delivered by SAP or transported in customer systems. It also provides authorization to display, activate and deactivate transient logs and traces without access to payload data. It grants authorization for the debugging of the own user and external debugging of other users. Authorization to change values of variables or to alter the code flow in the debugger is not granted. In case business authorizations are required for support, they are agreed in customer support cases and are copied from a specific customer business user or customer communication user as additional authorization.
<i>SUPPORT_DEFAULT_APP</i> (Platform Analysis, Display Configuration, Display Business Data)	The <i>SUPPORT_DEFAULT_APP</i> access level inherits all the authorizations from the <i>SUPPORT_DEFAULT</i> access level. Additionally, it grants display access to application tables and selected business transactions that enable analysis. It includes display of most business application logs as well as display, activation and deactivation of transient traces with access to payload data. Authorization to change customer data is not granted.
<i>SUPPORT_EXTENDE</i> D (Platform Analysis, Limited Administration, Full Business Authorization)	The <i>SUPPORT_EXTENDE</i> D access level inherits all the authorizations from the <i>SUPPORT_DEFAULT_APP</i> access level. Additionally, it grants full business application authorization. It includes all backend transactions and reports of the application layer. It grants limited ABAP Platform administration authorization, such as deletion of caches. Authorization to change system configuration, Customizing data, or development objects is not granted.

Name	Use
<a href="#">SUPPORT_CUSTOMIZING</a> (Limited Platform Customizing, Full Business Customizing)	The <a href="#">SUPPORT_CUSTOMIZING</a> access level inherits all the authorizations from the <a href="#">SUPPORT_DEFAULT</a> access level. Additionally, it grants authorization to maintain selected ABAP Platform Customizing as well as unrestricted business application Customizing.
<a href="#">SUPPORT_CONTENT_ACT</a> (Content Activation)	The <a href="#">SUPPORT_CONTENT_ACT</a> access level inherits all the authorizations from the <a href="#">SUPPORT_EXTENDED</a> and the <a href="#">SUPPORT_CUSTOMIZING</a> access levels. Additionally, it grants administrative authorization to the content framework which manages the Customizing content lifecycle.
<a href="#">SUPPORT_DEVELOP_LOCAL</a> (Local Development)	The <a href="#">SUPPORT_DEVELOP_LOCAL</a> access level inherits all the authorizations from the <a href="#">SUPPORT_EXTENDED</a> access level. Additionally, it grants authorization to create and execute local development objects. This access level may need to be used to support frameworks that generate local development objects in the customer name space (such as extensibility or data migration). It allows to test execute all function modules and static methods. It also allows changing field values and altering the code flow in the debugger. Authorizations to modify development objects delivered by SAP are not granted.
<a href="#">SUPPORT_DEVELOP</a> (Unrestricted Development)	The <a href="#">SUPPORT_DEVELOP</a> access level inherits all the authorizations from the <a href="#">SUPPORT_DEVELOP_LOCAL</a> access level. Additionally, it grants authorization to modify development objects delivered by SAP. Standard procedure for such changes is a hotfix or an emergency patch. This access level may only be used in emergency situations where that process is not applicable.
<a href="#">SUPPORT_USER_ADMIN</a> (User and Role Administration)	The <a href="#">SUPPORT_USER_ADMIN</a> access level inherits all the authorizations from the <a href="#">SUPPORT_DEFAULT</a> access level. Additionally, it grants authorization for local user and role administration. This access level may be used for support cases related to business user or communication user management.
<a href="#">SUPPORT_SYSTEM_CONFIG</a> (System Configuration)	The <a href="#">SUPPORT_SYSTEM_CONFIG</a> access level inherits all the authorizations from the <a href="#">SUPPORT_EXTENDED</a> access level. Additionally, it grants authorization to manually configure SAP managed communication scenarios. Automatic setup is mandatory for such communication scenarios in customer systems. This access level is used in situations where automatic setup failed.

Name	Use
<a href="#">SUPPORT_SYSTEM_ADMIN</a> (Unrestricted System Administration)	The <a href="#">SUPPORT_SYSTEM_ADMIN</a> access level grants unrestricted administrative access. It includes authorization profile SAP_ALL. Cloud operations may need to use it for system lifecycle management. Support teams may need to request it as the final escalation of privileges for support cases that cannot be resolved with other access levels. Root case analysis is mandated for such support cases. The root cause must be resolved.
	/

## Related Information

[SAP Support User Request Log \[page 2499\]](#)

[Access Categories \[page 2502\]](#)

### 6.3.1.14.9.1.2 Access Categories

Access categories classify the purpose of SAP support user access to customer systems.

Access Categories

Name	Use
<a href="#">Operations</a>	The <a href="#">Operations</a> access category is used for system access by central cloud operations teams for system lifecycle management, reactive system management and proactive system management. Such access is not based on individual support cases. Taking over authorization from customer business users or customer communication users is not possible.

Name	Use
<i>Customer Support</i>	<p>The <i>Customer Support</i> access category is used for system access based on support cases raised by the customer. The purpose of the system access is documented in a customer support case and can be reviewed in customer service management. System access is restricted to a processor of a customer case that is not completed. Support cases created for productive systems also allow access to non-productive systems. Support cases created for non-productive systems do not allow system access to productive systems. System access to a productive system requires a case for that specific system. Customers may allow the processor to copy authorizations from one specific customer business user or customer communication user. Consent to that is documented in the customer support case. The processor of the case can then copy these authorizations in addition to a support access level. The <i>SUPPORT_DEFAULT</i> and <i>SUPPORT_DEFAULT_APP</i> support access levels are automatically approved for processors of customer support cases to access customer systems. The <i>SUPPORT_EXTENDE</i>d support access level is also automatically approved for processors of customer support cases to access non-productive customer systems. To access productive customer systems using the <i>SUPPORT_EXTENDE</i>d support access level, an SAP internal approval process is in place for SAP S/4HANA Cloud as well as SAP BTP ABAP environment. Any requests for higher privileged support access levels in customer systems enforce the principle of dual control using SAP internal approval processes.</p>
<i>Health Check Support</i>	<p>The <i>Health Check Support</i> access category is used for system access based on support incidents raised internally by automatic health checks. The purpose of the system access is documented by SAP internally via the incidents. Procedures for approval of access levels match the procedures of the <i>Customer Support</i> access category. The same is true for restrictions of access to productive systems versus non-productive systems.</p>
<i>Emergency Support</i>	<p>Support user access is controlled by a platform for central cloud management. The <i>Emergency Support</i> access category is used for locally created support users in situations where the connection to the central cloud management is interrupted. The purpose of the emergency support access is documented in a customer support case and can be reviewed in customer service management.</p>

Name	Use
<a href="#">SAP Internal Support</a>	The <a href="#">SAP Internal Support</a> access category is used for system access to SAP internal test or demo systems. It is not intended for system access to customer systems. We recommend that you create an incident for cloud operations to validate the configuration of support user access if there is any such access in customer systems.

[Access Levels \[page 2500\]](#)

### 6.3.1.14.10 Business Catalogs

You use this app to display all available business catalogs.

With this app you can get an overview of the business catalogs, their status (for example *Deprecated*), and their usage within business roles. You use this application to see which applications and business catalogs delivered by SAP have changed, for example after an upgrade. They may also be deprecated. As a key user, you need to have an overview of these changes to adapt the affected business roles accordingly.

## Key Features

You can use this app to:

- Display business catalogs, their usage in roles, and general description
- Display business catalog changes: Check if the business catalogs or apps in your area have changed (for example, a transaction has been replaced with an SAP Fiori app), and which business roles are affected by these changes.
- Display deprecations: Check if any of the business catalogs in your area are deprecated and which successors they will be replaced with. Select the affected business role and transfer the changes.
- Display dependencies: Check if a business catalog depends on other business catalogs or if other business catalogs depend on a business catalog in order to be fully operational.
- Display scope items: check which scope items the business catalogs depend on. Business catalogs that do not depend on any scope items are always visible in the system. For these business catalogs, *Scope Items (0)* is displayed on the relevant tab and the following message appears in the table: *The business catalog is not scope-dependent.*
- Display component: check under which component you can create an incident if required.

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-IAM`.

### 6.3.1.14.10.1 How to Handle Deprecated Business Catalogs

If you want to check how many deprecated business catalogs you still have in use, or you want to change assignments from the old, deprecated business catalogs to the new, active catalogs quickly and easily, proceed as follows:

#### Context

Due to ongoing development of new features and new apps, we need to periodically revise existing business catalogs. This means that some business catalogs are deprecated and replaced by new ones, and you need to assign business roles and business users to these new catalogs.

Rather than disappearing, deprecated business catalogs are identified as being obsolete, which allows you to identify them at a glance. You can also check how many deprecated business catalogs you still have in use with the *Business Catalogs* app. This app lets you change assignments from the old, deprecated business catalogs to the new, active catalogs quickly and easily.

#### Note

Some business catalogs might be redesigned in each release. Please check the assignments for your business roles and business users and make the necessary changes to the assignments as soon as possible.

#### Procedure

1. In the *Business Catalogs* app, check how many deprecated business catalogs you still have in use.  
You can filter the list of catalogs for the deprecated ones but the deprecated business catalogs are also marked with the appendix (deprecated) in the list of all catalogs in use.
2. Change assignments from the old, deprecated business catalogs to the new, active catalogs.  
Once the deprecation of a business catalog is announced via the *Business Catalogs* app, the catalog will remain in the system for six months before being deleted. During this period you can use the old or the new

business catalog. Within this timeframe you can do the replacement when it suits you best. In the [Business Catalogs](#) app, you can see the release in which the deprecation of a business catalog was announced.

**Example:** A business catalog is deprecated with a Cloud 2202 release. The business catalog will then be deleted with the Cloud 2208 release.

## 6.3.1.14.11 IAM Information System

With this app you can get an overview of business users in your system and what roles and restrictions are assigned to them.

With this app you can display information about the usage of business roles, business catalogs, business users and restrictions, and how they are related.

If you want to look up more information about a business role, derived business role, business user, business catalog, business role template or restriction, you can jump directly to the respective app by clicking the entity.

You can use this app for administrative tasks as part of your daily work.

### Key Features

You can use this app to:

- Check the usage of the following entities and how they are related: Business role, derived business role, business role template, application, business user, business catalog, restriction
- Check, for example, which business roles are assigned to a business user, which business catalogs and restrictions are therefore assigned to the business user and to which applications a user has access. You can also download a list of business users and business catalogs.
- Check, for example, which business roles and business catalogs are required to make a certain app visible for a business user on the SAP Fiori Launchpad.

#### Note

You can also display the scope items the business catalogs depend on. Business catalogs that do not depend on any scope items are always visible in the system. For these business catalogs, **Scope Items (0)** is displayed on the relevant tab and following message appears in the table: *The business catalog is not scope-dependent.*

### Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-SRV-APS-IAM.

### 6.3.1.14.12 Business Role Templates

You can use this app to you get an overview of the business role templates delivered by SAP.

With this app you can get an overview of the delivered business role templates, any changes included in upgrade, and whether you need to adapt your business roles to these changes. For example, after an upgrade, you can check if the business role templates have changed and are therefore different from the existing business role - a new business catalog might have been added or an existing catalog replaced by another. You can see which business roles were affected by the changes and adapt them if required.

## Key Features

You can use this app to:

- Display business role templates
- Display usage of business role templates in business roles
- Display differences between business role templates and business roles
- Check which business roles are affected by these changes
- Adapt business role to changes
- Create a business role
- Display scope items: check which scope items the business role templates depend on. Business role templates that do not depend on any scope items are always visible in the system. For these business role templates, *Scope Items (0)* is displayed on the relevant tab and the following message appears in the table: *The business role template is not scope-dependent.*
- Display component: check under which component you can create an incident if required.

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-SRV-APS-IAM.

## Related Information

[How to Create a New Business Role \[page 2454\]](#)

[How to Create a Business Role from a Template \[page 2455\]](#)

### 6.3.1.14.13 IAM Key Figures

You can use this app to display the following information:

- Number of business users assigned to business roles
- Month of the business user's last log-on
- Number of locked and unlocked business users
- Validity of business users
- Number of business roles with unmaintained restrictions
- Number of business roles with unrestricted access

#### Note

You can filter for the productive business roles in your area, for example by adding a certain namespace followed by an asterisk (\*) in the *Filter by Business Role ID* field in the tile configuration.

- Business user price categories
- Business roles with default values from business catalogs  
The default values are delivered automatically and can't be overwritten. This means either that an asterisk (\*) overwrites all defined values or that fixed values are added to the restrictions you have defined. Business roles affected by these non-changeable values are displayed in red in the overview chart.

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-IAM`.

## 6.3.1.14.13.1 IAM Key Figures - Background

The charts in the **IAM Key Figures** app support you to increase the security in your area and to reduce costs by displaying which business users are inactive and can be removed.

They also provide a good overview that can be useful before go-live to help, for example, you evaluate if the business user and role distribution in your area is ready to be used.

To define threshold values, you can use color codes for the bars in your charts (green: **Accepted**, yellow: **Warning**, red: **Critical**). You can, for example, define the colors based on certain time frames. If a user has not logged on to the system for 6 months and you want to use this point in time as a threshold value, you can determine that the corresponding bar in the chart is red.

You can also jump directly to the **Maintain Business Users** app or **Maintain Business Roles** app if you need more information about the business users or business roles that are shown in the overview charts.

## 6.3.1.14.14 Display Authorization Trace

With this app you can enable an authorization trace for a business user. This helps you to analyze if any authorizations are missing or are insufficient.

### Key Features

You can use this app to:

- Activate or deactivate a trace
- Display authorization check results including already assigned authorizations and failed checks
- Display all business roles granting access to selected fields and values

A maximum of 10.000 data sets is possible, therefore we recommend to consider this when defining the selection criteria, especially the date range.

The following authorization check statuses are possible:

Status	Meaning
Successful	The authorization check was successful.
Failed	The authorization check failed.
Filtered	When reading an object, an authorization check is taking place and certain data is filtered out defined by a DCL (Data Control Language).

If an authorization check resulted in a *Filtered* status, you can check which business roles expose the affected restriction type. One potential solution is that the business user that has been checked is not assigned to the required business role or that the required value has not been maintained yet.

## Note

The trace entries are deleted automatically within a certain time frame.

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-IAM`.

## 6.3.1.14.15 Business Catalogs for Identity and Access Management Apps

Get an overview of available business role catalogs and their restrictions.

You assign business catalogs to business roles that are assigned to business users. Business catalogs contain authorizations that define what a business user with a certain business role is allowed to do.

Business Catalogs for Identity and Access Management Apps

Business Role Catalog	Authorizations	Restrictions
<i>Identity and Access Management</i> SAP_CORE_BC_IAM	All authorizations for the IAM apps	Business catalog was set to obsolete due to potential SoD (segregation of duties) conflicts. Please use the other three catalogs listed below.
<i>User Management</i> SAP_CORE_BC_IAM_UM	Maintain Business Users	Not possible to assign business roles to the business users
	Display Technical Users	None
	IAM Information System	None
<i>Role Management</i> SAP_CORE_BC_IAM_RM	Maintain Business Roles	Not possible to assign business roles to the business users
	Business Role Templates	None
	Business Catalogs	None

Business Role Catalog	Authorizations	Restrictions
	IAM Information System	None
<i>Role Assignment</i> SAP_CORE_BC_IAM_RA	Maintain Business Users	Only possible to assign business roles to the business users. Not possible to change the user data.
	Maintain Business Roles	Only possible to assign business roles to the business users. Not possible to change the business roles
	IAM Information System	None
<i>Identity and Access Management - Group Management</i> SAP_CORE_BC_IAM_GRP_PC	This business catalog enables users to create and maintain business user groups and business role groups.	None

## 6.3.1.14.16 Glossary for Identity and Access Management

Overview of terminology used for identity and access management

Terminology Overview

Term	Description
Access category	A category that defines what kind of access is granted to the users assigned to a business role, for example, <i>Read</i> , <i>Write</i> , or <i>Value Help</i> .
Business role	A business role provides users with authorizations to access apps.
Business role template	A pre-defined set of authorizations and assigned business catalogs you can use as a basis for creating new business roles.

Term	Description
Business user	Any person who can log on to the system, including administrators.
Restriction	<p>An access limitation that is defined on business role level.</p> <p>You can determine what kind of access is granted to specific objects, such as <i>company code</i>.</p>
Restriction field	A field that is used to restrict the access to a specific business object, for example, <i>organizational area</i> .
Restriction type	An authorization entity that bundles the available restriction fields to a logical definition, for example, company code.
Leading restriction	A property that defines a certain restriction field as leading restriction. No matter in which restriction types the restriction field is being used, the field will have the same restriction assigned in all types.
Technical user	A technical user corresponds to a local or remote process which is typically part of the cloud management process (e.g. system provisioning, support) or intrinsic system processes (e.g. periodic clean-up of logs). There are technical users that belong to the software or service provider and there are technical users that belong to the customer.

### 6.3.1.15 Message Monitoring

[Message Dashboard \[page 2513\]](#)

[Message Monitoring Overview \[page 2513\]](#)

[Message Monitoring for Integration Experts \[page 2515\]](#)

[Assign Recipients to Users \[page 2516\]](#)

[Message Monitoring \(Emergency Correction\) \[page 2516\]](#)

[SOAP Error Log, OData Error Log, and Event Error Log \[page 2517\]](#)

[Assigning the Business Catalog for SOAP Error Log, OData Error Log, and Event Error Log to Your Business Role \[page 2518\]](#)

[Automatic Reprocessing \[page 2519\]](#)

## 6.3.1.15.1 Message Dashboard

With this app, you can get an overview of the interfaces you're responsible for and their current status. You can analyze the root causes of errors, restart or cancel data messages.

### Key Features

You can use this app to:

- See all interfaces you've been assigned to using recipients.
- See the general status of your interfaces over time and restrict the time range.
- See the message numbers and statuses (error, warning, success) by namespace and interface.
- Navigate to the message summary for an overview of how often a certain log message was written to the application log and how many data messages used a certain log message.
- Navigate to the monitoring and error handling to analyze the log messages in detail.
- Display the contents of the data messages.
- Create custom hints, message texts, and functions for certain log messages.
- Cancel data messages with issues that don't require you to take action (this functionality is only available for selected message formats).
- Solve errors by correcting the underlying data content of the messages.
- Restart corrected data messages or messages that had a temporary issue (this functionality is only available for selected message formats).
- Download payload for SOAP, IDoc, and XML messages.

### Supported Device Types

- Desktop
- Tablet

### Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-AIF`.

## 6.3.1.15.2 Message Monitoring Overview

With this app, you can see an overview of all the interfaces that you're responsible for monitoring. The intuitive card-based view provides a holistic overview of your message interfaces and also provides additional details like the number of messages in different statuses for each interface. When you click on the specific status for a

specific interface, you're redirected to [Message Monitoring](#). Here, you can see a filtered view of the messages in the status that you selected for the specific interface containing the log information and key field information. For example, in the [Message Monitoring Overview](#) app, if you're monitoring an interface [AIF\\_XXX\\_MMO](#) and in the card specific to [AIF\\_XXX\\_MMO](#), you click on the status [Error](#), you're redirected to the [Message Monitoring](#) where you can see all the messages in status [Error](#) for the interface [AIF\\_XXX\\_MMO](#). You also see the log information and key field information for the messages in the [Error](#) status. This improves the efficiency of you finding the list of messages in a specific status for a given interface.

#### → Tip

If you don't see the interface you're assigned to, verify that your user is assigned to the corresponding recipient using the [Assign Recipients to Users](#) app.

## Key Features

This app provides the following key features:

- Monitoring overview of all the responsible interfaces
- Quick overview of key parameters of the selected messages
- Filter or search for messages with key content as the search parameters
- Navigate to [Message Monitoring](#) with appropriate filter conditions for specific interfaces and message status, significantly improving the user experience
- Order the cards to keep an eye on mission-critical interfaces using drag-and-drop mechanism
- Identify interfaces with an active alert

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-SRV-AIF.

## Related Information

[Assign Recipients to Users \[page 2516\]](#)

### 6.3.1.15.3 Message Monitoring for Integration Experts

With this app, you can display an overview of your interfaces and get details on all messages processed through them.

#### → Tip

If you don't see the interface you're assigned to, verify that your user is assigned to the corresponding recipient using the [Assign Recipients to Users](#) app.

## Key Features

You can use this app to:

- Get a tabular overview of your interfaces and all messages (with specific status) processed through them.
- Filter your overview by time and/or interface, and restrict it to show only interfaces with messages or errors.
- Drill down on the messages of a specific interface and filter them by time, status, and key fields (if defined).
- Get more information on an individual message (such as log messages, message details, and data structure).
- Download the payload of a specific message.
- Edit, restart, or cancel a message (if in status *Error* or *In Process*) (this functionality is only available for selected message formats).
- Perform mass error handling for multiple messages of an interface at once.
- Set process information for a message (such as defining a process status).
- Identify interfaces with an active alert and confirm the alert.

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-AIF`.

## Related Information

[Assign Recipients to Users \[page 2516\]](#)

## 6.3.1.15.4 Assign Recipients to Users

With this app you can assign your business users to the recipients that were defined for the communication scenarios. Once the users are assigned they can use the [Message Monitoring Overview](#) and [Message Dashboard](#) to monitor the interfaces and data messages they are responsible for.

### Key Features

You can use this app to:

- Find and add users.
- Find and assign pre-defined recipients to these users.
- Define which types of log messages the user can see in the Message Dashboard, for example, warnings only.
- Define if the messages are displayed or hidden on the Message Dashboard.
- Define if the user can see messages that are in process or that had a technical error using [Advanced Error Handling](#).
- Unassign recipients from users.

### Supported Device Types

- Desktop
- Tablet

### Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-SRV-AIF.

## 6.3.1.15.5 Message Monitoring (Emergency Correction)

With this app, you can edit non-customized fields of a message payload in an emergency.

## Key Features

You can use this app to:

- Get a tabular overview of your interfaces and all messages (with specific status) processed through them.
- Filter your overview by time and/or interface, and restrict it to show only interfaces with messages or errors.
- Drill down on the messages of a specific interface and filter them by time, status, and key fields (if any are defined).
- Get more information on an individual message, such as log messages, message details, and data structure.
- Download the payload of a specific message.
- Edit, restart, or cancel a message (if in status *Error* or *In Process*) (this functionality is only available for selected message formats).
- Set process information for a message (such as defining a process status).
- Identify interfaces with an active alert and confirm the alert.
- Edit the payload of messages, even if the messages aren't customized to be changeable.

Despite having similar functionalities as [Message Monitoring for Integration Experts](#), [Message Monitoring \(Emergency Correction\)](#) doesn't support navigating to the [Message Monitoring](#) app or performing mass error handling.

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-AIF`.

### 6.3.1.15.6 SOAP Error Log, OData Error Log, and Event Error Log

With these apps, you can view and filter error logs related to SOAP web services, OData services, and events using SAP Application Interface Framework.

## Key Features

You can use these apps to:

- Get a comprehensive overview of failed communications relating to **SOAP web services**, **OData services**, and **events**
- Filter the SOAP Error Log, OData Error Log, and Event Error Log for various capabilities, such as Message ID, User Name, or Processing Date

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-AIF`.

### 6.3.1.15.7 Assigning the Business Catalog for SOAP Error Log, OData Error Log, and Event Error Log to Your Business Role

#### Context

If you want to display the technical monitoring apps SOAP Error Log, OData Error Log, and Event Error Log in SAP Fiori launchpad, your user needs business roles that are authorized for the relevant business catalog.

#### Procedure

1. In SAP Fiori launchpad, go to [Identity and Access Management](#) [Maintain Business Roles](#).
2. Select *Business Role*, then click *Edit*.
3. In the tab *Assigned Business Catalogs*, select *Add*.
4. In the pop-up *Assigned Business Catalogs*, select the following business catalog: *Communication Management – Technical Message Monitoring SAP\_CA\_BC\_COM\_TECH\_ERR\_PC*.

5. Click *OK*, then select *Save*. The tiles *SOAP Error Log*, *OData Error Log*, and *Event Error Log* are now visible in SAP Fiori launchpad.

## 6.3.1.15.8 Automatic Reprocessing

With this app you can configure the automatic reprocessing that is executed when a data message fails with a specific log message.

### Key Features

You can use this app to:

- Create, edit, and delete automatic reprocessing settings for a specific combination of log message and interface. Whenever a data message fails with the selected log message, the configuration you defined is executed.
- Define a maximum number of reprocessing attempts that can be executed for a failed data message.
- Define a minimum waiting time that must pass before the application can trigger a reprocessing attempt. The waiting time can take longer depending on the interval of the background job that executes the reprocessing.
- Define the intermediate status (In Process or Error) the failed data message displays while it's waiting to be reprocessed.

### Supported Device Types

- Desktop
- Tablet

### Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-AIF`.

## 6.3.1.16 Output Management

[Maintain Print Queues \[page 2520\]](#)

[Monitor Email Transmissions \[page 2524\]](#)

## 6.3.1.16.1 Maintain Print Queues

### Purpose

Using this app, you can set up print queues to manage the printing of documents and monitor the print jobs in each queue.

This helps you to identify and analyze errors and gives you a sense of direction for doing troubleshooting to solve them.

### Key Features

With this app you can:

- Create a new print queue
- Delete a print queue
- Pause a print queue  
This allows you to stop print items from being collected by the printing process while you are carrying out repairs.
- Restart a print queue
- Check the status (such as *New*, *Failed*, *Transmitted*, *Successful*, *Warning*) of queues or individual print items in the queue and display detailed information regarding the status
- Reassign a print item to another print queue

### Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-CCM-PRN-OM-PQ or BC-CCM-PRN-OM-PM.

### Related Information

## 6.3.1.16.1.1 Before Getting Started

### Background Information for Print Queues

In a cloud environment, the back-end system does not have a connection to local printers in the customer's network (no virtual private network access is available, for example). To establish this connection, you need to create a print queue in the cloud system representing an output channel to a local printer. To do so, you have to install *SAP Cloud Print Manager for Pull Integration* in the customer's network from the [Install Additional Software](#) app so that the print manager can regularly check via a connection to the backend system whether new print items are in the print queue. If this is the case, *SAP Cloud Print Manager for Pull Integration* retrieves these items and sends them to the locally configured printer. In addition to that, you need to define communication scenario `SAP_COM_0466`. For more information on the *SAP Cloud Print Manager for Pull Integration*, see [3048273](#).

Watch the following video to learn how to get started with printing:

### Related Information

## 6.3.1.16.1.2 Creating Print Queues

You want to set up print queues to manage the printing of documents.

### Procedure

1. Open the [Maintain Print Queues](#) app.
2. Click [New](#) to create a new print queue.
3. Select a print manager.
4. Enter the required information:
  - **Queue:** Print queue name
  - **Description:** Print queue description
  - **Format:** The format is the printer language type of the queue. The following language types are available: PDF, CAB 203 dpi, CAB 300 dpi, Datamax 203dpi, Datamax 300 dpi, Datamax 406 dpi, Datamax 600 dpi, HP Laserjet 4350 PCL 5e, HP LaserJet 4350 PS, PCL 5c (Color), PCL 5e (Monochrome), Intermec 203 dpi, Intermec 300 dpi, Intermec 400 dpi, Lexmark T644 PCL 5e, Lexmark T644 PS, PostScript 2, Postscript 3, Toshiba 203 dpi, Toshiba 305 dpi, XMLDATA, Zebra 203 dpi, Zebra 300 dpi, Zebra 600 dpi.
  - **Communication User:** Technical user with which the *SAP Cloud Print Manager for Pull Integration* logs on to the system. You have to define a communication user in the communication scenario

SAP\_COM\_0466 first. You can connect several queues to the same *SAP Cloud Print Manager for Pull Integration* - in this case all queues must use the same communication user.

- **Retention:** Spool Retention Period. The retention period is the number of days after which the print queue items that are in final state (*successful* or *failed*) will be deleted automatically.

5. Click *Create* to create a new print queue.

## Results

You have created a print queue you can use in the *SAP Cloud Print Manager for Pull Integration*.

### Note

The *Maintain Print Queues* app always includes a print queue called *DEFAULT*. It's the only print queue provided by SAP and serves as a sample queue that can't be used for productive output as it can't be connected to the *SAP Cloud Print Manager for Pull Integration*.

To connect to your physical printers, you therefore need to create one or more custom print queues.

Keep in mind that you can't define custom retention time for items in the *DEFAULT* queue and that SAP might adapt the standard retention time at any time to avoid misuse. The *DEFAULT* print queue should also not be used as storage for all documents that are printed from the system, as SAP might restrict the given quota at any time to avoid misuse. A cleanup job will delete all items in the *DEFAULT* print queue after eight days, regardless of their status. This will not affect the behavior of other print queues.

## Related Information

### 6.3.1.16.1.3 Configuring the SAP Cloud Print Manager for Pull Integration

You want to configure the *SAP Cloud Print Manager for Pull Integration* to be able to use the *Maintain Print Queues* app.

## Prerequisites

You have enabled the *Maintain Print Queues* app and created a print queue.

## Context

*SAP Cloud Print Manager for Pull Integration* receives print jobs from the print queues you created in the *Maintain Print Queues* app and enables you to print documents from *S/4HANA Cloud* to the printer in your local network.

## Procedure

1. Download the *SAP Cloud Print Manager for Pull Integration* installation package from the *Install Additional Software* app and select *Run as Administrator*.

### Note

Keep in mind that you need to have administrator rights in order to proceed with the installation. The installation should be performed on a Windows server.

2. Start the downloaded installer executable file. The *SAP Front-End Installer* opens. Select *SAP Cloud Print Manager for Pull Integration* and click *Next*. Wait until the installation has finished and confirm the final dialog. The print manager is now installed.
3. Copy the system URL that you can find on the bottom of the initial screen of the *Maintain Print Queues* app. You will need this URL to establish a connection from the print manager to your S/4HANA cloud system.
4. You will find the *SAP Cloud Print Manager for Pull Integration* in the Windows start menu of your print server. After the installation, start the program once with *Run as Administrator*. Enter your system account details. The print manager opens.
5. Select *Runtime System* and choose *New*.
6. A pop-up appears asking you to choose an authentication method. Select the *Basic Authentication*.
7. Choose a *Name* for your print system and enter the URL of *Maintain Print Queues* that you have previously copied.
8. Enter the communication user and the password you have defined in the communication scenario *SAP\_COM\_0466*. Select *OK*.

Your print queue is now visible in the *SAP Cloud Print Manager for Pull Integration*.

## Related Information

[Maintain Print Queues \[page 2520\]](#)

[Creating Print Queues \[page 2521\]](#)

## 6.3.1.16.2 Monitor Email Transmissions

### Use

You can use this app to display successful and failed email transmissions and to provide background information. This app is read-only and doesn't allow any data changes.

### Key Features

With this app, you can:

- Search for a specific email by adapting filters
- Sort, add, or remove columns
- Display all outgoing email requests
- Export a results list as a spreadsheet
- Get the header data and information about the sending status on a specific email request
- Send a test email to check if the email outbound in a system is working

### Supported Device Types

- Desktop
- Tablet

### Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-SRV-COM.

### Related Information

[Monitoring Email Transmissions \[page 2525\]](#)

## 6.3.1.16.2.1 Monitoring Email Transmissions

Find out how to monitor your email transmissions.

### Procedure

Start the *Monitor Email Transmissions* app. On the starting page, you can search for a specific email by adapting the following filters:

- Subject
- Status
- Sender
- Created at
- Recipient Address

In addition, you can

- Sort columns
- Add or remove columns

Click [Go](#) to display the search results. In the results list, all email requests are displayed according to the filters you've set. You can export the results list as a spreadsheet.

To get more information on a specific email request, click a request in the results list. On the *Details* page, the following information is displayed:

- Status
- Sender
- Status Code
- Subject
- Created at
- Response

You can also get information about the recipients, such as:

- Latest status
- Recipient address
- Copy (BCC or TO)
- Latest status changed at

You can get additional information about the present and former recipient's status by selecting a recipient.

### Email Reorganization

Due to data protection reasons, all displayed emails will be deleted from the table view after 30 days.

## Testmail Functionality

You can send out a test email to any recipient chosen by you. The subject and the text are fixed values that are set by the app. The mail sender will automatically be set as the email address of the user currently logged on, or, if that user has no email address, as the default email address. After the successful creation of the send requests, the email can be viewed in the main table of the *Monitor Email Transmissions* app.

Sending test emails can help administrators to check if the email outbound of their system is working. If the email outbound is not working, you'll either directly receive an error message, or you can see the error message in the main view of the *Monitor Email Transmissions* app.

## Related Information

[Monitor Email Transmissions \[page 2524\]](#)

## 6.3.16.2.2 Regulating Email Outbound

You can restrict the email outbound by checking the sender and recipient addresses.

### Context

If the address doesn't match with the sender or recipient domains on the allowlists, the email will not be sent.

### Managing the Sender or Recipient Domains Allowlists

To restrict the email outbound, open *Implementation Activities* (or *Central Business Configuration* in case you're using a 2-system landscape) and maintain the activities in the structure *E-Mail Configuration*. This must be done in each system separately.

If you want to allow all senders or recipients, you can enter \* into the allowlist. You can also allow single or multiple domains with a pattern like `*@sap.com`. If no value is entered into the table, no sender or recipient will be allowed.

#### ❖ Example

If the sender domain `*@sap.com` is allowed and the recipient domain `*@sap2.com` is allowed, the following scenarios may occur:

1. An email with sender address `sender@sap.com` and recipient address `recipient@sap2.com` will be created and sent.
2. An email with sender address `sender@sap.com` and recipient address `recipient@sap.com` is not allowed and will not be created.

## Configuring the Default Sender

In addition to the allowed domains, you can define a default sender. This default sender will be used as sender at any time when no sender has been defined for an outgoing email. The default sender can too be maintained in the structure *E-Mail Configuration*.

### Note

You can define only one default sender per system.

## 6.3.1.17 Read Access Logging

### Definition

Read Access Logging (RAL) is used to monitor and log read access to sensitive data. This data may be categorized as sensitive by law, by external company policy, or by internal company policy. The following typical questions might be of interest for an application that uses Read Access Logging:

- Who accessed the data of a given business entity, for example a bank account?
- Who accessed personal data, for example of a business partner?
- Which employee accessed personal information, for example religion?
- Did anyone search, for example, if VIPs were admitted to hospital?
- Which accounts or business partners were accessed by which users?

These questions can be answered using information about who accessed particular data within a specified time frame. Technically, this means that all remote API and UI infrastructures (that access the data) must be enabled for logging. Read Access Logging is available for different channels such as Dynpro and Web Dynpro.

### Main Purposes of Read Access Logging

Read Access Logging is often required to comply with legal regulations or public standards such as data protection and privacy, for example in banking or healthcare applications. Data protection and privacy is about protecting and restricting access to personal data. In some countries, data protection and privacy regulations even require that access to certain personal data is reported. Companies and public institutions may also want to monitor access to classified or other sensitive data for their own reasons. If no trace or log is kept on who accesses data, it is difficult to track the person responsible for any data leaks to the outside world. Read Access Logging provides this information.

Read Access Logging is always based on a logging purpose that is freely defined according to the requirements of an organization (for example, data protection and privacy). This logging purpose is then assigned to each log entry as an attribute, which allows the log data to be classified and organized according to the logging purpose. For example, various archiving rules or reportings can be created based on logging purposes.

The Read Access Logging framework can thus be used to fulfill legal or other regulations, to detect fraud or data theft, for auditing purposes, or for any other internal purpose.

## Background Information on the Architecture of Read Access Logging

When an application is started, the Read Access Logging configuration is read. It indicates whether, for example, the current function module, operation, or UI element is log-relevant and to what extent. For example, should only the access itself be logged, or the content too? Log entries can be structured according to their semantics.

SAP applications may contain predefined configurations. However, the customer's key user will usually have to adapt them to his or her needs in order to fulfill the legal requirements of his or her organization - requirements that are not all known to SAP.

### Note

- As with all logging, your need to log data must be balanced with the effect logging will have on the performance of your system. The performance of your system will depend upon the amount of data you log, as well as the complexity of the conditions you specify for which data is logged.
- You can find information on Read Access Logging configurations and templates in specific areas in the documentation for those areas.

## Activities

### Configuration Tasks

1. Determine which data must be logged under which circumstances.  
The organization must define which legal or security requirements to apply and which data must be logged on a semantic level. For example, the legal department might determine that access to the social security number must be logged.
2. Define purposes for Read Access Logging.  
Depending on the logging purpose and the laws and regulations that must be fulfilled, the application can define reports and rules for saving and processing the data. For more information, see [How to Define Purposes of Read Access Logging \[page 2531\]](#).
3. Determine the channels (such as Dynpro or Web Dynpro) through which the data can be accessed.
4. Define log domains.  
Log domains are groups of semantically related data fields that need to be logged. For example, *Gross salary* and *Net salary* might be grouped together in the *Salary* log domain. Log domains bundle different technical representations of the same semantic entity. Log domains are channel-independent. For more information, see [How to Define Semantic Grouping of Fields to Be Logged \[page 2532\]](#).
5. Define which data needs to be logged and whether only the access is logged or also the content.  
For more information, see [How to Define What to Log \[page 2536\]](#).

### Tasks During Operations

- Defining a user exclusion list for Read Access Logging configurations.  
If you want to exclude certain users from Read Access Logging, they need to be added to a user exclusion list. This is useful for any automatic processing without user interaction, for example, background jobs. For more information, see [How to Exclude Specific Users from Read Access Logging \[page 2552\]](#).
- Displaying changes made to Read Access Logging configuration and evaluating errors and warnings.  
For more information, see [How to Check Runtime Errors and See Changes to Configurations \[page 2552\]](#)

## Monitoring

You can view all log entries using the Read Access Logging monitor. For more information, see [How to Monitor the Read Access Log \[page 2555\]](#).

## Related Information

[SAP Signavio Process Navigator for Data Protection and Privacy \(Scope Item 5LE\)](#) 

### 6.3.1.17.1 Read Access Logging for Data Protection

You can use Read Access Logging (RAL) to monitor and log access to personal data. The information provided may include, for example, which business users accessed business partner personal data, and in which time frame.

SAP delivers default configurations, which assign dedicated fields to log domains. A log domain is a category that groups semantically identical or related data fields. Logging occurs for all fields disclosed on the UI that are related to these domains. The domain is displayed in the log.

You can activate or deactivate the available RAL configurations in the [Read Access Logging Configuration](#) app, or make changes. You should carefully consider which information is relevant for logging. Configure your system to log only what you really control. If you maintain a wide scope of information to be logged, you will end up with a lot of data that will be more difficult to process than if you are more specific in your logging configurations.

The following table lists the log domains that are part of the delivered sample configuration content. You can use these log domains or define your own, according to your needs.

Log Domain Name	Description
BANK	Data referring to a bank account
BIOMETRIC*	Data referring to biometric data
CRIME*	Data referring to criminal or administrative offenses or suspected criminal or administrative offenses
ETHNIC_ORIGIN*	Data referring to racial or ethnic origin
GENETIC*	Data referring to genetic data
HEALTH*	Data referring to health data
POLITICAL_OPINION*	Data referring to political opinion

Log Domain Name	Description
PROFILE*	Data which is usually based on profiling like: scoring, rating, unwanted customer
RELIGION*	Data referring to religious or philosophical beliefs
SECRECY*	Data referring to professional secrecy
SEX_LIFE*	Data referring to sex life
SEXUAL_ORIENTATION*	Data referring to sexual orientation
SSN	Data referring to social security number
TRADE_UNION*	Data referring to trade union membership

These log domains are logged with fields related to business partner (BP), customer (CUSTOMER), supplier (VENDOR), legal entity (LEGAL\_ENTITY), employee (EMPLOYEE), or student (STUDENT) because they are only identifiable with this additional personal data. For example, TRADE\_UNION data requires details on the EMPLOYEE.

Log conditions are used, if required, to limit the logging of data (in technical terms, these fields are considered as **and** conditions). For example, you could configure RAL to log a field related to the employee in a specific transaction only if the employee's religion is shown. If this field is only visible on a tab where the employee's religion is not displayed, access to this field is not logged.

RAL is switched off by default. You can activate it in the respective section of the [Read Access Logging Configuration](#) app. In the [Read Access Logging: Monitor](#) app, you can view created logs. If you need a downloaded version of your RAL logs, please contact the Service Center. Also contact the Service Center if you need to create new configurations.

## More Information

For more information on Read Access Logging and the related apps, see [Read Access Logging \[page 2527\]](#).

### 6.3.1.17.2 Read Access Logging Configuration

With this app you can configure Read Access Logging to determine which read access to data is logged and under which conditions.

#### ⚠ Restriction

RAL items can not be created in the P system, only in the Q system. If you try to create configurations, log domains, purposes or recordings in the P system, you will get an error message saying `Items of type SRAL_<RAL Item> must not be edited in this system`. You can still activate and deactivate RAL items in the P system.

## Key Features

You can use this app to:

- Define purposes of Read Access Logging
- Define semantic grouping of fields to be logged
- Manage recordings of application user interfaces
- Change predelivered configurations of what to log
- Enable Read Access Logging in current client
- Check runtime errors and see changes to configurations

## Prerequisites

To access the app, you need to have the `SAP_CORE_BC_RAL_CONF` business catalog assigned to your user. This business catalog is contained in the `SAP_BR_ADMINISTRATOR` business role template.

## Supported Device Types

- Desktop
- Tablet
- Smartphone

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SEC-RAL`.

### 6.3.1.17.2.1 How to Define Purposes of Read Access Logging

Read Access Logging is always based on a logging purpose that is freely defined according to the requirements of an organization. It describes why specific data is logged.

## Context

In the configuration, you specify the logging purpose and each log entry in the log is assigned its purpose as an attribute. This configuration enables you to organize the log data by the logging purpose. For example, various archiving rules or reportings can be created based on logging purposes.

In each Read Access Logging configuration, assign a logging purpose. When you define archiving rules, use the logging purpose as the basis.

## Procedure

1. In the *Read Access Logging Configuration* app, choose *Logging Purposes*.
2. Decide whether to create a purpose or modify one of the templates delivered by SAP.

SAP delivers default purposes you can copy and modify to your needs or you can create your own.

- To create your own purpose, choose *Create* under *Search Results*.
- To copy a purpose from SAP, do the following.
  - a. Under *Search Criteria*, choose *Search*.
  - b. From the search results, select a template from SAP.

Templates from SAP use the  (*SAP Template*) icon under *Owner* or list SAP under *Created By* or *Changed By*.

- c. Under *Actions*, choose  (*Copy*).
3. Enter the required data.

The ID is limited to ten characters. We recommend that you use an abbreviation of the purpose name as ID.

The purpose name appears on all UIs.
  4. Save your entries.

## Results

Assign logging purposes during the creation of Read Access Logging configurations. Logging purposes help you with the definition of archiving rules.

### 6.3.1.17.2.2 How to Define Semantic Grouping of Fields to Be Logged

Within an application, the data to be logged must be defined on a semantic level, before the actual fields and rules are defined. Log domains are semantic descriptions of semantically identical or related fields that have different technical representations.

## Context

In Read Access Logging, you define a log domain. When changing Read Access Logging configurations, assign a log domain to each field to be logged.

For a log domain, specify a name and a business area that the data element is related to. This definition is necessary because different applications might use the same log domain. For example, a log domain *account* can be something different in the Human Resources application than it is in the Banking application.

## Procedure

1. In the *Read Access Logging Configuration* app, choose *Log Domains*.
2. Decide whether to create a log domain or modify one of the templates delivered by SAP.

SAP delivers default log domains you can copy and modify to your needs or you can create your own.

- To create your own log domain, choose *Create* under *Search Results*.
- To copy a log domain from SAP, do the following.
  - a. Under *Search Criteria*, choose *Search*.
  - b. From the search results, select a template from SAP.

Templates from SAP use the  (*SAP*) icon under *Owner* or list *SAP* under *Created By* or *Changed By*.

- c. Under *Actions*, choose  (*Copy*).

3. Enter the required data.

You can freely define the business area. The business area functions as a namespace for the data element.

The description appears in the detailed view of the read access log and can be helpful for the person evaluating the log to identify the log domain.

4. Save your entries.

## Results

When you change a configuration, you can assign a log domain to each field to be logged. The log domain is displayed in the read access log and helps the log evaluator to understand the semantics of the field. It enables the evaluator to search for a given semantic field regardless of the technical representation or ID of this field.

### 6.3.1.17.2.3 How to Manage Recordings of Application User Interfaces

To use Read Access Logging with user interface technologies like Web Dynpro and Dynpro, you first identify the log-relevant fields. Read Access Logging provides a user interface recorder to identify those fields.

## Context

When read access to remote APIs is logged, their contents are already known at design time. All fields of a Web service are therefore available for read access logging configuration. For user interface technologies however,

the elements that are visible are not known until the application is started. Therefore, it is not possible to offer all fields for read access logging configuration. First, determine which fields are needed for read access configuration. A user interface recorder, which is started from the [Read Access Logging Configuration](#) app, helps you. When the recorder runs, the key user navigates the user interface and records every UI element that is relevant for read access logging.

### Note

The value of the fields that are displayed on the UI during the recording (the so-called sample values) become visible in the recording. The sample values and UI labels help the key user to identify the fields when changing a configuration. However, you can rerecord or delete the sample values. For example, if you find it more helpful for the key user, you can replace them with a description of the field. You can also search for one or more recordings and clear all sample values at once. Select one or more recordings from the search results and choose [Clear Sample Values](#).

### → Tip

During the recording, the field labels are recorded in the UI language in which the recording is made. These labels are displayed in the configuration using the same language of the user interface recording. We recommend that you perform the recording in a language that the key user, who creates the configuration, understands.

## Procedure

1. In the [Read Access Logging Configuration](#) app, choose [Recordings](#).
2. Decide whether to create a recording or modify one of the default recordings delivered by SAP.  
SAP delivers default recordings you can copy and modify to your needs or you can create your own.
  - To create your own recording, choose [Create](#) under [Search Results](#).
  - To copy a recording from SAP, do the following.
    - a. Under [Search Criteria](#), choose [Search](#).
    - b. From the search results, select a template from SAP.  
Templates from SAP use the  ([SAP Template](#)) icon under [Owner](#).
    - c. Under [Actions](#), choose  ([Copy](#)).
3. Enter the required data.
4. Save your entries.
  - If you copied a recording, you can use the copy as is or modify the recording to fit your needs. You can skip the rest of the steps in this procedure.
  - If you created your own recording, the recording is created and started. You can now start the user interface you want to record. The recorder stays in the [Recording](#) state until you stop it (choosing the [Stop Recording](#) icon). You can restart the recording at a later point in time by choosing the [Start Recording](#) icon.  
Perform the steps as follows.
5. Start the application that you want to record.

### Note

If the application is already open when you create the recording, you must restart it. The check if Read Access Logging is activated or not is performed when an application is started.

6. Right-click (Web Dynpro) or `Ctrl` + right-click (Dynpro) each field that you want to collect for the recording and choose ► *Read Access Logging* ► *Record Field* ▾ from the context menu.
7. To remove a field from a recording, right-click the field and choose ► *Read Access Logging* ► *Remove Field from Recording* ▾.
8. When you have recorded all fields, close the application and return to the Read Access Logging Configuration app and choose *Stop Recording* in the list of recordings.

If you do not close the Web Dynpro session, the recording is locked and you cannot change it.

## Results

A recording for a Dynpro or Web Dynpro application is created. If the recording includes errors or is missing values, restart the recording.

### → Tip

When you restart a recording, you can select another user to be recorded. This function enables you to have another user carry out the steps you want to record with their authorizations in the system. You avoid running the recording with missing or too many authorizations.

You can also download and upload the recording.

### Note

If you record fields from different applications (Web Dynpro) or programs (Dynpro) within one recording, the recording is separated into the programs and applications that were used. Create configurations for each program or application within the recording.

For Dynpro, single transactions can contain more than one program, which may not be apparent to you when you create the recording. In this case too, your recording is separated into the programs that were used.

## 6.3.1.17.2.4 How to Define What to Log

To define what to log, use a read access logging configuration.

### Context

There are pre-existing configurations delivered by SAP that you can use immediately. If you need a configuration that is more customized to your needs, you can either create a configuration from scratch or change an existing one.

The configuration can then be activated and used for different applications.

### Related Information

[How to Create a New Configuration \[page 2536\]](#)

[How to Activate or Deactivate the Correct Read Access Logging Configuration \[page 2538\]](#)

## 6.3.1.17.2.4.1 How to Create a New Configuration

You can define what to log by creating your own read access logging configuration or modifying a template delivered by SAP.

### Procedure

1. In the *Read Access Logging Configuration* app, choose *Configuration*.
2. Select a channel.
3. Decide whether to create a configuration or modify one of the templates delivered by SAP.

SAP delivers default configurations you can copy and modify to your needs or you can create your own.

- To create your own configuration, select a channel and choose *Create* under *Search Results*.  
For channels that use recordings, choose a recording.
- To copy a configuration from SAP, do the following.
  - a. Under *Search Criteria*, filter with **Owner is SAP Template**.
  - a. From the search results, select a template from SAP.

Templates from SAP use the  (SAP) icon under *Owner*.

- b. Under *Actions*, choose  (*Copy*).

For channels that use recordings, copy the recording that comes with the template under the same name or enter a new name.

- c. Find the channel you just copied and choose  (*Edit Configuration*).
4. Depending on the channel, select the object you want to create a configuration for.

For example, an operation for a Web Service, a function module for an RFC, or an application for a Web Dynpro. If you are editing an existing channel, the object is already selected for you.

For more information, see [Channel-Specific Information \[page 2540\]](#).

5. Enter the required data.
  - For Dynpro, choose *Application / Software Component*.
  - For Dynpro and Web Dynpro, specify a *Log Context*.
6. Create log groups.

#### Note

For a logging purpose, only create one logging group.

- a. Under *Log Groups*, choose  (*Create Log Group*).
- b. Specify a logging purpose and a description for the log group.
- c. Specify the fields that you want to log together in the log group.

Move fields in the *Field list* to the log group.

- d. In the *Fields* list, define how each field should be logged.
  - The *Logging Type* determines if only the field name is logged when accessed or if the value of that field is also logged.
  - To save space in the database, set *Exclude if Initial* to have Read Access Logging ignore a field if its value is initial.

#### Note

The initial value is not the default value, but the technical initial value. For example, the empty value for string or character-based fields or the number zero for integers. The default value is logged in any case.

If this option is set and all fields within a Web service, RFC, or Web Dynpro UI are initial, no log entry is created for any of the fields.

- For Dynpro and Web Dynpro, specify the *Field Type*, which is whether an input field, an output (display) field, or both.

#### Note

Values for password fields cannot be included in logs. The *Logging Type* is *Without Value* and cannot be changed.

7. Create conditions.
  - a. Under *Conditions* choose  (*Create Condition*).

If you do not assign any conditions, select the *Without Condition* checkbox in the log group attributes and continue with the next step.

  - b. Specify a name and a description for the condition.
  - c. Create one or more expressions for the condition.

Expressions are joined using logical AND.

- d. Specify the fields that you want to define rules for.

Move fields in the *Field list* to the expression.

- e. For each field, specify the select option (the selection criteria).

For example, *Username Inclusive Equals John Smith*.

Select options are joined using logical OR.

- f. Assign conditions to a log group or set the *Without Condition* option.

To assign a condition, select the Log Group, choose *Assign Condition* and select a condition. Activate the assignment if you want to apply the condition to the log group. The log groups and conditions do not need to be activated, however.

8. To check the configuration for consistency and function: choose  (*Check Configuration*) *Check*.
9. Save your entries.

## 6.3.1.17.2.4.2 How to Activate or Deactivate the Correct Read Access Logging Configuration

### Context

To activate or deactivate Read Access Logging for certain apps, follow the steps described below.

### Procedure

1. Go to the app for which you want to activate or deactivate Read Access Logging.
2. Open the app and navigate to your user area (*User Actions Menu*).
3. Click the *About* icon.
  - If the app has an app ID such as F1492, please proceed with the steps in the section *Activating and Deactivating Read Access Logging for Apps with App ID*.

#### Activating and Deactivating Read Access Logging for Apps with App ID:

4. Copy the app ID.
5. Go to the [SAP Fiori apps reference library](#) and select *All Apps*.
6. In the *Search* bar, paste the app ID you have just copied.
7. Click the app entry in the results list.
8. On the *App Details* screen, select *SAP S/4HANA Cloud* from the dropdown list.
9. In the section *Implementation Information*, select your current SAP S/4HANA Cloud release.
10. Open the subsection *Configuration* and copy the OData service name/s and the OData service version of the app.

11. Go back to the SAP Fiori launchpad and open the app Read Access Logging Configuration.
12. Go to *Configuration*.
13. Select the channel *SAP Gateway*.
14. Paste the OData service name that you have just copied in the field *Service ID*.

If you have copied more than one OData service name, you can add further *Service ID* fields to your search criteria.

15. Paste the OData service version that you have just copied in the field *Service Version*.
16. Click *Search*.

In the search results list, you can see if Read Access Logging configurations exist for the service/s and, thus, for the app, and if the Read Access Logging is active or inactive.

17. To activate or deactivate Read Access Logging, select the service/s, and click either *Activate* or *Deactivate*.

Read Access Logging is now activated or deactivated for the respective app.

### 6.3.1.17.2.4.3 How to Compare an Existing Configuration With an SAP Template

You can compare an existing configuration that has been created based on an SAP template with the current SAP template to see if there are any deviations.

## Context

Because SAP templates are updated from time to time, it can be useful to compare existing configurations that are based on an SAP template. To check for templates with deviations and to see what has changed, follow these steps:

## Procedure

1. Under *Administration* open *Configuration*.
2. Choose the channel that you want to search through.
3. Under *Search Criteria* select **Deviations from SAP Template is True**.
4. Choose *Search*.

5. Choose one of the search results.
6. Choose *More* and select  *Compare with SAP Template*.

#### Note

If you want to rebuild a configuration based on an updated version of the SAP Template, close the pop-up window, choose the configuration, then choose *More* and select  *Rebuild from SAP Template*.

## Results

A pop-up window opens where you can check which values are different between the SAP Template (left) and the existing configuration (right).

### 6.3.1.17.2.4.4 Channel-Specific Information

The Read Access Logging framework handles the channels generically, but each channel configuration is specific.

The following table shows the objects for each channel that can be logged.

Channels Available to the Read Access Logging Framework

Channel	Data Logged
Remote Function Call	<p>Remote-enabled function modules:</p> <p>Read Access Logging takes place when data leaves the system.</p> <ul style="list-style-type: none"> <li>• Asynchronous outgoing request calls on client side. Logging takes place before the call is made.</li> <li>• Synchronous requests on the provider side are logged with their response and fault messages to ensure that the response can be understood. Logging takes place before the call is made.</li> </ul>
Dynpro	<p>Configuration is based on Dynpro recordings that list the UI elements from a Dynpro application. Read access to these UI elements is then logged.</p> <p>For more information, see:</p> <ul style="list-style-type: none"> <li>• <a href="#">Dynpro Screen Elements that Can Be Logged [page 2545]</a></li> <li>• <a href="#">Tips for Configurations with Log Contexts [page 2549]</a></li> </ul>

## Channel

## Data Logged

Web Dynpro

Configuration is based on Web Dynpro recordings that contain UI elements from a Web Dynpro application. When recording, UI elements from more than one Web Dynpro application can be gathered, but each configuration is based on UI elements from only one Web Dynpro application within a recording.

### Note

Web Dynpro applications are technically identified by their Web Dynpro application configurations.

For more information, see:

- [Web Dynpro UI Elements that Can Be Logged \[page 2543\]](#)
- [Tips for Configurations with Log Contexts \[page 2549\]](#)

Web Service

Web service operations:

- Synchronous and asynchronous outgoing request messages on consumer side.
- Synchronous requests on the provider side are logged with their response and fault messages in a single log entry to ensure that the response can be understood.

### Note

Synchronous requests on the provider side are logged with their response and fault messages in a single log entry to ensure that the response can be understood.

Asynchronous requests on the provider side are logged after the message passes authentication. Waiting until after authentication prevents denial of service (DOS) attacks from being logged. Log entries are created independently of the processing of messages by applications. Log entries are created and remain in the log, irrespective of whether an error is subsequently caused in the application or if the message is later canceled.

Local shortcut Web service calls are not logged, since these calls do not leave the system.

Channel	Data Logged
ALE/IDoc Communication	<p>IDoc outbound</p> <p>Supported are the following default IDoc outbound protocols:</p> <ul style="list-style-type: none"> <li>• tRFC 3.0/3.1,4.x</li> <li>• qRFC</li> <li>• File, XML file</li> <li>• http, SOAP</li> </ul> <p>Read Access Logging takes place when IDoc data leaves the system, right before the data is handed over to the single communication protocols.</p>
SAP BW	<ul style="list-style-type: none"> <li>• Query requests</li> <li>• Query results or outputs</li> <li>• Value help</li> <li>• Master data maintenance data</li> <li>• Data preview of InfoProviders</li> </ul>
KPro	<p>Read Access Logging takes place when Knowledge Provider (KPro) is used to access the documents.</p> <p>Logging is done for specific PHIO classes for which the Read Access Logging is activated.</p>
Output Forms (DDIC Interface)	<p>Read Access Logging takes place when an Output Form is rendered for Print Output, Preview or next processing by application. You can configure logging for the name of the Output Form as well as for its fields. Note that the name of the form is logged as the field <code>FORM_NAME</code>.</p>
SAP Gateway (OData)	<p>For OData version 2 (V2) and version 4 (V4) both output logging and input logging is supported: In the RAL configuration users can define the requests for which a service should be logged, so the data that is returned by an OData service. The data which is marked as confidential, is logged.</p> <p>For OData V4 compared to OData V2, some channel fields have been changed/added.</p> <p>For more information, see:</p> <ul style="list-style-type: none"> <li>• <a href="#">Read Access Logging (RAL) and OData V2</a></li> <li>• <a href="#">Read Access Logging (RAL) and OData V4</a></li> </ul>

Channel	Data Logged
Electronic Document	<ul style="list-style-type: none"> <li>Administrative eDocument data</li> <li>Administrative eDocument file data</li> <li>eDocument type-specific fields</li> <li>eDocument file content data: <ul style="list-style-type: none"> <li>If the file structure is filled, then all the fields from the file structure are available for logging.</li> <li>If no file structure is defined, then all the data can be logged without its structure (for example, a PDF file). The Electronic Document channel provides three fields for domain assignment.</li> </ul> </li> </ul>

## 6.3.1.17.2.4.4.1 Web Dynpro UI Elements that Can Be Logged

### Structure

#### Note

- Both output and input elements can be logged, but they must be context-bound UI elements.
- UI elements that are generated automatically (for example, when using F4 Help) can be logged. They do not need to have a UI element ID assigned during application development. In these cases, a temporary ID is assigned during the recording.

The table below shows all UI elements that can be logged in Web Dynpro applications. It shows the properties that can be recorded for each UI element.

UI Element	Property
TextEdit	Value
TextView	Text
FormattedTextEdit	Value
FormattedTextView	Text

If *value suggest* is active, all proposed texts for this UI element that are displayed on the UI are logged.

UI Element	Property
InputField	Value  If <i>value suggest</i> is active, all proposed texts for this UI element that are displayed on the UI are logged.  Historical values are not recorded.
ToolBarInputField	Value
DropDownByIndex	Texts
Caption	Text
Button	Text
ToolBarButton	Text
ToolBarDropDownByIndex	Texts
LinkChoice	Text
ToolBarLinkChoice	Text
ButtonChoice	Text
ToolBarBtnChoice	Text
ToggleButton	Text
ToolBarToggleButton	Text
Checkbox	Text
Label	Text
LinkToAction	Text
LinkToURL	Text
ToolBarLinkToAction	Text
ToolBarLinkToURL	Text
FileDownload	fileName, mimeType, text, data
Panel	Title
RadioButton	Text  Selected Key
RadioButtonGroupByIndex	Text

UI Element	Property
RadioButtonGroupByKey	Selected Key
ToggleLink	Text
TriStateCheckbox	Text
SectionHeader	Text
DropDownByKey	Selected Key
ToolBarDropDownByKey	Selected Key
DropDownListBox	ItemText ItemDescription Texts
ToolBarDropDownListBox	ItemText ItemDescription Texts

The constituents of the following multiple UI elements can be logged with Read Access Logging:

- Table
- CTable
- RowRepeater
- MultiPane
- Accordion and MultiAccordionItem

### 6.3.1.17.2.4.4.2 Dynpro Screen Elements that Can Be Logged

A list of screen elements in Dynpro applications that can have read access logged.

The main scope of Read Access Logging is to log output fields on result screens. Optionally, also the input fields of the corresponding selection or query screens can be logged. Logging and defining a log context are supported for such selection or query screens and their result screens if both are implemented and processed

in the same program. Please note that one business transaction may be processed using more than one program. In such cases, logging of the input is not possible.

The table below shows the basic screen elements that can be logged in Dynpro applications.

Basic Screen Element	Comment
Input fields	Value of input field
Output fields	Value of output field
Radio buttons	For each radio button, a value is logged (true/false). Note that each radio button is logged separately. There is no logging of entire groups of radio buttons.
Checkboxes	Value of checkbox
Dropdown lists	Technical key value with marker for selected key. Note that the texts from the user interface are not logged.
Table controls	Columns of table control
Parameters	Value of the parameters of a selection screen
Subscreens	As subscreens consist of the same elements as screens, logging takes place for the elements of subscreens in the same way as for screens

Basic Screen Element	Comment
Select-Options	<p>Value of each select-option of a selection screen (list of sign, option, low/high values).</p> <p>A select-option SELOPT is displayed as:</p> <ul style="list-style-type: none"> <li>• a LOW or HIGH field for a single selection</li> <li>• a push-button (arrow icon) for a multiple selection that is represented as a table of fields (SIGN, OPTION, LOW, HIGH)</li> </ul> <p>To be able to log SELOPT-LOW or SELOPT-HIGH fields, they have to be configured.</p> <p>You can enter the data to SELOPT-LOW or SELOPT-HIGH manually:</p> <ul style="list-style-type: none"> <li>• If a program was executed without a screen round trip, the fields SELOPT-LOW and SELOPT-HIGH can be logged as input fields.</li> <li>• The multiple selection is attached to the SELOPT-LOW field: if the field SELOPT-LOW is configured for logging, the multiple selection is configured for logging as well. If a screen round trip was done (e.g. pressing <code>Enter</code>), or if the multiple selection was used, the SELOPT data is added to the multiple selection table, therefore the SELOPT-LOW field can be logged as an input or output field.</li> </ul> <p>If a variant that is used to provide the input data for a selection-option shall be logged, it has to be configured for output logging. Input data provided for the multiple selection can be logged, even if it was not displayed.</p> <p>Input data provided via variant for other parameter fields on a selection screen can be logged using the input logging.</p> <div data-bbox="804 1451 1396 1621" style="background-color: #f0f0f0; padding: 5px;"> <p><b>Note</b></p> <p>To be sure that all the data related to the select-option field is logged, it should be configured for both input and output logging.</p> </div>

Value help (F4)	Entries from the value help (F4 help) can be recorded by choosing the read access logging function from the context menu.
-----------------	---

The table below shows the screen attributes that can be logged:

Screen Attribute	Comment
Screen title	The title of a screen

Screen Attribute	Comment
Transaction code	The value of a transaction code at runtime
OK code	Code that is set when triggering an action (for example, clicking a button)
Message	The status message displayed on a screen

The table below shows the controls that can be logged:

Control	Comment
ALV grid	Columns of a display-only ALV grid control
Tab strip	Same logging behavior as for subscreens. If switching tabs happens on front-end, logging is done together for all tabs. If, on the other hand, switching tabs happens on application level, the tabs are logged separately. In addition, an OK code can only be logged when switching tabs happens on application level.

The table below shows the additional screen elements that can be logged:

Screen Element	Comment
ABAP Lists	ABAP lists can be recorded by choosing the read access logging function from the context menu. The pseudo field <code>\$_LIST_CODE</code> will be added to the created recording. Using this pseudo field, all lists of a program can be configured for logging. It is not possible to log input fields and OK codes of a list.

It is not possible to log other screen objects, such as the following:

- Input-enabled ALV grid
- ALV tree
- File download

For more information about the availability of features of Read Access Logging, see SAP Note [1969086](#).

## 6.3.1.17.2.4.4.3 Tips for Configurations with Log Contexts

### Definition

In a Read Access Logging configuration for Dynpro and Web Dynpro channels, you might need to use a log context to make sure that your log can be interpreted correctly. The log context is the UI element that other UI elements within the logging session depend on. When read access is being logged and the field that is defined as the log context changes on the user interface, all other fields are deleted from memory before the next log entry is created. Whether or not you need a log context depends on the user interface of your application. The graphic below shows a screen sequence taken from a simple HR application and the accompanying table gives recommendations on how to configure Read Access Logging for this screen sequence with the help of the log context.

#### Note

Log contexts are based on single applications or programs, like configurations. Log contexts cannot be applied across several configurations or applications/programs.

For Dynpro, single transactions can contain more than one program, which may not be apparent to you when you create a recording. In this case too, log contexts cannot be spread over multiple programs used in the transaction.

### Example

The graphic below shows a sequence of three screens. On Screen 1, the user enters an employee number. Screen 2 displays the social security number and religion of the employee. Screen 3 displays the salary of the employee.

Example screen sequence

The table below shows how to configure the screen sequence depicted in the graphic above. Note that the field *Employee Number* is a different field on the three screens; on the first screen, it is an input field and on the second and third field, it is an output field like the other fields that cannot be edited.

Screen Number	UI Element	Recommended Logging Type	Comment
Screen 1	Employee No	Log with value and define as log context	<p>The employee number is an input field, we recommend that you log it. As the other fields on Screen 2 depend on the employee number, we recommend defining it as the log context.</p> <p>In the log, the field that is the log context is marked for easy identification.</p>
Screen 2	Employee No	No logging necessary	<p>The employee number has been entered on Screen 1 and is repeated here as an output field. As you have already specified it as the log context, you do not need to log this field.</p> <div style="border: 1px solid #ccc; background-color: #f0f0f0; padding: 10px; margin-top: 10px;"> <p><b>Note</b></p> <p>Even if the employee number is not repeated on each screen, the log context is still logged as part of the log entry of these screens.</p> </div>
	Social Security No	Log without value (for example, legal regulations may prohibit logging social security numbers)	<p>The social security number of this employee is displayed within the same log entry as the log context. If you configure to log it without the value, only the fact that the field was accessed is logged, but not the value.</p>
	Religion	Log with value	<p>The religion of this employee is displayed within the same log entry. If you configure to log it with value, the religion is displayed in the log.</p>

Screen Number	UI Element	Recommended Logging Type	Comment
Screen 3	Employee No	No logging necessary	As you have specified the employee number from Screen 1 as the log context, you do not need to log this field.
	Salary	Log with value	As it is the only field that is configured on this screen, the salary of this employee will be displayed with the log context from Screen 1 in one log entry.

**Note**

Even if the employee number is not repeated on each screen, the log context is still logged as part of the log entry of these screens.

### Result

When a user clicks through this screen sequence when it is configured as described above, two log entries are created, one for Screen 2 and one for Screen 3. On Screen 1, no output field exists that can be logged. On Screen 3, the employee number does not have to be logged as the employee number field from screen 2 is the log context and is thus automatically logged during a screen sequence even if it is not displayed on subsequent screens.

### Related Information

[Channel-Specific Information \[page 2540\]](#)

[How to Define What to Log \[page 2536\]](#)

## 6.3.1.17.2.5 How to Exclude Specific Users from Read Access Logging

### Context

You cannot exclude specific users from Read Access Logging by using the app Read Access Logging Configuration.

### Procedure

- To let users be excluded from Read Access Logging, please contact the Service Center.

## 6.3.1.17.2.6 How to Check Runtime Errors and See Changes to Configurations

### Context

The Administrative Log of Read Access Logging provides information about different types of information such as:

- Action - changes made to Read Access Logging configuration.
- Error - errors that occur within the Read Access Logging framework.

### Action Log Entries

The action log records the following Read Access Logging changes:

- Configuration
- User exclusion list
- Enabling and disabling of Read Access Logging in the current client

#### Note

Only configuration changes performed manually are recorded in the log. Configurations that have been transported into the system are not included in the Administrative Log.

## Error Log Entries

Error entries could be errors in the configuration, or problems that occur during logging. The log entry may recommend action to resolve the error and/or provide other information relevant for key users or SAP Active Global Support.

## Procedure

1. In the app Read Access Logging Configuration, open *Administrative Log*.
2. Select a *Data Source*, either the database or the archive.
3. For *Databases*, specify a time filter. For *Archives*, select the *Archive Name*.
4. Enter a *User Name* to search the log for configuration actions or read access performed by a specific user.
5. Specify a log *Type* for archives or *Event Type* for databases (*Error*, *Warning*, *Message*, *Action* or *Logging Error*).

## 6.3.1.17.2.7 Transporting Read Access Logging Data

RAL objects that you've created can be transported from a Q system to a P system (development system to production system) with the *Export Customizing Transports* app

In your RAL application, you can create different customizing objects like configurations or recordings. These objects are added to the default customizing request that you can export from a Q system and import into a P system. The objects that come from the RAL application are:

- Configurations  
Refer to SAP note [2963664](#) for details.
- Log domains
- Purposes
- Recordings

To transport your changes from the development system to the productive system, perform the following steps:

### In your development system:

1. Use the *Manage Software Components* app to make sure there is a cloned business configuration software component. See [Manage Software Components](#).  
In case it is not available yet, you need to create a business configuration software component and clone it. See [How to Create Software Components](#) and [How to Clone Software Components](#).
2. Make sure that there is an open customizing transport request for your system and that the customizing transport request belongs to the cloned business configuration software component.  
To create a customizing transport request, you use the *Export Customizing Transport* app. You need the `SAP_BR_BPC_EXPERT` role to access this app. See [Export Customizing Transports \[page 2380\]](#).  
If a software component of the type Business Configuration is available in the system, the created request will target this software component. If no such software component is available, the request will be created without any target.

3. Make the actual changes to the RAL objects.
4. Release the task and customizing transport request in the *Export Customizing Transport* app.

#### **In your productive system:**

1. In the Manage Software Components app, pull the changes for the business configuration. See [How to Pull Software Components](#).
2. Check in the *Read Access Logging Configuration* app if the changes are visible.

## **Related Information**

[Working in the Export Customizing Transports App \[page 2382\]](#)

### **6.3.1.17.3 Read Access Logging: Monitor**

With this app you can use the read access log for evaluation purposes. In it, all log entries as well as all errors that occurred in Read Access Logging are displayed.

## **Key Features**

You can use this app to:

- Choose a data source
- Search for log entries
- Evaluate log entries

## **Prerequisites**

To access the app, you need to have the `SAP_CORE_BC_RAL` business catalog assigned to your user. This business catalog is contained in the `SAP_BR_DATA_PRIVACY_SPECIALIST` business role template.

## **Supported Device Types**

- Desktop
- Tablet
- Smartphone

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-SEC-RAL.

### 6.3.1.17.3.1 How to Monitor the Read Access Log

#### Context

You use the read access log for evaluation purposes. In it, all log entries as well as all errors that occurred in Read Access Logging are displayed. There are the following data sources from which you can display log entries:

- *Expanded Database* (default)
- *Expanded Archive*
- *Raw Database*  
Only contains the Read Access Logging data of the current client.
- *Raw Archive*  
Archive of the raw database.
- *Raw Archive with Index*  
Indexed archive of the raw database.

#### Procedure

1. Open the Read Access Logging: Monitor app.
2. Select the data source from which you want to display log entries.
3. Search for the log entries you want to evaluate.

To search for values of fields that have been accessed, you must use the *Expanded Database* as the source.

For data source *Archive*, select the archive in which you want to search for log entries. Additionally, there are various search criteria that you can use (choose the *Add Line* icon). Typically, you would search for a time range and a log domain or a logging purpose. These search criteria are also available if you search using the database as the source.

#### Note

Searching the archive may be time-consuming. It is much faster if you search an archive with an index. In this case, the search criteria that you have specified for the index are available.

When you choose *Search*, all log entries are displayed that match your search criteria. By default, only a few attributes are displayed per log entry. You can switch between the default and the extended view.

Within the search, you can clear the values you have entered for search criteria by choosing [Clear](#), and you can reset the search criteria to the default by choosing [Reset](#).

#### Note

You can use the button [Download](#) at the top left of the search result table to save your search results in an Excel file.

4. Select a log entry to display detailed information at the bottom.

On the [Details](#) tab, all fields are displayed with their log domain and, if logged, the field values. On the [Access Environment](#) tab, you find more information about the underlying object that was logged.

## 6.3.1.18 Security

### [Maintain Certificate Trust List \[page 2556\]](#)

With this app you can maintain a list of trusted certificates. If certificates of communication partners are classified as trusted, outbound communication to these partners can be enabled.

### [Maintain Protection Allowlists \[page 2557\]](#)

With this app you can maintain a list of trusted hosts or URL patterns.

### [Manage Content Security Policy \[page 2559\]](#)

### [Display Security Audit Log \[page 2560\]](#)

### [Maintain Client Certificates \[page 2564\]](#)

### 6.3.1.18.1 Maintain Certificate Trust List

With this app you can maintain a list of trusted certificates. If certificates of communication partners are classified as trusted, outbound communication to these partners can be enabled.

With this app you can monitor all available trusted certificates.

#### Key Features

You can use this app to:

- Display a list of all already existing trusted certificates
- Upload a new certificate
- Display detailed information
- Check for updates of certificate trusts and adopt the changes if required

### Note

SAP delivers its systems with pre-defined trusted certificates. If the trusted certificates change at a later point in time, there are no automatic updates. We therefore recommend that you use the [Check for Updates](#) function on a regular basis and adopt any changes to certificate trusts that you require.

- Delete trusted certificates from the list. This feature is enabled only for the certificate type [Managed By Customer](#). Certificates of the type [Managed By SAP](#) cannot be deleted and therefore the [Delete](#) button is disabled.

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-COM`.

### 6.3.1.18.2 Maintain Protection Allowlists

With this app you can maintain a list of trusted hosts or URL patterns.

With this app you can define secure applications by adding trusted hosts to allowlists. The following allowlists are available:

- [Clickjacking Protection](#)  
By default, clickjacking protection is active to protect your systems against malicious clickjacking. If the system is embedded into another application, the check determines whether the other application is secure. To add trusted hosts, you have to enter specific details, such as schema and port, for each trusted host to make sure that malicious hosts are identified and prevented from calling your system.
- [Trusted Network Zones](#)  
Here you can list URL patterns for which a redirect is allowed or blocked.
- [Trusted CSS Style Sheets](#)  
Here you can list URL patterns for loading CSS style sheets. This may be necessary if customer extensions are using external CSS style sheets.

## Key Features

You can use this app to:

- Add trusted hosts to the required allowlist
- Edit trusted hosts or URL patterns
- Delete trusted hosts or URL patterns

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-COM`.

### 6.3.1.18.2.1 How to Add Trusted Hosts for Cross-Origin Resource Sharing (CORS)

#### Context

CORS is a mechanism that allows web browsers or other web clients access to your sites. Access of this kind is usually forbidden by the Same-Origin-Policy (SOP). To add trusted hosts using CORS, proceed as follows:

#### Procedure

1. Open the *Maintain Protection Allowlists* app on the SAP Fiori Launchpad.
2. Open the *Cross-Origin Resource Sharing* tab.
3. Enter the *Trusted Host Name* (SAP Analytics Cloud, for example, could have the following pattern: *mytenant.us1.sapbusinessobjects.cloud*).
4. Enter the *HTTP Service Path* (for example */sap/opu/odata/sap/APS\_IAM\_API\_BROLE\_CDOC*).
5. Select the allowed HTTP methods .
6. Enter the allowed headers (for example `content-type`)

Only the following response headers are generally accessible in a CORS query:

- [Cache Control](#)
- [Content Type](#)
- [Last Modified](#)
- [Content Language](#)
- [Expires](#)
- [Pragma](#)

If the server wants to give the client access to further headers, it has to use the [Exposed Headers](#) option.

7. In addition, you can define exposed headers under [Optional Response Headers](#) if required. Please select the required checkboxes.
8. Click [Add](#).

## Related Information

[Understanding the Same-Origin Policy and CORS](#)

### 6.3.1.18.3 Manage Content Security Policy

Content Security Policy is a standard that allows to disable certain HTML/Javascript features to reduce the attack surface of applications running in a browser (for example as second line of defense against cross-site scripting attacks).

With this app you can view an allowlist of trusted sources. You can add your own trusted content for example if you have developed your own SAPUI5 app that loads external resources such as fonts, scripts or styles. Moreover, you can display any violations of the policy in a log.

## Key Features

You can use this app to:

- Display an allowlist of trusted sources
- Add new trusted sources to the allowlist  
For fonts, use `UI_RESOURCES_FONTS`; for scripts, use `UI_RESOURCES_SCRIPTS`, for styles, use `UI_RESOURCES_STYLES`.

- Display logs listing violations

Please note the following information about browser-related effects that in some cases might result in additional violations while in other cases violations are not listed:

- The violation logs might contain records indicating that an EVAL violation has occurred. These violations can be ignored. They are caused by unexpected behavior in Google Chrome.
- Firefox does not send the session cookie with the reporting requests. These requests will therefore be rejected by the backend, and are thus not included in the log.

- Browser extensions sometimes insert non-policy conform code into an HTML page. This results in violation log entries that are not caused by the applications themselves.

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-COM`.

### 6.3.1.18.4 Display Security Audit Log

With this app, you can display information about security-relevant events that occur in your SAP system. This can be necessary in case of an audit.

## Key Features

This app provides the following key features:

- Recording of security-relevant events in your SAP system.
- Access to previously specified log files in the form of an audit analysis report.

## Scope

The Security Audit Log records the following information:

- Security-related changes to the ABAP Platform (for example, change of system changeability)
- Information that provides a higher level of transparency (for example, successful and unsuccessful logon attempts)
- Information that enables the reconstruction of a series of events (for example, successful or unsuccessful transaction starts)

SAP Note [2903873](#) provides a list of currently recorded Security Audit Log events.

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, report an incident under component `BC-SEC-SAL`.

### 6.3.1.18.4.1 Integrating Security Audit Logs

Service name: `RSAU_LOG_API`

This service enables you to retrieve the security audit log data. You can use the audit log data to integrate them into your Security and Event Management solution (SIEM) to detect security relevant event situations.

This is an OData version 4 service. This version aims to improve processing time and resource consumption of clients and servers. This includes a lightweight JSON format that reduces the size of every response.

## Technical Details

A service group contains services belonging to the same business object model and so it shares similar environment conditions. This means the configuration and administration of a service group apply to all services in a service group, that is, routing, authorization, and so on, so you only have to do them once.

In the OData version 4 (V4) runtime implementation of the SAP Gateway Foundation, framework services originate from repositories.

Service Group (incl. Name-space if Existent)	Repository ID	Service Name (incl. Name-space if Existent)	Version
<code>RSAU_LOG_API</code>	<code>SRVD_A2X</code>	<code>RSAU_LOG_API_SERVICE</code>	<code>0001</code>

## Service Structure

### Service Header (optional)

The service header contains information about the service.

### Entities

The entities contain the business data of the service.

Entity	Description	Necessity	Link to Details
Security Audit Log	Security Audit Log		<a href="#">Retrieving Security Audit Log [page 2563]</a>

## Service Response

The details included in the response vary according to the type of operation. For more information, see [Operation for Security Audit Log Integration](#).

## Integration with SIEM Solution

Service name: RSAU\_LOG\_API

Communication scenario: SAP\_COM\_0750

This service enables you to retrieve the security audit log data. You can use the audit log data to integrate them into your Security and Event Management solution (SIEM) to detect security relevant event situations.

## Additional Information

### Note

For more details about Communication Management, see [Communication Management \[page 2390\]](#).

## 6.3.1.18.4.1.1 Operations for Security Audit Log Integration - Read

The Security Audit Log Integration - Read offers the following operations:

Operation	HTTP Method	Sample URL
<a href="#">Retrieving Security Audit Log [page 2563]</a>	GET	Example getting the first 1000 audit log entries:  GET <host>/sap/opu/odata4/sap/rsau_log_api/srvd_a2x/sap/rsau_log_api/0001/SecurityAuditLog?\$top=1000

## 6.3.1.18.4.1.1.1 Retrieving Security Audit Log

With `SecurityAuditLog` you can retrieve the Security Audit Log by using the HTTP method `GET`.

### Request

You have to include the following properties in the URL of the request:

Property	Necessity	Comment
<code>eventID</code>	Optional	Security Audit Log Event <ul style="list-style-type: none"><li>String &lt;= 3 characters</li></ul> Example: AU1, AU2
<code>log_tstmp</code>	Optional	Timestamp of the security audit log event <ul style="list-style-type: none"><li>String(\$date-time)</li></ul> Example: 2017-04-13T15:51:04Z
<code>slgmand</code>	Optional	Client within the SAP System <ul style="list-style-type: none"><li>String &lt;=3 characters</li></ul> Example: 100
<code>sid</code>	Optional	System ID <ul style="list-style-type: none"><li>String &lt;=3 characters</li><li>Example: Y13</li></ul>
<code>counter</code>	Optional	Message counter <ul style="list-style-type: none"><li>integer(\$int16)</li></ul>
<code>slgtc</code>	Optional	Transaction Code <ul style="list-style-type: none"><li>String &lt;= 20 characters</li></ul> Example: VA01
<code>slgrepna</code>	Optional	Program Name <ul style="list-style-type: none"><li>String &lt;= 40 characters</li></ul> Example: SAPMSSY8

### Response

The operation returns the Security Audit Log.

## Examples

### Get events within a specific timeframe:

```
GET <host>/sap/opu/odata4/sap/rsau_log_api/srvd_a2x/sap/rsau_log_api/0001/SecurityAuditLog?$filter=(log_tstmp%20ge%202021-05-08T10%3A25%3A09Z%20and%20log_tstmp%20le%202021-05-09T10%3A25%3A09Z)
```

### Response

```
{
  "eventID": "AU1",
  "log_tstmp": "2021-05-08T10:26:22.740611Z",
  "slgmand": "100",
  "sid": "ABC",
  "counter": 0,
  "terminal_name": "",
  "user_fullname": "Example Administrator",
  "slgtc": "S000",
  "slgprepna": "RSBTCRTE",
  "rsau_text": "Logon successful (type=B, method=A)",
  "UserDescription": "Example Administrator"
},
{
  "eventID": "AU1",
  "log_tstmp": "2021-05-08T10:28:22.924215Z",
  "slgmand": "100",
  "sid": "ABC",
  "counter": 0,
  "terminal_name": "",
  "user_fullname": "Example Administrator",
  "slgtc": "S000",
  "slgprepna": "RSBTCRTE",
  "rsau_text": "Logon successful (type=B, method=A)",
  "UserDescription": "Example Administrator"
},
}
```

## 6.3.118.5 Maintain Client Certificates

With this app you can upload client certificates for your area to enable secure outbound certificate-based authentication. You can maintain one central list of certificates you can use when defining communication systems for outbound communication.

### Key Features

You can use this app to:

- Upload certificates in PKCS #12 format
- Download certificates
- Display general information and usage in communication arrangements and systems

- Replace client certificates
- Create signing requests

**Note:**

Once you have uploaded your certificate in the [Maintain Client Certificates](#) app, you have to edit it to enable it for usage in SAP BTP. You do this by selecting [Client Default for ABAP on BTP](#) in the [Certificate Category](#) dropdown.

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-SRV-APS-COM.

## Related Information

[Communication Arrangements \[page 2394\]](#)

### 6.3.1.18.5.1 Prerequisites for Maintaining Client Certificates

To enable client certificate-based authentication in SAP Cloud Platform ABAP Environment, the following prerequisites have to be met:

SAP Cloud Platform Cockpit:

#### For Web Socket RFC

1. Select your Web Socket destination within your used destination service.
2. Under [Additional Properties](#), apply the [jco.client.tls\\_client\\_certificate\\_logon\\_property](#) and set it to value **1**.
3. Click [Save](#).

#### For HTTP

1. Select your HTTP destination within your used destination service.
2. In the [Authentication](#) dropdown list of the [Destination Configuration](#) area, select [Client Certificate Authentication](#).

3. Click [Save](#).

## 6.3.1.19 System Management

[Maintain User Sessions \[page 2566\]](#)

### 6.3.1.19.1 Maintain User Sessions

With this feature you can view all sessions containing locks in the current system. You can also display further information, such as associated business users. If required, you can delete a session, for example if it is blocking an app.

#### ⚠ Caution

Please note that it is not possible to delete sessions that are related to drafts.

### Key Features

You can use this app to:

- View details of the sessions, such as user IDs, user names, or number of locks
- Delete sessions if required

#### 📌 Note

Please note that the business user does not get a warning message when a session is deleted. Therefore, we recommend that you do this with caution.

The following business catalog is required to make this app visible:

[System Management – Sessions \(SAP\\_CORE\\_BC\\_CST\\_DP\\_MAS\\_PC\)](#)

### Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SRV-APS-IAM`.

#### 6.3.1.20.1 Application System Overview

With this app you can get access to a set of essential data to monitor the application system.

#### Key Features

This app provides the following key features:

- Navigation to detail views, such as memory utilization, work process utilization, dialog step times, and top transactions by CPU utilization
- Thumbnail previews of essential application system metrics

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-OP-MON.

## More Information

The application system overview is part of the technical monitoring cockpit. For more information about the technical monitoring cockpit, see the documentation at [https://help.sap.com/viewer/tmc\\_cloud](https://help.sap.com/viewer/tmc_cloud).

## 6.3.1.20.2 Database System Overview

With this app you can get access to a set of essential data to monitor the database system.

## Key Features

This app provides the following key features:

- Thumbnail previews of essential database metrics
- Navigation to detail views on, for example, alerts, CPU utilization, memory utilization, SQL workload, top column tables by size, growth, and reads

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-OP-MON.

## More Information

The database system overview is part of the technical monitoring cockpit. For more information about the technical monitoring cockpit, see the documentation at [https://help.sap.com/viewer/tmc\\_cloud](https://help.sap.com/viewer/tmc_cloud).

### 6.3.1.20.3 SQL Statement Analysis

With this app you can analyse the performance of SQL statements within a given time range. The SQL statement analysis provides you with a chronology of performance metrics such as execution time and lock-wait time, and the database access plans.

## Key Features

This app provides the following key features:

- List of the most expensive SQL statements from the plan cache
- View of the execution and waiting behavior over time for a selected SQL statement
- Complete, formatted display of a selected SQL statement
- Access plan of a selected SQL statement

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-OP-MON.

## More Information

The SQL statement analysis is part of the technical monitoring cockpit. For more information about the technical monitoring cockpit, see the documentation at [https://help.sap.com/viewer/tmc\\_cloud](https://help.sap.com/viewer/tmc_cloud).

## 6.3.1.20.4 Table Analysis

With this app you can get an in-depth view on the characteristics, resource consumption, and workload of a table.

### Key Features

This app provides the following key features:

- View the total memory consumption of the biggest tables
- For a selected table, detail views for partitions, indexes, memory, and load

### Supported Device Types

- Desktop
- Tablet

### Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-OP-MON`.

## 6.3.1.20.5 Work Process Analysis

With this app you can display a snapshot of the status of the work processes of your SAP system.

### Key Features

This app provides the following key features:

- Drilldown from an overview of the application server instances to the details of a single work process
- Analysis of current workload

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-OP-MON`.

## More Information

The work process analysis is part of the technical monitoring cockpit. For more information about the technical monitoring cockpit, see the documentation at [https://help.sap.com/viewer/tmc\\_cloud](https://help.sap.com/viewer/tmc_cloud).

## 6.3.1.20.6 Sampled Work Process Data

With this app, you can check, for example, how much ABAP CPU time and main memory your work processes have consumed and find out the dialog and background work process utilization. This helps you to identify the top consumer workloads that might slow down your system and cause bottlenecks.

## Key Features

This app provides the following key features:

- Identification of resource utilization and main workload
- Analysis of concurrent workload
- Detail views of single work process samples
- Analysis of the root cause of an identified expensive workload or a bottleneck by further drilling down to single code lines via sampled stack traces

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-OP-MON.

### 6.3.1.20.7 System Workload

With this app you can get an overview of your system workload and see how it behaves over time.

#### Key Features

This app provides the following key features:

- Response time distribution in terms of, for example, CPU, database, and processing times
- Time series of the response time distribution of the system
- Drilldown to request processing details and ABAP statistics records

#### Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-OP-MON.

### 6.3.1.20.8 System Outbound Communication

With this app you can get an overview of the system outbound communication over time, which helps you identify obvious expensive outbound communication.

## Key Features

This app provides the following key features:

- It shows the top 10 communication scenarios by calling time.
- The *System Outbound Communication* screen and its related drill-down screens provide sample records of expensive system outbound communication.
- Outbound communication of type RFC, HTTP, and Web service is supported.

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-OP-MON`.

### 6.3.1.20.9 Capture Request Statistics

With this app you can capture request statistics to find out which activities are running in your ABAP system. With the activation of a capture profile, you can capture system activities. Requests are recorded with technical information, such as response time, program name, or CPU time. Using the request statistics, you can investigate the performance of a system or of a tenant in more detail.

## Key Features

This app provides the following key features:

- Creation of capture profiles that define which request statistics are collected and when
- Display of profiles for capturing request statistics defined by SAP
- Activation and deactivation of profiles for capturing request statistics
- Navigation to the analysis of request statistics and to system sizing
- Activation and deactivation of SQL traces

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-OP-MON.

### 6.3.1.20.10 Perform System Sizing

With this app, you can calculate how many ABAP compute units are consumed based on captured request statistics of selected business scenarios. With the result of the system sizing, you can estimate how many ABAP compute units the production system will need.

## Key Features

This app provides the following key features:

- Navigation from the definition of profiles for capturing request statistics to system sizing based on these statistics
- Estimation of required total ABAP memory, work process time, and ABAP CPU time in ABAP compute units for selected ABAP statistics records
- Fine-tuning of system sizing by changing the selected ABAP statistics records, the process executions per minute, or the available ABAP compute units

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-OP-MON.

## 6.3.1.20.11 Health Monitoring

With this app you can check the health of your ABAP system. The KPIs and time series of various metrics are displayed on individual cards. These metrics indicate the health state of the system.

### Key Features

This app provides the following key features:

- Overview of the metrics for the monitored system  
Health metrics are represented by cards with a KPI that summarizes the current status.
- Display of the history of the metrics to, for example, compare trends, identify performance bottlenecks, or investigate resource shortages
- Navigation to related apps from some cards for further analysis or issue fixing

### Supported Device Types

- Desktop
- Tablet

### Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-OP-MON.

## 6.3.1.20.12 Schedule Metric Provider Collection

With this app you can schedule and monitor application jobs that collect metric providers that have been created in ABAP Development Tools (ADT) using ABAP for Cloud Development. After you've scheduled your application job and set up the communication to SAP Cloud ALM, your metrics will also be available in SAP Cloud ALM Health Monitoring.

### Key Features

This app provides a view on the [Application Jobs](#) app. Therefore, its key features are identical with the key features of the [Applications Jobs](#) app.

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

## Related Information

[Application Jobs \[page 2360\]](#)

### 6.3.1.20.13 Partition HANA Tables

With this app you can break down large columnar tables into partitions. By default, database tables on SAP HANA are not partitioned. The SAP HANA database allows for a maximum number of approximately two billion records per table. If this threshold is exceeded, your application stops working. To avoid this, you need to partition your tables in time.

## Key Features

This app provides the following key features:

- Search for large tables that can be partitioned according to certain filter criteria
- Partition large tables
- Undo the partitioning of a table by merging the partitions of a table back into one table

#### Note

With this app you can only partition your own tables or tables that have explicitly been classified for partitioning by SAP.

## Supported Device Types

- Desktop

- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component BC-OP-MON.

## More Information

For more information about the partitioning limits of the SAP HANA database, see SAP Note [2154870](#) and [Partitioning Limits](#).

### 6.3.1.20.13.1 Partitioning a Large HANA Table

Break down large columnar tables into partitions before the SAP HANA database threshold of two billion records per table is reached.

## Procedure

1. On the SAP Fiori launchpad of your ABAP environment, search for the *Partition HANA Tables* app.
2. To search for tables that contain a large number of records, enter your search criteria.

By default, the search criteria include the table name, the number of records, the total memory in MB and the number of partitions. If you want to include other search criteria, choose the *Adapt Filters* button.

3. Choose the *Go* button.

A list of tables that match the search criteria and that are eligible for partitioning is displayed, such as your own tables or tables released for partitioning by SAP. You can identify large tables in this list by checking the number of records and the total memory of the individual tables.

#### Note

You can add or remove columns in the list by choosing the *Settings* button.

4. Choose the table that you want to partition and choose the *Partition Table* button.
5. In the *Change Partitioning Schema* dialog box, select the partitioning key and enter the number of partitions that you want to create. Then choose *Partition Table*.
6. In the *Confirm Table Partitioning* dialog box, choose *OK*.

A background job is scheduled on the backend system that carries out the table partitioning.

7. To check whether the job has finished and your table was partitioned successfully, refresh the list of tables by choosing the *Go* button.

#### 📘 Note

You can always undo the partitioning of a table by choosing a partitioned table in the list and then choosing the *Merge Partitions* button. All partitions of this table will then be merged back into one partition.

## 6.3.1.20.14 ABAP Runtime Errors

App ID: F7770

With this app, you can display and analyze the ABAP runtime errors that have occurred in your current tenant.

### Key Features

This app provides the following key features:

- List of all ABAP runtime errors that have occurred in your current tenant, which you can personalize
- Display of summary information, the source code, and the call stack for each ABAP runtime error that has occurred
- Option to navigate to ABAP development tools (ADT) to fix the error or to display the error in the Web browser (HTML)

### Supported Device Types

- Desktop
- Tablet

### Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-OP-MON`.

## 6.3.1.21 Manage Banks - Master Data

With this app you can display, create, and change data about the banks your company, your customers, and your suppliers use to transact business.

## Key Features

You can use this app to:

- Create, display, and edit data for banks and house banks in which your company has one or more accounts.
- Create, display, and edit data for banks that your customers and suppliers use to transact business with your company.
- Associate house banks, contact persons, and business partners with your banks.

### Note

This app contains in-app help for key fields and concepts. To display the help while working in the app, press F1 or choose the question mark displayed in the app header.

In addition, the app supports the following technical features and options:

- Banks can be replicated to other systems using SAP Master Data Integration. For more information, see [Master Data Replication Using SAP Master Data Integration \(Related Links\)](#).

## Access Information

For information on what business role and business catalog need to be assigned to your user to access the app, see the overview table in the chapter [Applications for General Functions for Key Users](#).

## Supported Device Types

- Desktop
- Tablet

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `FIN-FSCM-BNK`.

## Related Information

[Master Data Replication Using SAP Master Data Integration](#)

## 6.3.1.22 Translation

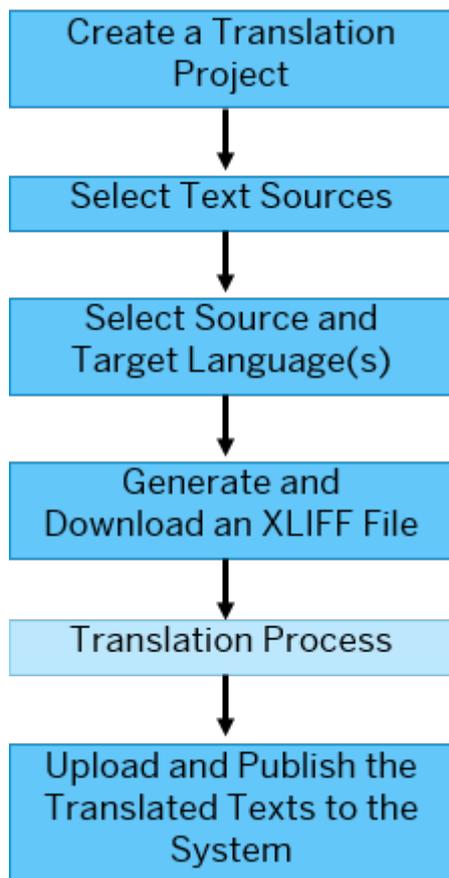

[Maintain Translations \[page 2580\]](#)

### 6.3.1.22.1 Maintain Translations

The [Maintain Translations](#) app provides an easy way to translate developer extensions into other languages.

#### Context

You've built a developer extension and would now like to translate it into other languages. The [Maintain Translations](#) app allows you to select your text sources and generate an XLIFF (1.2) file containing the translatable texts as well as useful notes on them. XLIFF (XML Localization Interchange File Format) is a standard used in localization. The XLIFF file can then be forwarded to a dedicated translator or translation agency. Once the XLIFF file has been translated, you can use the [Maintain Translations](#) app to upload it and publish the translated texts into your system.

- [Create a Translation Project](#) [page 2582]
- [Select Your Text Sources](#) [page 2583]
- [Select Your Source and Target Language](#) [page 2585]
- [Generate and Download the XLIFF File](#) [page 2585]
- [Upload and Publish the Translated XLIFF File to the System](#) [page 2586]

## Key Features

You can use this app to:

- generate an XLIFF file of the texts that need to be translated.
- publish the translated texts to the system.

### ⓘ Note

If you want to have your texts translated by SAP, you can use the SAP Translation Hub. For more information, see [SAP Translation Hub](#).

## Supported Device Types

- Desktop

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-DOC-TTL-MTR`.

### 6.3.1.22.1.1 Create a Translation Project

#### Context

You want to translate your developer extension. Before you can select your text sources and target languages, you need to create a translation project.

#### Note

Please assign the business catalog `SAP_A4C_BC_TRN_MNG_PC` to ensure that changes can be recorded on transport requests.

#### Procedure

1. Open the *Maintain Translations* app.
2. Click **+** (Create) to create a new translation project.
3. Fill in an identifier for your project, a name and description, and the name of the package that should contain your translation project.
4. Click *Create* at the bottom right of your screen.
5. You now need to add your translation project to a transport. You can either use an existing transport request that matches the transport target of the package you have selected for the translation project, or create a new one by clicking *Create*. Save your changes by clicking *Select*.

#### Results

Your project has now been created and added to the overview list.

## Related Information

[Select Your Text Sources \[page 2583\]](#)

### 6.3.1.22.1.2 Select Your Text Sources

#### Context

Select the text sources that you want to have translated.

#### Procedure

1. In the *Maintain Translations* app, open the project you want to add text sources to.
2. Scroll down to *Text Sources* and click *Add*.
3. Here you can select which text source types to add. The following text source types are supported:
  - Domains
  - Data Elements
  - Data Definitions (View Entities, Projection Views, Abstract Entities and Custom Entities)
  - Message Classes
  - Metadata Extensions
  - Application Log Objects
  - Business Configuration Objects
  - Text Pools
  - Text Tables
  - IAM Business Catalogs
  - CDS Type Definitions

It's also possible to specify a package from which all supported translatable elements will be pulled into the translation project. Please note that translatable elements in sub packages are not included.

4. Select *Add* to open the *Add Text Source* dialog which displays all text sources that can be added to the translation project. By filtering the type and name, you can choose the text sources you want to add. Select *Add* to add the text sources you selected to your translation project.

#### ⓘ Note

Text sources that can be translated by a translation project need to reside in the same software component as the translation project.

#### ⓘ Note

- If you want to test the translated texts of IAM business catalogs directly in the Fiori launchpad of the development system, you have to publish the IAM business catalog once again locally in ADT.

- If you want to test the translated texts of data definitions or metadata extensions directly in the development system with a Fiori app built on top of these objects, you should first reactivate the objects in ADT to ensure that all caches will be invalidated.

## 📘 Note

### Text Tables

Text tables are database tables that were created as part of a business object and in which language-dependent texts are stored.

A database table needs to fulfill the following requirements to be considered a text table by the *Maintain Translations* app:

- The database table has exactly one key field of ABAP Dictionary built-in type LANG.
- The database table is of delivery class C or S.
- The database table is located in the same software component as the translation project.
- The translation of text tables that contain key fields of type p (packed number), i (integer) or x (byte field) is not supported. That includes any kind of UUID and raw types, such as `SYSTUID_X16`.

If these requirements are fulfilled, the database table can be added to a translation project as a text table. Additionally, the following rules apply:

- Every non-key field of the text table that is of an ABAP Dictionary Build-in type that is character-like and has a minimum length of 1 will be interpreted as a text attribute for which translations can be maintained.
- When the translations are published, the rows containing the texts in the target language will be added to the selected transport via R3TR TABU.

In this tutorial ([Create an SAP Fiori-based Table Maintenance App with SAP BTP, ABAP Environment](#)) on how to create a business configuration application to maintain error code definitions, for instance, the language-dependent texts for the respective error code definitions are stored as entries in the database table `ZERROR_CODE_T###` with `###` being replaced by a number chosen by the developer, such as `000`. The non-key field for which translations can be maintained is field `DESCRIPTION`.

## 📘 Note

Please note that the translation of text table entries is only available in environments that support transporting client-specific data.

## Related Information

[Select Your Source and Target Language \[page 2585\]](#)

## 6.3.1.22.1.3 Select Your Source and Target Language

### Context

Select your source language as well as the languages you want to translate your texts into.

### Procedure

1. In the *Maintain Translations* app, open the project for which you want to select the source language and target language. You can choose to select either a single language or more than one language.
2. Scroll down to *Translations* and click *Create*.
3. Select a *Source Language* and *Target Language* from the dropdown menus and confirm with *Create*.

#### ⓘ Note

You can select from all of the languages that are installed in the system. In case of ABAP repository objects and text pools, it's only possible to maintain translations for languages other than the original language.

Note that deleting a previously created translation entry for a given source and target language pair will only delete the corresponding entry in the translation project. Already published texts for the target language of the translation will not be deleted from the system.

4. A new entry has now been added to the list.
5. Repeat these steps for all source and target languages.

## 6.3.1.22.1.4 Generate and Download the XLIFF File

### Context

You can generate an XLIFF file for your source and target language(s) that you can download and send to your dedicated translator or translation agency.

### Procedure

1. In the *Maintain Translations* app, open the project you want to have translated and scroll down to *Translations*.
2. Select the entry for the source and target language for which you want to generate the XLIFF file.
3. Navigate to *Download*. Here you can select whether the XLIFF file should contain all texts (*All Texts*) or only those texts that were changed since you last published a translated XLIFF file in these languages (*Changed Texts*). If this is the first time you are generating an XLIFF file for the project in this target language, choose *All Texts*.

The XLIFF file will now be downloaded to your computer. You can send it to your dedicated translator or translation agency to be translated.

## Related Information

[Upload and Publish the Translated XLIFF File to the System \[page 2586\]](#)

### 6.3.1.22.15 Upload and Publish the Translated XLIFF File to the System

#### Context

Your texts have been translated and a new XLIFF file has been sent back to you. You can now upload and publish the translated texts into the system. Here's how:

#### Procedure

1. In the *Maintain Translations* app, open your project and scroll down to *Translations*.
2. Select the entry for the source and target language for which you want to upload and publish the translated XLIFF file.
3. Click *Upload*.
4. Search for the translated file and confirm with *Upload*.
5. Now the translations have been uploaded to the system. They still need to be published, however. Select the entry and click *Publish*.
6. Select a transport to which you want to add the corresponding language (LANG) transport entries or R3TR TABU entries (in case of text tables) and click *Select*.

Your translations have now been published.

## 6.3.1.23 Software Component Lifecycle Management

The software component lifecycle management allows you to manage the lifecycle of software components that are available in your ABAP environment landscape.

### Purpose

For the lifecycle management of software components you can use the app [Manage Software Components](#) in your launchpad that displays available software components, and imports them to service instances in your ABAP environment landscape. With the app, you can create new software components and delete them. Due to similarity to the Git protocol and its workflows, the following documentation uses the term **pull** as synonym for **import**.

One software component is comparable to a repository in Git. These "repositories" are centrally stored in separate units and cannot be referenced by other software components, which means the transport of development objects between the components is not possible. All software components are managed by SAP.

Once you have pulled a new software component to a service instance, a new structure package is created. The structure package name corresponds to the software component name. A software component itself is developed in ABAP packages in ABAP Developments Tools (ADT). The development objects are then uploaded to the structure package, and the software component is made available for the import to other service instances.

#### Note

In your system you will see all software components linked to the same global account. Region or infrastructure provider do not matter. You only have to ensure that all systems are created within the same global account.

#### Caution

It is strongly discouraged to perform ABAP cloud development on a software component across multiple development systems. The reason for this is the potential for critical merge conflicts. When multiple developers work on the same software component simultaneously, edit it in different development systems, and release the transport requests afterward, inconsistencies and conflicts can arise in the target system.

This can lead to significant problems in the further development and maintenance of the software. It can even result in data loss. To avoid these issues, performing ABAP development on a software component in only one development system is highly recommended.

### Related Information

[Manage Software Components \[page 2592\]](#)

## 6.3.1.23.1 Supported ABAP Object Types

The following table contains all released ABAP object types that are supported in Git-enabled Change and Transport System (gCTS).

Object Name	Description	Generated
ADSO	DataStore Object	
ADVC	App Variant (LRep cross-client content)	
AIFC	Objects from AIF content	
AOBJ	Archiving Object	
APCO	Application Components	
APIS	API Release State of Objects	
APLO	Application Log Object	
AREA	InfoArea	
ATOM	ATO Manifest	
AUTH	Authorization Check Fields	
BDEF	Behavior Definition	
BRLC	Business Role Custom	
BUGR	Business User Group	
CDAT	View Cluster Maintenance: Data	
CDBO	Customer Data Browser Object	
CFDA	Custom Fields: BAdIs of Business Context	
CFDF	Custom Field	
CHDO	Change Document	
CHKC	ATC Check Category	
CHKE	Exemptions	
CHKO	ATC Check Object	
CHKV	ATC Check Variant	
CLAS	Class	
CTRT	Currency Translation Type	
DCLS	ABAP Data Control Language Sources	
DDLS	Data Definition Language Source	
DDLX	Core Data Services Metadata Extensions	
DEVC	Package	
DMOD	Data Flow	

Object Name	Description	Generated
DOMA	Domain	
DPTA	Data Protection Template	
DRTY	Dictionary: CDS Type Definitions	
DSFD	CDS Scalar Function Definition	
DSFI	CDS Scalar Function Implementation Reference	
DTDC	Dictionary Dynamic Cache	
DTEB	Dictionary Tuning: Entities Buffer	
DTEL	Data Element	
DTPA	Data Transfer Process: Active Version	
EEEC	Enterprise Event Enablement - Event Consumer	
ENHO	Enhancement Implementation Object	
ENHS	Enhancement Spot Object	
ENQU	Lock Object	
ESHA	Enterprise Search: DDL Activation	
EVTB	Event Binding	
FUGR	Function Group	
FUNC	Function Module	
G4BA	OData v4 – BEP - Service Group and Assignments	
G4BS	OData v4 – BEP - Service	
GCPM	SAP Gateway OData Client Proxy - Proxy Model	
GSMP	Metric Provider	
HCPR	SAP HANA Composite Provider	
HTTP	HTTP Service	
INA1	InA Service	
INTF	Interface	
IOBJ	InfoObject	
IWMO	SAP Gateway Business Suite Enablement - Model	
IWOM	SAP Gateway: Model Metadata	Yes
IWSG	SAP Gateway: Service Groups Metadata	Yes
IWSV	SAP Gateway Business Suite Enablement - Service	Yes

Object Name	Description	Generated
IWVB	SAP Gateway Business Suite Enablement -Vocabulary Annotation	Yes
LRCC	LRepository cross-client content	
LRCD	LRepository client-dependent content	
LRST	LRepository client-dependent content - customizing requests	
MSAG	Message Class	
NONT	SAP Object Note Type	
NROB	Number Range Object	
NTTY	Note Type	
OA2S	OAuth2 Scope Yes	
PCFN	Predefined Field: Extensible Node	
PROG	Program	
RABR	Read Access Logging: Recording	
RADB	Read Access Logging: Dynpro	
RAGB	Read Access Logging: Generic Channel	
RARB	Read Access Logging: Remote Function Call	
RASB	Read Access Logging: Web-Service	
RAWB	Read Access Logging: Web Dynpro	
RDOM	Read Access Logging: Log Domain	
RGRP	Business Role Group	
RONT	SAP Object Type	
RPUR	Read Access Logging: Purpose	
RSDS	DataSource in BW	
RSPC	Process chain	
RSPI	Interrupt Process	
RSPT	Trigger Process	
RSPV	Process variants	
SAJC	Application Job Catalog Entry	
SAJT	Application Job Template	
SC01	Communication: Communication Scenario	
SC02	Communication: Inbound Service	Yes
SC03	Outbound Service	
SIA1	IAM: Business Catalog	

Object Name	Description	Generated
SIA2	IAM: Restriction Type	
SIA3	IAM: Authorization Object Extension	
SIA5	IAM: Restriction Field	
SIA6	IAM: App	
SIA7	IAM: Business Catalog App Assignment	Yes
SIA8	IAM: Business Role Template	
SIA9	IAM: Business Role Templ. Bus. Catalog Assignment	
SIAD	Business Role Template Fiori Space Assignment	
SICF	ICFService	
SKTD	Knowledge Transfer Document	
SMBC	Maintainable Business Configuration	
SMIM	MIME Object	Yes
SOD1	API Package	
SOD2	API Package Assignment	
SPRV	SOAP Provider Model	
SUSI	Assignemnt: Service -> AuhtORIZATION Objects (with TADIR)	
SPRX	Proxy Object	Yes
SQL1	ABAP SQL Service	
SRVB	Service Binding	
SRVC	Service Consumption Model	
SRVD	Service Definition	
SUSH	Assignment: Service --> Authorization Objects	
SUSO	Authorization Object	
TABL	Table Definition	
TABU	Table Contents	
TDAT	Customizing: Table Contents	
TOBJ	Definition of a Maintenance and Transport Object	
TRCS	Communication Structure for Transformation	
TRFN	Transformation	
TRPC	Translation Project - Customizing	
TRPR	Translation Project	

Object Name	Description	Generated
TTYP	Table Type	
TYPE	Type Group	
UIAD	Application Descriptors for the Fiori Launchpad Environment	
UIPC	Fiori Launchpad Page - Customizing	
UISC	Fiori Launchpad Space - Customizing	
UOMT	Quantity Conversion Type	
VDAT	View Maintenance: Data	
WAPA	BSP Page	Yes
WEBI	Service definition - WEBI	Yes
XINX	Ext. Index	Yes
XSLT	Transformation	

#### Note

Object types flagged as "generated" cannot be created by customers directly but they are secondary objects that are necessary for the functionality of some objects.

Customizing

Object Name	Description
CDAT	View Cluster Maintenance: Data
SNUMS	Number Range Configuration
TABU	Table Entries
TDAT	Customizing: Table Contents
VDAT	View Maintenance: Data

## 6.3.1.23.2 Manage Software Components

You can use this app to create, display, clone, delete and configurate software components in your ABAP environment landscape. Moreover, you can pull (import) changes from the central software component into other instances.

### Purpose

This app allows you to create a software component on a service instance and make with a 'Clone' and import changes (=commits = transport requests) on other instances after an initial clone using a 'Pull'.

## Key Features

You can use this app to:

- display available software components
- create new software components
- pull software components and display pulls
- delete software components
- display logs for performed actions like Clone, Pull, and other
- create and delete branches
- display pushed commits (= released transport request)
- create and delete tags on commits
- configure the repository role (Source or Target)
- enable or disable a rollback mechanism for failed pull operations

In addition, the app supports the integration with Git.

## Supported Device Types

- Desktop
- Tablet
- Smartphone

## Related Information

[How to Display Available Software Components \[page 2594\]](#)

[How to Create Software Components \[page 2595\]](#)

[How to Pull Software Components \[page 2597\]](#)

[How to Delete Software Components \[page 2600\]](#)

## 6.3.1.23.2.1 How to Display Available Software Components

### Context

You want to see which software components already exist in the environment and are locally available. To display available software components, perform the following steps:

### Procedure

1. After opening the app, choose [Go](#) on the [Manage Software Components](#) screen to display the list of available software components. The list provides you with the following information:

Column Name	Description
<Name>	Name of the software component that has to be unique per service instance. The maximum length of the name is restricted to 18 characters including a namespace.
<Description>	Description of the software component, which can only contain 60 characters.
<Type>	Type of the software component. The software component must either be <a href="#">Development</a> or <a href="#">Business Configuration</a> .
<Checked Out Branch>	The name of the branch that is checked out.
<Cloned>	Shows whether or not the software component has been cloned.
<Created On>	Date and time when the software component was created.
<Created By>	Email address of the technical user who created the software component.
<Changed On>	Date and time when last changes were made to the software component.
<Changed By>	Email address of the technical user who performed the last changes on the software component.

2. To display detailed information on a software component, choose the list entry.

## 6.3.1.23.2.2 How to Create Software Components

### Context

To create a new software component, perform the following steps:

### Procedure

1. On the [Manage Software Components](#) screen, select [Create](#).
2. In the [New Software Component](#) popup, select your namespace from the drop-down menu and enter a name for the software component. Optionally you can also enter a description (max. 60 characters), which explains the functions of the component and is displayed in the app. Choose a type for your software component: Select either [Development](#) or [Business Configuration](#) from the drop-down menu.

Software Component Types

Software Component Type	Description
Development	Used for standard ABAP application development.
Business Configuration	Used to transport customizing content from one ABAP environment system to another ABAP environment system.

#### Note

You can create multiple business configuration software components. You can only clone one business configuration software component to a system. You can only release customizing transports to a business configuration software component

3. Click [Save](#) to make the software component centrally available.
4. Back on the [Manage Software Component Lifecycle](#) screen, choose [Go](#) to display the new software component in the list.
  1. As soon as your software component is cloned into a service instance, a structure package with the same name as the software component is created there. The structure package can contain several ABAP packages. See [How to Clone Software Components \[page 2596\]](#).
  2. The instance is integrated with the ABAP Development Tools (ADT), where ABAP development objects are created in development packages and uploaded to the structure package.

#### Note

Note that you have to create a development package first. Afterwards, create ABAP development objects in this newly created development package. The development package is a sub-package of the structure package dependent on the software component.

#### → Tip

We recommend that you add all your cloned software components (structure packages) to your *Favorite Packages* in eclipse to have an easy and quick access to it.

3. After the transport of the structure package, the software component becomes available for all instances and can be cloned to other system instances.  
As soon as the structure package is transported, for example, to provide a new version of the software component, the date and time of the transport as well as the user who triggered the transport are displayed in the *Branching* section of the detail page of a software component. More information about the released content can be found when navigating on the used branch.

#### ⓘ Note

Note that a maximum of 99 software components can be created per customer.

## 6.3.1.23.2.3 How to Clone Software Components

### Context

If a software component is not locally in your system yet, you will first need to clone it once to import it into your system.

You can now deactivate the rollback mechanism for clone actions in the Manage Software Components Fiori App. The clone rollback should only be deactivated in exceptional cases.

Example of a use case: If you have a faulty remote repository (software component) but no development system on which the repository (software component) is still available locally. Then you need a way to clone the faulty software component and fix the errors.

#### ⓘ Note

Cloning a software component is only necessary once per system instance.

### Procedure

1. Go to the details page of the software component you would like to clone.
2. Click *Clone*.
3. A pop-up opens. You can now select which branch you would like to import. If the software component does not have branches yet, the master or main branch (dependent on when the repository was created) is automatically selected. Select *By Tag* if you want to clone a specific git tag, which has been assigned to a commit. Select *By Commit* if you want to clone a software component with a specific commit ID. Confirm by clicking *Clone*.

#### ⓘ Note

There is no input validation for the entered values for the options *By Tag* and *By Commit*. If the entered values are not valid the cloning process will start, but will be shown as failed in the end of the cloning process. In this case, the clone *Latest* option is automatically called as a fallback. With this, the repository is still useable, but not in the originally requested version.

#### ⓘ Note

If the initial clone of a software component runs into errors, the partly imported objects will be removed again from the system instance and the system will be kept clean. The clone rollback is now available for all system types.

4. The software component with the selected branch is now imported into your current system instance. The *Clone* button turns into a *Pull* button. From now on, you can use it to pull (remotely available) changes of your software component to your system.

#### ⓘ Note

It is recommended to clone multiple software components one by one. Please clone software components with objects that are reused by other components first.

## Related Information

[How to Pull Software Components \[page 2597\]](#)

## 6.3.1.23.2.4 How to Pull Software Components

### Context

You can pull (remotely available) changes of your software component to the service instance you are currently on. To do the pull, perform the following steps:

#### ⓘ Note

Keep in mind that if a software component is not in your system yet, you will first need to clone it once. For more information see [How to Clone Software Components \[page 2596\]](#).

## Procedure

1. Navigate to the detail page of a software component from the list and choose *Pull* in the page header.
2. Select how you want to pull the software component. By selecting *Latest*, the last remote commit will be pulled into the system. Select *By Tag* if you want to pull a specific git tag, which has been assigned to a commit. Select *By Commit* if you want to pull a software component with a specific Commit ID.

### Note

To pull a specific tag, at least one tag has to exist on a commit on the currently active branch.

### Note

A rollback mechanism is activated which allows an automatic roll back to the last valid commit of the repository, in case an invalid commit is pulled. We define an invalid commit as a commit that can cause import errors during a pull operation. The pull of invalid commits is allowed for development and test systems only. If only one out of multiple commits causes an issue, none of the commits will be pulled.

Nevertheless, this mechanism cannot reverse any data loss that may occur due to ABAP Dictionary changes. For example, in the case of field shortening of a database table, the field length can be rolled back, but the lost content remains irretrievable. Therefore, ensure that deployments to the production systems are checked in the advance (via CI/CD processes), for example on quality systems.

3. Display the list of all pulls, checkouts and other actions by navigating to the *History* tab.  
To display pulls and checkouts that have been triggered for a particular software component, first select the component from the list and then scroll down to the *History* section where all actions are listed in the *Recent Actions* tables. In both cases, you will be navigated to the *Software Component Details* screen.
4. To display or refresh the list of *Recent Actions*, choose *Go* or click on the refresh button inside the search bar.

### Field Description

Column Name	Description
<ID>	A unique key (UUID) of the software component. This column is initially hidden.
<Branch Name>	The branch which was used for the executed action.
<Short Commit ID>	The short commit id that was used for the executed action.
<Tag>	The name of the tag which is eventually assigned to the used commit.
<Last Status Change>	The relative time from current system time and the time-stamp of the last status change.

Column Name	Description
<Status>	Displays whether the pull or checkout process has been successful, is still running, or there has been an error.
<Started By>	E-Mail address of the user who started the pull.
<Start Time>	Date and time when the pull has been triggered.
<Change Time>	Date and time of the changes during the pull procedure.

#### Note

Only one pull can be in status *Running*. If you trigger several pulls, other software components will switch to status *Error*.

If an error has occurred during a pull, you need to click Pull again.

#### Note

The <ID>, which is a unique key (UUID) of the software component is not in the table, but visible in the action detail page.

- You can display the pull details by choosing the entry from the list. The *Execution Log* and *Log Overview* are displayed as a table. You can find the new tables when navigating to the detail page of every action entry. Additionally, every log line is classified with a criticality level. A logline can have the criticality level "Information", "Success", "Warning" or "Error". Each level is represented with a colored criticality icon. Furthermore, you can also download the logs as an Excel-file. This may be helpful when communicating with SAP in the context of error analysis.

#### Note

Note that the execution logs and transport logs are deleted periodically. Please use the download feature in the UI or the OData service `MANAGE_GIT_REPOSITORY` (see [Pulling Git Repositories to an ABAP Environment System \[page 730\]](#)) to download the logs.

Field Description

Column Name	Description
<Index>	Index number to sort the table properly.
<Log>	Name of the log.
<Severity>	Can have the status success, warning, error or other.
<Transport Request>	Transport request ID which was used for the log.

Column Name	Description
<File including Path>	The system file path where the log files are saved.
<Timestamp>	Date and time when the log was created.

## 6.3.1.23.2.5 How to Delete Software Components

### Context

You want to delete a software component in order to:

- get rid of no longer used software components.
- get rid of software components that have been created by mistake (e.g. a typo in the software component name).

For every delete activity, the executing business user is documented in a log.

### Procedure

To delete a software component, perform the following steps:

1. In the *Manage Software Components* app, search for the software component out of the list that you want to delete.
2. Click onto the software component to be redirected to its detail page.
3. Choose the *Delete* button in the upper right corner.
4. You will be prompted to confirm the action and receive the opportunity to delete the remote repository together with the local one.

#### Caution

Make sure you delete all artifacts in the system locally first as the deletion will only delete the software component remotely. Please note that this action can't be undone.

## Software component deletion in a service instance

### Types of Software Component Deletion

Empty Software Component	Used Software Component
The software component contains no object locally in the service instance and no changes are committed to the remote repository. The remote repository, the associated structure package of the software component, and the software component itself are deleted. The deletion of the ABAP structure package and software component is executed without creating a transport request.	The software component contains objects locally and possible changes are committed to the remote repository. The remote repository is then deleted and the software component is locked. Since the software component is locked, no object changes can be released (pushed to remote) anymore.

### Local and Remote Deletion

Local Deletion	Remote Deletion	Local and Remote Deletion
When only deleting the local representation of the software component, this means all ABAP objects including the parent structure package.	When only deleting the remote representation (remote repository), a warning text will appear:  <i>The software component will be remotely deleted. As a consequence, no actions can be performed anymore. Please make sure to first delete the software component locally on all system instances where it is cloned. The component cannot be deleted from the other systems after it is remotely erased. This action cannot be undone.</i>	When deleting local and remote representations, local means only the current system instance.

#### Consequences:

You can re-clone the software component again.

#### ⚠ Caution

A local deletion can be critical when database tables are deleted. The local (not transported) table entries contained in this table will get lost. Though this would be a possible scenario on a quality or production system. On development systems, usually, there should be no business data (like table entries).

#### Consequences:

You cannot re-clone the software component again.

#### ⚠ Caution

If only the remote repository is deleted, the local objects will stay in the system, but the software component (structure package) will be locked. Currently, there is no safe option available for unproblematic recoveries or unlocking.

#### 📌 Note

A distributed local deletion (deleting local software components on other system instances than the current one) is not possible.

### Resulting behavior in service instances where the deleted Software Component is still imported

1. No further Git actions, including pull, switch branch and others, are possible.
2. Changes to SAP objects of the deleted software component can no longer be released.
3. Non-released requests, in which object changes have already been recorded before the software component was deleted, must be handled specially.

For example, you can delete the recorded object changes from the transport request. Alternatively, the transport layer of the transport request can be deleted.

## Result

The selected software component is deleted centrally if the checkbox *remote deletion* was selected. Otherwise it is only a local deletion, affecting the current system instance.

### ⚠ Caution

Here, centrally means the repository visible throughout the global account is deleted.

You can no longer pull or clone the software component to a service instance.

If this software component has already been pulled to a service instance, objects are not deleted in the ABAP instances but the status of the software component and all belonging objects are changed to *read-only*. You're not able to make any changes to the dedicated structure package and the development package that is contained in there. If you want to delete the objects, you must delete them and import the deletion into other systems, before you delete the software component.

## Restoring Deleted Software Components

### ℹ Note

Currently you cannot restore software components that have been deleted. Please also use new software component name instead of reusing previously deleted software components/ software component names.

### 6.3.1.23.2.6 How to Configure Your Git Repository

Up until this point, the ABAP repositories in SAP BTP, ABAP Environment were managed by the Manage Software Components Fiori app, which was the only interface where users could see the status of their remote repository. Bring Your Own Git (BYOG) allows users to connect their own Git repositories with the Manage Software Components app. In doing so, the user has a better overview of their own code, branches, and commits. However, the user is not allowed to make code changes in their remote Git repository and import these changes into the local SAP BTP, ABAP Environment system instance, as this might violate any guidelines for ABAP cloud development. See [Supported ABAP Object Types](#)

## Prerequisites

- You have created a new repository with the preferred Git provider. The repository does not have any objects except for a readme file.
- You have created a branch in your repository before cloning it.
- Your repository is publicly accessible on the internet. Repositories hosted on a private company network are currently not supported.
- You have administrative authorizations to push, pull and clone from the repository. Credentials must include a username and a password or token.
- The developer users have administrative authorizations to the Manage Software Components app.
- Production, development and/or test system instances are in the same global account.

## Restrictions

- Moving a BYOG software component from one global account to another is not supported.
- Changing the URL of the remote repository after it has been linked to a software component is not allowed. After changing the URL, the repository can no longer be used.
- It is important to distinguish between the user (pusher), whose credentials are entered during the clone process, and any other ABAP users (committers) that develop and release objects to be pushed to the remote repository. Although the committer will be noted in the commit history, the release and later the push will technically be performed using the credentials of the pusher. Therefore, it is recommended that the pusher does have push, pull and clone authorizations.

## Procedure

Follow the steps below to create and manage a BYOG (Bring Your Own Git) repository in the Manage Software Components (MSC) app.

### Creating a remote repository

To create a BYOG repository, first create a new repository in your preferred Git provider.

Make sure to create a branch as well, as a default branch is necessary for the clone later on.

Next, copy the HTTPS link (must end with `.git`) to clone the repository in the Manage Software Components app.

### Create a Software Component and link the remote repository

In the MSC app, create a new software component and enter the URL from the previous step in the *Repository URL* field. Add a name for your software component and choose the component type as development. Afterwards, click on *Create*. The software component is linked to the remote repository and is now ready to be cloned into the system.

## Cloning the Software Component

To clone the software component, click on the [Clone](#) button on the top right corner. A dialog will pop up:

Enter your user credentials that you would normally use to clone the repository, respectively a username and a password or token.

### Note

Remember to enter the credentials of a user that has administrative rights to the repository and has authorizations to push and pull changes directly into the repository.

Select the radio button which describes your method of authentication, either a password or an OAuth token. Then click on [Next](#). If the credentials are correct, the next step [Branch Selection](#), will be displayed. Otherwise, re-enter the correct credentials before you move forward.

From the dropdown select the name of the branch you want to clone. Click on [Next](#).

Select the repository role and import options. Choose [Latest](#) to import the latest commit.

Click on [Clone](#). When the clone is finished, the status should be green.

After the clone is finished, notice that there will be a new commit [Modify repository layout](#) generated in the remote repository by commit author `noreply@example.com` and a newly added file. This file is necessary for pushing and pulling changes into the SAP system.

### Caution

Do not edit or delete this file at any given time.

## Creating Branches

To create a branch, you should do so using the native interface (e.g., Git interface) of your git provider linked to your repository.

In the MSC app simply refresh the branch table to see the new branch. You can proceed as usual with the checkout.

### Note

To be able to work with an alternative branch, you should create the branch after the initial clone. It is important that any new branches are created based on the [Modify repository layout](#) commit, as mentioned above. The file generated from this commit will allow import into the local system instance.

## Deleting a Software Component

Deleting a software component in the SCLM app will unlink the component to the remote repository but will not delete the remote repository that resides in your chosen git provider. The local software component will be deleted and releasing transport requests will no longer be possible. Deleting the software component is an irreversible action. To delete the component simply proceed by clicking on the [Delete](#) button.

## Creating and deleting tags

Tagging functionality is the same as in classic non-BYOG software components. To create a tag, go to the commit view of your selected branch. The created tag will also be visible on your remote repository. Deleting a tag will also delete the tag in the remote repository.

## Related Information

[Development in the ABAP Environment](#)

### 6.3.1.23.2.7 How to Export Using SAP Cloud Transport Management

#### Context

1. A developer creates and modifies ABAP coding in the SAP BTP, ABAP environment by using the Eclipse-based IDE (ABAP Development Tools) with a rich debugger, troubleshooting, and testing tool support.
2. The changes are recorded in an ABAP transport request that is finally released. During the release, the changes are committed and pushed to the configured development branch of the corresponding Git repository (there is a one-to-one relation between an ABAP software component and a Git repository).
3. After testing and after the release decision, a release branch is created from the main branch.
4. The resulting combination of the corresponding software component and either the commit ID, Git tag, or the branch name is used as a reference by the following export call to the cloud transport management service (cTMS). It is recommended using the commit ID, because the latest commit of a branch may change, resulting in unreproducible deployments.
5. In cTMS a transport request is created containing the reference and added to the import queue of the following cTMS node (given by the configured service transport route).
6. Finally, a transport administrator uses the cloud transport management service UI to generate the import to the SAP BTP, ABAP system configured on the cTMS transport route. In doing so, the service calls an import API of the target SAP BTP, ABAP environment system by passing the reference.
7. The import is done asynchronously, and the progress status is monitored by the service. When the import is finished, the service receives the transport logs from the target SAP BTP, ABAP environment instance.

#### Procedure

Before we can start releasing transport requests that generate commits, a new communication arrangement is needed in order to use an endpoint.

1. Create a service instance and a service key of SAP Cloud Transport Management service. For more information, see [Creating a Service Instance and a Service Key](#).
2. Navigate to the [Communication Arrangements](#) Fiori app.
3. Click on [New](#) and search for `SAP_COM_0599` communication scenario in the list. Type in the name. Click on [Create](#).
4. On the following screen, a new communication system should be created. Click on [New](#). Type in your System ID, which is the URI from your service key. Click on [Create](#).
5. On the communication system creation page find general properties and define the [Host Name](#) parameter according to the URI property in the service key created for SAP Cloud Transport Management service. For example `https://transport-service-app-backend.ts.cfapps.eu10.hana.ondemand.com`

- Then find [OAuth 2.0 Settings](#) and put in a [Token Endpoint](#), which is the URL from your service key. For example `trnststest.authentication.sap.hana.ondemand.com/oauth/token?grant_type=client_credentials`.
- Now it's time to create a user for outbound communication. Click on **+** and select `oAuth 2.0` from the authentication method dropdown.
- Type in your OAuth 2.0 client ID and client secret that can be taken from the service key for the basic authentication. Click on [Create](#).
- Define a cTMS node name that you will need for the export. The selected transport node must allow uploads and you should use the same name when creating the communication arrangement and creating the same in cTMS.  
For more information, see [Create Transport Nodes](#). Click [Save](#) afterwards to complete the process.

### Export to SAP Cloud Transport Management using the Manage Software Components app

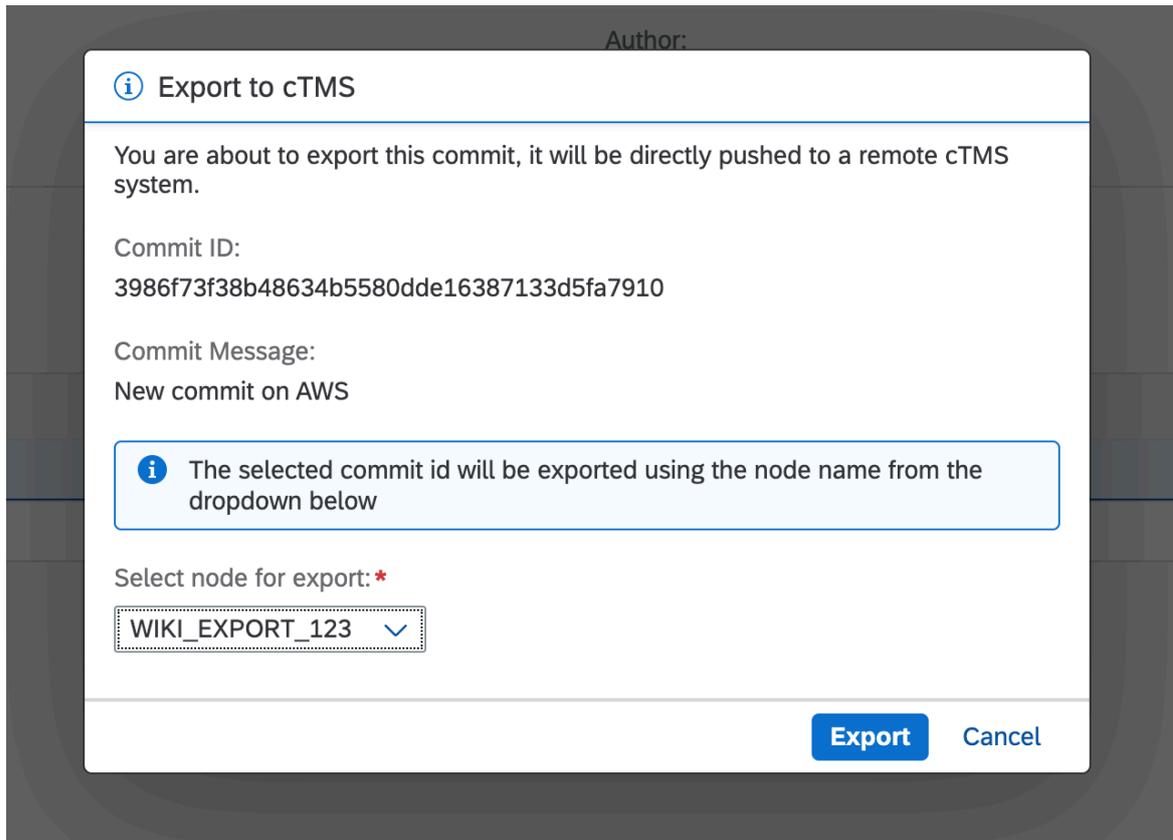

- Open the [Manage Software Components](#) app and navigate to the desired software component and a branch.
- Select a commit for the export and click on the [Export Commit](#) button.

**List of Commits**

Commits (2) | Standard ▾ | Search    | [Add Tag](#) | [Export Commit](#) |     ▾

Pulled	Short Commit ID	Message
<input checked="" type="radio"/> <input checked="" type="checkbox"/> Yes Pushed to Remote: Yesterday	386dbfc7	[H01K900026] CSW Demo >
<input type="radio"/> <input checked="" type="checkbox"/> Yes Pushed to Remote: Yesterday	e0c22f95	Initial repository commit >

- A new dialog will open, where you will be prompted to select a cTMS node you want to use for this export.

4. Click on *Export* after you are ready with the selection. A status modal in the center of the screen will let you know if the process was completed successfully.
5. In case of an error, you will get an HTTP error code with a description.

## 6.3.1.23.2.8 How to Work with Branches

### Context:

To allow you to easily work on and switch between different versions of code, you can create branches, a copy of your existing code at a certain point in time, that you can check out and work on without changing your original code.

Find out how to create, check out and switch between different branches:

### Procedure:

1. Upon opening the **Manage Software Components** app, you'll see a list of all available software components. Select the one you would like to work on.
  2. Scroll down to *Branching* to see a list of all available branches for your component. The table shows you which branch the different branches originally derived from and which branch is currently checked out. The first branch is always named 'main'. The main branch will be created directly with the creation of the software component. If a branch was successfully created, it should directly be visible on all other system instances.  
The column *Delta* shows information about the currently active/checked-out branch. It displays how many commits the branch is behind the remote repository (1 commit behind remote) or just informs, that the branch is up to date (No new commits). This information is only valid for the currently active branch. If the branch is not active, the column value will be set to "Please checkout first". If the branch is multiple commits behind, the column value will be set to "X commits behind remote", where X is the number of new commits on the remote branch.
  3. Note that you need to clone the repository once before you can check out a branch. Clone the repository by clicking *Clone*.
  4. To create a new branch, click on *Create*. Choose a name for your new branch and select the parent branch from the drop down menu. Confirm with *Create*.  
You can also create a branch based on a specific commit state. This referenced commit must be available in the current system, i.e. included in the currently selected branch. To do this, simply fill in the *Commit ID* in the *Create New Branch* popup. The commit ID can be provided in short or long format. Note that short commit IDs should only be used if the software component has already been pulled. Otherwise, the long ID needs to be used.
- Note**

When you delete a branch and recreate it with the same name, the creation will be denied with an error popup saying "Branch cannot be recreated". As a consequence, a branch name has to be unique once it has been used. Please choose another name in that case.
5. Refresh the page. Your new branch has now been created and added to the table.
  6. If you want to work on the new branch, you can check it out by selecting it and clicking *Checkout*. All objects in the target branch will overwrite existing objects in the system without further notice. It is

therefore important to ensure that all open transport requests in the current branch are released before switching to a new branch.

A new checkout is not possible while a checkout or pull is already in progress.

7. The branch selected for checkout is now available in the system.
8. You can easily switch between all your different branches by using the *Checkout* button.

#### 📘 Note

##### **Branch Deletion:**

While it is possible to delete branches, please consider the possible negative effects of branch deletion, like losing the commit history.

Please make sure that the branch you are deleting is no longer in use on other systems. If you delete the branch while it's in use in other systems, this code can no longer be released there, even if there are open transport requests.

The branch will be deleted locally and also on the remote repository. After the branch deletion, a pull of this branch is no longer possible on all system instances.

#### 📘 Note

The merging of branches is currently not supported.

#### 📘 Note

Note that a maximum of 25 branches can be created per software component.

## 6.3.1.23.2.8.1 How to Tag Commits

You can assign a tag name and tag description to individual commits.

1. In the *Manage Software Components* app, open your software component.
2. Navigate to a branch. Commits on this branch are displayed in the *List of Commits*.
3. Select a commit and click *Add Tag* to add a tag name and a tag description.
4. **(Optional)** Navigate to the *Tagging* tab of your software component to see a table listing all the tags on the branch that is currently checked out/active. Log entries for the creation and deletion of tags are also displayed in the *Recent Actions* table in the *History* tab.

#### 📘 Note

Note that a commit can have multiple tags assigned to it. There is no restriction on how many tags a commit can contain.

## 6.3.1.23.3 API for Managing Software Components

You can use the `MANAGE_SOFTWARE_COMPONENTS` API to work with Software Components on SAP BTP, ABAP Environment systems. The `MANAGE_SOFTWARE_COMPONENTS` API belongs to the Communication Scenario `SAP_COM_0948` and is an integral part of the partner add-on build pipeline.

### 6.3.1.23.3.1 Cloning Software Components to an ABAP Environment System

- You have an ABAP environment system.
- You have created a communication user as described in [How to Create Communication Users](#).
- You've created a communication system as described in [How to Create Communication Systems](#).
- You've created a communication arrangement as described in [How to Create a Communication Arrangement](#).
- You have selected the communication scenario `SAP_COM_0948` for your communication arrangement and have mapped it to your communication system.

If a software component is not in your system yet, you will first need to clone it once to import it into your system. Please note that you can clone a software component only once into your system.

#### 1. *Authentication on the server*

The first step serves the authentication on the server. The response header contains an `x-csrf-token`, which is used as authentication for the `POST` request following in step 2.

#### Sample Code

```
Request
GET /sap/opu/odata4/sap/a4c_mswc_api/srvd_a2x/sap/
manage_software_components/0001 HTTP/1.1
Accept: application/json
X-Csrf-Token: fetch
Host: host.sap
Response
HTTP/1.1 200 OK
X-csrf-token: xCsrfToken
```

#### 2. *Cloning a Software Component*

To trigger the clone, you need to insert the `x-csrf-token` that was retrieved in the first request in the header parameters. The software component is passed in the path of the request URL. The branch you want to clone is passed in the body of the request. If you don't enter a branch name, the main branch is automatically selected. Alternatively, you can clone a specific tag or commit ID by entering the tag name or commit ID. Make sure that the tag or commit ID exists on the branch. If that's not the case, no clone action will be executed.

#### Sample Code

```
Request
```

```

POST /sap/opu/odata4/sap/a4c_mswc_api/srvd_a2x/sap/
manage_software_components/0001/SoftwareComponents/%2FDMO%2FCOMPONENT/
SAP__self.clone HTTP/1.1
Accept: application/json
X-Csrf-Token: {{xcsrfToken}}
Host: host.abapcp.int.sap
Content-Length: 122
{
  "commit_id": "",
  "branch_name": "main",
  "tag_name": "",
}
Response
HTTP/1.1 200 OK
Content-Type: application/json
{
  "@odata.context": "../$metadata#Actions/$entity",
  "@odata.metadataEtag": "W/\\"20240111143934\"",
  "uuid": "96bbf3e1-5202-1ede-ad8e-b46db5437410",
  "sc_name": "/DMO/COMPONENT",
  "import_type": "Clone",
  "branch_name": "main",
  "namespace": "",
  "status": "Q",
  "status_descr": "Scheduled",
  "criticality": 0,
  "user_name": "WebAPI - CC0000000009",
  "commit_id": "",
  "tag_name": "",
  "relative_date_change_time": "",
  "change_time": "2024-01-16T13:46:26Z",
  "start_time": "2024-01-16T13:46:26Z",
  "execution_mode": "",
  "import_mode": "",
  "SAP__Messages": []
}

```

### 3. Tracking the Status of the Action

To track the status of the action, you can do a GET request using the UUID contained in the response.

#### Sample Code

```

Request
GET /sap/opu/odata4/sap/a4c_mswc_api/
srvd_a2x/sap/manage_software_components/0001/Actions/96bbf3e1-5202-1ede-
ad8e-b46db5437410 HTTP/1.1
Accept: application/json
Host: host.abapcp.int.sap

```

The response contains the same entity as the second request. The action is successful, when the *status* in the response body has the value *S*. The status description *status\_descr* will then return *Successful*. In case of an error *status* will have the value *E* and *status\_descr* the value *Error*.

## 6.3.1.23.3.2 Pulling Software Components to an ABAP Environment System

- You have an ABAP environment system.

- You've created a communication user as described in [How to Create Communication Users](#).
- You've created a communication system as described in [How to Create Communication Systems](#).
- You've created a communication arrangement as described in [How to Create a Communication Arrangement](#).
- You have selected the communication scenario SAP\_COM\_0948 for your communication arrangement and have mapped it to your communication system.
- You have cloned the software component to the ABAP Environment system. See Cloning Software Components to an ABAP Environment System.

You can use the communication scenario SAP\_COM\_0948 to pull software components to an ABAP environment system.

#### 1. *Authentication to the server*

The first step serves the authentication on the server. The response header contains an `x-csrf-token`, which is used as authentication for the `POST` request following in step 2.

##### Sample Code

```
Request
GET /sap/opu/odata4/sap/a4c_mswc_api/srvd_a2x/sap/
manage_software_components/0001 HTTP/1.1
Accept: application/json
X-Csrf-Token: fetch
Host: host.sap
Response
HTTP/1.1 200 OK
X-csrf-token: xCsrfToken
```

#### 2. *Pull a Software Component*

To trigger the pull of a software component, you need to insert the `x-csrf-token` that was retrieved in the first request in the header parameters. The software component you want to pull is passed in path of the request URL.

##### Sample Code

```
Request
POST /sap/opu/odata4/sap/a4c_mswc_api/srvd_a2x/sap/
manage_software_components/0001/SoftwareComponents/%2FDMO%2FCOMPONENT/
SAP__self.pull HTTP/1.1
Accept: application/json
X-Csrf-Token: {{xcsrfToken}}
Host: host.abapcp.int.sap
Content-Length: 39
{
  "commit_id": "",
  "tag_name": ""
}
Response
HTTP/1.1 200 OK
Content-Type: application/json
{
  "@odata.context": "../$metadata#Actions/$entity",
  "@odata.metadataEtag": "W/\\"20240111143934\"",
  "uuid": "763eca2a-340b-1eee-ad8e-c864d7a77c38",
  "sc_name": "/DMO/COMPONENT",
  "import_type": "Pull",
  "branch_name": "master",
  "namespace": "",
  "status": "Q",
  "status_descr": "Scheduled",
```

```

"criticality": 0,
"user_name": "WebAPI - CC0000000009",
"commit_id": "",
"tag_name": "",
"relative_date_change_time": "",
"change_time": "2024-01-16T13:50:54Z",
"start_time": "2024-01-16T13:50:54Z",
"execution_mode": "",
"import_mode": "",
"SAP__Messages": []
}

```

### 3. *Tracking the Status of the Action*

To track the status of the action, you can do a GET request using the UUID contained in the response.

#### Sample Code

```

Request
GET /sap/opu/odata4/sap/a4c_mswc_api/
srvd_a2x/sap/manage_software_components/0001/Actions/96bbf3e1-5202-1ede-
ad8e-b46db5437410 HTTP/1.1
Accept: application/json
Host: host.abapcp.int.sap

```

The response contains the same entity as the second request. The action is successful, when the *status* in the response body has the value *S*. The status description *status\_descr* will then return *Successful*. In case of an error *status* will have the value *E* and *status\_descr* the value *Error*.

## 6.3.1.23.3.3 Working with Branches on a Software Component

- You have an ABAP environment system.
- You've created a communication user as described in [How to Create Communication Users](#).
- You've created a communication system as described in [How to Create Communication Systems](#).
- You've created a communication arrangement as described in [How to Create a Communication Arrangement](#).
- You have selected the communication scenario SAP\_COM\_0948 for your communication arrangement and have mapped it to your communication system.
- You have cloned the software component to the ABAP Environment system. See Cloning Software Components to an ABAP Environment System.

You can use the communication scenario SAP\_COM\_0948 to work with software components on an SAP BTP, ABAP environment system.

### 1. *Authentication on the server*

The first step serves the authentication on the server. The response header contains an *x-csrf-token*, which is used as authentication for the POST request following in step 2 and 3.

#### Sample Code

```

Request

```

```

GET /sap/opu/odata4/sap/a4c_mswc_api/srvd_a2x/sap/
manage_software_components/0001 HTTP/1.1
Accept: application/json
X-Csrf-Token: fetch
Host: host.sap
Response
HTTP/1.1 200 OK
X-csrf-token: xCsrfToken

```

## 2. Create a Branch

To create a branch, you perform a POST request on the Branches entity. In the header parameters, you should include the `x-csrf-token` that was retrieved in the first request. Fill in the following data in your request body:

1. `sc_name`: the name of your software component
2. `branch_name`: the name of your new branch
3. `derived_from`: the branch that your new branch should derive from

### Sample Code

```

Request
POST /sap/opu/odata4/sap/a4c_mswc_api/srvd_a2x/sap/
manage_software_components/0001/Branches HTTP/1.1
Accept: application/json
X-Csrf-Token: {{xcsrfToken}}
Host: host.abapcp.int.sap
Content-Length: 103
{
  "sc_name" : "/DMO/COMPONENT",
  "branch_name" : "feature",
  "derived_from" : "main"
}
Response
HTTP/1.1 201 Created
Content-Type: application/json
{
  "@odata.context": "$metadata#Branches/$entity",
  "@odata.metadataEtag": "W/\\"202401111143934\"",
  "sc_name": "/DMO/COMPONENT",
  "branch_name": "feature",
  "is_active": false,
  "criticality": 0,
  "delta": "Please checkout first",
  "delta_criticality": 0,
  "derived_from": "main",
  "name_of_new_branch": "",
  "commit_id": "",
  "commit_message": "",
  "last_commit_by": "",
  "relative_date_last_rem_commit": "",
  "last_commit_on": null,
  "commit_id_on_system": "-",
  "created_by": "CC0000000009",
  "created_on": "2024-01-16T14:00:00Z",
  "execution_mode": "",
  "import_mode": "",
  "SAP__Messages": []
}

```

## 3. Check Out a Branch

Simply creating a branch did not change the state of the system. In order to work with the newly created branch, you need to import the branch to the system. This action is called *checkout branch*. You need to include the software component and the name of the branch in the path of the request URL.

### Sample Code

```
Request
POST /sap/opu/odata4/sap/a4c_mswc_api/
srvd_a2x/sap/manage_software_components/0001/Branches/%2FDMO%2FCOMPONENT/
main/SAP__self.checkout_branch HTTP/1.1
Accept: application/json
X-Csrf-Token: {{csrfToken}}
Host: host.abapcp.int.sap
Content-Length: 44
{
  "import_mode" : "",
  "execution_mode": ""
}
Response
HTTP/1.1 200 OK
Content-Type: application/json
{
  "@odata.context": "../
$metadata#com.sap.gateway.srvd_a2x.a4c_a2g_mswc_api.v0001.ActionType",
  "@odata.metadataEtag": "W/\\"20240111143934\\"",
  "uuid": "96bbf3e1-5202-1ede-ad8f-001e560df4e6",
  "sc_name": "/DMO/FCOMPONENT",
  "import_type": "Checkout",
  "branch_name": "main",
  "namespace": "",
  "status": "Q",
  "status_descr": "Scheduled",
  "criticality": 0,
  "user_name": "WebAPI - CC0000000009",
  "commit_id": "",
  "tag_name": "",
  "relative_date_change_time": "",
  "change_time": "2024-01-16T14:03:22Z",
  "start_time": "2024-01-16T14:03:21Z",
  "execution_mode": "",
  "import_mode": "",
  "SAP__Messages": []
}
```

#### 4. Tracking the Status of the Action

To track the status of the action, you can do a GET request using the UUID contained in the response.

### Sample Code

```
Request
GET /sap/opu/odata4/sap/a4c_mswc_api/
srvd_a2x/sap/manage_software_components/0001/Actions/96bbf3e1-5202-1ede-
ad8e-b46db5437410 HTTP/1.1
Accept: application/json
Host: host.abapcp.int.sap
```

The response contains the same entity as the second request. The action is successful, when the *status* in the response body has the value *S*. The status description *status\_descr* will then return *Successful*. In case of an error *status* will have the value *E* and *status\_descr* the value *Error*.

## 6.3.1.24 User Interface Monitoring

## 6.3.1.24.1 Display Launchpad Content Exposure Logs

With this app, you can check the application log created when publishing launchpad content to SAP BTP. You can check, for example, when the publishing run started, if the publishing was successful or if there were any issues.

### Implementation Information

To use the app, you need the following:

- Business catalog: SAP\_CORE\_BC\_UI\_MON
- Business role: SAP\_BR\_ADMINISTRATOR

To get the key information, including all the technical data you need for the installation and configuration, go to the [SAP Fiori apps reference library](#).

### Exposure Log Level

In your communication arrangement, you can define which log messages should be displayed. This can be useful if, for example, you want to only see the log messages from entities that couldn't be exposed.

This setting considers the overall exposure status of an entity. This means that if you, for example, select **2 - Show entities with errors and warnings**, messages from successfully exposed entities will not be stored in the log. This is the default value to prevent your log file from growing too big. If you increase the log level, logs for successfully exposed entities or even requests to the API will be logged.

In the *Exposure Log Level* field, you have the following options:

- 1 - Show entities with errors
- 2 - Show entities with errors and warnings (default)
- 3 - Show entities with errors, warnings and success messages
- 9 - Show all entities including API calls

See [Create Communication Arrangement](#).

## 6.3.1.25 Manage Security Audit Log

With this app, you can manage Security Audit Log related parameters.

## Key Features

You can use this app to:

- Each parameter can be active or inactive, so that changing the parameter value is possible without having the change immediately active
- Maintain parameter `DELETE`:
  - Maintain the default audit log retention time in days. After the number of days the Security Audit Log Events will be removed from database to reduce the consumption of the SAP HANA DB storage. The default retention period is 45 days. Confirm the default by activating the parameter `DELETE`, or define a custom retention period.

Mark the parameter you want to change and switch to *Edit* mode. Select the option for *Parameter Status* (active or inactive) and for *Parameter Value* (Keep, Replace, or Clear Value) and save your settings.

## Access Information

For information on what business role and business catalog need to be assigned to your user to access the app, see the overview table in the chapter [Applications for General Functions for Key Users](#).

## Supported Device Types

- Desktop
- Tablet
- Smartphone

## Component for Customer Incidents

If you need support or experience issues, please report an incident under component `BC-SEC-SAL`.

## 6.3.2 Communication Operations

### [Communication Management \[page 2618\]](#)

Learn more about the basic principles of communication management when integrating your system or solution with other systems to enable data exchange in your ABAP environment.

### [Overview of Communication Scenarios Managed by SAP \[page 2621\]](#)

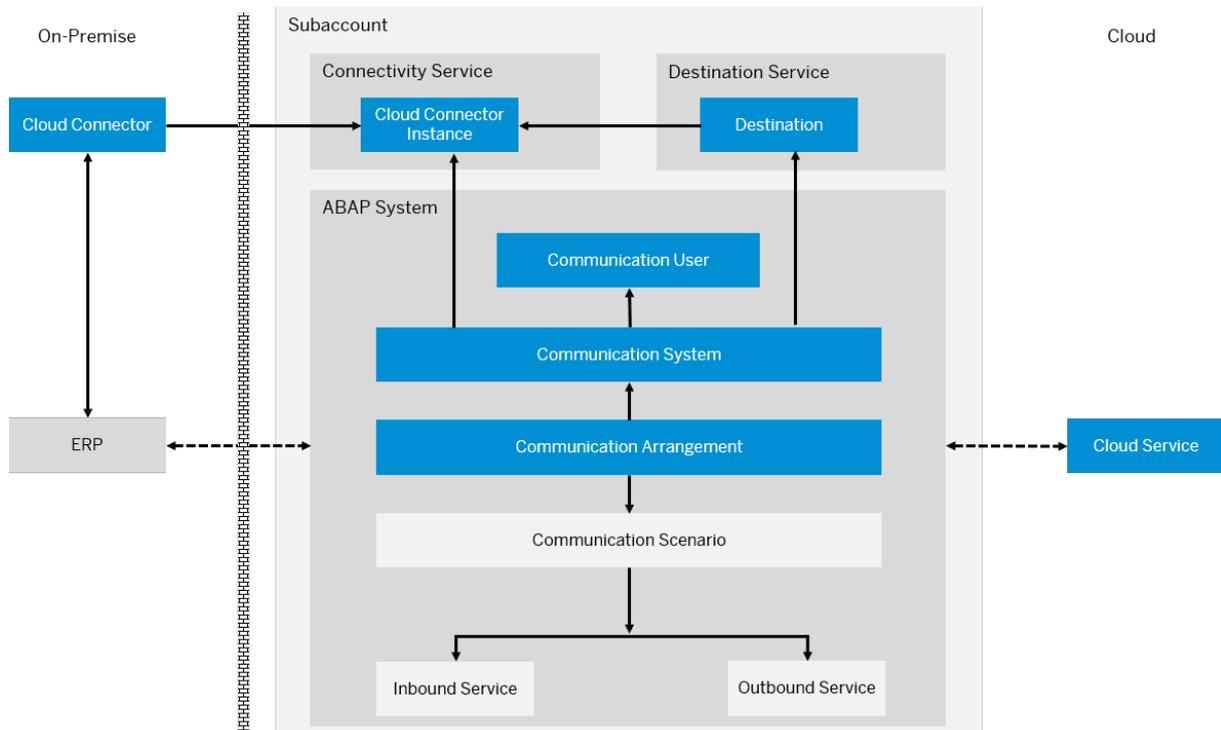

Find a quick overview of all the communication scenarios in the ABAP environment.

### [Integration Scenarios \[page 2623\]](#)

You can integrate the ABAP environment with the following services.

## 6.3.2.1 Communication Management

Learn more about the basic principles of communication management when integrating your system or solution with other systems to enable data exchange in your ABAP environment.

### 6.3.2.1.1 Communication Scenario

A communication scenario, which is created in the development system using `ABAP Development Tools` and transported to other systems, is a design time description of how two communication partners communicate with each other. It consists of inbound and/or outbound services as well as supported authentication methods.

It provides technical information, such as the used inbound and outbound services and their service type, for example OData or SOAP, and the number of allowed communication arrangement instances. If the scenario exposes inbound services, it specifies the authorizations that are required to run the services.

The following types of communication scenarios are available:

- **Managed by SAP**, where SAP provides a ready-to-use communication scenario and you create and maintain a communication arrangement.
- **Managed by the customer**, where you develop a communication scenario and create and maintain a communication arrangement.

## Related Information

[Display Communication Scenarios \[page 2394\]](#)

[Overview of Communication Scenarios Managed by SAP](#)

[Developing External Service Consumption \(Outbound Communication\) \[page 852\]](#)

[Developing APIs for Inbound Communication \[page 992\]](#)

### 6.3.2.1.2 Communication System

A communication system is a specification of a system that represents a communication partner and the technical information required for the communication, such as the host name, port, users for inbound or outbound communication, certificates, etc.

If the communication system represents an on-premise system that is protected by a firewall, the system can be connected by assigning a cloud connector.

Instead of maintaining the credentials for outbound communication in the communication system itself, the communication system can also refer to a destination from the destination service. This can be a destination on subaccount level, or a destination from a destination service instance.

An administrator user in the ABAP environment has to create the communication system in the [Communication Systems \[page 2397\]](#) app in SAP Fiori launchpad. Note that the communication system is not transported between ABAP systems but created locally. The communication partner can vary for each system.

### 6.3.2.1.3 Communication User

A communication user is a specific type of technical user that is assigned to a communication system. The user can be assigned a password or X.509 certificate.

A communication user is added as a user for inbound communication to communication systems.

An administrator user in the ABAP environment creates the communication user in the [Maintain Communication Users \[page 2391\]](#) app in SAP Fiori launchpad. Note that the communication user is not transported between systems but created locally. The technical users and their credentials can vary for each system.

### 6.3.2.1.4 Communication Arrangement

A communication arrangement is a runtime description of a specific communication scenario. It describes which communication partners communicate with each other in the scenario, and how they communicate.

To describe this runtime behavior, you have to create an arrangement for a scenario, assign the communication system and communication users, and select the authentication method that shall be used.

If the communication scenario exposes inbound services, the communication user is granted the authorizations that have been specified for the communication scenario.

An administrator user in the ABAP environment creates the communication arrangement in the [Communication Arrangements \[page 2394\]](#) app in SAP Fiori launchpad. Note that it is not transported between systems but created locally. For certain SAP-managed scenarios that integrate an SAP BTP service, you can also create a communication arrangement from a service key of the service instance that you would like to connect.

For inbound-only scenarios, you can create a communication arrangement by creating a corresponding service key for the ABAP environment service instance.

## Related Information

[Maintain a Communication Arrangement for Inbound Communication](#) 

### 6.3.2.1.5 Destination Service

Using the SAP destination service, you can retrieve and store technical information about the target resource (destination) that you want to connect with your application to a remote service or a system.

The destination service allows you to read and manage the address of a remote service and the user authentication information for the connection on subaccount and service instance level.

## Related Information

[Destination Service](#)

[Create a Destination \[page 854\]](#)

### 6.3.2.1.6 Destination

A destination is stored in the SAP destinations service and contains the connection details for the communication partner.

You can use a destination to:

- Connect your application to the Internet (via HTTP, RFC, or WebSocket RFC) or to an on-premise system (via HTTP or RFC)
- Send and retrieve emails by configuring a mail destination

#### Note

You can create a destination for a destination service on instance level or subaccount level.

A destination can be referenced in a communication system. To refer a destination from a destination service instance, a communication arrangement for SAP-managed scenario SAP\_COM\_0276 needs to be maintained to enable communication with the destination service instance. See [Create a Destination \[page 854\]](#). In this case, the destination name and the service instance name need to be maintained in the communication system.

## Related Information

[Managing Destinations](#)

### 6.3.2.1.7 Cloud Connector

The Cloud Connector serves as a link between cloud applications and on-premise systems.

In the Cloud Connector, the subaccount of the ABAP system is connected so that the Cloud Connector can be used within a communication system or destination in the subaccount.

It provides an easy setup with a clear configuration of the systems that are exposed to SAP BTP.

## Related Information

[Cloud Connector](#)

## 6.3.2.3 Integration Scenarios

You can integrate the ABAP environment with the following services.

[Integrating Security Audit Logs \[page 2624\]](#)

[Integrating Business Role Change Documents \[page 2627\]](#)

You can use this scenario to read the change documents of business roles.

[Integrating Business User Change Documents \[page 2628\]](#)

You can use this scenario to read the change documents of business users.

[Integrating Content with SAP Build Work Zone, standard edition \[page 2629\]](#)

Get an overview of the process for integrating content to the SAP Build Work Zone, standard edition.

This process is composed of a content exposure flow and a content consumption flow.

[Integrating SAP Analytics Cloud \[page 2631\]](#)

SAP Analytics Cloud is used as analytics client consuming ABAP environment data exposed via ABAP environment analytical queries.

[Integrating SQL Services Using SAP Datasphere \[page 2634\]](#)

You need the integration scenario `SAP_COM_0532` if you want to create a replication flow in SAP Datasphere to subscribe to CDS view entities from an ABAP system and consume data from these views. With a communication arrangement based on `SAP_COM_0532` combined with a communication arrangement for exposing the SQL service, you can consume data from custom CDS view entities that are exposed using the SQL service.

[Integrating SAP Document Management Service \[page 2636\]](#)

You can integrate the ABAP environment of SAP Business Technology Platform with SAP Document Management Service to establish a communication scenario.

[Integrating SAP BTP, ABAP environment and Local Printers \[page 2637\]](#)

To set up the integration between SAP BTP, ABAP environment and local printers, you can use two communication scenarios, `SAP_COM_0466` and `SAP_COM_0467`.

[Integrating External Scheduler \[page 2642\]](#)

This inbound OData service enables external systems to schedule an application job based on an application job template.

[Integrating Factory Calendar \[page 2658\]](#)

Learn how to integrate an ABAP Platform system with the factory calendar.

[Integrating SAP Enable Now Manager \[page 2659\]](#)

The ABAP environment supports the extended content scenario of SAP Enable Now that allows you to add an additional source for help content to the SAP Companion plugin. You can edit the context-sensitive in-app help delivered by SAP and adapt it to your needs or include your own content.

[Integrating UI Theme Designer \[page 2660\]](#)

To set up the integration between SAP BTP ABAP Environment and UI theme designer, you can use the communication scenario `SAP_COM_0623`.

[Integrating SAP Build Process Automation \[page 2664\]](#)

You can integrate your ABAP environment with SAP Build Process Automation.

[Integrating Workflow \[page 2674\]](#)

You can enable the communication between the ABAP environment and the workflow capability within the SAP Workflow Management service.

## 6.3.2.3.1 Integrating Security Audit Logs

Service name: RSAU\_LOG\_API

This service enables you to retrieve the security audit log data. You can use the audit log data to integrate them into your Security and Event Management solution (SIEM) to detect security relevant event situations.

This is an OData version 4 service. This version aims to improve processing time and resource consumption of clients and servers. This includes a lightweight JSON format that reduces the size of every response.

### Technical Details

A service group contains services belonging to the same business object model and so it shares similar environment conditions. This means the configuration and administration of a service group apply to all services in a service group, that is, routing, authorization, and so on, so you only have to do them once.

In the OData version 4 (V4) runtime implementation of the SAP Gateway Foundation, framework services originate from repositories.

Service Group (incl. Name-space if Existent)	Repository ID	Service Name (incl. Name-space if Existent)	Version
RSAU_LOG_API	SRVD_A2X	RSAU_LOG_API_SERVICE	0001

### Service Structure

#### Service Header (optional)

The service header contains information about the service.

#### Entities

The entities contain the business data of the service.

Entity	Description	Necessity	Link to Details
Security Audit Log	Security Audit Log		<a href="#">Retrieving Security Audit Log [page 2563]</a>

### Service Response

The details included in the response vary according to the type of operation. For more information, see Operation for Security Audit Log Integration.

## Integration with SIEM Solution

Service name: RSAU\_LOG\_API

Communication scenario: SAP\_COM\_0750

This service enables you to retrieve the security audit log data. You can use the audit log data to integrate them into your Security and Event Management solution (SIEM) to detect security relevant event situations.

## Additional Information

### Note

For more details about Communication Management, see [Communication Management \[page 2390\]](#).

### 6.3.2.3.1.1 Operations for Security Audit Log Integration - Read

The Security Audit Log Integration - Read offers the following operations:

Operation	HTTP Method	Sample URL
<a href="#">Retrieving Security Audit Log [page 2563]</a>	GET	Example getting the first 1000 audit log entries:  GET <host>/sap/opu/odata4/sap/rsau_log_api/srvd_a2x/sap/rsau_log_api/0001/SecurityAuditLog?\$top=1000

#### 6.3.2.3.1.1.1 Retrieving Security Audit Log

With `SecurityAuditLog` you can retrieve the Security Audit Log by using the HTTP method `GET`.

## Request

You have to include the following properties in the URL of the request:

Property	Necessity	Comment
eventID	Optional	Security Audit Log Event <ul style="list-style-type: none"><li>String &lt;= 3 characters</li></ul> Example: AU1, AU2
log_tstamp	Optional	Timestamp of the security audit log event <ul style="list-style-type: none"><li>String(\$date-time)</li></ul> Example: 2017-04-13T15:51:04Z
slgmand	Optional	Client within the SAP System <ul style="list-style-type: none"><li>String &lt;=3 characters</li></ul> Example: 100
sid	Optional	System ID <ul style="list-style-type: none"><li>String &lt;=3 characters</li><li>Example: YI3</li></ul>
counter	Optional	Message counter <ul style="list-style-type: none"><li>integer(\$int16)</li></ul>
slgtc	Optional	Transaction Code <ul style="list-style-type: none"><li>String &lt;= 20 characters</li></ul> Example: VA01
slgrepna	Optional	Program Name <ul style="list-style-type: none"><li>String &lt;= 40 characters</li></ul> Example: SAPMSSY8

## Response

The operation returns the Security Audit Log.

## Examples

### Get events within a specific timeframe:

```
GET <host>/sap/opu/odata4/sap/rsau_log_api/srvd_a2x/sap/rsau_log_api/0001/SecurityAuditLog?
```

```
$filter=(log_tstmp%20ge%202021-05-08T10%3A25%3A09Z%20and%20log_tstmp%20le%202021-05-09T10%3A25%3A09Z)
```

## Response

```
{
  "eventID": "AU1",
  "log_tstmp": "2021-05-08T10:26:22.740611Z",

  "terminal_name": "",
  "user_fullname": "Example Administrator",
  "slgtc": "S000",
  "slgprepna": "RSBTCRTE",
  "rsau_text": "Logon successful (type=B, method=A)",
  "UserDescription": "Example Administrator"
},
}
```

## 6.3.2.3.2 Integrating Business Role Change Documents

You can use this scenario to read the change documents of business roles.

### Context

This scenario allows you to read the change documents of business roles. We recommend that you limit the number of change documents according to the *Changed On* and the *Business Role ID* fields to avoid a high volume of data.

### Procedure

1. Check if a communication user already exists for this scenario. If not, create a communication user in the *Maintain Communication Users* app.  
For more information, see the *Related information* section.
2. Check if a communication system already exists for this scenario. If not, create a communication system in the *Communication Systems* app.

3. Check if a communication arrangement already exists for this scenario. If not, create a communication arrangement for the *Business Role Change Document Integration* scenario (SAP\_COM\_0366) in the *Communication Arrangements* app.

For more information, see the *Related information* section.

## Related Information

[How to Create a Communication Arrangement \[page 2395\]](#)

[How to Create Communication Users \[page 2393\]](#)

### 6.3.2.3.3 Integrating Business User Change Documents

You can use this scenario to read the change documents of business users.

## Context

This scenario allows you to read the change documents of business users. We recommend that you limit the number of change documents according to the *Changed On* and the *Business User ID* fields to avoid a high volume of data.

## Procedure

1. Check if a communication user already exists for this scenario. If not, create a communication user in the *Maintain Communication Users* app.

For more information, see the *Related information* section.

2. Check if a communication system already exists for this scenario. If not, create a communication system in the *Communication Systems* app.

For more information, see the *Related information* section.

3. Check if a communication arrangement already exists for this scenario. If not, create a communication arrangement for the *Business User Change Document Integration* scenario (SAP\_COM\_0327) in the *Communication Arrangements* app.

For more information, see the *Related information* section.

### 6.3.2.3.4 Integrating Content with SAP Build Work Zone, standard edition

Get an overview of the process for integrating content to the SAP Build Work Zone, standard edition. This process is composed of a content exposure flow and a content consumption flow.

#### Exposing Content to SAP Build Work Zone, standard edition

Communication scenario `SAP_COM_0647` - SAP Fiori Launchpad Content Exposure Integration is needed to supply the SAP Build Work Zone, standard edition with content from the connected system.

For a description of the steps required to set up the communication scenario `SAP_COM_0647`, see [Expose Launchpad Content to Launchpads on SAP BTP](#).

#### Consuming Content in SAP Build Work Zone, standard edition

##### Prerequisite

Launchpad content from the same system/client has been transferred to SAP Build Work Zone, standard edition using `SAP_COM_0647` - SAP Fiori Launchpad Content Exposure Integration.

[Content Consumption - Cloud Solutions](#)

[Content Consumption - Portal Service](#)

[Content Consumption - SAP Work Zone](#)

## Related Information

[Set SAP BTP, ABAP Environment as a Content Provider for SAP Build Work Zone, standard edition](#)

## 6.3.2.3.4.1 Enabling Notifications on SAP BTP, ABAP environment in Launchpads Running on SAP BTP

Get an overview of the communication scenario `SAP_COM_0683` - Enabling Notifications from SAP BTP, ABAP environment in launchpads running on SAP BTP. The launchpads running on SAP BTP include the SAP Build Work Zone, standard edition and SAP Cloud Portal service.

### Prerequisites

- To receive notifications, every user must have the same email configured in the SAP BTP system user management section and in the Identity Provider (IdP) used by the launchpad running on SAP BTP, Cloud Foundry environment.
- If you want to deliver push notifications to mobile devices, the target user is identified using the email ID they provided. Currently, it is not possible to use other types of identifiers.
- You've generated and noted the following parameters from the launchpad running on SAP BTP:
  - Host
  - OAuth 2.0 Client ID
  - Client Secret
  - Authorization Endpoint
  - Token Endpoint

### Procedure

1. Log on to the SAP Fiori launchpad in your SAP BTP, ABAP environment system.
2. Open the *Communication Arrangements* app.
3. Create a communication arrangement. Choose scenario `SAP_COM_0683`.
4. Enter a name for the communication arrangement.
5. Create a new communication system by choosing *New* next to the communication system.
6. Provide values for *System ID* and *System Name* and then choose *Create*.
7. In the *Technical Data* section, enter the value for *Host* obtained from the launchpad running on SAP BTP.
8. In the *OAuth 2.0 Settings* section, enter values for *Auth. Endpoint* and *Token Endpoint* obtained from the launchpad running on SAP BTP.
9. Create a new user for Outbound Communication by entering the following details:
  - Authentication Method: OAuth 2.0
  - Client Authentication: Basic
  - OAuth 2.0 Client ID: Client ID obtained from the launchpad running on SAP BTP
  - Client Secret: Client Secret obtained from the launchpad running on SAP BTP
10. Save the Communication System and Communication Arrangement.

## Related Information

[Working with Notifications](#)

### 6.3.2.3.5 Integrating SAP Analytics Cloud

SAP Analytics Cloud is used as analytics client consuming ABAP environment data exposed via ABAP environment analytical queries.

#### Prerequisites

- You have the *BI Admin* role in the SAP Analytics Cloud system. For more information, see [Requesting Roles](#).
- You have the *Administrator* role (role template ID `SAP_BR_ADMINISTRATOR`). For more information, see [Maintain Business Roles](#).
- Your end users' web browsers must be configured to:
  - Allow pop-up windows from the SAP Analytics Cloud domain: [ \* . ]`sapbusinessobjects.cloud`, if you'll be choosing the single sign-on (SSO) authentication method in step 2.
  - Allow 3rd party cookies from the Tomcat server's domain. For example, in Internet Explorer 11, go to [▶ Internet Options ▶ Security ▶ Trusted Sites ▶](#), add your domain name, then select [Enable Protected Mode](#).

#### Context

You can configure a live data connection in SAP Analytics Cloud and create an SAP Analytics Cloud model based on an ABAP environment analytical query to consume the result set in an SAP Analytics Cloud Story. The analytical query is delivered as CDS content and is exposed via the analytical engine and the InA protocol via the REST services under `/sap/bw/ina/...` to SAP Analytics Cloud.

SAP BTP destinations are created by the SAP Analytics Cloud app when you define an SAP Analytics Cloud connection of the type ABAP environment.

You set up the scenario using the following tasks:

1. [Configure Identity Authentication \[page 2632\]](#)
2. [Create a Communication System \[page 2632\]](#)
3. [Create a Communication Arrangement \[page 2633\]](#)
4. [Configure Live Data Connection \[page 2634\]](#)

## 6.3.2.3.5.1 Configure Identity Authentication

Configure your Identity Authentication tenant as the identity provider.

### Prerequisites

You have the *System Owner* role.

### Procedure

1. Log on to the SAP Analytics Cloud system via the default identity provider tenant.

The identity provider is the Identity Authentication tenant that you get with the ABAP environment tenant.

2. Go to **System > Administration > Security** and change the *Authentication Method* from *SAP Cloud Identity (Default)* to *SAML Single Sign-On (SSO)*, then follow the steps for *SAML Single Sign-On (SSO) Configuration*.
3. Under *Step 2: Upload Identity Provider metadata*, deselect *Identity Provider will also be used...* if this checkbox is visible.
4. Under **Step 3**, set the *SAML User Mapping* to *Custom SAML User Mapping*. Under **Security > Users**, the value in the *Custom SAML User Mapping* column must equal the **User Data > User Name** of the corresponding business user in the ABAP environment.

## 6.3.2.3.5.2 Create a Communication System

You can create a communication system in the ABAP environment.

### Prerequisites

You have the *Administrator* role (role template ID `SAP_BR_ADMINISTRATOR`).

### Procedure

1. Log on to the SAP Fiori launchpad in the ABAP environment.
2. Open the *Communication Systems* app from the SAP Fiori Launchpad.
3. Choose *New*.

4. Enter *System ID* and *System Name*. The system ID should be unique.
5. Turn off the *Destination Service* to view the *Host Name*.
6. Under **► Technical Data ► General ►**, enter the *Host Name* of the SAP Analytics Cloud tenant and *Port* as **443**. SAP Analytics Cloud follows the host name schema `xxx.sapanalytics.cloud`.
7. Choose *Save*.

### 6.3.2.3.5.3 Create a Communication Arrangement

You create a communication arrangement in the ABAP environment.

#### Prerequisites

You have the *Administrator* role (role template ID `SAP_BR_ADMINISTRATOR`).

#### Procedure

1. Log on to the SAP Fiori launchpad in the ABAP environment.
2. Open the *Communication Arrangement* app.
3. Choose *New*.
4. Select the communication scenario `SAP_COM_0065`.
5. Enter a name for the arrangement.
6. Choose *Create*.
7. In the *Common Data* section, select the *Communication System* that you created in the previous section.
8. Under **► Additional Properties ► Tenant ID ►** maintain the tenant ID that is visible in the URL of the SAP Analytics Cloud app.

When you call `https://xxx.sapanalytics.cloud`, you will be redirected to the full URL where you can find the tenant ID as shown in this example: `https://xxx.sapanalytics.cloud/sap/fpa/ui/tenants/<tenant ID>/app.html`. You can also find the tenant ID under **► Menu ► SAC Tenant ► System ► About ► System Name ►**.

9. Under **► Outbound Services ► UI Link Navigation ►**, check the *Service Status* as *Active*.
10. Under *Retrieve Stories*, uncheck the *Service Status*.

#### Note

Retrieving stories is not supported.

11. Choose *Save*.

#### Note

Do not create more than one communication arrangement with communication scenario SAP\_COM\_0065 in your ABAP Environment tenant.

### 6.3.2.3.5.4 Configure Live Data Connection

You configure a live data connection in SAP Analytics Cloud.

#### Prerequisites

You have the *BI Admin* role in the SAP Analytics Cloud system.

#### Procedure

1. Login to the SAP Analytics Cloud tenant.
2. Choose **Main Menu** > **Connection** > **+**.
3. In the *Select a data source* dialog, expand *Connect to Live Data* and select *SAP S/4 HANA*.
4. In the *S/4 HANA Live Connection* dialog, enter the name and description.
5. Select the *Connection Type* as **Direct Connection**.
6. Enter the host name as `xxx.abap-web.stagingaws.hanavlab.ondemand.com`.
7. Enter *HTTPS Port* as **443** and *Client* as **100**.
8. Select the *Authentication Method* as **SAML Single Sign-on (Standard Compliant)**.
9. Choose *OK*.

### 6.3.2.3.6 Integrating SQL Services Using SAP Datasphere

You need the integration scenario SAP\_COM\_0532 if you want to create a replication flow in SAP Datasphere to subscribe to CDS view entities from an ABAP system and consume data from these views. With a communication arrangement based on SAP\_COM\_0532 combined with a communication arrangement for exposing the SQL service, you can consume data from custom CDS view entities that are exposed using the SQL service.

The connection that you establish for this scenario is shared by all SAP Datasphere users, and SAP Datasphere controls the usage of the connection and accessed data assets through its integrated policy management agent.

SAP Datasphere connects to the CDC (Change Data Capture) functionality for CDS view entities that records changes of exposed CDS view entities. This component allows multiple consumers to subscribe to a CDS view entity to get the CDS data including the option for delta recording and delta consumption.

SAP Datasphere either adds another subscription to an existing CDS extraction process (if the CDS view entity is already processed by another subscriber) or creates a new extraction process and adds a subscription (if the CDS view entity is configured for extraction the first time), followed by the consumption of the data.

## Prerequisites

- You have entered the user and password for your user (typically a technical user) and have selected [SAP ABAP](#) as the connection type for the connection to the SAP system in the [Connections](#) area.
- The user in the SAP system that you use to complete the configuration steps should have administrator privileges or at least Business Catalog ID `SAP_CORE_BC_COM` for access to [Communication Management](#).
- You are familiar with steps required to expose CDS view entities. For more information, see [Data Consumption Using SAP Datasphere \[page 1101\]](#).

## Procedure

1. Create a communication user in the [Maintain Communication Users](#) app. You will later need this user name and password to establish the connection in SAP Datasphere.
2. Create a communication system in the [Communication Systems](#) app and select the checkbox [Inbound only](#).  
**Background information:** A communication system is important for outbound services, as it is used to register a destination for the communication system in the ABAP system. In the given scenario, requests always originate from the external system, so selecting the checkbox [Inbound only](#) is sufficient.
3. For a production scenario, switch on [OAuth 2.0 Identity Provider](#), enter a provider name and upload a signing certificate. Note that this step is not relevant if you are creating a test scenario.
4. Add the communication user that you created in step 1 with authentication method [User Name and Password to Users for Inbound Communication](#).
5. Create a communication arrangement for communication scenario `SAP_COM_0532` in the [Communication Arrangement](#) app and enter the name of the communication system that you created in step 2. Note that you do not need to specify an authorization group ID.
6. In SAP Datasphere, choose [Connections](#). On the [Local Connections](#) tab, choose the [Create](#) button.
7. Enter the necessary information. Choose the connection type [SAP ABAP](#). In the [Protocol](#) field, select the value [Web Socket RFC](#). In the [SAP Logon Connection Type](#) field, select the value [Application Server](#). In the [Use Cloud Connector](#) field, ensure the value [False](#) is selected. Use the inbound user data from step 4.
8. Test the connection by choosing the [Validate](#) button. Ensure that the status is [OK](#) before proceeding.
9. Create a communication arrangement based on a communication scenario with object privileges so that the communication user created in step 1 can access the exposed CDS view entities. For more information, see [Creating a Communication Arrangement for Exposing the SQL Service \[page 1114\]](#).

You can now create a replication flow in SAP Datasphere to consume data from CDS view entities.

## 6.3.2.3.7 Integrating SAP Document Management Service

You can integrate the ABAP environment of SAP Business Technology Platform with SAP Document Management Service to establish a communication scenario.

### Prerequisites

- You've subscribed to the service Document Management Service, Integration Option and created an instance in Cloud Foundry environment. See [Initial Setup for Document Management Service, Integration Option](#).
- The global administrator of your SAP BTP account has added the service plan for Document Management Service, Repository Option to your subaccount via entitlements. See [Configure Entitlements for Subaccounts](#).
- You've onboarded Document Management provided storage capability. See [Connect to Document Management Service, Repository Option Using API](#).
- You've created and copied the service key in the same subaccount of Cloud Foundry environment where Document Management, integration option instance is created. For more information about creating service key, see [Create Service Keys Using the Cockpit](#).
- You've the *Administrator* role (role template ID `SAP_BR_ADMINISTRATOR`). See [Maintain Business Roles](#).

### Context

SAP Document Management Service helps companies with managing records or attachments that are linked to business objects or a specific business context.

For each tenant of SAP BTP ABAP environment, a service instance of SAP Document Management Service in Cloud Foundry environment has to be created.

You can build and edit communication arrangements that your organization has set up with a communication partner using the *Communication Arrangement* application. The system provides communication scenarios for inbound and outbound communication that you can use to create communication arrangements. Inbound communication describes how a communication partner receives business documents, while outbound communication describes how a communication partner sends business documents to a communication partner. The communication scenario specifies the authorizations, inbound and outbound services, and supported authentication methods that are necessary for the communication.

#### Note

For the collection of sample classes available in the following GIT Hub location <https://github.com/SAP-samples/abap-cmis-client-sample> that helps you to use SAP Document Management Service, Integration option, in the SAP BTP, ABAP environment.

## Related Information

[Create a Communication Arrangement \[page 2637\]](#)

### 6.3.2.3.7.1 Create a Communication Arrangement

Create a communication arrangement in the ABAP environment.

#### Prerequisites

You've the *Administrator* role (role template ID `SAP_BR_ADMINISTRATOR`).

#### Procedure

1. Log on to the SAP Fiori launchpad in the ABAP environment.
2. Open the *Communication Arrangement* app from the SAP Fiori Launchpad.
3. Choose *New*.
4. Select the communication scenario `SAP_COM_0668`.
5. Enter *Service Key* that you generated. For more information about creating service key, see [Create Service Keys Using the Cockpit](#).
6. Choose *Create*.

A communication system created with the name `ZSAP_COM_0668`.

#### Note

Don't create more than one communication arrangement with communication scenario `SAP_COM_0668` in your tenant in the ABAP environment.

### 6.3.2.3.8 Integrating SAP BTP, ABAP environment and Local Printers

To set up the integration between SAP BTP, ABAP environment and local printers, you can use two communication scenarios, `SAP_COM_0466` and `SAP_COM_0467`.

Both communication scenarios are designed to connect third-party output management systems (OMS). OMS provide you with more refined printing functionalities. With `SAP_COM_0466`, the OMS use polling to check for the availability of new items to print. The communication scenario only has inbound communication. The *SAP Cloud Print Manager for Pull Integration* is supported by this communication scenario.

With `SAP_COM_0467`, the SAP BTP, ABAP environment system sends a notification to the OMS if new items are available to print. Therefore, the communication scenario has in- and outbound communication. This communication scenario doesn't support the use of the *SAP Cloud Print Manager for Pull Integration*.

Item retrieval and status update is the same for both methods. The only difference is the determination of new items to print.

Please check the documentation of your OMS first to see which method is supported before creating a communication arrangement of any type.

## Related Information

[SAP\\_COM\\_0466 \[page 2638\]](#)

[SAP\\_COM\\_0467 \[page 2640\]](#)

### 6.3.2.3.8.1 SAP\_COM\_0466

This document describes the configuration steps that have to be carried out by customers to set up the integration between SAP BTP, ABAP environment and local printers using `SAP_COM_0466`.

## Purpose

The communication scenario `SAP_COM_0466` enables you to print from a system on your locally installed printers. The communication scenario is designed to connect the *SAP Cloud Print Manager for Pull Integration* and third-party output management systems (OMS). OMS provide you with more refined printing functionalities.

### Note

The term 'OMS' will stand for both an OMS as well as the *SAP Cloud Print Manager for Pull Integration* for the remainder of this document.

## Prerequisites

- You've installed an OMS.
- You have the following business role assigned to your user:
  - `SAP_BR_ADMINISTRATOR`
- This business role contains the following business catalogs:
  - Communication Management (`SAP_CORE_BC_COM`)

- Output Management (SAP\_CORE\_BC\_OM\_PRT)

## Process Steps

### (SAP BTP, ABAP environment)

1. Log in to your system and navigate to the *Display Communication Scenarios* app.
2. Search for scenario ID SAP\_COM\_0466 and click on it.
3. Now click on *Create Communication Arrangement* in the top right corner.
4. Choose a name for your communication arrangement and click *Create*.
5. You will now need to create a communication system. You can do this by clicking *New* next to the field *Communication System*. For more information on general concepts of communication management, see [Communication Management \[page 2390\]](#).
6. Choose a new *System ID* and click *Create*.

#### Note

The *System Name* is filled in automatically with the same name as the ID. We recommend leaving this as it is to prevent confusion.

7. In the *General* section, mark the *Inbound Only* checkbox.
8. Now scroll down to *Users for Inbound Communication* and click "+" to add a new communication user.
9. Click on *New User*. Enter a username and a description. You can then choose to either enter a new password or upload a client certificate by clicking on *Upload*. Click *Create* to save the user, then click *OK*.
10. Save your communication system by clicking *Save* on the bottom right, then save your communication arrangement the same way.
11. Now search for the *Maintain Print Queues* app, open it and select *New* to create a print queue of the type *Pull Integration Queue*.

#### Note

The selection of the print queue type is only possible if more types are available. If this is not the case, *Pull Integration* is automatically selected. In case more options are available, it is important to select the *Pull Integration* queue type for the scenario. You won't see the print queue in your OMS system if you choose the wrong queue type.

12. Enter a name and description for the queue. Choose a format and make sure to select the name you chose for your communication arrangement in step 3. Leave the other settings as they are and save your test queue by clicking *Create*.
13. Scroll to the bottom of the print queue list window and select *System URL*. Copy the URL, as you'll need it later on.
14. Open the print queue and create a couple of test pages by clicking *Create Test Page*. They'll have the status *New*.
15. **(OMS):** Open your OMS and log in to the SAP BTP, ABAP environment system by using the system URL you copied in step 13 as well as the user and password created in step 8 and assign a physical printer to your print queue. Now you can print the test pages from your OMS. For details, please refer to the individual product documentation.
16. **(SAP Cloud Print Manager for Pull Integration):** For more information on how to configure your SAP Cloud Print Manager for Pull Integration, see [Communication Management \[page 846\]](#).

17. **(SAP BTP, ABAP environment)** : In the *Maintain Print Queues* app, your documents will now be labeled *Successful*.

## 6.3.2.3.8.2 SAP\_COM\_0467

This document describes the configuration steps that have to be carried out by customers to set up the integration between SAP BTP, ABAP environment and local printers using SAP\_COM\_0467.

### Purpose

The communication scenario SAP\_COM\_0467 enables you to print from an SAP BTP, ABAP environment system on your locally installed printers. The scenario consists of an inbound OData API which is designed for third-party output management systems (OMS) to connect, as well as a REST outbound API for the notification of new documents to be printed. OMS provide you with more refined printing functionalities.

### Prerequisites

- You've installed an OMS.
- You've configured a user in your OMS.
- You have the following business role assigned to your user:
  - SAP\_BR\_ADMINISTRATOR
- This business role contains the following business catalogs:
  - Communication Management (SAP\_CORE\_BC\_COM)
  - Output Management (SAP\_CORE\_BC\_OM\_PRT)

### Process Steps

1. Log in to your SAP S/4HANA system. Go to the *Communication Management* section and start the app **Display Communication Scenarios**.
2. Search for scenario ID SAP\_COM\_0467 and click on it.
3. Now click on *Create Communication Arrangement* in the top right corner.
4. Choose a name for your communication arrangement and click *Create*.
5. You will now need to create a communication system. You can do this by clicking *New* next to the field *Communication System*.
6. Choose a new *System ID* and click *Create*.

#### ⓘ Note

The *System Name* is filled in automatically with the same name as the ID. We recommend leaving this as it is to prevent confusion.

7. In the *General* section enter the host name, the IP address, or the URL of your OMS. Leave the HTTPS port as it is.
8. Now scroll down to *Users for Inbound Communication* and click "+" to add a new communication user.
9. Click on *New User*. Enter a username and a description. You can then choose to either enter a new password or upload a client certificate by clicking on *Upload*. Click *Create* to save the user, then click *OK*.
10. Now scroll down to *Users for Outbound Communication* and click "+" to add a new communication user.
11. Enter the username and password you created in your OMS. Click *Create* to save the user, then click *OK*.
12. Save your communication system by clicking *Save* on the bottom right.
13. Scroll down to the *Outbound Services* section and enter the service path you got from your OMS provider in the field *Path*. The service url will be configured automatically.
14. Save your communication arrangement by clicking *Save* on the bottom right.
15. Now search for the *Maintain Print Queues* app, open it and select *New* to create a print queue of the type **OMS for Notification Integration Queue**.
16. Enter a name and a description for the queue. Choose a format and make sure to select the name you chose for your communication arrangement in step 4. Set the notification type: When print queue items are added to the queue, a notification call is sent out. Here you can decide whether you want notifications for a certain number of items or for every single new item. Leave the other settings as they are and save your test queue by clicking *Create*.
17. Scroll to the bottom of the print queue list window and copy the system URL, as you'll need it later on.
18. Open the test queue and create a couple of test pages by clicking *Create Test Page*. They'll have the status *New*.
19. **(OMS)**: Open your OMS and log in to the S/4 HANA system by using the system URL you copied in step 17 as well as the user and password created in step 9 and assign a physical printer to your print queue. Now you can print the test pages from your OMS. For details, please refer to the individual product documentation.
20. **(SAP BTP, ABAP environment)**: In the *Maintain Print Queues* app, your documents will now be labeled *Successful*.

### 6.3.2.3.8.3 Managing Print Profiles

You can manage your print profiles for SAP\_COM\_0466 and SAP\_COM\_0467 in the *Maintain Print Queues* app.

#### Procedure

1. Assign a printer to a 0466 or 0467 print queue in your OMS or in the *SAP Cloud Print Manager for Pull Integration*. Mind that print profiles in the print manager are only supported when in PDF format. Make sure to ignore the print profile in the *PDF Settings* of your print manager in order to secure a correct runtime of the tool.

#### Note

If you've used SAP\_COM\_0467 to integrate your local printers to the SAP BTP, ABAP environment system, you can only choose a local printer from your external OMS instead.

2. Now, open the [Maintain Print Queues](#) app and select the print queue for which you want to define your print profiles.
3. Select [Manage Print Profiles](#) in the taskbar to set your print profile.
4. In the [Print Options](#) dialog, you can manage your print settings. After you've selected your individual print settings from the dropdown menu, select [Save As](#).
5. Choose a profile name. Select [Use as favorite](#) to save the settings of your print profile. If no favorite has been selected, a default will be used. Each print job going into the same print queue will use these same settings. Click [OK](#). Your new print profile has now been created. To delete a print profile, select [Delete](#) from the [Print Options](#) dialog.

**Note**

You can only define print profiles if you have administrator rights.

[SAP\\_COM\\_0467 \[page 2640\]](#)

### 6.3.2.3.9 Integrating External Scheduler

This inbound OData service enables external systems to schedule an application job based on an application job template.

The technical name of this inbound OData service is `BC_EXT_APPJOB_MANAGEMENT`. Please see the description of the operation [JobSchedule](#) for restrictions. Additionally, the service offers other elementary operations on application jobs.

## Service Structure

### Entities

The entities contain the business data of the service.

Entity	Description
Jobinfo	Detailed information on a single application job.
JobTemplate	Information on an application job template.
JobScheduleStatus	Information on a scheduled job.
FuncImpReturn	Return code.

## Service Response

The details included in the response vary according to the type of operation. For more information, see [Operations for External Job Scheduling Service \[page 2643\]](#).

### 6.3.2.3.9.1 Operations for External Job Scheduling Service

The external job scheduling service API offers the following operations:

Operation	HTTP Method	Sample URL
<a href="#">Read an Application Job Without Parameters [page 2648]</a>	GET	<host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobHeaderSet(JobName='JobName',JobRunCount='JobCount')?\$expand=JobStepSet/JobStepLogInfoSet/JobLogMessageSet
<a href="#">Read Application Job Templates [page 2648]</a>	GET	<host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobTemplateSet
<a href="#">Schedule an Application Job [page 2649]</a>	POST	<host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobSchedule?JobTemplateName='TemplateName'&JobText='Test'&JobUser='BusinessUser'&TestModelInd=false&JobParameterValue=''
<a href="#">Read Application Job Status [page 2650]</a>	GET	<host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobStatusGet?JobName='JobName'&JobRunCount='JobCount'
<a href="#">Abort a Running Application Job [page 2652]</a>	POST	<host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobAbort?JobName='JobName'&JobRunCount='JobCount'
<a href="#">Cancel an Application Job [page 2652]</a>	POST	<host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobCancel?JobName='JobName'&JobRunCount='JobCount'
<a href="#">Read Detailed Job and Step Information [page 2653]</a>	GET	<host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobinfoGet?JobName='JobName'&JobRunCount='JobCount'

Operation	HTTP Method	Sample URL
<a href="#">Read Application Job Status Texts [page 2654]</a>	GET	<host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobStatusInfoSet
<a href="#">Restart a Failed Application Job [page 2655]</a>	POST	<host>/sap/opu/odata/sap/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobRestart?JobName='JobName'&JobRunCount='JobCount'&JobRestartMode='E'
<a href="#">Check Parameters for Scheduling a Job [page 2656]</a>	POST	<host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobScheduleCheck?JobTemplateName='TemplateName'&JobParameterValues='ParameterValueString'

For more information on these operations, see [3383044](#).

## Error Handling

In case of an error, the external job scheduling service API sets the http status code to 400 and returns a message of an SAP message class. In the http response, you'll see the message class, the message number, and the message text. One example:

### Sample Code

```
<code>APJ_RT/003</code><message xml:lang="en">Job doesn't exist.</message>
```

In this example, the message with number 003 of message class APJ\_RT and the text "Job doesn't exist" was returned.

In most cases, a message of the message class APJ\_RT is used. The following table lists the message numbers and the corresponding texts:

Message code	Message constant	Text
001	TECHNICAL_ERROR	Job was aborted due to a technical error.
002	no_appl_log_found	No application log found
003	no_job_exists	Job doesn't exist.
004	cancel_job_failed	Job &1 couldn't be canceled.
005	no_cancel_privilege	User &1 has no authorization to cancel job &2.
006	delete_job_failed	Job &1 couldn't be deleted.
007	no_job_delete_privilege	User &1 has no authorization to delete job &2.
008	job_cancel_internal_error	Job &1 couldn't be canceled due to an internal error.

Message code	Message constant	Text
009	job_cancellation_successful	Job &1 has been canceled.
010	job_deletion_successful	Job &1 has been deleted.
011	job_wrong_state_for_deletion	You can't delete job &1 due to its status.
012	no_runs_for_job_found	Job &1 has no runs.
013	job_schedule_successfully	Job &1 has been scheduled.
014	job_catalog_entry_not_found	Job catalog entry &1 doesn't exist.
015	job_template_entry_not_found	Job template &1 doesn't exist.
016	report_for_job_not_found	Job &1 couldn't be created.
017	job_creation_failed	Report for job &1 couldn't be found.
018	job_metadata_inconsistent	Job &1 metadata are inconsistent.
019	read_job_log_failed	Log for job &1 couldn't be read.
020	job_start_immediate_failed	Job &1 couldn't start immediately
021	job_invalid_startdate	Job &1 has an invalid start date.
022	job_close_failed	Job &1 couldn't be scheduled.
023	job_list_internal_error	Internal error occurred during job list processing.
024	user_no_auth_report	User &1 not authorized to schedule report &2. Report on BC-SRV-APS-APJ.
025	future_schedules_restricted	Job &1 was restricted to 1000 scheduled runs.
026	job_completed_wo_info	Job completed without errors
027	no_auth_appl_log	User &1 is not authorized to read the log.
028	no_auth_job_details	User &1 is not authorized to read the job details.
029	no_auth_job_log	User &1 is not authorized to read the job log.
030	no_auth_job_delete	User &1 is not authorized to delete the job.
031	no_auth_job_cancel	User &1 is not authorized to cancel the job.
032	job_scheduling_failed	Job couldn't be scheduled.
033	job_no_end_date	No end date supplied for job &1.
034	job_start_before_end_date	Job &1 must start before the end date.
035	job_no_max_iterations	Enter a number of iterations for the job &1.
036	job_end_cond_ignored	End date of job &1 will be ignored due to missing recurrence pattern.

Message code	Message constant	Text
037	job_aborted	An error occurred. Please create an incident on component &1.
038	job_cancel_checking_failed	Job &1 couldn't be canceled: Check of job failed
039	job_cancel_not_exist	Job couldn't be canceled: Job does not exist.
040	JOB_CANCEL_NOT_RUNNING	Job couldn't be canceled: Job is not running.
041	job_delete_event_failed	Job &1 couldn't be deleted: Event scheduling can't be deleted
042	job_delete_steps_failed	Job &1 couldn't be deleted: Job steps couldn't be deleted
043	job_delete_time_failed	Job &1 couldn't be deleted: Deadline scheduling can't be deleted
044	job_delete_derelease	Job &1 couldn't be deleted: Previous job can't be modified
045	job_delete_enq_pre	Job &1 couldn't be deleted: Succeeding job can't be locked
046	job_delete_enq_suc	Job &1 couldn't be deleted: Previous job can't be locked
047	job_delete_enq_tbtco	Job &1 couldn't be deleted: Job can't be locked
048	job_delete_update_pre	Job &1 couldn't be deleted: Previous job can't be modified
049	job_delete_update_suc	Job &1 couldn't be deleted: Succeeding job can't be modified
050	job_delete_commit_failed	Job &1 couldn't be deleted: A technical error occurred.
051	job_delete_already_run	Job &1 couldn't be deleted: Job has already been published.
052	illegal_report_or_variant	Report name or variant name contains invalid characters.
053	illegal_variantname	Variant couldn't be created: Its name is empty, or contains '&' or '%'
054	no_auth_variant_create	User &1 is not authorized to create a variant.
055	variant_not_executed	Variant couldn't be created: Variant can't be executed.
056	variant_no_report_exists	Variant couldn't be created: Report doesn't exist.
057	variant_no_report_supplied	Variant couldn't be created: Report is not of type 1.

Message code	Message constant	Text
058	variant_locked	Variant couldn't be created: Variant is locked.
059	variant_lock_enqueue_error	Variant couldn't be created: Internal error from enqueue server
060	job_must_not_periodic	Job &1 must not be periodic. Report incident on component BC-SRV-APS-APJ.
061	job_wrong_periodic_value	Value &1 for recurrence pattern is invalid for job &2.
062	invalid_factory_calendar	Job &1 is not scheduled due to invalid calendar.
063	invalid_restriction_code	Job &1 is not scheduled due to invalid restriction code
064	job_list_filter_failed	Filter for job list couldn't be applied.
065	job_delete_internal_error	Job couldn't be deleted due to an internal error.
066	INVALID_MONTH_SHIFT_DIR	Invalid shift direction for days of month
067	WEEKDAY_WRONG_STARTDATE	Start date and day of recurrence must be the same weekday.
068	INVALID_TIMEZONE	Time zone &1 is invalid.
069	INVALID_FC_ID	Calendar &1 is invalid.
070	SCHEDULING_DATE_ADJUSTED	Start date was adjusted to fit the recurrence pattern.
071	INVALID_SCHEDULING_START_TS	Job must start before the end date.
072	SELECT_AT_LEAST_ONE_WEEKDAY	For weekly recurrence, select at least one weekday.
073	CREATE_JOB_VARIANT_FAILED	Job variant couldn't be created.
074	VALUES_OF_READ_ONLY_PARAM_REMOVED	Parameter &1 has been removed because it is read-only
075	USER_NO_AUTH_TO_SCHEDULE_JOB	Parameter &1 has been removed because it's read-only
076	JOB_CANCELED_BY_USER	Job was canceled by user &1.
077	NO_AUTH_SCHEDULE_FOR_USER	User &1 has no authorization to schedule the job.
078	PARAM_CHANGE_BEFORE_SCHEDULE	Invalid change of parameter when scheduling. Please open a ticket on &1
079	INVALID_JOB_RUN_STATUS	Invalid job run status.
080	JOBCATALOG_IS_NOT_BASIC	Job catalog is not basic.
081	JOB_RESTART_INCORRECT_STATUS	Can't restart the job due to the status
082	JOB_RESTART_INCORRECT_MODE	Can't restart the job after the last step
083	INVALID_USER	User &1 doesn't exist or is invalid.

## 6.3.2.3.9.1.1 Read an Application Job Without Parameters

Read an application job including step and log data, without parameters, using the HTTP method `GET`. An application job consists of a job header, a job step, a log header, and a log message. Via `$expand` all these job data can be read with one request.

### Request

You can retrieve all entities of an application job

with one call: `GET <host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobHeaderSet(JobName='JobName',JobRunCount='JobCount')?$expand=JobStepSet/JobStepLogInfoSet/JobLogMessageSet`

You can include the following properties in the URL of the request:

Property	Necessity	Comment
JobName	Mandatory	This is the name of the application job.
JobRunCount	Mandatory	This is the ID of the application job.

### Example

```
GET <host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobHeaderSet(JobName='JobName',JobRunCount='JobCount')?$expand=JobStepSet/JobStepLogInfoSet/JobLogMessageSet
```

For more information, see [3383044](#).

## 6.3.2.3.9.1.2 Read Application Job Templates

Get a list of all application job templates using the HTTP method `GET`.

### Request

Use the URL `<host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobTemplateSet` without parameters.

## Response

The operation returns a list of all application job templates.

## Examples

### Request

```
GET <host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobTemplateSet
```

### Response

```
{
  "d": {
    "results": [
      {
        "JobTemplateName": "string",
        "JobTemplateVersion": "string",
        "JobTemplateStepCount": "Unknown Type: integer,null",
        "JobPeriodicGranularity": "Unknown Type: string,null",
        "JobReportName": "Unknown Type: string,null",
        "JobUserName": "Unknown Type: string,null",
        "JobPeriodicValue": "Unknown Type: string,null",
        "JobTemplateText": "Unknown Type: string,null",
        "CreationDateTime": "/Date(1492098664000)/",
        "CreationUserName": "Unknown Type: string,null",
        "LastChangeDateTime": "/Date(1492098664000)/",
        "LastChangeUserName": "Unknown Type: string,null",
        "SupportsTestModeInd": "Unknown Type: boolean,null"
      }
    ]
  }
}
```

## 6.3.2.3.9.1.3 Schedule an Application Job

With JobSchedule you can schedule an application job based on a job template using the HTTP method `POST`. No start condition can be specified, it is always 'immediate start'.

### Request

You can include the following properties in the URL of the request:

Property	Necessity	Comment
TestModelInd	Optional	Reserved should be set to false.

Property	Necessity	Comment
JobParameterValues	Optional	These are the parameter values of the application job.
JobTemplateName	Mandatory	This is the name of the application job template.
JobText	Mandatory	This is the name of the application.
JobUser	Mandatory	This is the user ID of the user performing the job.
JobUserName	Obsolete	This is the user name of the user performing the job.
JobUserID	Obsolete	This is the ID of the application job user.

## Response

The operation schedules an application job.

## Examples

### Request

```
POST <host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobSchedule?
JobTemplateName='TemplateName'&JobText='Test'&JobUser='BusinessUser'&TestModeInd=
false&JobParameterValues=''
```

### Response

```
{
  "d": {
    "results": [
      {
        "JobName": "string"
        "JobRunCount": "string"
        "JobStatus": "char"
        "ReturnCode": "integer" (0 = ok, <> 0 = error)
      }
    ]
  }
}
```

## 6.3.2.3.9.1.4 Read Application Job Status

Read the status of an application job using the HTTP method `GET`.

## Request

You can include the following properties in the URL of the request:

Property	Necessity	Comment
JobRunCount	Mandatory	This is the ID of an application job.
JobName	Mandatory	This is the name of an application job.

## Response

The operation returns the status of an application job.

## Additional Information

Please note that to obtain the status of jobs that weren't scheduled using the external scheduler API, you should assign your communication user not only to SAP\_COM\_0064 but also to SAP\_COM\_0326. For more information on this issue, see [3358110](#).

## Examples

### Request

```
GET <host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobStatusGet?  
JobName='JobName'&JobRunCount='JobCount'
```

### Response

```
{  
  "d": {  
    "results": [  
      {  
        "JobName": "string"  
        "JobRunCount": "string"  
        "JobStatus": "char"  
        "ReturnCode": "integer" (0 = ok, <> 0 = error)  
      }  
    ]  
  }  
}
```

## 6.3.2.3.9.15 Abort a Running Application Job

Abort a running application job using the HTTP method POST.

### Request

You can include the following properties in the URL of the request:

Property	Necessity	Comment
JobRunCount	Mandatory	This is the ID of an application job.
JobName	Mandatory	This is the name of an application job.

### Examples

#### Request

```
POST <host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobAbort?
JobName='JobName' & JobRunCount='JobCount'
```

#### Response

```
{
  "d": {
    "results": [
      {
        "ReturnCode": "integer" (0 = ok, <> 0 = error)
      }
    ]
  }
}
```

## 6.3.2.3.9.16 Cancel an Application Job

Cancel an application job in general using the HTTP method POST.

This operation is more general than JobAbort. JobCancel treats a job depending on its status:

- If a job is already running, JobCancel will cancel the job like JobAbort.
- If a job has not yet started, JobCancel will delete it.

## Request

You can include the following properties in the URL of the request:

Property	Necessity	Comment
JobRunCount	Mandatory	This is the ID of an application job.
JobName	Mandatory	This is the name of an application job.

## Examples

### Request

```
POST <host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobCancel?
JobName='JobName' & JobRunCount='JobCount'
```

### Response

```
{
  "d": {
    "results": [
      {
        "ReturnCode": "integer" (0 = ok, <> 0 = error)
      }
    ]
  }
}
```

## 6.3.2.3.9.17 Read Detailed Job and Step Information

Read detailed job and step information using the HTTP method `GET`.

This operation returns one line for each job step, where each line contains some global information of the job (like status, start time, end time) and step specific information like step status and step start time.

### Request

You can include the following properties in the URL of the request:

Property	Necessity	Comment
JobRunCount	Mandatory	This is the ID of an application job.
JobName	Mandatory	This is the name of an application job.

## Examples

### Request

```
GET <host><host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobInfoGet?
JobName='JobName' & JobRunCount='JobCount'
```

### Response

```
{
  "d": {
    "results": [
      {
        "JobName": "string",
        "JobRunCount": "string",
        "JobStatus": "string",
        "JobSdlDateTime": "DateTime",
        "JobStartDateTime": "DateTime",
        "JobEndDateTime": "DateTime",
        "JobAppRC": "Integer",
        "StepCount": "DateTime",
        "StepStatus": "String",
        "StepStartDateTime": "DateTime",
        "StepAppRC": "Integer",
      }
    ]
  }
}
```

## 6.3.2.3.9.1.8 Read Application Job Status Texts

Get a list of all possible application job statuses and their corresponding status texts using the HTTP method GET.

### Request

Use the URL <host>/sap/opu/odata/SAP/BC\_EXT\_APPJOB\_MANAGEMENT;v=0002/JobStatusInfoSet without parameters.

### Response

The operation returns a list of all application job statuses and their texts.

## Examples

### Request

```
GET <host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobStatusInfoSet
```

optional with language settings:

```
GET <host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobStatusInfoSet?sap-language=EN
```

### Response

```
<d:JobStatus>C</d:JobStatus>  
<d:JobStatusText>Canceled</d:JobStatusText>
```

or

```
<d:JobStatus>S</d:JobStatus>  
<d:JobStatusText>Scheduled</d:JobStatusText>
```

and so on.

## 6.3.2.3.9.1.9 Restart a Failed Application Job

Create a copy of the failed application job and start it from or after the failed step using HTTP method `POST`.

### Request

You can include the following properties in the URL of the request:

Property	Necessity	Comment
JobRunCount	Mandatory	This is the ID of an application job
JobName	Mandatory	This is the name of an application job
JobRestartMode	Mandatory	This is the type of restart you can trigger

There are two restart modes:

- `JobRestartMode='E'`: Restart the job from the failed step. The job steps before the failed step will be skipped.
- `JobRestartMode='A'`: Restart the job after the failed step. The failed step and the steps before will be skipped.

## Response

The operation restarts a failed application job.

## Examples

### Request

```
POST <host>/sap/opu/odata/sap/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobRestart?
JobName='JobName' &JobRunCount='JobCount' &JobRestartMode='E'
```

### Response

```
<d:JobName>JobName</d:JobName>
<d:JobRunCount>JobCount</d:JobRunCount>
<d:JobStatus>R</d:JobStatus>
<d:ReturnCode>0</d:ReturnCode>
```

## 6.3.2.3.9.1.10 Check Parameters for Scheduling a Job

Check the parameter string that you intend to schedule a job with. This call makes the same checks as the [Check](#) button contained within the [Application Jobs](#) app.

### Request

You can include the following properties in the URL of the request:

Property	Necessity	Comment
JobTemplateName	Mandatory	This is the name of the application job.
JobParameterValues	Mandatory	These are the parameter values of the application job. For more information, see <a href="#">3383044</a> .

### Response

The operation returns:

- **Parameter String:** An overview of the supplied parameter string. (In some applications, the supplied parameters can be changed by the framework. In such cases, a string with the changed parameters is returned in the response).

- Successful Indicator: Returns `true` when the supplied parameters are allowed. Otherwise it will return `false`.
- Changed Indicator: Returns `true` if the parameters have been adjusted. Otherwise it will return `false`.
- Dynamic Properties: `<Reserved>`
- Error Messages: Shows errors or warnings regarding the supplied parameter string.

## Examples

### Request

```
GET <host>/sap/opu/odata/SAP/BC_EXT_APPJOB_MANAGEMENT;v=0002/JobScheduleCheck?
JobTemplateName='TemplateName' &JobParameterValues='ParameterValueString'
```

### Response

```
{
  "d": {
    "results": [
      {
        "JobParameterValues": "ParameterValueString",
        "SuccessfulInd": "boolean",
        "ChangedInd": "boolean",
        "DynamicProperties": "",
        "ErrMessages": "ErrorMessagesString",
      }
    ]
  }
}
```

## 6.3.2.3.9.2 SAP\_COM\_0326

This communication scenario concerns application job scheduling authorizations.

### Context

If you create a communication arrangement based on SAP\_COM\_0326, your communication user will have the authorization to schedule any application job template under any business user. Furthermore, you'll also have the authorization to run all available operations on application jobs that were created by other users. This means that you can delete or cancel any application job created by any business user.

## Process Steps

1. Open the *Display Communication Scenarios* app.
2. Search for the scenario ID `SAP_COM_0326` and click on it.
3. Select *Create Communication Arrangement* in the top right corner.
4. Choose a name for your communication arrangement and click *Create*.
5. You'll now need to create a communication system. To do this, click *New* next to the field *Communication System*. For more information on general concepts of communication management, see [Communication Management \[page 2390\]](#).
6. Choose a new *System ID* and click *Create*.

### Note

The *System Name* is filled automatically with the same name as the ID. We recommend leaving this as it is to prevent confusion.

7. In the *General* section, mark the *Inbound Only* checkbox.
8. Now, scroll down to *Users for Inbound Communication* and click "+" to add a new communication user.
9. Select *New User*. Enter a user name, a description, and a new password or select *Propose Password*. Click *Create* to save the user, then click *OK*.

### Note

Please don't use the *Certificate* section. At the moment, only basic authentication has been implemented.

10. Select *Save* to save your communication system.
11. You'll be forwarded to your communication arrangement. In the *Additional Properties* section, enter an *External Scheduler Company* and an *External Scheduler Product*.
12. Finally, select *Save* to save your communication arrangement.

## 6.3.2.3.10 Integrating Factory Calendar

Learn how to integrate an ABAP Platform system with the factory calendar.

### Context

This communication scenario allows you to set up a connection to the import factory calendar customizing from another ABAP client. There can be at most one source client for an ABAP tenant.

## Prerequisites

You have to connect your ABAP system via RFC. To do this, follow the steps described in [3148310](#) or install the required support package. The following RFC-enabled function modules are called during import:

- SCAL\_TO\_FHC\_MIG\_COMPLETED
- SCAL\_READ\_CUSTOMIZING
- FHC\_READ\_CUSTOMIZING

## Procedure

1. Create a communication user in the *Maintain Communication Users* app. For more information, see [How to Create Communication Users \[page 2393\]](#).
2. Create a communication system in the *Communication Systems* app. For more information, see [How to Create Communication Systems \[page 2398\]](#).
3. Create a communication arrangement in the *Communication Arrangements* app. For more information, see [How to Create a Communication Arrangement \[page 2395\]](#).

After creating the communication arrangement, assign the business catalog SAP\_CA\_BC\_IC\_LND\_CAL\_CA0\_PC or SAP\_CA\_BC\_IC\_LND\_CAL\_CA1\_PC to schedule an application job. The application job is required to pull the data of the three related IMG activities via the connection. The check logic of the application job and the transaction prevent the scheduling and execution in clients where the selected customizing objects are not editable.

### Note

Existing factory calendar customizing will be overwritten by the import. In case the automatic pull destination is configured, a warning is issued in the customizing maintenance UIs to prevent concurrent changes.

All changes are recorded on a task.

The source of the factory calendar depends on the migration state of the source client:

- If the source client has not yet been migrated, the cross-client calendar will be pulled
- If the source client has been migrated, the client-dependent calendar will be pulled

## 6.3.2.3.11 Integrating SAP Enable Now Manager

The ABAP environment supports the extended content scenario of SAP Enable Now that allows you to add an additional source for help content to the SAP Companion plugin. You can edit the context-sensitive in-app help delivered by SAP and adapt it to your needs or include your own content.

To use the SAP Enable Now Manager, you have to create a communication arrangement that uses communication scenario SAP\_COM\_0011.

In addition, you have to install the SAP Enable Now Manager.

If you need further information, see the [SAP Companion Integration guide](#). The specifics for the ABAP environment are described in section *Set Up of SAP Companion for SAP S/4HANA Cloud and Similar Systems*.

## Related Information

[SAP Enable Now](#)

[SAP Companion Authoring](#)

### 6.3.2.3.12 Integrating UI Theme Designer

To set up the integration between SAP BTP ABAP Environment and UI theme designer, you can use the communication scenario `SAP_COM_0623`.

You can use `SAP_COM_0623` to establish a connection to the Cloud Foundry environment.

Create a communication arrangement in SAP BTP ABAP Environment to establish a connection to Cloud Foundry for fetching custom themes which can then be used in SAP BTP ABAP.

## Prerequisites

Your user needs a business role with the business catalog *Communication Management* (`SAP_CORE_BC_COM`) as well as *Security* (`SAP_CORE_BC_SEC`) assigned (e.g., the administrator user).

In Cloud Foundry, you need to have the environment for the UI theme designer prepared as described in [Portal Scenario](#).

A custom theme needs to be created and published in UI theme designer to be available for consumption in SAP BTP ABAP Environment. For more information, see [Create Themes — End to End Flow](#). The theme ID shown in UI theme designer will be used to define default theme or additional themes to be used in SAP BTP ABAP Environment.

An entitlement for the UI theme designer (theming) service is required in your global account and needs to be assigned to the subaccount.

## Creating an Instance for UI Theme Designer Service in Cloud Foundry

To consume published themes in SAP BTP ABAP Environment, an instance of UI theme designer service needs to be created in Cloud Foundry.

1. Navigate to the [Service Marketplace](#) in the Cloud Foundry subaccount. Select service *UI Theme Designer* (name: theming) and click [Create](#).
2. In the creation dialog, enter basic info for the service instance

1. Service: UI Theme Designer
  2. Plan: standard
  3. Runtime Environment: Cloud Foundry
  4. Space
  5. Instance Name
3. In the next screen, no further parameters need to be configured.
  4. Review and verify the instance details in the following screen and confirm the creation with [Create](#).
  5. Make sure that a new instance for the *UI Theme Designer (theming)* service is successfully created.

## Creating a Service Key in Cloud Foundry

The simplest way to enable communication between SAP BTP ABAP Environment and Cloud Foundry is to create a service key in Cloud Foundry and use its content for configuring the communication arrangement.

1. Navigate to the space of your Cloud Foundry subaccount. Go to **Services > Instances** and select the instance for the UI theme designer.
2. Now you can create a service key. For more information, see [Creating Service Keys \[page 236\]](#).
3. Open the service key and copy its content (e.g., by clicking [Copy JSON](#)).

## Using mTLS for the Communication

To enable mTLS for the communication between SAP BTP ABAP Environment and the UI theme designer in Cloud Foundry, the steps are a little bit different:

1. In SAP BTP ABAP Environment, go to [Maintain Client Certificates](#).
2. Export the Client Default certificate. Choose one where *Valid to* is a date in the future.
3. In Cloud Foundation, navigate to the space of your subaccount. Go to **Services > Instances** and select the instance for the UI theme designer.
4. Now create a service key with mTLS information. For more information, see section [Creating a Service Key in Cloud Foundry](#). When doing this via the Cockpit, enter the following text into the parameters field in the [New Service Key](#) wizard. Replace the `xxxxxxxxxxxxxxxxxxxx` with the text you find in your exported certificate.

### Sample Code

```
{
  "xsuaa": {
    "credential-type": "x509",
    "x509": {
      "certificate": "-----BEGIN CERTIFICATE----- xxxxxxxxxxxxxxxxxxxxxxxx
-----END CERTIFICATE-----",
      "ensure-uniqueness": false,
      "certificate-pinning": true
    }
  }
}
```

5. After creating the service key, open it and copy its content (e.g. by clicking on [Copy JSON](#)).

If the client certificate is not valid anymore, you need to repeat the described steps.

1. As there can be only one Service Key at the same time for a Service Instance with a client certificate, you either need to delete the old one and create a new one, or you use two Service Instances where one is used active and the other can be used to update the Service Key.
2. Download the new Client Default certificate as described above in steps 1 and 2.
3. Recreate the Service Key as described above in steps 3 and 4. Copy this new key.
4. Then go to the SAP BTP ABAP Environment, and in the launchpad choose ► [Communication Management](#) ► [Communication Arrangements](#) ►.
5. Select the previously created Communication Arrangement for `SAP_COM_0623`. Choose [Update by Service Key](#), paste the newly created Key and then choose [Update](#).

## Creating a Communication Arrangement in SAP BTP ABAP Environment

1. Log on to the SAP BTP ABAP Environment system as administrator (or as a user with the necessary role/catalog assigned).
2. In the launchpad, navigate to the group [Communication Management](#) and choose the tile [Communication Arrangements](#).
3. In the [Communication Arrangements](#) dialog, choose [New](#).
4. Select communication scenario `SAP_COM_0623` ([UI Theme Designer Integration](#)). If you want, change the proposed arrangement name.
5. Paste the service key into the field [Service Key](#).
6. In the [Additional Properties](#) section, enter the custom theme as a default theme. (You can do or change this later in the detail screen).
7. Now click [Create](#). With the help of the service key, everything is created in the background - communication system and communication arrangement - and all fields relevant for enabling a connection to Cloud Foundry are filled.

### Note

In a SAP BTP ABAP Environment system, there is only one communication arrangement for `SAP_COM_0623` (connection to the Cloud Foundry environment) per client possible. If you have already an existing connection for custom themes and want to create a new connection, you must delete the old connection first.

8. Now you can maintain the fields for the communication arrangement. Besides the default theme ID, you can also maintain the field [Additional Theme IDs](#). Here you can provide additional themes (resp. their IDs) from which the users can select one in the SAP Fiori launchpad personalization.

### → Tip

We strongly recommend that you have a test phase first and enter the custom theme only as an additional theme. If tests by selected users are successful, you can enter your theme as the default theme (which applies to all users as soon as you save the communication arrangement).

9. Click on [Save](#).

## Maintain Content Security Policy in SAP BTP ABAP Environment

To be able to correctly display custom themes in SAP BTP ABAP Environment, the runtime endpoint of UI theme designer (theming) service needs to be maintained as trusted site.

1. Log on to the SAP BTP ABAP Environment system as administrator (or as a user with the necessary role/catalog assigned).
2. In the launchpad, navigate to the group *Security* and choose the tile *Manage Content Security Policy*.
3. In the app, select the *Trusted Sites* tab and navigate into the *UI\_RESOURCES\_FONTS* allow list.
4. Press *Add*, then press *New* in the *Managed by Customer* section.
5. Fill in the theming runtime URL for your landscape and press *Save* (e.g. <https://theming-runtime.cfapps.eu10.hana.ondemand.com>)

### → Tip

The theming runtime URL can be retrieved from the service key of the UI theme designer service instance, where it is the value of the "endpoints" → "runtime" property.

## Results

After a refresh in the FLP of SAP BTP ABAP Environment, your custom theme is available according to your configuration, as follows:

- If you have entered the custom theme as an *additional theme*, the SAP Fiori launchpad is unchanged but the theme is now available in the *User Actions* menu under **Settings > Appearance**.
- If you have set the custom theme as a *default theme* (only after thorough tests!), the SAP Fiori launchpad is displayed with the new theme for all users.  
**Exception:** Users who have switched their theme previously in the user settings of the SAP Fiori launchpad keep their theme. But they can switch to the new default theme in their user settings since it is listed there.

### ⓘ Note

If there were changes within your instance on Cloud Foundry and you need to update the service key, you can copy the new content of the service key and use *Update by Service Key* within the communication arrangement.

## Troubleshooting

- **Theming runtime not included in Content Security Policy**  
Custom themes are largely shown correctly, but many icons are not displayed. Icons are loaded via fonts. This is reflected in the Developer Tools console (e.g. F12 in Google Chrome) as an error of the type "Refused to load the font ... because it violates the following Content Security Policy directive ..."  
**Solution:** Theming runtime URL needs to be included into the *UI\_RESOURCE\_FONTS* allow list in *Manage Content Security Policy* app.

- **Custom Theme in Theming Service is not available and FLP in ABAP Environment is broken**  
FLP in SAP BTP ABAP Environment is not usable because default theme or theme selected for business user cannot be loaded.  
**Solution:** Is it possible to specify theme ID to be used for FLP in SAP BTP ABAP Environment using an URL parameter `sap-theme=<theme-id>`  
See [Usage of the sap-theme URL parameter](#) in SAP Note [2043817](#).  
This is especially useful if the FLP is broken, and the business user needs to select another theme to resolve the issue e.g., while using SAP-provided theme `sap-theme=sap_fiori_3`.

## 6.3.2.3.13 Integrating SAP Build Process Automation

You can integrate your ABAP environment with SAP Build Process Automation.

### 6.3.2.3.13.1 Configuring the SAP Build Process Automation Integration

You can enable the communication between the ABAP environment and SAP Build Process Automation.

This scenario enables ABAP environment applications to extend their business workflows or business processes with workflow capability of SAP Build Process Automation. It allows the provisioning of an API in the ABAP environment to start and control workflow instances running on workflow capability.

You set up the scenario using the following tasks:

1. [Create a Communication Arrangement Using a Service Key \[page 2664\]](#) (recommended)
2. [Create Destinations \[page 2665\]](#)
3. [AIF Monitoring \[page 2672\]](#)

#### 6.3.2.3.13.1.1 Create a Communication Arrangement Using a Service Key

To connect the ABAP environment and SAP Build Process Automation, you need a communication arrangement.

#### Procedure

1. Get the service key.
  - a. In the SAP BTP cockpit, navigate to your space. See [Navigate to Orgs and Spaces](#).
  - b. From the navigation pane, choose ► [Services](#) ► [Service Instances](#) ►.

- c. Click the name of your SAP Build Process Automation instance.
  - d. From the navigation pane, choose [Service Keys](#).
  - e. Select one entry, and copy the service key.
2. Open the [Communication Arrangements](#) app in your SAP S/4HANA Cloud system.
3. Create a communication arrangement.
4. Choose scenario [SAP\\_COM\\_0863](#).
5. Enter a name for the arrangement.
6. Choose [Additional Properties](#) and enter:
  - Consumer Type (Workflow) - This is the default.
  - Optional. Consumer Type (Visibility)  
Choose the types relevant for SAP applications according to their documentation.
  - Others: Leave empty.
7. Select a communication user (of which you know the password) or create a new one to use for inbound communication (from SAP BTP to your ABAP environment).
8. Paste the service key into the corresponding field, and choose [Create](#).

The password of the newly created user for the inbound communication is shown in an information message in the status bar. You need the user and password for maintaining a destination in SAP BTP.

## Results

You've created the communication arrangement, the communication system, and an inbound user. The consumer type is used to identify the communication arrangement. Therefore, you must only assign it to exactly one communication arrangement. You can assign multiple consumer types to one communication arrangement.

Consumer types can be added or removed later from the communication arrangement, if needed.

### 6.3.2.3.13.1.2 Create Destinations

In the SAP BTP cockpit, you need to create destinations to enable the communication to the ABAP environment. In addition, the destination must be enabled for use in SAP Build.

## Procedure

1. In the SAP BTP cockpit, navigate to your subaccount. See [Navigate to Orgs and Spaces](#).
2. Choose [Connectivity](#) > [Destinations](#).
3. Choose [New Destination](#) > [Blank Template](#), and enter the following data:

## Process Visibility Capability

Field	Value
Name	Enter the destination name.
Type	Select <i>HTTP</i> .
Description	Enter a description.
URL	API-URL of the ABAP environment. The format is: https://*****.on-demand.com/.  Set the destination URL to the API endpoint URL found in the service key that was created for the service instance of SAP Build Process Automation and which was used creating the communication arrangement. Access the communication arrangement and copy the API URL displayed under <a href="#">▶ Common Data ▶ API-URL ▶</a> .
Proxy Type	<i>Internet</i>
Authentication	Select <i>BasicAuthentication</i> .
User	(Inbound) communication user used in the communication arrangement
Password	Set the password to the secret. Password of the (inbound) communication user used in the communication arrangement.
Additional Properties	Add the following properties: <ul style="list-style-type: none"><li>• "sap.applicationdevelopment.actions.enabled" → true</li><li>• "sap.processautomation.enabled " → true</li></ul>

4. Save your entries.
5. Open the Settings of SAP Build on your subaccount.
6. Choose [▶ Destinations ▶ New Destination ▶](#).
7. Select the destination that you have created in the SAP BTP cockpit and click *Add*.

## Results

You have created a destination in your SAP BTP subaccount that can be used for the callback to the SAP BTP ABAP environment. The callback indicates the completion of a process on SAP Build Process Automation.

## Related Information

[Configure SAP Build Process Automation Destinations](#)

## 6.3.2.3.13.13 Model Action Project to Notify the ABAP Environment About Workflow Completion

As the workflow capability within SAP Build Process Automation doesn't support the enterprise messaging service, you must model an additional action right before each end event for each process definition, that was started from the ABAP environment. This action calls an inbound service and notifies the ABAP Environment that the process that has been started on SAP Build Process Automation is now completed.

### Prerequisites

You've modeled a project with a process within SAP Build.

### Context

The action triggers the completion in the ABAP environment tenant and must be called exactly once.

With this approach, cancellations on workflow instances directly from the workflow capability API aren't communicated to the ABAP environment tenant.

### Procedure

1. Create a new project in SAP Build by choosing [Build an Automated Process](#) > [Actions](#) .
2. Upload the API specification.

#### Sample Code

```
<?xml version="1.0" encoding="utf-8"?>
<edmx:Edmx Version="4.0" xmlns:edmx="http://docs.oasis-open.org/odata/ns/edmx" xmlns="http://docs.oasis-open.org/odata/ns/edm">
  <edmx:DataServices>
    <Schema
      Namespace="com.sap.gateway.default.api_workflow_notification.v0001"
      Alias="SAP_self">
      <ComplexType Name="CT_NOTIFICATION_RESULT">
        <Property Name="notificationProcessed" Type="Edm.Boolean"
          Nullable="false"/>
      </ComplexType>
      <Action Name="ProcessCompleted">
        <Parameter Name="workflowInstanceId" Type="Edm.String"
          Nullable="false" MaxLength="36"/>
        <Parameter Name="outcome" Type="Edm.String" Nullable="false"
          MaxLength="255"/>
        <ReturnType
          Type="com.sap.gateway.default.api_workflow_notification.v0001.CT_NOTIFICATION_RESULT"
          Nullable="false"/>
      </Action>
    <EntityContainer Name="Container">
```

```

    <ActionImport Name="ProcessCompleted"
Action="com.sap.gateway.default.api_workflow_notification.v0001.ProcessCompleted"/>
  </EntityContainer>
</Schema>
</edm:DataServices>
</edm:Edmx>

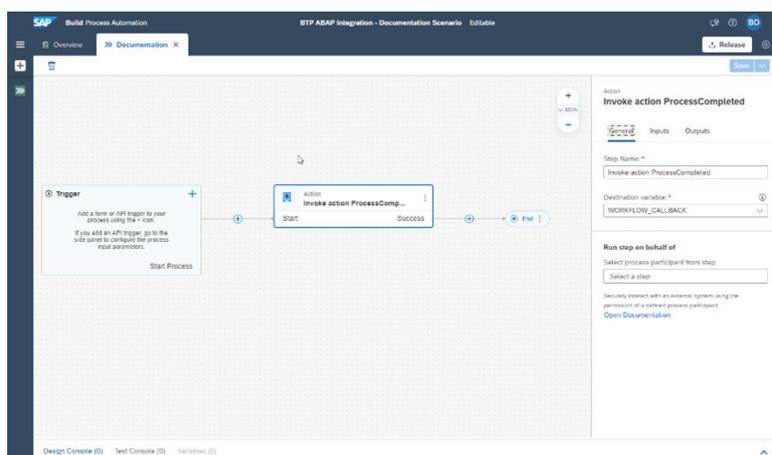

```

3. Enter a project name.
4. In the *Add actions ...* dialog, choose only the service operation *POST /Process Completed* and then choose *Add*.
5. Modify the project settings as follows
  - a. Enable CSRF tokens for all actions in the project, and set *Token Fetch End Point* to *„/“*.
  - b. Set the URL prefix to *„/sap/opu/odata4/sap/api\_workflow\_notification/default/sap/api\_workflow\_notification/0001“*.
6. Save the project.
7. Release the project and publish it to the library.

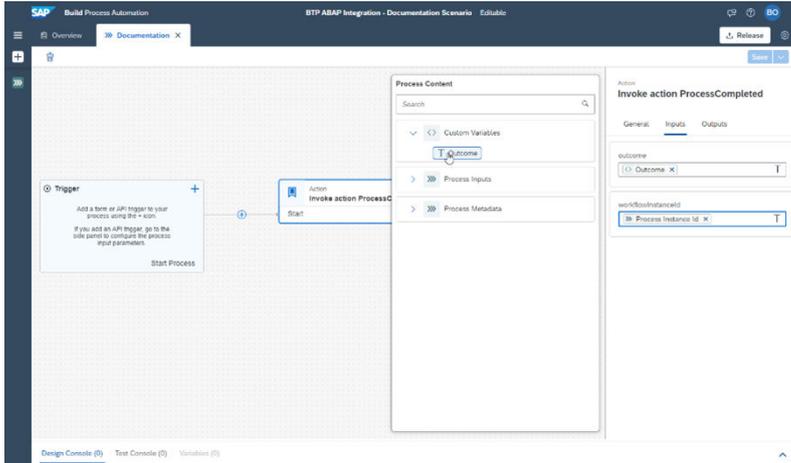

## Using the Action in a Process

### Procedure

1. Include a new action step as last step in your process by choosing **► Actions ► Browse Library ►**.
2. Search for „Invoke action ProcessCompleted“ and choose *Add*.
3. Specify a destination variable in the action step details – create a new variable if necessary.

4. Configure the inputs of the action step.
  - a. From *Process Metadata*, assign *Process Instance Id* to the *workflowInstanceId* input.
  - b. Optional. To communicate the result of the process, assign any relevant variable to the *outcome* input.

- When deploying your project, specify the destination created in the SAP BTP cockpit for the destination variable used in the action step.

### 6.3.2.3.13.1.3.1 Using the Workflow Proxy API on SAP BTP ABAP Environment

To start and control a workflow process on SAP Build Process Automation from your application running in the SAP BTP ABAP environment, the following released APIs can be used.

Artifact	Description
CL_SWF_CPWF_API_FACTORY_A4C	Factory for instantiating an API instance
IF_SWF_CPWF_API	Actual API interface
I_CPWF_INST	RAP façade for the workflow API to be used within RAP behavior definitions

For more information, see the ABAP documentation of these objects in the system.

### 6.3.2.3.13.1.4 Modeling Extension Processes

As the SAP Build Process Automation processes don't integrate using SAP Event Mesh, you must ensure the communication back to SAP S/4HANA Cloud through the process models.

#### Prerequisites

- You've created the destination for the workflow capability integration. See [Create Destinations \[page 2665\]](#).

- You've set the scopes. See .
- You have the necessary roles to develop and deploy SAP Build Process Automation projects. See [Managing Project Members](#).

## Context

To ensure the communication, you have to model an additional service task right before each end event for each process, that was started from SAP S/4HANA Cloud.

### Note

Cancellations of process instances on SAP Build Process Automation aren't communicated to the SAP S/4HANA Cloud system.

## Procedure

1. To reate an action for communicating the process completion to the SAP S/4HANA Cloud system, create an actions project. See [Model Action Project to Notify the ABAP Environment About Workflow Completion \[page 2667\]](#).
2. Create a SAP Build Process Automation process.
  - a. Create a business project. See [Create a Business Process Project](#).
  - b. Create a data type for the input of the process.

The data type is for receiving the input from the SAP S/4HANA Cloud system. You assign it to the process trigger. Choosing New Field, you enter the following Names:

- **SystemID**
- **SAPObjectNodeType**
- **SAPObjectNodeTypeKey**
- **Result**

Add children to the **SAPObjectNodeTypeKey** field and name them **Key1** to **Key6**.

The data type then looks as follows:

Name	Type	Sample	List	Required	
SystemID	String		No	No	<a href="#">New Child</a>
SAPObjectNodeType	String		No	No	<a href="#">New Child</a>
▼ SAPObjectNodeTypeKey	Object		No	No	<a href="#">New Child</a>
Key1	String		No	No	<a href="#">New Child</a>
Key2	String		No	No	<a href="#">New Child</a>
Key3	String		No	No	<a href="#">New Child</a>
Key4	String		No	No	<a href="#">New Child</a>
Key5	String		No	No	<a href="#">New Child</a>
Key6	String		No	No	<a href="#">New Child</a>
Result	String		No	No	<a href="#">New Child</a>

- c. Create a business process. See [Create a Business Process](#).
- d. Receive the input from the SAP S/4HANA Cloud system.
  1. Select the trigger tile.
  2. Open the *Inputs/Outputs* tab.
  3. Choose *Configure* next to *Process Inputs*.
  4. Choose add *Input*.
  5. Enter **ExchangeData** in the *Name* field, and select the previously created data type.
  6. Choose *Apply*.
3. Communicate the process completion to the SAP S/4HANA Cloud system.
  - a. Add the action that you created before each end event. For information about how to add actions, see [Add Actions to a Process](#).
  - b. On the *General* tab, create a destination variable for the completion callback so that you can map it to the destination on deployment.
  - c. On the *Inputs* tab, assign **Process Metadata** **Process Instance Id** to the *workflowInstanceId* input of the action.
  - d. Optional: On the *Inputs* tab, assign any variable to the outcome input of the action to indicate the result of the extension process to the caller.
4. Release your project.
5. Deploy your project.
  - a. In the *Runtime Variables* step, assign the destination for the workflow capability integration to the destination variable that you created.

## Related Information

[Configure Service Tasks](#)

## 6.3.2.3.13.2 AIF Monitoring

The Application Interface Framework (AIF) enables you to monitor background communication with your connected SAP Build Process Automation tenant.

### Procedure

First, you need to assign business roles to a business user and then to assign recipients to this user.

### 6.3.2.3.13.2.1 Maintain Business Roles and Business Users

As a preparation to monitor messages for the integration of the SAP Build Process Automation, you assign business roles to a business user.

### Procedure

1. Log on to the SAP Fiori launchpad as an administrator user.
2. With the *Maintain Business Roles* app, create and edit business roles and add business catalogs to the roles.
  - a. To grant access to the *Assign Recipients to Users* app, add the business catalog *Communication Management – Message Monitoring Configuration* (SAP\_CA\_BC\_COM\_CONF\_PC) to a business role.
  - b. To grant access to the *Message Dashboard* app, add the business catalog *Business Network Integration* (SAP\_BR\_CONF\_EXPERT\_BUS\_NET\_INT) to a business role.

Both business catalogs are also contained in the business role template *Configuration Expert – Business Network Integration* (SAP\_BR\_CONF\_EXPERT\_BUS\_NET\_INT).

3. With the *Maintain Business User* app, provide business users with access rights.

### 6.3.2.3.13.2.2 Monitor Messages for SAP Build Process Automation Integration

You can monitor the background processes for the integration of the SAP Build Process Automation.

### Prerequisites

You have assigned business roles and business users.

## Context

With the [Message Dashboard](#) or [Message Monitoring Overview](#), you can monitor and administrate the SAP Build Process Automation background processing. You can manually trigger or cancel monitored background tasks that have issues.

AIF messages are deleted after a retention time, which can be configured in AIF customizing. The default value for all workflow-relevant namespaces and interfaces is set to 7 days.

## Procedure

1. Log on to the SAP Fiori launchpad as an administrator user.
2. With the [Assign Recipients to Users](#) app, assign the corresponding recipients to a business user.
  - a. Select the user for which you want to perform the assignment.
  - b. Repeatedly choose [Assign](#) and successively enter the following recipients:

Namespace	Recipient
<a href="#">/SWFCP</a> (for workflow capability)	<a href="#">REC_PROC_BGRFC</a> (process bgRFC) REC_RAISE_EVT (Recipient for raise of event)
<a href="#">/SWFPV</a> (for process visibility capability)	<a href="#">EVENT_PUBL</a> (Process bgRFC)

Also choose the message types that the user is allowed to view.

For more information, see [Assigning Users to Recipients](#).

3. To view the results, open the [Message Dashboard](#) app.
4. To view the triggered messages, use the [Calendar Monitor](#) to select the date range and choose [Search](#).
5. Alternatively, view the results with the [Message Monitoring Overview](#) app.

The overview displays the interfaces and message types to which you're subscribed. To see more details, click a message type.

## Related Information

[Blog on Working with the Message Dashboard](#) 

## 6.3.2.3.14 Integrating Workflow

You can enable the communication between the ABAP environment and the workflow capability within the SAP Workflow Management service.

This scenario enables the ABAP environment applications to extend their business processes by using the workflow capability in the Cloud Foundry environment. It allows the provisioning of an API in the ABAP environment to start and control workflow instances running on workflow capability.

You set up the scenario using the following tasks:

1. [Create a Communication Arrangement Using a Service Key \[page 2674\]](#) (recommended)
2. [Create a Destination \[page 2675\]](#)
3. [Maintain Business Roles and Business Users \[page 2679\]](#)

### 6.3.2.3.14.1 Create a Communication Arrangement Using a Service Key

To connect the ABAP environment and the SAP BTP cockpit, you need a communication arrangement.

#### Procedure

1. Get the service key.
  - a. In the SAP BTP cockpit, navigate to your space. See [Navigate to Orgs and Spaces](#).
  - b. From the navigation pane, choose **Services** > **Service Instances** > .
  - c. Click the name of your workflow capability instance.
  - d. From the navigation pane, choose **Service Keys**.
  - e. Select one entry, and copy the service key.
2. Open the **Communication Arrangements** app in your ABAP environment.
3. Create a communication arrangement.
4. Choose scenario **SAP\_COM\_0542**.
5. Enter a name for the arrangement.
6. Select a communication user to use for inbound communication (from SAP Business Technology Platform to your ABAP environment).
7. Paste the service key into the corresponding field, and choose **Create**.

The password of the newly created user for the inbound communication is shown in an information message in the status bar. You need the user and password for the destination in the SAP Business Technology Platform.

## Results

You've created the communication arrangement, the communication system, and an inbound user. The communication arrangement is assigned to the DEFAULT consumer type. The consumer type is used to identify the communication arrangement. Therefore, you must only assign it to exactly one communication arrangement. You can assign one communication arrangement to multiple consumer types.

## Adjust the Consumer Type

### Procedure

1. Select the communication arrangement, and choose [Edit](#).
2. Set the consumer type to DEFAULT.

### 6.3.2.3.14.2 Create a Destination

In the SAP BTP cockpit, you need to create a destination to enable the communication to the ABAP environment.

### Procedure

1. In the SAP BTP cockpit, navigate to your subaccount. See [Navigate to Orgs and Spaces](#).
2. Choose [Connectivity](#) > [Destinations](#).
3. Choose [New Destination](#), and enter the following data:

Field	Value
Name	Enter the destination name. This name is also used in the SAP Web IDE as the destination name in the service task properties.
Type	Select <a href="#">HTTP</a> .
Description	Enter a description.

Field	Value
URL	<p>URL for the ABAP environment. The format is: <code>https://*****.ondemand.com/</code>.</p> <p>Set the destination URL to the authorization endpoint URL found in the service key that was created for the workflow capability when creating the communication arrangement. Access the communication arrangement and copy the root URL under <a href="#">Inbound Services &gt; Service URL/Service Interface</a>.</p>
Proxy Type	<i>Internet</i>
Authentication	Select <i>BasicAuthentication</i> .
User	Set the user to the client ID as specified for the inbound communication.
Password	Set the password to the secret.

4. Save your entries.

### 6.3.2.3.14.3 Set Scopes for the Service Instance Using the Command Line Interface

To set the necessary scopes of a service instance, you need to install a new service interface with all scopes needed or you update an already existing service interface.

#### Procedure

1. To update the workflow capability instance with the necessary scopes, save the following JSON file that specifies all necessary scopes:

```
{
  "authorities": [
    "WORKFLOW_INSTANCE_START",
    "WORKFLOW_DEFINITION_GET",
    "WORKFLOW_INSTANCE_GET",
    "WORKFLOW_INSTANCES_UPDATE",
    "WORKFLOW_INSTANCE_CANCEL",
    "WORKFLOW_INSTANCE_GET_ERROR_MESSAGES",
    "WORKFLOW_INSTANCE_GET_CONTEXT",
    "WORKFLOW_INSTANCE_GET_EXECUTION_LOGS",
    "MESSAGE_SEND",
    "TASK_GET"
  ]
}
```

To set these scopes, see *Update an existing service instance* in [Enable Technical Authentication](#).

2. Model the workflow as described in [Developing Applications with Workflow Capability](#).

## 6.3.2.3.14.4 Model Service Task to Complete the Workflow in the ABAP Environment

As the workflow capability doesn't support the enterprise messaging service, you must model an additional service task right before each end event for each workflow definition, that was started from the ABAP environment.

### Prerequisites

You have modeled a workflow. See [Modeling a Workflow](#).

### Context

This task triggers the completion in the ABAP environment tenant and must be called exactly once.

The screenshot displays the SAP Workflow Editor interface. On the left, a workflow diagram shows a sequence: StartEvent1 (a circle) → S/4 Completion Callback (a blue rounded rectangle) → EndEvent1 (a thick circle). The 'S/4 Completion Callback' task is selected, and its configuration is shown in the 'Service Task Properties' panel on the right. The panel has two tabs: 'GENERAL' and 'DETAILS'. The 'DETAILS' tab is active, showing the following configuration:

- Destination:** MY-DESTINATION
- Choose a Service from:** Others (dropdown menu)
- Path:** /sap/opu/odata/sap/SWF\_CPWF\_NOTIFICATION\_SRV/ProcessCompleted?wor
- HTTP Method:** POST (dropdown menu)
- Path to XSRF Token:** /sap/opu/odata/sap/SWF\_CPWF\_NOTIFICATION\_SRV/
- Request Variable:** (empty text field)

With this approach, cancellations on workflow instances directly from the workflow capability API aren't communicated to the ABAP environment tenant.

### Procedure

1. Open the workflow that you have modeled in the workflow editor.
2. Select the service task, and go to the *DETAILS* tab.

3. Enter the following data:

Field	Value
Destination	Enter the name of the destination you've created in Cloud Foundry.
Choose a Service from	<i>Others</i>
Path	<code>/sap/opu/odata/sap/SWF_CPWF_NOTIFICATION_SRV/ProcessCompleted?workflowInstanceId='\${info.workflowInstanceId}'</code>
HTTP Method	<i>POST</i>
Path to XSRF Token	<code>/sap/opu/odata/sap/SWF_CPWF_NOTIFICATION_SRV/</code>

### 6.3.2.3.14.5 AIF Monitoring

AIF (Application Interface Framework) enables you to monitor inbound and outbound messages in the ABAP environment and allows you to analyze communication issues.

#### Procedure

First, you need to assign business roles to a business user and then to assign recipients to this user.

#### Related Information

[Maintain Business Roles and Business Users \[page 2679\]](#)

[Monitor Messages for Workflow Capability Integration \[page 2679\]](#)

## 6.3.2.3.14.5.1 Maintain Business Roles and Business Users

As a preparation to monitor messages for background workflow processes, you create a business role and a business user.

### Procedure

1. Log on to the SAP Fiori launchpad as an administrator user.
2. With the [Maintain Business Roles](#) app, create and edit business roles and add business catalogs to the roles.
  - a. To grant access to the [Assign Recipients to Users](#) app, add the business catalog [Communication Management – Message Monitoring Configuration](#) (SAP\_CA\_BC\_COM\_CONF\_PC) to a business role.
  - b. To grant access to the [Message Dashboard](#) app, add the business catalog [Business Network Integration](#) (SAP\_CA\_BC\_COM\_ERR\_PC) to a business role.
3. With the [Maintain Business User](#) app, provide business users with access rights.

## 6.3.2.3.14.5.2 Monitor Messages for Workflow Capability Integration

You can monitor the background processes for workflow capability integration.

### Prerequisites

You have assigned business roles and business users.

### Context

With the [Message Dashboard](#) or [Message Monitoring Overview](#), you can monitor and administrate the SAP Business Workflow background processing. You can manually trigger or cancel monitored background tasks that have issues.

AIF messages are deleted after a retention time, which can be configured in AIF customizing. The default value for all workflow-relevant namespaces and interfaces is set to 7 days.

## Procedure

1. Log on to the SAP Fiori launchpad as an administrator user.
2. With the *Assign Recipients to Users* app, assign the corresponding interface to a business user.
  - a. In the *Namespace* field, enter the namespace **/SWFCEP** for the workflow capability integration.
  - b. Select the interfaces using the recipient names:
    - REC\_PROC\_BGRFC (Process bgRFC)
    - REC\_RAISE\_EVT (Recipient for raise of event)
  - c. Choose the message types the user is allowed to view:
    - Application Error or Technical Error
    - Info
    - Success
    - Warning
    - Application Error
    - Technical Error
    - None

For more information, see [Assigning Users to Recipients](#).

3. To view the results, open the *Message Dashboard* app.
4. To view the triggered messages, use the *Calendar Monitor* to select the date range and choose *Search*.
5. Alternatively, view the results with the *Message Monitoring Overview* app.

The overview displays the interfaces and message types to which you're subscribed. To see more details, click a message type.

## Related Information

[How to enable users to work with the message dashboard](#) 

### 6.3.3 Technical Operations

Learn more about what you can do to operate your ABAP environment.

As an administrator in the ABAP environment, you need metrics and alerts to monitor the availability and performance of your systems. You also need an indication whether your purchased service volume has been exhausted. Therefore, the following metrics and alerts are particularly relevant for the ABAP environment:

- Utilization metrics for computing, storage, and network resources
- Performance metrics
- Exceptional situations such as aborted jobs or runtime errors

In the ABAP environment, you have different tools available to support you with your tasks.

## Local Monitoring

For local monitoring of your ABAP environment, you can use the technical monitoring cockpit. In the technical monitoring cockpit, multiple monitoring screens help you identify and solve bottlenecks and performance issues by giving you an in-depth view on important technical data of the database and application server, such as CPU, memory, network, storage, performance, time spent, workload, and configuration. You can use the technical monitoring cockpit also for a profound analysis of the most important entities, such as work processes, tables, SQL traces, and SQL statements.

For more information, see [Technical Monitoring Cockpit \(Cloud Version\)](#).

## System Landscape Monitoring

For monitoring an entire system landscape, consider using a central monitoring and alerting infrastructure. If you use SAP Focused Run or SAP Cloud ALM for monitoring your system landscape, you can use the integrated health monitoring for the ABAP environment.

For more information, see [Central Health Monitoring Using SAP Focused Run and SAP Cloud ALM \[page 2712\]](#).

### 6.3.3.1 Common Tasks: Quick Reference

Learn how you can perform typical tasks during technical operations using the available tools in the ABAP environment.

#### Note

To be able to use the available local apps for technical monitoring, you need a business role based on the business role template `SAP_BR_ADMINISTRATOR` or `SAP_BR_DEVELOPER`.

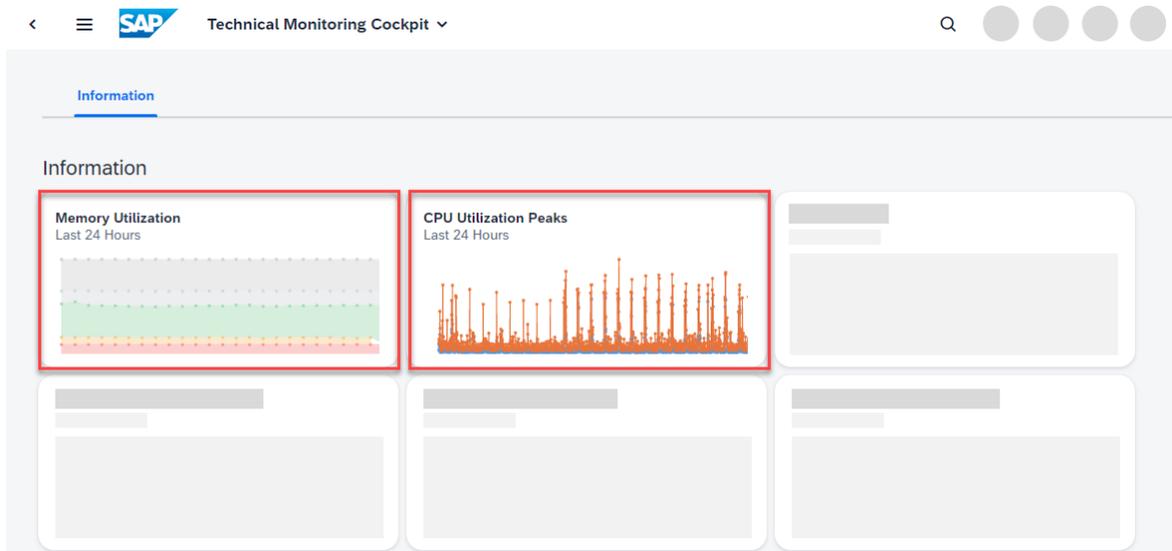

#### 6.3.3.1.1 Analyzing the SAP HANA Resource Utilization of the ABAP Environment

### Context

When you're planning, for example, system capacities or facing performance issues with hosted applications, you want to understand the resource utilization of your ABAP environment.

## Procedure

1. On the SAP Fiori launchpad of your ABAP environment, search for [Database System Overview](#).  
The technical monitoring cockpit opens.
2. To gain insights into the memory utilization of the SAP HANA database, choose the [Memory Utilization](#) tile.

As a rule of thumb, the sum of memory used for [Code and Stack](#), [Database Management](#), and [Data](#) should in average remain below 70% of the available memory - excluding temporary peaks. The memory used for only [Data](#) should remain below 50% of the available memory.

For more information about the [Memory Utilization](#) screen, see [Memory Utilization \(SAP HANA DB\)](#).

3. To gain further insights into the CPU consumption of SAP HANA, choose the [CPU Utilization Peaks](#) tile.

As a rule of thumb, the average CPU utilization should remain below 70% - excluding temporary peaks. Note that the 100% mark reflects the CPU capacity that is available on the entire SAP HANA host, which is shared with other SAP HANA service instances and therefore is not guaranteed. Depending on the volume of your subscribed SAP HANA capacity, the actual CPU quota might be lower than indicated in the technical monitoring cockpit.

For more information about the [CPU Utilization Peaks](#) screen, see [CPU Utilizations Peaks](#).

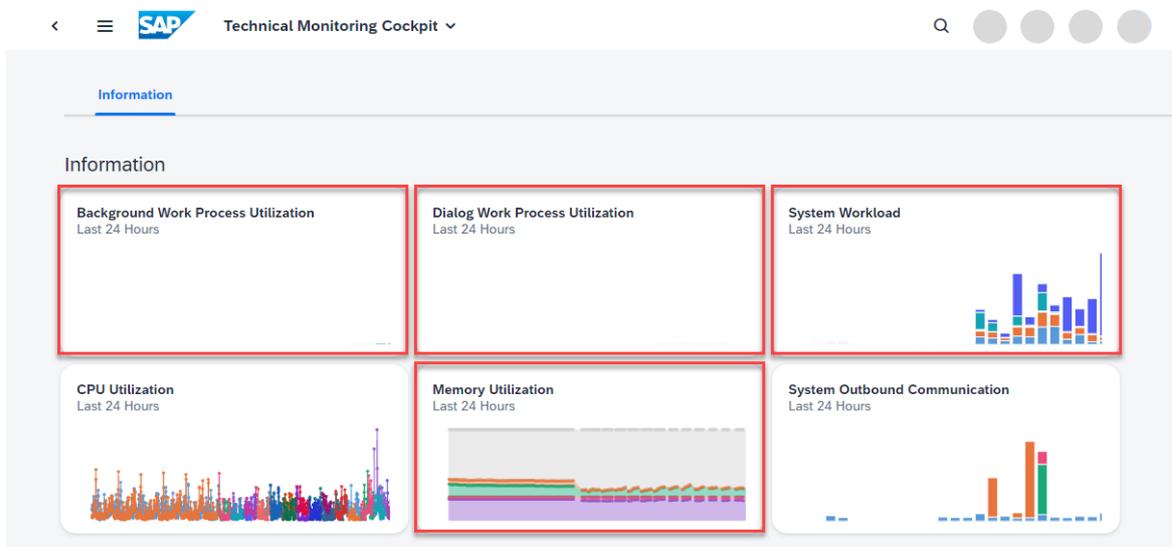

## 6.3.3.1.2 Analyzing the ABAP Resource Utilization of the ABAP Environment

### Context

When you're planning, for example, system capacities or facing performance issues with SAP or partner cloud services running on the ABAP environment, you want to understand the resource utilization of your ABAP environment.

### Procedure

1. On the SAP Fiori launchpad of your ABAP environment, search for *Application System Overview*.  
The technical monitoring cockpit opens.
2. To gain insights into the memory utilization of the ABAP application server, choose the *Memory Utilization* tile.

For more information about the *Memory Utilization* screen, see [Memory Utilization \(Application Server ABAP\)](#).

3. To gain further insights into the work process utilization of the ABAP application server, choose the *Batch Work Process Utilization* and the *Dialog Work Process Utilization* tiles.

A high load on the batch work processes isn't critical if it's only for a short duration. If the batch work process utilization is at 100%, jobs are started delayed.

For more information about the *Work Process Utilization* screen, see [Work Process Utilization](#).

4. To gain more insights into the application workload of the system, choose the *System Workload* tile from the application system dashboard.

Click on any peak in the chart to get the top 10 most contributing ABAP requests in the *System Workload: Details* section.

For more information about the *System Workload* screen, see [System Workload](#).

## 6.3.3.1.3 Analyzing the System Workload

You want to know more about the ABAP system workload.

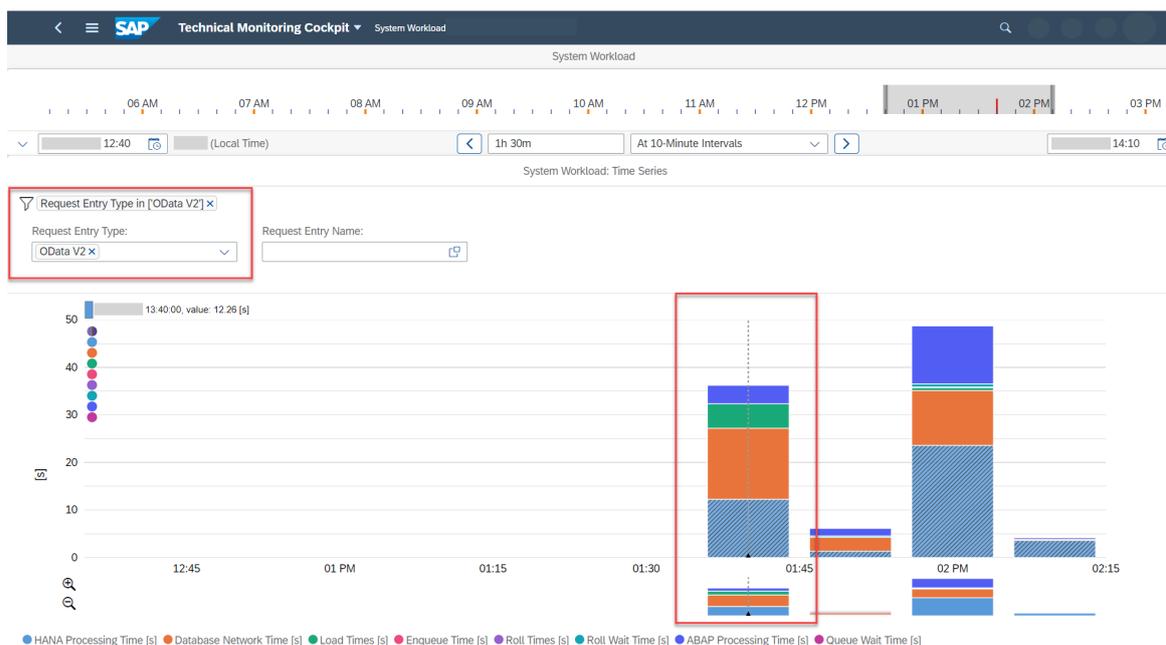

### Context

Using the *System Workload* screen, you benefit from a seamless connection between an overview of your system workload and single ABAP statistics records (main records and subrecords) down to SQL statements and their prepared plan. This gives you an excellent starting point for further performance analysis on SAP HANA level in the case of high database response times, which is true especially in the example below. Of course, you might also find records with a high ABAP CPU time where you don't need to further investigate the execution of SQL statements. In that case, a performance analysis on SAP HANA level would not be needed.

In the following example, let's analyze the usage of an application built according to the ABAP RESTful Application Programming Model (RAP). We're going to use the well-known demo application for flight booking, which is often used as a reference scenario in SAP contexts.

### Procedure

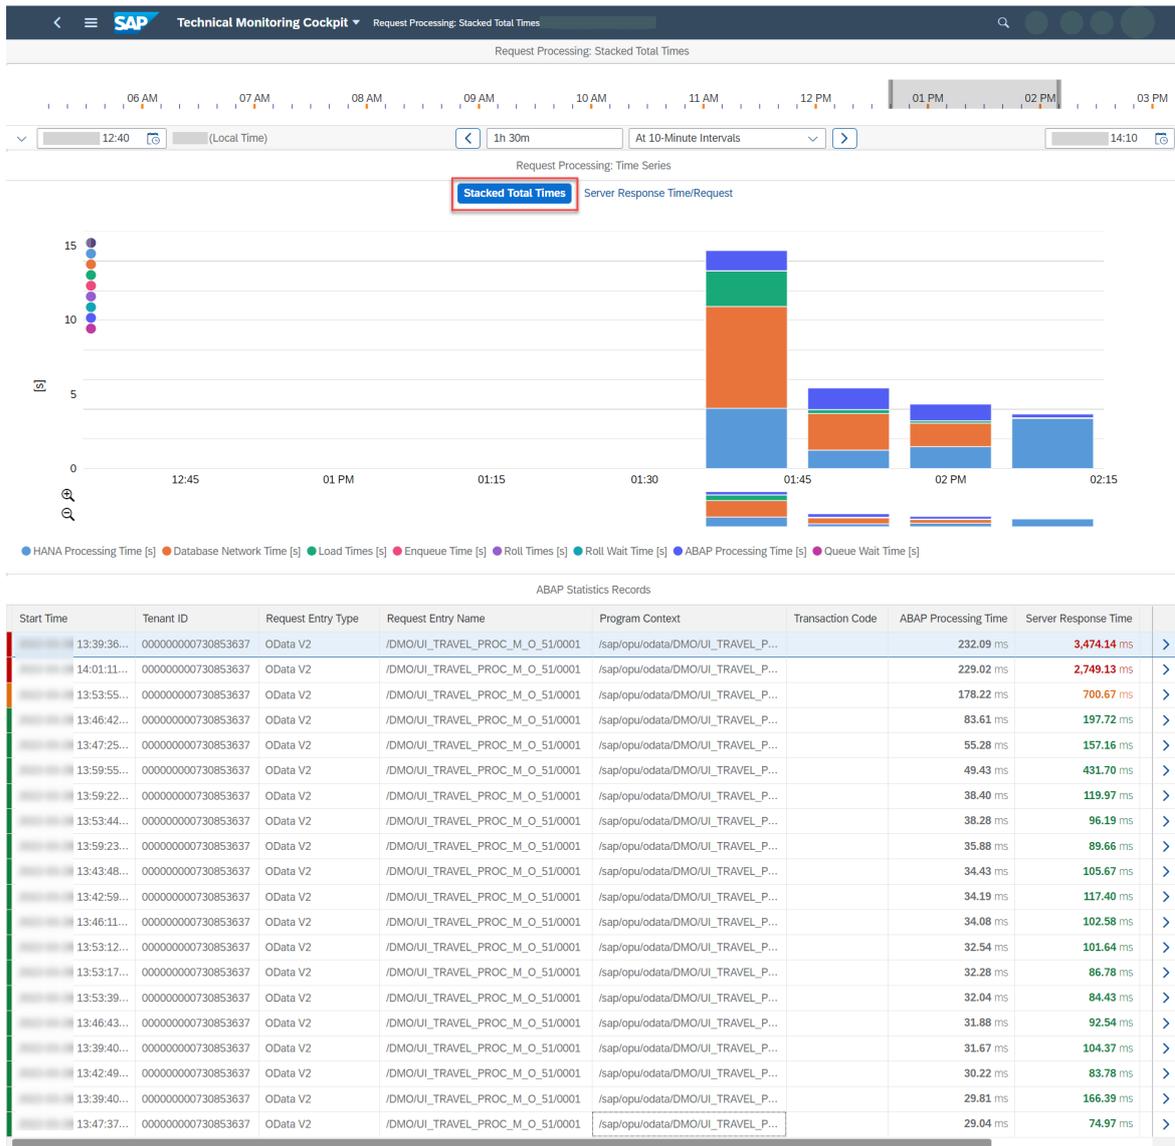

1. On the SAP Fiori launchpad of your ABAP environment, search for *System Workload*.  
The technical monitoring cockpit opens with the *System Workload* screen.
2. Let's assume you're interested in the behavior of the OData V2 services and set a filter on *Request Entry Type* for *OData V2*.
3. In the chart, click on the HANA processing time that seems high, for example, at 01:40 p.m.

The *System Workload: Details* section below the chart changes accordingly and now displays the top contributors to the HANA processing time at the time you clicked in the chart. The contributors are grouped by request entry type and request entry name.

System Workload: Details						
Request Entry Type	Request Entry Name	Program Context	Transaction Code	HANA Processing Time	Avg. Server Response Time	
OData V2	/DMO/UI_TRAVEL_PROC_M_O_51/0001	/sap/opu/odata/DMO/UI_TRAVEL_PROC_M_O_51/\$batch		4.07 s	0.65 s	>
OData V2	/DMO/UI_TRAVEL_PROC_M_O_51/0001	/sap/opu/odata/DMO/UI_TRAVEL_PROC_M_O_51/\$metadata		3.41 s	2.56 s	>
...	...	...	...	...	...	>
...	...	...	...	...	...	>
...	...	...	...	...	...	>
...	...	...	...	...	...	>
...	...	...	...	...	...	>
...	...	...	...	...	...	>
...	...	...	...	...	...	>
...	...	...	...	...	...	>
R				0.01 s	0.07 s	>
T				12.26 s	0.96 s	>

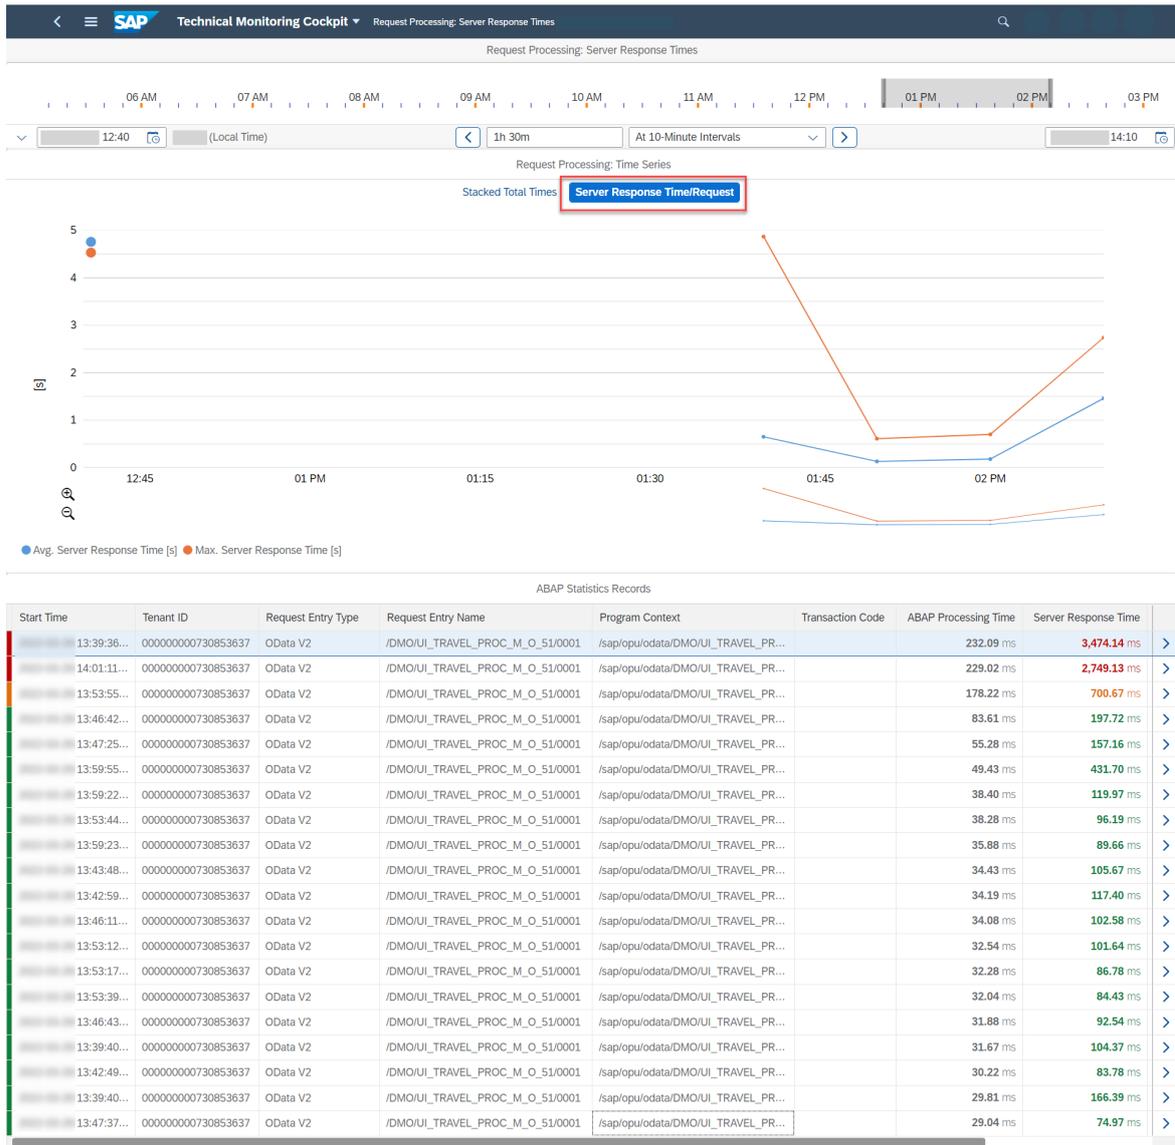

- To get more details, let's choose that first highlighted entry in the list. The subsequent *Request Processing* screen shows the behavior of this specific workload (the flight processing service) over time:

The chart shows the stacked total times of the metrics, and - depending on what you click in the chart - the table below shows the relevant detail view, that is, a list of a maximum of 20 single ABAP statistics records for this workload sorted by the metric you chose in the chart. This is very helpful for your further analysis: You're coming from a workload perspective and now get the single records the workload consists of.

The color coding of the single records is based on their deviation from the average server response times (top to bottom): Red for very high, orange for above normal, and green for normal server response times.

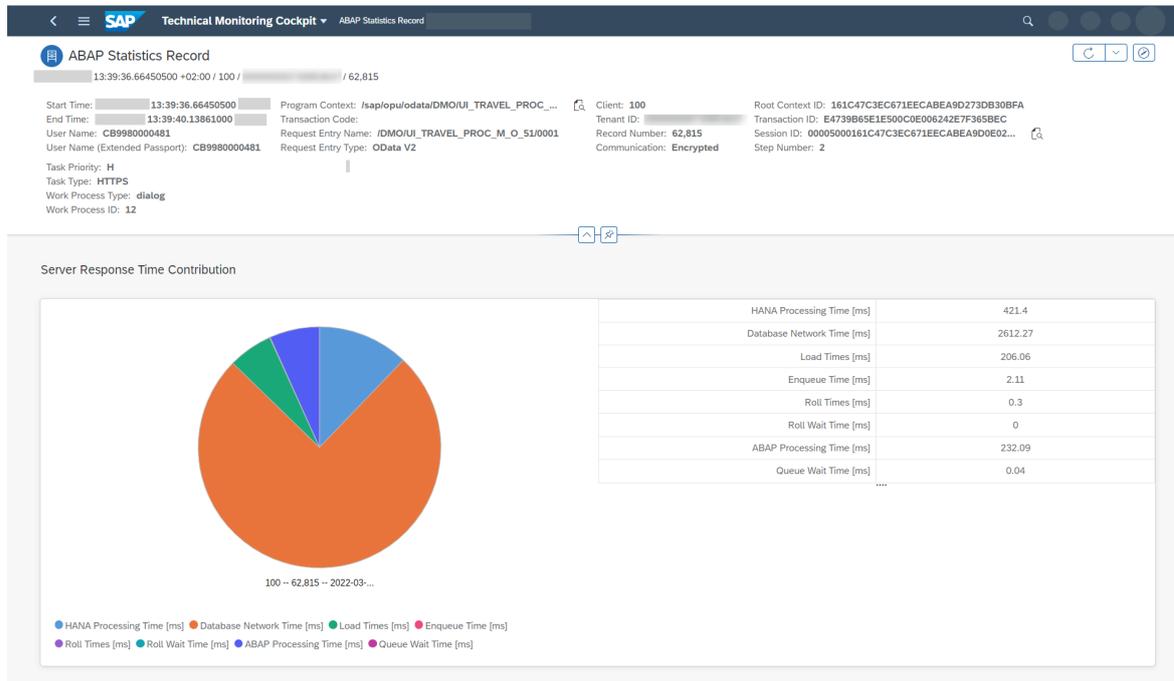

- Let's switch views by choosing the *Server Response Time/Request* button:

Like in the *Stacked Total Times* view, the color rating of the single records is based on their deviation from the average server response times. The average server response time per request is around one second here. However, there are some requests with higher times, so let's have a closer look at a "bad" request.

- In the table, choose the first red entry (the one with 3,474.14 ms).

On the following *ABAP Statistics Record* screen, you get more detailed information about this record. The pie chart for the server response time contributions clearly shows that the response time is dominated by the database network time:

What's also noticeable is the DEFAULT database connection that apparently fired 1,284 database requests:

Database Connections

Connection Name	DB Requests ...	Database Processing Time	HANA Processing Time	HANA CPU Time	HANA Maximum Memory
DEFAULT	1,284	2,969.87 ms	418.35 ms	393.61 ms	1,206.57 kB
	1	25.31 ms	0.00 ms	0.00 ms	0.00 kB
	7	29.48 ms	3.04 ms	1.72 ms	35.41 kB
	2	9.00 ms	0.00 ms	1.85 ms	17.37 kB

- Let's dig deeper: In the *Database Connections* section of the *ABAP Statistics Record* screen, choose the first entry (connection name DEFAULT) to get more information.

The *Database Connection Details* screen opens and shows that 1,284 logical database requests were fired to fetch almost 13,000 database rows, which explains the high network time: It was caused by the many database requests.

Technical Monitoring Cockpit Database Connection Details

Other	928.76 ms	0	0	0	0	0.00 ms

8. Another thing you may want to check in this example is the *SQL Statements* section on the *ABAP Statistics Record* screen: The table shows the top SQL statements contributing to the HANA processing time.

**Note**

The SQL statements are available in the single record by default. You do **not** need to activate any tracing explicitly.

Let's see if the access on CDS views is OK (in this case on the booking view). Place the cursor on the entry so that it's highlighted and simply choose *Analyze Statement* to resolve the SQL statement:

SQL Statements

Analyze Statement

Connection Name	Statement	Database Processing Time	HANA Processing Time	HANA CPU Time	HANA Max. Memory
DEFAULT	SELECT "LDATA" FROM "REPOLOAD" WHERE "PROGNAME" = ? AND "RSSTATE" = ? AND "MACH" = ? AND "MAJO...	1,298.39 ms	107.56 ms	68.99 ms	47.57 kB

Query Parameters

From the prepared plan, a HANA expert could now dig deeper and start analyzing the statement in detail.

# Results

With the drilldown options to all kinds of details that are all in one place in the technical monitoring cockpit, you're able to identify several possible reasons for the high HANA processing time and network time.

Are you interested in a "good" example of this kind of workload for comparison, with a server response time per request of under one second? The *ABAP Statistics Record* screen in such a case might look like this:

SAP Technical Monitoring Cockpit ▾ ABAP Statistics Record

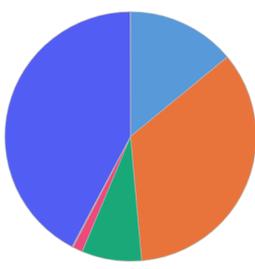

**ABAP Statistics Record** 🔍 📄 🔄

	2	9.79 ms	0.00 ms	1.73 ms	14.09 kB

Here, everything's fine: The server response time per request is only 0.197 seconds. The number of database requests is low, and therefore the database network time and processing times are low, too.

## Related Information

<https://blogs.sap.com/2023/04/24/analyzing-performance-degradations-in-the-abap-environment-in-the-cloud/>

### 6.3.3.1.4 Capturing ABAP Statistics Records to Analyze System Activities

Capture ABAP statistics records to find out which activities are running in your ABAP and database system.

#### ABAP Request Statistics

By default, in the ABAP environment, requests are recorded with technical information, such as response time, program name, or CPU time. The resulting individual ABAP statistics records are written to the file system of the relevant tenant. ABAP statistics records are well suited to investigating the performance or resource consumption of a system or of a tenant in more detail, or, if performance problems occur, to identifying the area causing the problems.

#### Use Cases

You typically use ABAP statistics records in the following scenarios:

- You want to investigate your system workload to find out about top consumers and investigate in detail the overall response time contributions or the database connections. In this case, you can use the ABAP statistics records that are captured by default and visualized in the *System Workload* app. For more information, see [Navigating from System Workload to Single ABAP Statistics Records](#).
- You want to analyze a specific workload, for example, the request statistics of an individual user or program name at a particular time. For more information, see [Capturing Request Statistics \[page 2693\]](#) and [Analyzing Captured Request Statistics \[page 2695\]](#).

## Related Information

[ABAP Statistics Records](#)

## 6.3.3.1.4.1 Capturing Request Statistics

With the *Capture Request Statistics* app, you can capture request statistics to find out which activities are running in your ABAP system.

### Context

With the activation of a capture profile, you can capture system activities. Requests are recorded with technical information, such as response time, program name, or CPU time. Using the request statistics, you can investigate the performance or the resource consumption of a system or of a tenant in more detail.

In the *Capture Request Statistics* app, you can also find predefined profiles for capturing expensive requests (with names starting with `SAP_`). These predefined capture profiles are active by default, and you can't edit or deactivate them.

You can view the captured data from all profiles in the technical monitoring cockpit on the *Captured Request Statistics* and *Request Processing* screens. You can get to the *Request Processing* screens by choosing *System Workload* from the menu. In addition, the captured ABAP statistics records are the basis for ABAP system sizing in the *Perform System Sizing* app.

### Procedure

1. On the SAP Fiori launchpad of your ABAP environment, search for the *Capture Request Statistics* app.  
The *Capture Request Statistics* app opens.
2. To create a new capture profile, choose *Create*.
3. Enter the following data:

Field	What to Enter
<i>Profile ID</i>	Enter a short, meaningful name for your profile. Don't use the prefix <code>SAP_</code> because this prefix is reserved for profiles predefined by SAP.
<i>Description</i>	If needed, you can enter a longer description of your profile.
<i>Start/End Time</i>	The start and end time specify when request statistics were captured by the app. These fields are automatically filled after you have activated the profile.
<i>Retention Time</i>	Select how long you want to keep the captured request statistics stored in the system.
<i>Record Limit per Minute</i>	Enter the maximum number of records that you want the system to capture per minute.

Field	What to Enter
	<p>The record limit prevents that too much database memory is consumed by captured request statistics. The maximum possible record limit per minute is 1,000.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;"> <p><b>Note</b></p> <p>To get a realistic idea of the workload, consider a relatively high record limit. However, you must keep in mind that you generate load on your system while request statistics are captured.</p> </div>
<i>Sampling Rate</i>	<p>Enter a sampling rate, which is the probability of capturing one single ABAP statistics record in percent.</p> <p>With the sampling rate, you ensure that a number of random records are selected during the capturing of request statistics.</p>
<i>Target User Group</i>	Choose one of the target groups starting with <i>Customer</i> .
<i>Profile Type</i>	This field is automatically populated by the system. Only static profile types (with fixed values) are possible.
<i>Profile Owner</i>	The profile owner is automatically set to <i>Customer</i> when you create a new profile. Predefined profiles have the profile owner <i>SAP</i> .
<i>Health Monitoring</i>	You can select the checkbox <i>Health Monitoring</i> for any capture profile that you create. As a result, the total number of captured ABAP statistics records for these profiles is shown in Health Monitoring of SAP Cloud ALM.

- Choose *Create*.

The profile has been created, but is still inactive and has no filter conditions yet.

- To define the filter conditions under which request statistics are captured, choose *Create*.
- With *Field ID*, *Operator*, *High*, and *Low*, you can select a filter condition that determines what kind of data is captured. For example, you might be interested in requests with a high ABAP CPU or network time. Alternatively, you can also select a program name to capture requests relating to that program, for example

#### Note

If you don't need to define a range (lower and upper limit), but only a single value, enter the value in the *Low* field.

For example, you can select *User ID* as field ID, *include equal to* as operator and your business user name to capture all request statistics relating to your business user.

- Choose *Create*.

A new filter condition has been created.

- To start capturing request statistics during the time period that's defined in the profile, choose *Activate*.

Make sure that you enter a start time that's right now or in the future. You can't activate profiles with a start time in the past.

## Results

Request statistics are captured and processed by a collector that runs every minute. Therefore, you must expect that captured request statistics are displayed with a delay of a minute in the *System Workload* or in the *Perform System Sizing* app. Capturing request statistics is finished when the status of relevant capture profile has changed to *Finished*.

### Note

If you have a long-running request, ABAP statistics records for this request will only show up in the technical monitoring cockpit after the request is done. The collector then captures the request and calculates its workload over its runtime.

## 6.3.3.1.4.2 Analyzing Captured Request Statistics

Get an overview of the request statistics that you have captured using the *Capture Request Statistics* app. View the server response time contribution or the database connections of a single request.

## Context

With the *Capture Request Statistics* app, you can define conditions for which request statistics are collected in the system (see [Capturing Request Statistics \[page 2693\]](#)). You can use the technical monitoring cockpit to view the results.

### Note

Before ABAP statistics records are shown in the technical monitoring cockpit, they are captured and processed by a collector that runs every minute, so you must expect that captured request statistics are displayed with a delay.

## Procedure

1. In the *Capture Request Statistics* app, choose a profile for which you want to analyze the captured data.
2. Choose *Analyze Captured Request Statistics*.

The *Captured Request Statistics* screen opens in the technical monitoring cockpit. The captured request statistics shown are filtered; only the results for the selected profile are shown.

3. Analyze the data for different aspects like identifying expensive requests and their context (program name, transaction code, or path of an HTTP request), so that you can find the area causing performance issues or resource shortages.

For more information, see [Captured Request Statistics](#).

### 6.3.3.1.5 Monitoring Expensive Outbound Communication

The [Capture Request Statistics](#) app and the technical monitoring cockpit, optionally in combination with SAP Cloud ALM, help you to identify service requests that cause expensive outbound communication (RFC, HTTP, and Web service calls).

#### Use Cases

You might want to find out what the requests with the most expensive system outbound communication are:

- Which communication arrangements have a long calling time?
- How is the calling time distributed among communication scenarios and how does it behave over time?
- Are there any outliers?

After you have found answers to these questions, you might want to dig deeper into the details of one particular communication arrangement.

Alternatively, you might already have a good idea which communication arrangements are associated with a longer calling time. For example, you notice that one of your customer applications does not run smoothly because the related system communication takes a long time.

In both cases, you want to find out the root cause for the long calling times. Therefore, you might want a heads-up when the long calling times occur. In addition, you also need to find the affected service requests and you want to collect their ABAP statistics records.

In these cases, a combined use of the technical monitoring cockpit, the [Capture Request Statistics](#) app and SAP Cloud ALM is beneficial.

#### Process Flow

1. If you want to get an overview of the system outbound communication first, use the technical monitoring cockpit to find expensive service requests and their related communication arrangements (see also [Monitoring System Outbound Communication in General \[page 2697\]](#)). In the technical monitoring cockpit, the top 10 communication scenarios by calling time are shown, which helps you identify obvious expensive outbound communication. If you have identified a particular communication arrangement, you can now get more detailed data. However, sometimes the issues during outbound communication occur too infrequently, so you might miss them with only an occasional check. It might also happen that critical service requests do not appear in the top 10 communication scenarios by calling time, or they do, but the related detailed statistics are not part

of the samples that are collected by default for the technical monitoring cockpit. Therefore, you now turn to the [Capture Request Statistics](#) app to collect more specific, user-defined data.

2. To collect ABAP statistics records relating to expensive outbound communication, for example, for a specific communication arrangement or for particularly long calling times, define a profile in the [Capture Request Statistics](#) app. Make sure that the [Health Monitoring](#) checkbox is selected in your profile (see [Capturing Request Statistics Relating to Expensive Outbound Communication \[page 2700\]](#)).
3. In Health Monitoring in SAP Cloud ALM, use the metric [Captured Request Statistics](#) to find out whether service requests exceed a defined threshold in their calling time (see [Getting Alerted About Expensive Outbound Communication Using SAP Cloud ALM \[page 2702\]](#) ). You can also use the settings in SAP Cloud ALM to get alerted with an e-mail notification.
4. After you have received a notification, use the [Captured Request Statistics](#) screen in the technical monitoring cockpit to analyze the captured request statistics for outbound communication (see [Analyzing Expensive Outbound Communication Using the Technical Monitoring Cockpit \[page 2704\]](#)).

### 6.3.3.1.5.1 Monitoring System Outbound Communication in General

Get an overview of the system outbound communication over time.

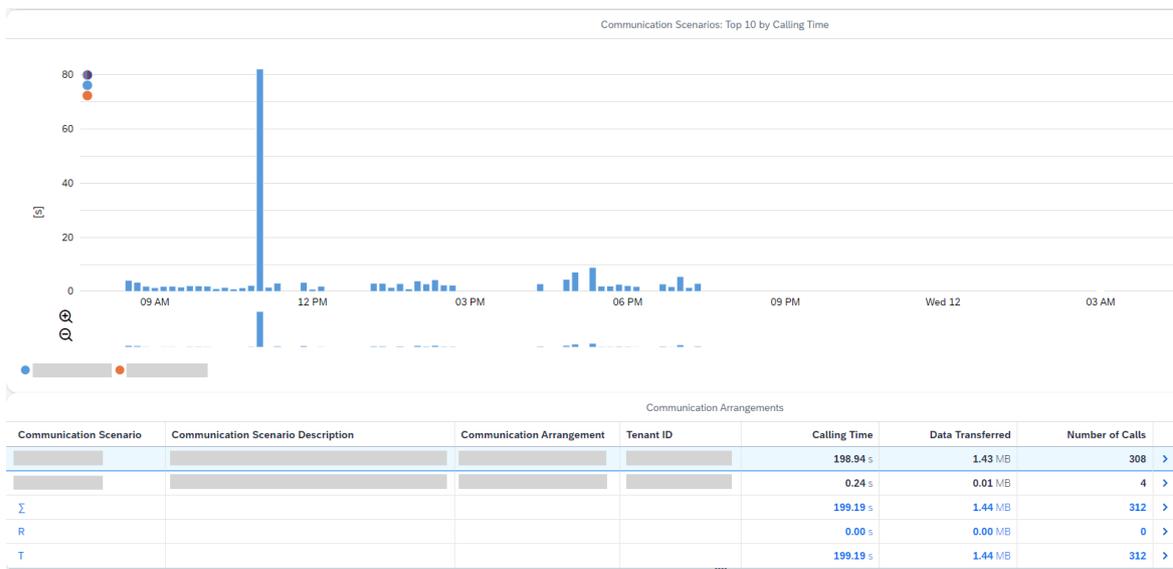

#### Context

In the technical monitoring cockpit, the top 10 communication scenarios by calling time are shown, which helps you identify obvious expensive outbound communication. The focus is on outbound communication of type RFC, HTTP, and Web service.

#### Procedure

1. On the SAP Fiori launchpad of your ABAP environment, search for [Application System Overview](#).  
The technical monitoring cockpit opens.
2. On the dashboard shown, choose the [System Outbound Communication](#) tile.

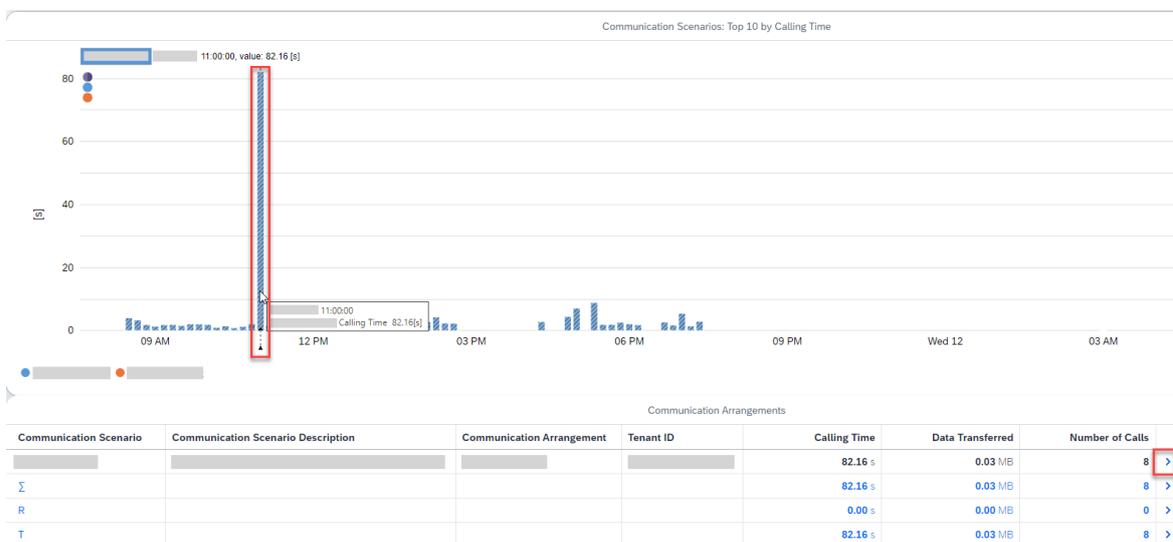

The top 10 communication scenarios by calling time are shown, including the related communication arrangements. In the chart, the development over time is shown. Only customer workload using customer communication arrangements is displayed; SAP workload and SAP communication arrangements are filtered out.

3. In the chart, you can also click on a communication scenario at a particular time.

As a result, the table of communication arrangements is updated with the single communication arrangements at this particular time.

In this rather quiet test system, workload is low, but one tenant communication scenario before 12 p.m. in the chart stands out with a long calling time.

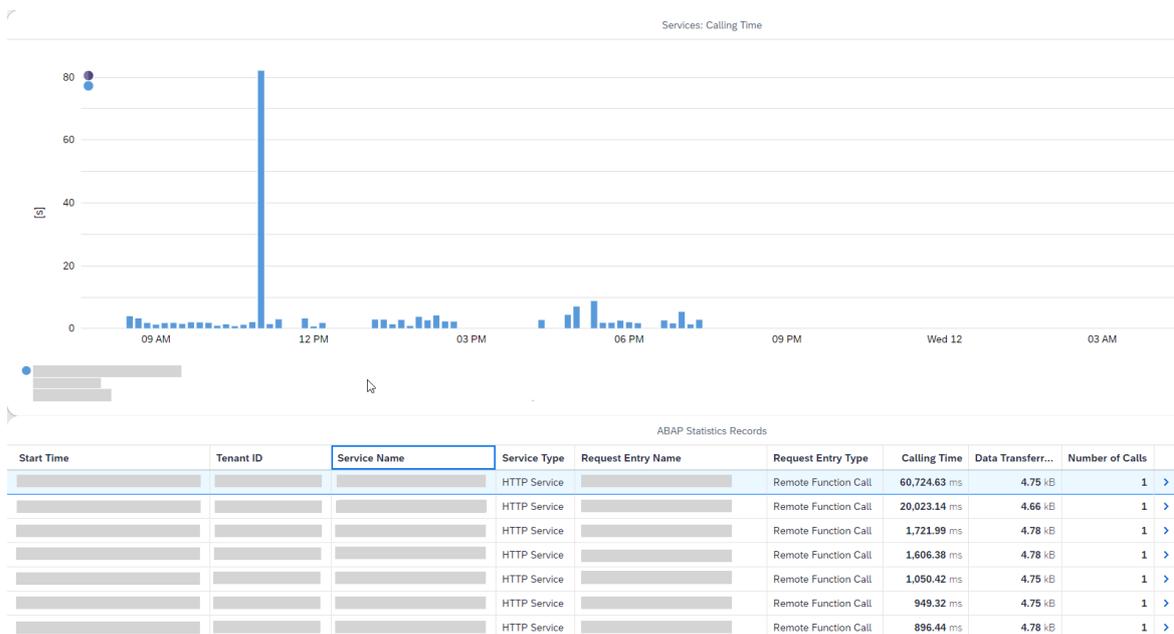

4. To analyze such a specific communication arrangement in more detail, choose its entry from the list of communication arrangements.

The *Communication Arrangement* screen opens, where the selected communication arrangement with its related outbound services is shown. The chart indicates how the outbound services perform over time. You can now check whether calling time is distributed evenly or whether there are any outliers.

In the list, you can find the single ABAP statistics records for the top outbound-calling services. The records include the calling time, the amount of transferred data and the number of calls.

Again, in the example shown here, there's an outlier among the services that merits further investigation.

5. To show more details of a single ABAP statistics record, choose it from the list.

As a result, you navigate to the *ABAP Statistics Record* screen, where more details, such as the server response time and multiple subrecords are shown.

6. To see the details of the HTTP subrecord, choose *HTTP*.

Here, you can find the single outbound HTTP client calls that were made during the service request.

7. To drill down to even more details, choose an entry from the table of HTTP client calls.

You now get the HTTP client call details, including its calling time, and also the related communication arrangement.

## Results

The *System Outbound Communication* screen and its related drill-down screens are configured by default in such a way that they provide sample records of expensive system outbound communication. If you want to get a full set of ABAP statistics records for a particular communication arrangement with a long calling time, use the *Capture Request Statistics* app. With this app, you can capture request statistics relating to defined expensive outbound communication arrangements.

## Related Information

[Capturing Request Statistics Relating to Expensive Outbound Communication \[page 2700\]](#)  
[System Outbound Communication](#)

## 6.3.3.1.5.2 Capturing Request Statistics Relating to Expensive Outbound Communication

Use the [Capture Request Statistics](#) app to collect statistics of service requests with an expensive outbound communication (RFC, HTTP, or Web service).

### Prerequisites

You need a system administrator role (based on `SAP_BR_ADMINISTRATOR`) to perform these tasks.

### Context

With the [Capture Request Statistics](#) app, you can capture single ABAP statistics records of dedicated workloads in your ABAP system (see also [Capturing Request Statistics \[page 2693\]](#)). You can also use this app for monitoring expensive outbound communication. For this purpose, you configure a capture profile to monitor the calling time of outbound calls of type HTTP, RFC, and Web service that exceed a defined threshold. In this procedure, you can capture records related to a high calling time. Alternatively, you might already have an idea which communication arrangements are related to expensive outbound communication, and you would like to find out the corresponding service requests.

With the checkbox [Health Monitoring](#) selected, you can also automatically export the number of captured ABAP statistics records of the profile to Health Monitoring in SAP Cloud ALM so that you get alerted when expensive outbound communication occurs.

### Procedure

1. On the SAP Fiori launchpad of your ABAP environment, search for the [Capture Request Statistics](#) app.
2. Choose [Create](#) and enter the basic header information for the profile.

If you want to export the number of capture request statistics to SAP Cloud ALM, select the [Health Monitoring](#) checkbox.

For more information about how to fill out the individual fields in the header, see the built-in SAP Companion documentation.

3. To define a filter for high outbound calling times, choose [Create](#) and enter the following data:

Option	Description
Field ID	Choose <a href="#">Calling Time [ms]</a> from the dropdown list.
Operator	Select <a href="#">Include greater than or equal to</a> .

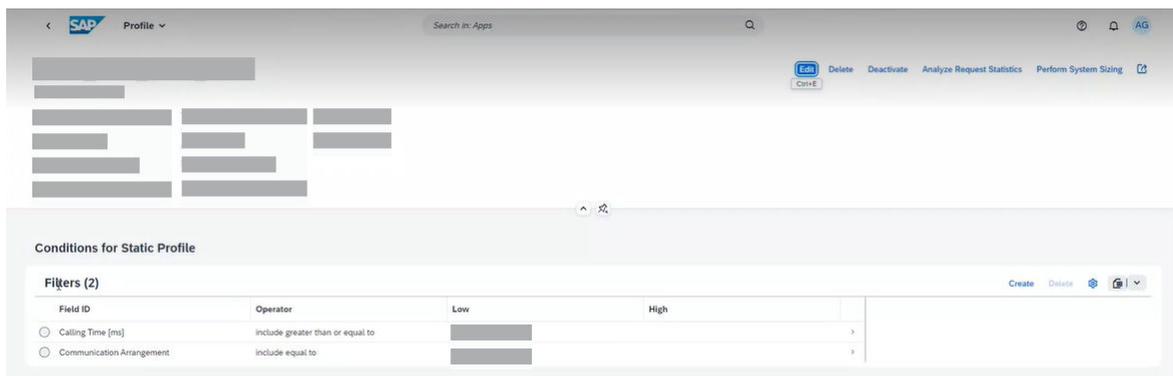

Option	Description
	<div style="border: 1px solid #ccc; padding: 10px; background-color: #f9f9f9;"> <p><b>Note</b></p> <p>When you enter a metric in the <i>Low</i> field, it doesn't matter which operator you choose here because it's always interpreted as threshold. The operator is therefore always interpreted as <i>Include greater than or equal to</i>.</p> </div>
<b>Low</b>	Enter a threshold for the calling time, for example, 1000. As a result, data for all service requests is captured whose calling time exceed 1,000 ms.
<b>High</b>	Leave this field empty.

- Choose [Create](#) to save the filter and go back to the header data.

If you don't want to filter for any specific communication arrangement, you can stop defining filters here and activate your capture profile. The app will then capture any service request that makes at least one outbound RFC, HTTP, or Web consumer call and whose **total** calling time for all calls of each type exceeds the defined threshold.

- To define a filter for a specific communication arrangement, choose [Create](#) and enter the following data:

Option	Description
<b>Field ID</b>	Select <i>Communication Arrangement</i> from the dropdown list.
<b>Operator</b>	Select <i>Include equal to</i> .
<b>Low</b>	From the dropdown list, select the communication arrangement that you want to monitor.
<b>High</b>	Leave this field empty.

- Choose [Create](#) to save the filter and go back to the header data.

Optionally, you can define more filters for additional communication arrangements.

If you have also defined filters for communication arrangements, the *Capture Request Statistics* app will then only consider the service requests for the communication arrangements in the filters. In addition, data for a request using one of these communication arrangements is only captured if the total of at least

one of the request's outbound RFC, HTTP, or Web consumer calls exceeds the defined threshold for the calling time.

7. Activate the capture profile.

### 6.3.3.1.5.3 Getting Alerted About Expensive Outbound Communication Using SAP Cloud ALM

If you use SAP Cloud ALM to monitor your applications in a Cloud system landscape, you can also use health metrics to get alerted about expensive outbound communication.

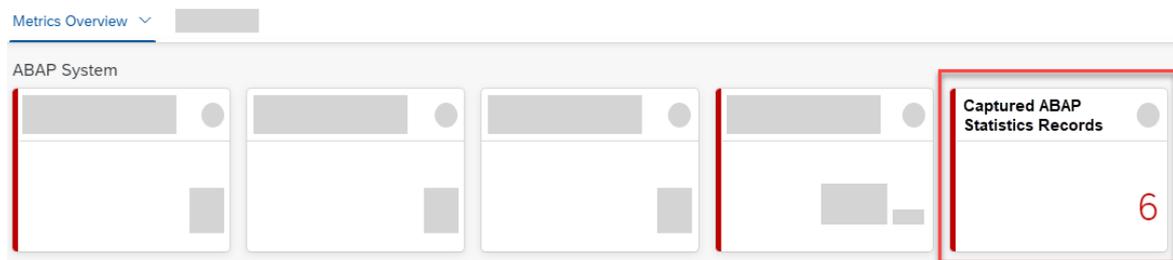

#### Prerequisites

You have SAP Cloud ALM set up (see [Central Health Monitoring Using SAP Focused Run and SAP Cloud ALM \[page 2712\]](#)).

You have captured request statistics relating to outbound communication using the *Capture Request Statistics* app, and you have selected the checkbox *Health Monitoring* in the relevant capture profiles (see [Capturing Request Statistics Relating to Expensive Outbound Communication \[page 2700\]](#)).

#### Procedure

1. Log on to SAP Cloud ALM and call up Health Monitoring.
2. On the Health Monitoring dashboard for your ABAP system, check the metric *Captured ABAP Statistics Records*.

The number of captured ABAP statistics records that is shown in SAP Cloud ALM is the total number of captured records for profiles with the checkbox *Health Monitoring* selected.

3. If the number of records is above zero, you have a clear indication that there was expensive outbound communication in the ABAP system during the last 5 minutes.
4. Choose the *Captured ABAP Statistics Records* tile and then *History*.

On the *History* popup, you can find out how many records were captured by the profile that you've chosen and how the number of records changed over time.

## Note

A high number of captured ABAP statistics records with a high calling time are an indication that the performance of outbound communication gets critical. Use the settings in SAP Cloud ALM if you want to get notified with an e-mail as soon as a critical number of ABAP statistics records have been captured.

## Results

You can now go to the technical monitoring cockpit to analyze the expensive outbound communication in more detail.

## Related Information

[Analyzing Expensive Outbound Communication Using the Technical Monitoring Cockpit \[page 2704\]](#)

## 6.3.3.1.5.4 Analyzing Expensive Outbound Communication Using the Technical Monitoring Cockpit

With the technical monitoring cockpit, you can analyze expensive outbound communication in detail.

### Prerequisites

You have set up a profile to capture request statistics relating to outbound communication using the *Capture Request Statistics* app (see [Capturing Request Statistics Relating to Expensive Outbound Communication \[page 2700\]](#)).

### Procedure

1. On the SAP Fiori launchpad of your ABAP environment, search for the *Capture Request Statistics* app.
2. From the list of capture profiles, choose the profile that you have defined to collect ABAP statistics records for expensive system outbound communication.
3. Choose the *Analyze Request Statistics* button.

The *Captured Request Statistics* screen in the technical monitoring cockpit opens. On this screen, you can find all workloads that were captured using your profile in the *Capture Request Statistics* app. You can now investigate in more detail which service requests were responsible for expensive outbound communication and what details their ABAP statistics records contain, such as the related outbound HTTP, RFC, or Web service calls.

## 6.3.3.1.6 Analyzing the Performance of SQL Statements Running on Your ABAP Environment

Learn how you can use SQL statement and trace analysis in the ABAP environment.

Data retrieval and modification via SQL statements is the main business of the SAP HANA database in your ABAP Environment. When you develop new applications, or when you operate applications productively, you want to analyze the performance of the SQL statements executed by your applications on the database.

When you analyze statement performance, you typically have one of the following scenarios:

- You are only interested in the performance of SQL statements of your application regardless of other SQL activity on your database.

For this, you can use the SQL trace analysis in the technical monitoring cockpit to display and analyze SQL traces you have run with your ABAP Development Tools.

- You want to see the performance of SQL statements alongside the rest of the SQL activity on your database. The right starting point for this is the SQL statement analysis of the technical monitoring cockpit.

For each of the scenarios, we show you how to proceed here.

## 6.3.3.1.6.1 Analyzing SQL Statements of Your Application

### Context

#### 📘 Note

The following procedure is for developers. If you have the role of an administrator, see [Tracing SQL Activities for Administrators \[page 2709\]](#).

During developing and operating applications on your ABAP environment, these situations are typical when you take an SQL trace of your ABAP application and turn to the SQL trace analysis:

- You want to analyze the performance of the SQL statements of your ABAP application in the sequence as they run.
- When analyzing the performance of an ABAP application, you want to clarify whether the SQL activity of the application is a relevant contribution to the processing time.

If you're familiar with on-premise products from SAP and know the SAP GUI transaction ST05 (performance trace), you'll be happy to see that the SQL trace functions described in the following procedure are similar to what you know from the SQL trace in transaction ST05.

### Procedure

1. Take an SQL trace of your ABAP application using ABAP development tools (ADT):
  - a. Right-click on your ABAP project on the project explorer and choose [SQL Trace](#) from the context menu.
  - b. Activate the trace.
  - c. Run the ABAP application that you want to trace.
  - d. Deactivate the trace again and choose [View Trace Directory](#).

This opens the [SQL Trace Analysis](#) screen of the technical monitoring cockpit.

Time Stamp	Client	Owner	Instance Name	Expiry Date	Description
14:04:46 +02:00	000		,33	0000-00-00	
14:04:46 +02:00	000		,34	0000-00-00	
14:04:46 +02:00	000		,33	0000-00-00	

2. On the *Trace Directory* tab page of the SQL trace analysis, choose the new trace you just took.

The default view shows you all SQL traces taken by your ABAP user in the last 24 hours.

The UI philosophy of the *SQL Trace Analysis* screen is: With each move to a tab page to the right, you get more information about what you've selected on the previous tab pages to the left.

3. Choose the trace that you want to look at and change to the *Trace Records* tab page.
4. On the *Trace Records* tab page, single out expensive or otherwise interesting SQL statements.

By default, you see all trace records in chronological order. However, you can apply filter conditions, for example, on the SQL statement text, or sort the entries by duration to put the longer running statements to the top of the list. Note that you can display additional columns that aren't shown by default by choosing *Characteristics* or *Metrics*.

To go further into detail from here, you have three options on the following three tab pages to the right (*SQL Statement*, *Prepared Plan*, *Executed Plan*), which are mostly independent of each other. You can, for example, jump from here directly to the calculation of an executed access plan for your statement.

5. Choose the *SQL Statement* tab page to get a decent view of your selected SQL statement, pretty-printed and with syntax highlighting.

The *Application Source Position* field shows you the ABAP code location (if available) where the SQL statement originates from. You can choose one of the *Show ABAP Source in ...* buttons to display the ABAP source in the web browser or in ABAP Development Tools.

6. Choose the *Prepared Plan* tab page to display and analyze a newly calculated prepared access plan for your SQL statement.
7. Choose the *Executed Plan* tab page to display and analyze a newly calculated executed access plan for your SQL statement.

You can also download the PlanViz (PLV) file of the executed access plan containing the comprehensive plan information to display it with other HANA plan visualizing tools like HANA SQL Analyzer.

## 6.3.3.1.6.2 Analyzing SQL Statements in the Context of What Else Is Going On on the Database

### Context

When developing and operating applications on your ABAP environment, you turn to the SQL statement analysis typically in the following situations:

- You want to see the performance of one SQL statement of your application alongside the rest of the SQL activity on your database for a given time period.
- You're planning to identify the expensive SQL statements in your system to find candidates that merit the effort of performance tuning.

In the second situation, your starting point isn't a particular SQL statement but you have a look at the whole set of statements running on the database. The most important metric to look at is the share of total execution time. However, you might also like to look for a large lock-wait time, if locking is an issue (for example, for data changing statements). Choosing specific time ranges can help to highlight SQL statements that are expensive when they run but don't run often. They can also show a large average execution time while the total execution time on a larger time scale isn't that prominent in the top 25.

Once you've identified expensive SQL statements, which you would like to analyze in more detail to find potential for performance improvement. In any case, you also end up with analyzing single statements in the end.

### Procedure

1. On the SAP Fiori launchpad of your ABAP environment, search for [SQL Statement Analysis](#).

The technical monitoring cockpit opens with the [SQL Statement Analysis](#) screen.

2. Use the sorting and filtering functions of the technical monitoring cockpit to get what you want:

If the statement you want to analyze isn't among the 25 most expensive statements in the last 24 hours, use sorting, filtering, or the time slider to find it. For example, you can change the time period, set filters on the statement string, or sort by another metric to highlight other aspects of SQL statement execution. On the [Plan Cache](#) tab page, you can also display more SAP HANA plan cache characteristics and metrics than shown by default by choosing [Characteristics](#) or [Metrics](#) and following the selection dialog.

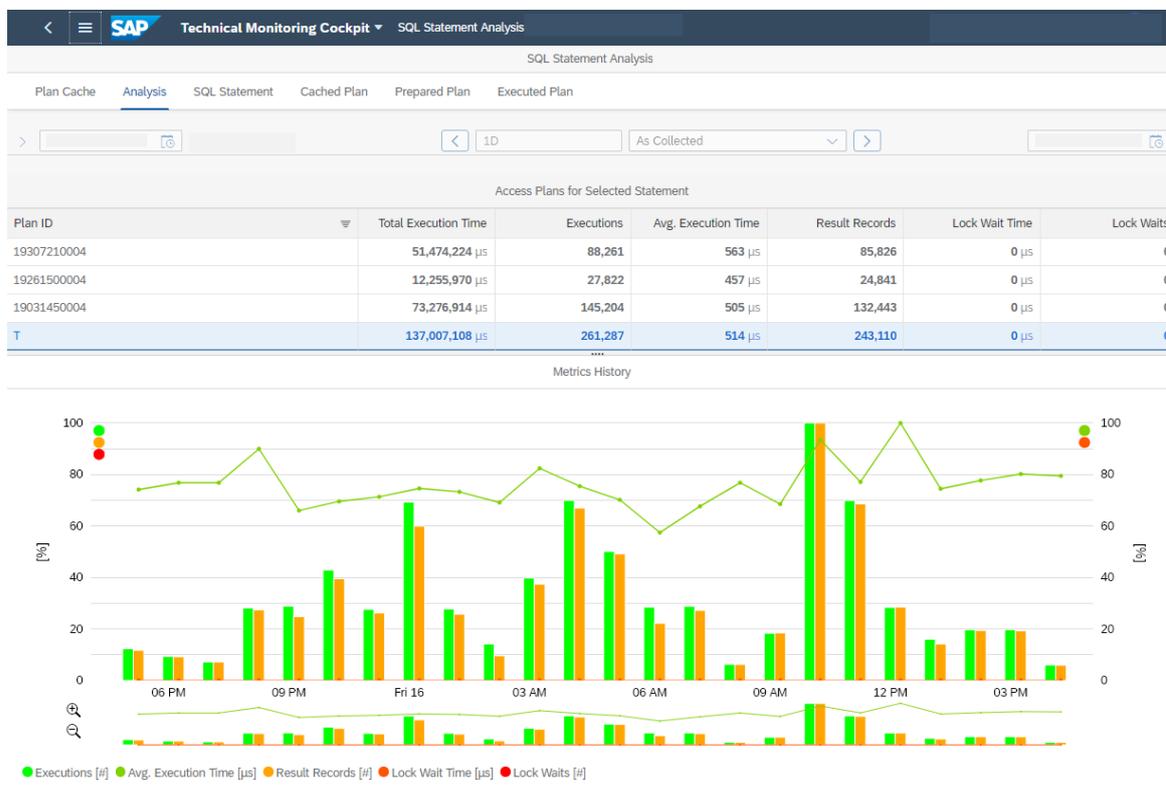

Once you've found your statement in the list, you can put the performance of your statement into perspective. Compare it to other statements appearing in the list, but also against the accumulated performance of all the rest of the statements matching your filter criteria. The accumulated performance of all statements not matching your filter criteria is subsumed in the bottom row, labeled with the statement string *R*.

3. Choose the statement that you are interested in.

As a result, all subsequent tabs to the right of [Plan Cache](#) now contain detailed information on the statement that you have selected.

- Choose the *Analysis* tab page to see how your statement's execution performance has developed over time.

On the screen area *Access Plans for Selected Statement*, you can see whether your statement has entered the HANA plan cache with different plan IDs in the selected time range. The bottom row, labeled with plan ID *T*, shows you the metrics totals, that is, the aggregated values.

Seeing more than one plan ID often only means that the access plan of a statement was evicted from the plan cache at some point and reentered it later. However, it can sometimes also indicate a change of the access plan of your statement with implications for its performance. As you get the same performance metrics as on the *Plan Cache* tab page separately for each plan ID, you can check whether the average execution time has significantly changed with plan ID. If this is the case, you may be on to something.

On the *Metrics History* screen area, you can see the time dependence of the major performance metrics in relative units. You get the absolute value of a metric by hovering over a datapoint.

When you choose a particular plan ID in the upper screen area, you'll see the performance metrics of the execution of your chosen SQL statement with this plan ID only. When you choose the totals row (plan ID *T*), the overall performance metrics of the statement are shown, regardless of the plan ID.

If you want to go further into detail from here, you can use the tabs *SQL Statement*, *Cached Plan*, *Prepared Plan*, and *Executed Plan*, which are mostly independent of each other. You can, for example, jump from here directly to the calculation of an executed access plan for your statement. However, we follow here the order of the tabs in the program.

- Choose the *SQL Statement* tab page to get a decent view of your selected SQL statement, pretty-printed and with syntax highlighting.

The *Application Sources* dropdown list shows you the list of ABAP code locations (if available) where the SQL statement originated from in the selected time range. Choose an ABAP location from the list and

choose one of the [Show ABAP Source in ...](#) buttons to display the ABAP source in the web browser or ABAP Development Tools.

You can also edit the SQL statement and recalculate the prepared or executed access plan. In this way, you can try out if changes to the statement or adding optimizer hints have a positive or negative impact on the access plan. You can iterate this procedure. Note though that the information on the tab page [Analysis](#) corresponds to the SQL statement that you selected originally on the [Plan Cache](#) tab page. There is no cached access plan for your edited statement on the [Cached Plan](#) tab page, obviously. Once you've edited the SQL statement, you can get back to the original statement by using the undo function (CTRL+Z) of your browser while having focused on the statement display area. Alternatively, you can go back to the [Plan Cache](#) tab page and choose the relevant SQL statement there.

Note that the SQL statement analysis doesn't support SQL query parameters.

6. Choose the [Cached Plan](#) tab page to display and analyze the prepared plan that has been calculated when your SQL statement entered the HANA plan cache with the selected Plan ID from tab page [Analysis](#).
7. Choose the [Prepared Plan](#) tab page to display and analyze a newly calculated prepared access plan for your SQL statement.
8. Choose the [Executed Plan](#) tab page to display and analyze a newly calculated executed access plan for your SQL statement.

You can also download the PlanViz (PLV) file of the executed access plan containing the comprehensive plan information to display it with other SAP HANA plan visualizing tools like HANA SQL Analyzer.

### 6.3.3.1.7 Tracing SQL Activities for Administrators

With the [Capture Request Statistics](#) app, you can activate and capture SQL traces for a later analysis.

#### Context

The [Capture Request Statistics](#) app allows you to trace the SQL activity of your ABAP environment from the SAP Fiori Launchpad if you're in the role of an administrator (business role template `SAP_BR_ADMINISTRATOR`).

To run an SQL trace, you create a profile of type [SQL Trace](#) and activate it (the app does not offer predefined SQL trace profiles). All SQL activities of your ABAP environment that fulfill the filter conditions defined in the profile are then recorded until you deactivate the profile. You can view the trace results on the [SQL Trace Analysis](#) screen in the technical monitoring cockpit.

#### Procedure

1. On the SAP Fiori launchpad of your ABAP environment, search for the [Capture Request Statistics](#) app and open it.

On the first page of the app, you'll find a list of existing profiles. The relevant profiles for your use case are capture profiles of type [SQL Trace](#).

- To create a new capture profile, choose [Create](#).
- Enter the following data in the header section that opens:

Field	What to Enter
<a href="#">Profile ID</a>	Enter a short, meaningful name for your profile. Don't use the prefix <code>SAP_</code> because this prefix is reserved for profiles predefined by SAP.
<a href="#">Description</a>	If needed, you can enter a longer description of your profile.
<a href="#">Target User Group</a>	Choose one of the target groups starting with <a href="#">Customer</a> .
<b>Profile Type</b>	Choose <a href="#">SQL Trace</a> .

#### Note

You can only define user filters on users that match the target user group of the profile.

- To confirm your input, choose [Create](#).

Now the profile is created, but is still inactive and has no filter conditions yet apart from a filter on your own user name, which you can keep or remove according to your preferences.

- To define filter conditions under which SQL statements are captured by the profile, choose [Create](#) in the [Conditions for SQL Trace](#) section.
- In the dialogue that opens, choose a [Field ID](#) from the dropdown list, such as [CDS View or Table](#), [Program Name](#), or [User Name](#). Also choose an [Operator](#) (for example, [include equal to](#)), and in the [Low](#) field, enter your specific filter value.

#### Note

You can set almost all conditions only with the [include equal to](#) operator. Only for the field [CDS View or Table](#) can you choose between [include](#) and [exclude equal to](#).

There's a limit for the number of operators:

For [CDS View or Table](#), you can enter up to **five** [include equal to](#) and up to five [exclude equal to](#) conditions. Such a combination results in a hit if one of the [include](#) and one of the [exclude equal to](#) conditions match. It's possible to use a wildcard (\*).

For [Program Name](#), [RFC Function Name](#), and [Transaction Name](#), you cannot set multiple conditions, but only one per profile.

- Choose [Create](#).

A new filter condition has been created. If you want to set more filter conditions for the profile, repeat steps 5 to 7.

- To finally start the SQL trace, choose [Activate](#).

The following popup tells you whether another user is currently running an SQL trace in the system. If so, you cannot start a new one because it's only possible to run one trace at a time. The running trace must first be stopped before you can start a new one.

### Note

You cannot stop a running trace if it was started on a different tenant. You can only stop running traces of users of your own user group.

9. To stop SQL tracing, choose [Deactivate](#).

10. To view and analyze the captured SQL statements for your profile, choose [View Trace Directory](#).

This leads you to the [SQL Trace Analysis](#) in the technical monitoring cockpit. If you activate an SQL trace profile that you've previously run, you'll trigger a new trace run, which is then available again on the [SQL Trace Analysis](#) screen as a new set of trace records.

## 6.3.3.2 Monitoring the System Health

With health monitoring metrics, you can check the health of your ABAP system from an application and customer perspective.

Metrics are collected on a regular basis and give you an idea of the system health with a special focus on performance, events, configuration, and the quota used by the ABAP system.

For the ABAP environment, you can choose between central monitoring tools such as SAP Cloud ALM or SAP Focused Run and an SAP Fiori app for local health monitoring:

	SAP Cloud ALM or SAP Focused Run	SAP Fiori App
<b>Use cases</b>	Monitoring multiple systems in a customer system landscape	Monitoring the local ABAP system
<b>Prerequisites and constraints</b>	SAP Cloud ALM or SAP Focused Run available	Local monitoring of only the system where the user is logged on
<b>Benefits</b>	<ul style="list-style-type: none"><li>• Display of health metrics for multiple systems</li><li>• Alerts and notifications</li></ul>	Overview of metrics on one single screen

In addition to metrics provided by SAP, you can also define your own metrics for health monitoring using ABAP Development Tools. You can make these metrics automatically available in SAP Cloud ALM or SAP Focused Run.

## Related Information

[Central Health Monitoring Using SAP Focused Run and SAP Cloud ALM \[page 2712\]](#)

[Local Health Monitoring \[page 2719\]](#)

[Health Monitoring Using Your Own Metrics \[page 2724\]](#)

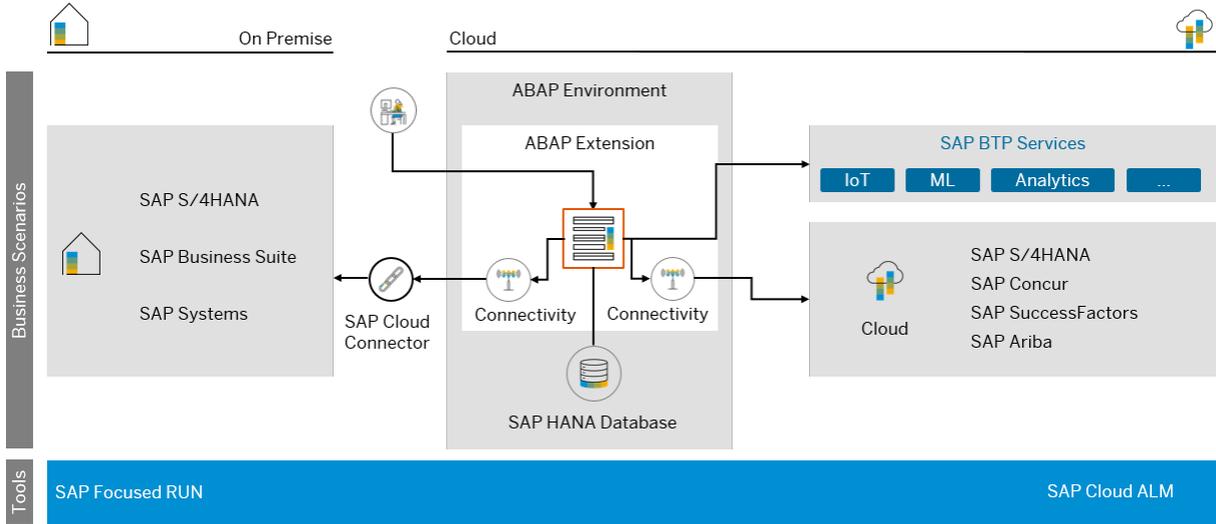

### 6.3.3.2.1 Central Health Monitoring Using SAP Focused Run and SAP Cloud ALM

Learn more about how you can monitor the ABAP environment using SAP Focused Run and SAP Cloud ALM.

#### Context

If you run SAP BTP, ABAP environment, as part of a hybrid landscape with on-premise and cloud systems, you might already have a central monitoring and alerting infrastructure in place. For example, the service offering SAP Focused Run is designed specifically for businesses that need high-volume system and application monitoring, alerting, and analytics, especially for hybrid landscapes including on-premise SAP solutions.

In addition, for cloud-centric customers, there's SAP Cloud ALM as an application lifecycle management offering.

If you use SAP Focused Run or SAP Cloud ALM as monitoring and alerting infrastructure, you can integrate monitoring of the ABAP environment into your existing infrastructure. Using the health monitoring in SAP Focused Run or SAP Cloud ALM, you can watch whether your ABAP environment is still up and running and whether any exceptional situations occurred. In addition, you can use the real-user monitoring to monitor requests coming from business users and integration monitoring to watch the communication between integrated systems.

## Available Metrics for the ABAP Environment

In the health monitoring of SAP Focused Run and SAP Cloud ALM, the following metrics for application checks are available for the ABAP environment:

Metrics for the ABAP Environment in Health Monitoring (Application Check)

Area	Metric Label	Technical Metric Name	Description
ABAP System	ABAP Runtime Errors	abap_core_dump_count_5m	The number of ABAP runtime errors during the last 5 minutes
ABAP System	Current Unique Users	abap_system_users_count	The number of current unique users in the ABAP system
ABAP System	Locked Business Users	abap_system_locked_bus_usr_count	The number of currently locked business users
ABAP System	Locked Communication Users	abap_system_locked_com_usr_count	The number of currently locked communication users
ABAP System	Current Sessions	abap_system_sessions_count	The number of current sessions in the ABAP system
ABAP System	Captured ABAP Statistics Records	abap_system_ksr_captured_count_5m	The number of ABAP statistics records that were captured by the <a href="#">Capture Request Statistics</a> app during the last 5 minutes

In the [Capture Request Statistics](#) app, you can select the checkbox [Health Monitoring](#) for any capture profile that you create. The number of records that is shown in SAP Cloud ALM is the total number of captured ABAP statistics records during the last 5 minutes for profiles with the checkbox [Health Monitoring](#) selected.

For more information about one use case of this metric, see [Monitoring Expensive Outbound Communication \[page 2696\]](#).

Area	Metric Label	Technical Metric Name	Description
ABAP System	ABAP Compute Units	abap_acu_used_count_5m (type: memory)	<p>Used quota for ABAP system memory during the last 5 minutes</p> <p>A quota represents the available system size and therefore the maximum allowed consumption of a resource. A resource is measured against the quota independently. For ABAP system resources, the quota is measured in ABAP compute units (ACUs).</p>
ABAP System	ABAP Compute Units	abap_acu_used_count_5m (type: cpu)	<p>Used quota for ABAP CPU utilization during the last 5 minutes</p> <p>A quota represents the available system size and therefore the maximum allowed consumption of a resource. A resource is measured against the quota independently. For ABAP system resources, the quota is measured in ABAP compute units (ACUs).</p>
ABAP System	ABAP Compute Units	abap_acu_used_count_5m (type: allocation)	<p>Resources (CPU and memory) that were allocated to your ABAP system during the last five minutes</p> <p>For ABAP system resources, the allocation is measured in ABAP compute units (ACUs). In a static service plan, the allocation corresponds to the quota limit of the service plan. In an elastic service plan, the allocation of resources is handled in an adaptive way.</p>

Area	Metric Label	Technical Metric Name	Description
ABAP System	Expiry of Client Certificates	abap_system_client_cert_expiry_d	<p>Expiry of client certificates in days</p> <p>With this metric, you can monitor whether any client certificates expire that you have uploaded to the ABAP system for the communication with systems or services outside the ABAP system, for example, BTP services. Make sure that your client certificates are valid, so that communication doesn't break off.</p> <p>If the client certificate expires within 7 days, it's marked red. If it expires within 30 days, it's marked yellow.</p>
ABAP System	Expiry of Communication System Certificates	abap_system_comsys_cert_expiry_d	<p>Expiry of communication system certificates in days</p> <p>With this metric, you can monitor whether any communication system certificates uploaded to the ABAP system expire for the communication with systems or services outside the ABAP system. Make sure that your communication system certificates are valid, so that communication doesn't break off.</p> <p>If the communication system certificate expires within 7 days, it's marked red. If it expires within 30 days, it's marked yellow.</p>

Area	Metric Label	Technical Metric Name	Description
ABAP System	Expiry of Trust List Certificates	abap_sys- tem_trusts_cert_expiry_d	<p>Expiry of trust list certificates in days</p> <p>With this metric, you can monitor certificates from communication partners that you have added to the certificate trust list in your ABAP system. The metric shows whether any of these trusted certificates expire for the communication with systems or services outside the ABAP system. Make sure that your trusted certificates are valid, so that communication doesn't break off.</p> <p>If the trusted certificate expires within 7 days, it's marked red. If it expires within 30 days, it's marked yellow.</p>
ABAP System	Critical Number Range Intervals	abap_system_nr_critical_in- terval_pct	<p>Fill ratio of number range intervals</p> <p>Only critical number range intervals are shown. When you create a number range interval, you can define the critical remaining fill ratio when a warning is generated.</p> <p>If a critical number range was reported and is extended, it's reported once again with its now uncritical, good fill ratio to report the fixed state. After that, this number range is dropped from reported number range intervals because it's not critical anymore.</p>
ABAP System	E-Mail Transmissions (Last Day)	abap_system_email_er- ror_count_1d	The total number of e-mails and the number of e-mails with errors during the last day

Area	Metric Label	Technical Metric Name	Description
ABAP System	E-Mail Transmissions (Last 5 Minutes)	abap_system_email_error_count_5m	The total number of e-mails and the number of e-mails with errors during the last 5 minutes
HANA	HANA Out-of-Memory Events	hana_db_oom_event_count_5m	The number of out-of-memory events on the SAP HANA index server during the last 5 minutes
HANA	HANA Compute Units (CPU)	hana_hcu_used_count_5m (type: cpu)	Used quota for CPU utilization during the last 5 minutes  A quota represents the available system size and therefore the maximum allowed consumption of a resource. Each resource is measured against the quota independently. For SAP HANA database resources, the quota is measured in HANA compute units (HCUs).
HANA	HANA Compute Units (Disk)	hana_hcu_used_count_5m (type: disk)	Used quota for disk space consumption during the last 5 minutes  A quota represents the available system size and therefore the maximum allowed consumption of a resource. Each resource is measured against the quota independently. For SAP HANA database resources, the quota is measured in HANA compute units (HCUs).

Area	Metric Label	Technical Metric Name	Description
HANA	HANA Compute Units (Memory)	hana_hcu_used_count_5m (type: memory)	<p>Used quota for memory utilization during the last 5 minutes</p> <p>A quota represents the available system size and therefore the maximum allowed consumption of a resource. Each resource is measured against the quota independently. For SAP HANA database resources, the quota is measured in HANA compute units (HCUs).</p>
Application Jobs	Average Application Job Delay	abap_system_appl_jobs_avg_delay_s_5m	Average application job delay in seconds during the last 5 minutes
Application Jobs	Maximum Application Job Delay	abap_system_appl_jobs_max_delay_s_5m	Maximum application job delay in seconds during the last 5 minutes
Application Jobs	Delayed Application Jobs	abap_system_appl_jobs_delayed_count_5m	<p>The number of delayed application jobs during the last 5 minutes.</p> <p>An application job is counted as delayed when its delay exceeds a certain threshold. The default configuration uses a threshold of 60 seconds.</p>
Application Jobs	Failed Application Jobs	abap_system_appl_jobs_failed_count_5m	The number of failed application jobs during the last 5 minutes
Application Jobs	Running Application Jobs	abap_system_appl_jobs_running_count	The number of currently running application jobs
Application Jobs	Finished Application Jobs	abap_system_appl_jobs_success_count_5m	The number of successfully finished application jobs during the last 5 minutes
Application Jobs	Application Logs	abap_system_appl_logs_count	The total number of application logs
Application Jobs	Application Logs with Errors	abap_system_appl_logs_errors_count_5m	The number of application logs with errors during the last 5 minutes

## Setup of ABAP Environment Monitoring with SAP Cloud ALM

For more information about setting up ABAP environment monitoring with SAP Cloud ALM, see the tutorial [Monitor An SAP BTP ABAP Environment Service Using SAP Cloud ALM](#) and the documentation [Setup for SAP BTP ABAP Environment](#).

### More Information

[SAP Focused Run on SAP Support Portal](#)

[Health Monitoring in SAP Focused Run](#)

[SAP Cloud ALM on SAP Support Portal](#)

[Health Monitoring in SAP Cloud ALM](#)

[Monitoring the Health of the ABAP System in the Cloud](#) (blog post on SAP Community)

### 6.3.3.2.2 Local Health Monitoring

With the *Health Monitoring* app, you can check the health of your local ABAP system.

#### Context

This app allows you to monitor your system health **locally** directly on your ABAP system.

You get an overview of the metrics for the monitored system on one overview page. The health metrics are represented on individual cards with a KPI that summarizes the current status and with a history of the metrics to, for example, compare trends, identify performance bottlenecks, or investigate resource shortages.

The *Health Monitoring* app offers the following features:

- The time filter settings apply globally to all cards on the screen, that is, to all KPIs and charts.
- All charts are displayed on one screen and you can easily compare metrics over time.
- Multiple characteristics are visible in one chart if applicable.
- From some cards, you can navigate to related apps for further analysis or issue fixing. For more information, see the in-app help for the individual cards.

#### Note

If you want to monitor the health of multiple systems **centrally**, you can use SAP Cloud ALM. For more information, see [Central Health Monitoring Using SAP Focused Run and SAP Cloud ALM \[page 2712\]](#).

## Available Metrics for the ABAP Environment

In the *Health Monitoring* app, the following metrics for application checks are available for the ABAP environment:

Metrics for the ABAP Environment in Health Monitoring

Metric Card	Technical Metric Name	Description
<i>ABAP Compute Units</i>	abap_acu_used_count_5m	<p>Used quota for ABAP system resources and resources that were allocated during the last 5 minutes</p> <p>A quota represents the available system size and therefore the maximum allowed consumption of a resource. Each resource (memory or CPU) is measured against the quota independently. For ABAP system resources, the quota is measured in ABAP compute units (ACUs).</p> <p>The allocation of ABAP system resources (memory and CPU) is also measured in ABAP compute units (ACUs). In a static service plan, the allocation corresponds to the quota limit of the service plan. In an elastic service plan, the allocation of resources is handled in an adaptive way.</p> <p>The number of ACUs on this card refers to the resource (memory or CPU) with the highest quota usage.</p>
<i>ABAP Runtime Errors</i>	abap_core_dump_count_5m	The number of ABAP runtime errors during the last 5 minutes

Metric Card	Technical Metric Name	Description
<a href="#">Application Jobs</a>	<ul style="list-style-type: none"> <li>Delayed application jobs: abap_system_appl_jobs_delayed_count_5m</li> <li>Failed application jobs: abap_system_appl_jobs_failed_count_5m</li> <li>Running application jobs: abap_system_appl_jobs_running_count</li> <li>Successful application jobs: abap_system_appl_jobs_successful_count_5m</li> </ul>	<p>The number of application jobs, which includes the following:</p> <ul style="list-style-type: none"> <li>The number of delayed application jobs during the last 5 minutes. An application job is counted as delayed when its delay exceeds a certain threshold. The default configuration uses a threshold of 60 seconds.</li> <li>The number of failed application jobs during the last 5 minutes</li> <li>The number of currently running application jobs</li> <li>The number of successfully finished application jobs during the last 5 minutes</li> </ul> <p>The KPI on this card refers to the number of recently failed application jobs. You can compare this value with the successfully finished application jobs to get an overview of your overall application job health.</p>
<a href="#">Application Logs</a>	abap_system_appl_logs_count	The total number of application logs
<a href="#">Application Logs with Errors</a>	abap_system_appl_logs_errors_count_5m	The number of application logs with errors during the last 5 minutes
<a href="#">Average Application Job Delay</a>	abap_system_appl_jobs_avg_delay_s_5m	Average application job delay in seconds during the last 5 minutes
<a href="#">Captured ABAP Statistics Records</a>	abap_system_ksr_captured_count_5m	<p>The number of ABAP statistics records that were captured by the <a href="#">Capture Request Statistics</a> app during the last 5 minutes</p> <p>In the <a href="#">Capture Request Statistics</a> app, you can select the checkbox <a href="#">Health Monitoring</a> for any capture profile that you create. The KPI on this card is the total number of captured ABAP statistics records during the last 5 minutes for profiles with the checkbox <a href="#">Health Monitoring</a> selected.</p> <p>For more information about one use case of this metric, see <a href="#">Monitoring Expensive Outbound Communication [page 2696]</a>.</p>

Metric Card	Technical Metric Name	Description
<i>Critical Number Range Intervals</i>	abap_system_nr_critical_interval_pct	<p>Fill ratio of number range intervals</p> <p>Only critical number range intervals are shown. When you create a number range interval, you can define the critical remaining fill ratio when a warning is generated.</p> <p>If a critical number range was reported and is extended, it's reported once again with its now uncritical, good fill ratio to report the fixed state. After that, this number range is dropped from reported number range intervals because it's not critical anymore.</p>
<i>Current Unique Users</i>	<ul style="list-style-type: none"> <li>• Sessions: abap_system_sessions_count</li> <li>• Users: abap_system_users_count</li> </ul>	The number of current unique users and sessions in the ABAP system
<i>E-Mail Transmissions (Last Day)</i>	abap_system_email_error_count_1d	The total number of e-mails and the number of e-mails with errors during the last day
<i>E-Mail Transmissions (Last 5 Minutes)</i>	abap_system_email_error_count_5m	The total number of e-mails and the number of e-mails with errors during the last 5 minutes
<i>Expiry of Client Certificates</i>	abap_system_client_cert_expiry_d	<p>Expiry of client certificates in days</p> <p>With this metric, you can monitor whether any client certificates expire that you have uploaded to the ABAP system for the communication with systems or services outside the ABAP system, for example, BTP services. Make sure that your client certificates are valid, so that communication doesn't break off.</p> <p>If the client certificate expires within 7 days, it's marked red. If it expires within 30 days, it's marked yellow.</p>

Metric Card	Technical Metric Name	Description
<i>Expiry of Communication System Certificates</i>	abap_system_comsys_cert_expiry_d	<p>Expiry of communication system certificates in days</p> <p>With this metric, you can monitor whether any communication system certificates uploaded to the ABAP system expire for the communication with systems or services outside the ABAP system. Make sure that your communication system certificates are valid, so that communication doesn't break off.</p> <p>If the communication system certificate expires within 7 days, it's marked red. If it expires within 30 days, it's marked yellow.</p>
<i>Expiry of Trust List Certificates</i>	abap_system_trusts_cert_expiry_d	<p>Expiry of trust list certificates in days</p> <p>With this metric, you can monitor certificates from communication partners that you have added to the certificate trust list in your ABAP system. The metric shows whether any of these trusted certificates expire for the communication with systems or services outside the ABAP system. Make sure that your trusted certificates are valid, so that communication doesn't break off.</p> <p>If the trusted certificate expires within 7 days, it's marked red. If it expires within 30 days, it's marked yellow.</p>
<i>HANA Compute Units (CPU)</i>	hana_hcu_used_count_5m	<p>Used quota for SAP HANA database resources during the last 5 minutes</p> <p>A quota represents the available system size and therefore the maximum allowed consumption of a resource. Each resource (memory, disk or CPU) is measured against the quota independently. For SAP HANA database resources, the quota is measured in HANA compute units (HCUs).</p> <p>The number of HCUs on this card refers to the resource (memory, disk or CPU) with the highest quota usage.</p>

Metric Card	Technical Metric Name	Description
<i>HANA Out-of-Memory Events</i>	hana_db_oom_event_count_5m	The number of out-of-memory events on the SAP HANA index server during the last 5 minutes
<i>Locked Business Users</i>	abap_system_locked_bus_usr_count	The number of locked business users
<i>Locked Communication Users</i>	abap_system_locked_com_usr_count	The number of locked communication users
<i>Maximum Application Job Delay</i>	abap_system_appl_jobs_max_delay_s_5m	Maximum application job delay in seconds during the last 5 minutes
<i>Table Change Deltas (Last Day)</i>	abap_system_bc_dbtablog_delta_count_1d	Table changes during the last day per database table for database tables with more than 10,000 changes
<i>Table Changes (Last Month)</i>	abap_system_bc_dbtablog_count_1m	Total table changes per database table for database tables with more than 50,000 changes

### 6.3.3.2.3 Health Monitoring Using Your Own Metrics

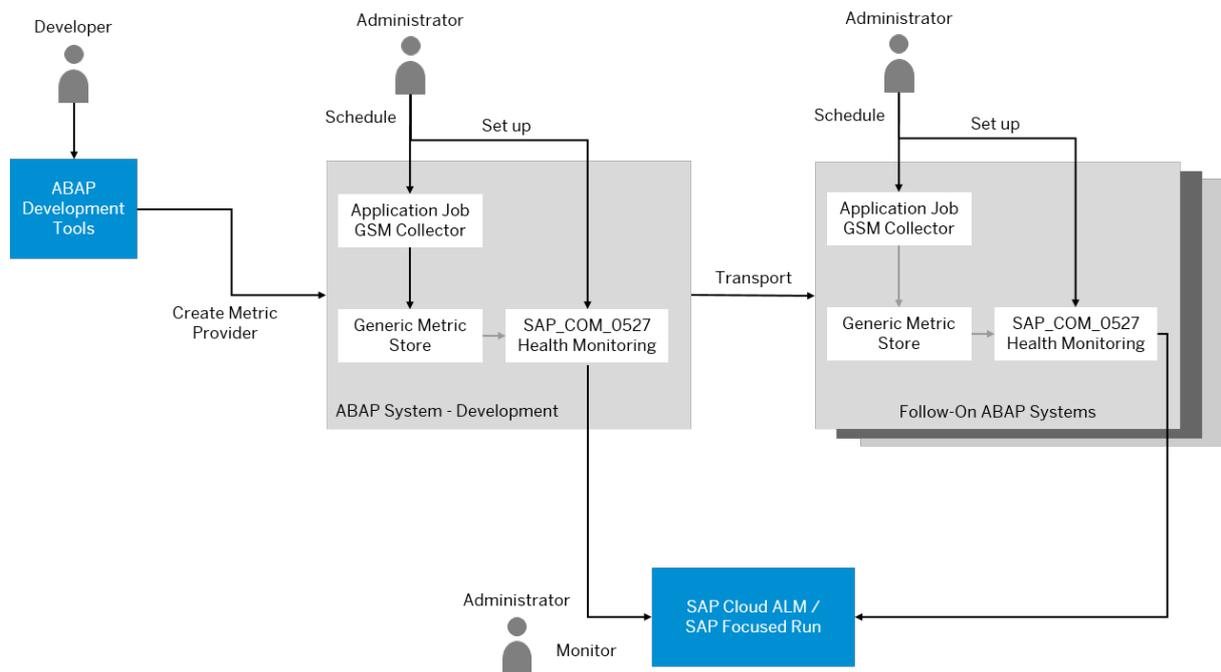

In addition to using the metrics for health monitoring provided by SAP, you can define your own application-specific metrics for the health monitoring of your customer and partner solutions running on the ABAP environment. The new metrics can be consumed by Health Monitoring in SAP Cloud ALM.

#### Background and Use Case

As a customer or partner, you can use SAP Cloud ALM or SAP Focused Run to monitor the health of your systems. As part of the health monitoring in SAP Cloud ALM and SAP Focused Run, you get metrics defined by SAP that support you to watch technical issues such as the number of ABAP runtime errors, failed application jobs, or locked business users, for example, in the ABAP environment.

For your own customer or partner solutions running on the ABAP environment, you might want to define your own application-specific metrics to be able to monitor the health of these solutions. As a partner, you might also want to provide additional health monitoring metrics for your partner solution to your customers.

## Architecture Overview

To define, set up, and use your own metrics, you proceed as follows:

1. Using ABAP Development Tools (ADT), a developer at your customer or partner company defines the relevant metrics for your solution.
2. As an administrator, you schedule an application job using the *Schedule Metric Provider Collection* app. The application job collects the metrics that you have defined and stores the values in the generic metric store.

### Note

Make sure that you schedule this job for the development system and all follow-up systems.

3. As an administrator, you define a communication arrangement based on the communication scenario *SAP\_COM\_0527 (Health Monitoring)* in your ABAP system. As a result, a technical background job pushes the measured metrics automatically to SAP Cloud ALM or SAP Focused Run.

## Related Information

[Central Health Monitoring Using SAP Focused Run and SAP Cloud ALM \[page 2712\]](#)

[Developing Metrics for Health Monitoring \[page 1087\]](#)

### 6.3.3.3 Displaying and Analyzing ABAP Runtime Errors

With the [ABAP Runtime Errors](#) app, you can display and analyze the ABAP runtime errors that have occurred in your current tenant.

#### Displaying ABAP Runtime Errors

When you open the app, you get a list of all ABAP runtime errors that have occurred in your current tenant and that have written a short dump.

You can search this list for certain dates and times, users, runtime errors, exceptions, and programs. In addition, you can filter the content of the list by using the corresponding filters.

#### Analyzing ABAP Runtime Errors

To analyze an ABAP runtime error, click on a row in the list. This takes you to detailed information about this runtime error:

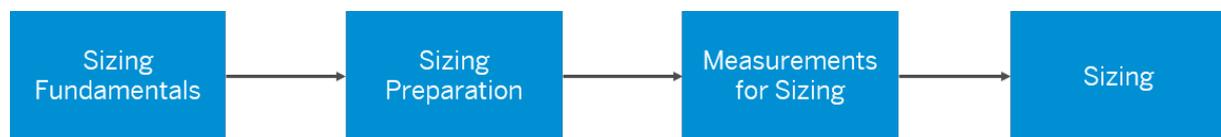

- The [General](#) section shows a description of what happened, an analysis of the error and information on where the program terminated.
- The [Source Code Extract](#) section shows an extract of the ABAP source code where the error occurred. You can work in the source code now and return to the source code position where the error occurred at any time by choosing [Go to Line with Runtime Error](#). You can now choose whether you want to go to the ABAP code in the ABAP development tools for Eclipse (ADT) to debug or change the development object or whether you want to display the code read-only in HTML.
- The [Active Calls/Events](#) section lists all events with information on where the events occurred. From here, you can also navigate to the ABAP code in the ABAP development tools for Eclipse (ADT) or display it in HTML.

## 6.3.3.4 ABAP System Sizing

This documentation describes the principles of how to perform system sizing for a custom application operated in the ABAP environment.

### About this Documentation

This documentation introduces you to the following:

- [Sizing Fundamentals \[page 2728\]](#)
- [Sizing Preparation \[page 2732\]](#)
- [Measurements for Sizing \[page 2735\]](#)
- [Sizing \[page 2739\]](#)

#### 1. Sizing fundamentals

You learn more about sizing occasions and methods, especially about expert sizing and how sizing works for scalable applications in the ABAP environment.

#### 2. Sizing preparation

Important preparatory steps are to identify the business processes that are relevant for sizing and to define test cases for them.

#### 3. Measurements for sizing

You can perform measurements for sizing using the *Capture Request Statistics* app.

#### 4. Sizing

You can use the *Perform System Sizing* app to perform the actual sizing of your ABAP system based on what you have measured before.

As the types of applications developed and operated in the ABAP environment are highly diverse, use this documentation as a rough guideline. This documentation assumes that in your business scenario, most business processes comprise the synchronous processing of single transactions. These business processes are the basis for measuring and calculating sizing values. If your business application mainly comprises other types of processing, for example, the mass processing of background jobs at specified dates and times, you need other sizing methods to achieve meaningful results.

This documentation focuses on the sizing of the ABAP layer. It doesn't include sizing for the SAP HANA database.

## 6.3.3.4.1 Sizing Fundamentals

Sizing describes the process of translating business requirements into hardware requirements.

Sizing determines resource requirements such as CPU processing power, physical memory, as well as disk and network bandwidth. The outcome is influenced by both business and technological aspects. This means that the number of users and their application usage is as important as the behavior of the application and the underlying technology stack.

### 6.3.3.4.1.1 Sizing Occasions and Methods

Sizing makes sense at different occasions, such as before a go-live or after an increased usage of applications. You can use different sizing methods, ranging from educated guess to expert sizing.

#### Occasions for Sizing

Sizing can be performed at different occasions:

- Before the initial go-live of an application (greenfield sizing)
- After the initial go-live and after an increased usage of applications, or after functionality has been added or changed (delta sizing or resizing)

Reliable sizing can only be achieved if the hardware as well as the platform layer used are scalable, but most importantly, the application software must be scalable. Load tests are used to check the scalability of all involved components.

In a typical productive environment, 80% of the workload is caused by 20% of the business processes. Consequently, detailed sizing focuses on these relevant business processes. Sizing for the remaining business processes is typically done using an educated guess.

As a rule of thumb, sizing should target an average resource utilization of no more than 70%. Keep extra space available for peak times as well as for anticipated future growth because of increasing business activity.

#### → Recommendation

We recommend that you consider a resizing of the environment if the resource utilization frequently exceeds 80%. Going beyond 90% resource utilization in normal operation mode usually causes resource contention in individual components and can considerably impact user experience with longer response times.

#### Sizing Methods

There are different sizing methods that allow you to perform sizing with different efforts required, but also resulting in different levels of accuracy. Sophisticated sizing methods are applied in environments where

hardware resources are the main cost driver. Simple and less elaborate sizing methods can be applied in smaller environments, or to get a starting point for less critical scenarios.

Sizing Method	Advantages	Disadvantages
Educated guess (Rule of thumb)	<ul style="list-style-type: none"> <li>• Easy to apply</li> <li>• Delivers a quick rough estimate</li> </ul>	<ul style="list-style-type: none"> <li>• Depends on many assumptions</li> <li>• Highly depends on the experience of the person who makes the guess</li> </ul>
T-shirt sizing (Predefined application model and categories of workload sizes)	<ul style="list-style-type: none"> <li>• Easy to apply</li> <li>• Easy to understand</li> </ul>	<ul style="list-style-type: none"> <li>• Depends on many assumptions</li> <li>• Requires an underlying sizing model that fits well to the actual application</li> </ul>
Expert sizing (Manual measurement and creation of sizing formula)	<ul style="list-style-type: none"> <li>• Delivers the most realistic results</li> <li>• Allows for more variables</li> <li>• Transparent sizing model</li> </ul>	<ul style="list-style-type: none"> <li>• Suggests accuracy that sizing can't deliver</li> <li>• Requires the highest efforts</li> </ul>

### 6.3.3.4.1.2 Expert Sizing

As the ABAP environment is a platform-as-a-service offering, sizing in this context refers to applications that aren't standard SAP coding but are custom development of either an SAP partner or an SAP customer. This fact usually prevents the usage of the educated guess or t-shirt sizing method, as there's typically no reference available. This documentation therefore focuses on the expert sizing method.

Expert sizing involves the following steps:

1. Identify the sizing-relevant (main) business scenarios and their variable dimensions.
2. Determine the throughput requirements during defined time periods and their day-time distribution. As part of the requirement determination, separate scenarios that are time-critical from those scenarios that can be postponed to times with lower load.
3. Define test cases for each relevant scenario with a reasonable number of input parameters and assumptions. These test cases must be self-contained and idempotent, which means repeatable with a stable load profile.
4. Execute each test case in single-user mode to measure its individual workload profile.
5. Create sizing models based on the results of the previous steps.
6. Create a structured load analysis to verify and refine the sizing model regarding scalability aspects (mass user testing).

#### Note

This step isn't in the scope of this document.

7. To simplify the consumption of the sizing formulas resulting from expert sizing, you can also define and precalculate representative t-shirt sizes for the system.

#### → Recommendation

Changes to the underlying technology stack (for example, configuration changes in the ABAP environment), as well as changes in the application behavior (for example, enhanced functionality in a

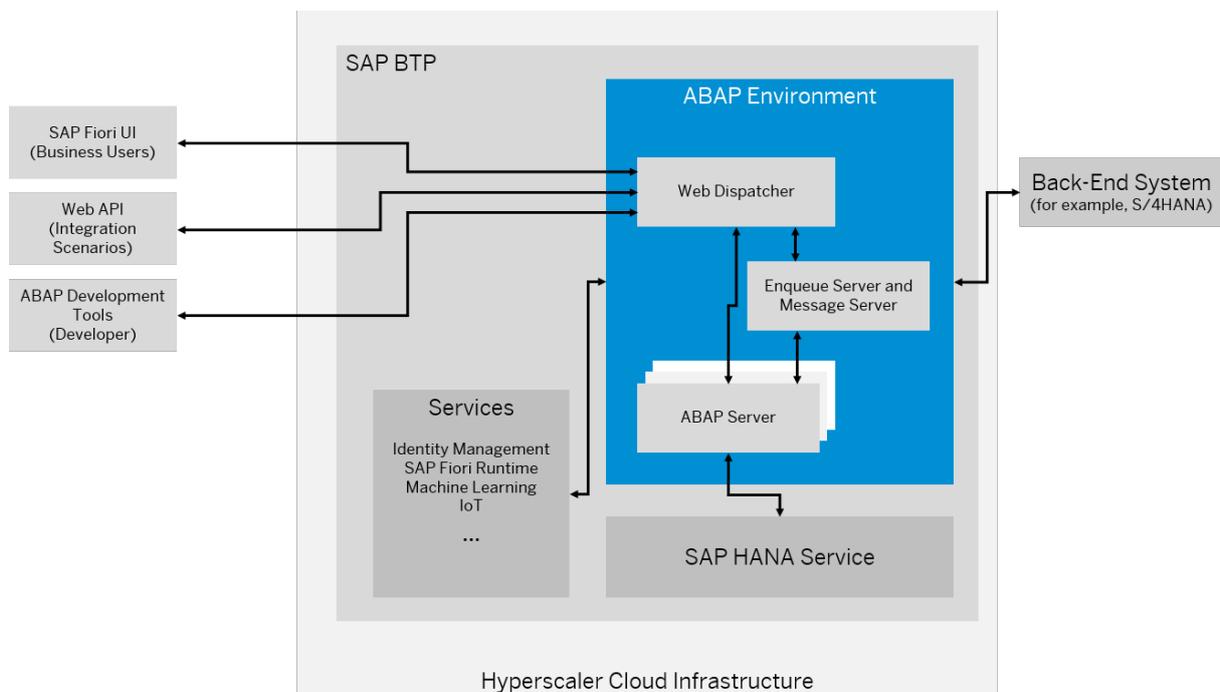

new software release) can invalidate your sizing results. We recommend that you validate from time to time whether the sizing is still adequate for your system workload.

### 6.3.3.4.1.3 Scalable Applications in the ABAP Environment

Get an overview of the technical architecture of an ABAP environment. It's important to understand which aspects are conditioned by this architecture and are therefore relevant for creating scalable applications in the ABAP environment and for the sizing of such applications.

#### Architecture of the ABAP Environment

The following figure provides an overview of the technical architecture of the ABAP environment:

Both the developer and the business user access the ABAP environment using HTTPS OData calls. The web dispatcher of the ABAP system dispatches these calls to an ABAP server. The respective ABAP server processes the request and might access the SAP HANA database to read or modify data. Besides user-driven calls, the web API can be used to integrate ABAP environment-based applications with other systems, for example, to consume IoT data.

While there's only one web dispatcher and one enqueue and message server, the number of ABAP servers can be increased based on demand (scale-out approach). There are always at least two ABAP servers.

The ABAP environment itself consumes reuse services of SAP BTP, for example, identity management or the SAP Fiori UI runtime. The ABAP environment developer can consume additional reuse services such as machine learning. Furthermore, predefined connectivity services of SAP BTP can be consumed to connect an ABAP environment with an SAP S/4HANA (or SAP ERP) back-end system.

## Relevance for Sizing

The following aspects are important regarding the scalability of the ABAP environment-based applications:

- The ABAP environment is designed to scale primarily via the number of ABAP servers (scale-out), and not via the size of individual ABAP servers (scale-up). It's therefore important to split larger work packages into smaller ones, and to process these smaller packages in parallel on many rather small ABAP servers .
- With the in-memory architecture of SAP HANA and its support for heavily parallelized operations, it has become popular to push down application logic into the database layer (ABAP supports this pushdown using ABAP-Managed Database Procedures). While this pushdown remains a valid use case for operations that are time-critical or benefit greatly from being executed close to the data, care must be taken not to overload the central (and expensive) SAP HANA instance. In many cases, scaling out by using more (comparatively cheap) ABAP servers provides a better total cost of ownership.
- The ABAP environment and SAP HANA as a cloud service are co-located in a single virtual data center (one hyperscaler region, but not necessarily the same data center). Therefore, the network latency between these components is still slightly higher than in a typical on-premise environment. Consequently, performance anti-patterns such as small `SELECT` queries within loops are even more problematic in an ABAP environment than in an on-premise setup.
- As for any cloud service, network latency is also a limiting factor for clients interacting with the ABAP environment. Avoid performing many small calls to the ABAP environment.

Keep these aspects in mind when you plan scalable applications in the ABAP environment and their sizing.

### 6.3.3.4.1.4 Native Storage Extension for the ABAP Environment

You can use SAP HANA Native Storage Extension for selected database tables to save in-memory storage.

#### SAP HANA Native Storage Extension

SAP HANA Native Storage Extension (NSE) is a general-purpose, built-in warm data store in SAP HANA that lets you manage less-frequently accessed data without fully loading it into memory. It integrates disk-based or flash-drive based database technology with the SAP HANA in-memory database for an improved price-performance ratio.

For more information, see [SAP HANA Storage Extension](#) in the SAP HANA administration guide.

#### Enabling Native Storage Extension for Selected Database Tables

When you create or alter database tables in the ABAP Development Tools, go to the technical table settings. In the *Load Unit* field, select *Page Enforced*.

## 6.3.3.4.2 Sizing Preparation

Before you start any measurements for system sizing, it's important that you prepare system sizing carefully.

Such preparations include first and foremost identifying the main business processes that use the custom application for which you want to perform sizing. As a second step, formulate test cases that you want to use for the actual measurements.

### 6.3.3.4.2.1 Defining the Sizing-Relevant Business Processes

Before the actual sizing, identify sizing-relevant business processes and determine the throughput requirements for each of these business processes.

#### Context

##### Note

Examples used in this sizing documentation refer to the ABAP flight reference scenario of the ABAP RESTful Programming Model. For more information, see [Downloading the ABAP Flight Reference Scenario](#).

#### Procedure

1. Identify the main business processes of the application as well as their variable dimensions.

The main business processes included processes that are critical for the company, for example, from revenue, reputation, or legal perspective.

Examples of variable dimensions are the number of items in a sales order, or the number and size of documents uploaded by a user. It's unavoidable to make some assumption on these variables to limit the complexity of the resulting sizing model. As an example, it can be sufficient to assume an average of 10 items per sales order, instead of making items per sales order an input parameter of the sizing model.

2. Determine throughput requirements for each sizing-relevant business process, with its distribution over a typical business day. Determining throughput requirements also includes the separation of business processes that are time-critical from those processes that can be postponed to times of low load. For example, a background job performing some reporting activity can be shifted into non-business hours.

## Results

The resulting overview of sizing-relevant business processes can look as follows, for example:

Flight Reference Example: Sizing-Relevant Business Processes

Business Process	Load Type	Process Executions per Minute	Criticality	Variable Dimensions
Creation of a new travel request	HTTPS / User-driven	160 per minute during main business hours (8 am to 7 pm)	High	Number of bookings per travel
Approval of a travel request	HTTPS / User-driven	160 per minute during main business hours (8 am to 7 pm)	High	--
Calculation and sending of metrics for reporting	Batch Job / Scheduled	Once a day	Low	Number of travel requests created per day

In this example, variable dimensions have been turned into assumptions to simplify the sizing model and to reduce complexity of the overall sizing procedure. For the flight reference example, we can assume an average of 2 bookings per travel (inbound and outbound flight). With eliminating this variable dimension, the only remaining input parameter of the respective business process is the number of process executions expected per minute.

### 6.3.3.4.2.2 Defining Test Cases for Sizing

After you've identified the sizing-relevant business processes, define test cases for each business process for baseline measurements.

It's important that these test cases are self-contained and idempotent, which means they're repeatable and return the same resource requirements after each repetition. Such a careful design of test cases is important to avoid side effects because, for example, data volume processed by SAP HANA increases during query execution (empty table versus table with high volume of irrelevant data).

Furthermore, make sure that each test case is limited to a single business process. For example, split the creation and the approval of a travel request into two test cases because creation and approval are performed by different users and at different points in time.

## Example

A test case description for the business process *Creating a new travel request* can look as follows:

Test Case Example: Travel Request

Step ID	Description	Input Fields	Input Values
<b>Preparation Steps (Not Measured)</b>			

Step ID	Description	Input Fields	Input Values
SystemLogon	Link to SAP Fiori launchpad	User Password	<tester name>, <tester password>
<b>Test Case (Measured)</b>			
OpenApp	Open the travel management app from the launchpad (or using the Fiori Elements preview).	--	--
CreateTravel_1a	Choose <i>Create</i> from the table toolbar of the travel overview.	--	--
CreateTravel_1b	<ol style="list-style-type: none"> <li>Open the search help of field <i>Customer ID</i>.</li> <li>Choose <i>Go</i> without entering any search data.</li> <li>Select an arbitrary entry from the persons listed.</li> </ol>	Customer ID	<arbitrary, using search help>
CreateTravel_1c	<ol style="list-style-type: none"> <li>Open the search help of field <i>Agency ID</i>.</li> <li>Choose <i>Go</i> without entering any search data.</li> <li>Select an arbitrary entry from the agencies listed.</li> </ol>	Agency ID	<arbitrary, using search help>
CreateTravel_1d	<ol style="list-style-type: none"> <li>Open the search help of the currency field next to <i>Total Price</i>.</li> <li>In the <i>Currency</i> field, enter <b>EUR</b> and choose <i>Go</i>.</li> <li>Select <i>EUR</i>.</li> </ol>	Currency	EUR
CreateTravel_1e	Enter the remaining input and choose <i>Save</i> .	Starting date End date Total price Booking fee Status Description	<arbitrary> <arbitrary> 0 9.99 0 <optional>
<b>Cleanup Steps (Not Measured)</b>			
DeleteTravel	Delete the created travel from either the travel overview or the travel details.	--	--

### 6.3.3.4.3 Measurements for Sizing

After you've defined test cases for sizing-relevant business processes, you can now measure the workload that each business process generates.

#### Note

This section of the documentation describes the steps necessary to prepare and execute a single test case for a business process. To obtain a combined sizing of all relevant business processes (see [Defining the Sizing-Relevant Business Processes \[page 2732\]](#)), perform the steps described in this section for each business process individually and add up the results.

#### 6.3.3.4.3.1 Measurement Prerequisites

To ensure meaningful and reproducible results, make sure that prerequisites for the test system and test organization are met before measurements for sizing are taken.

Before you start testing, check the following:

- The setup and configuration of the test environment should be equivalent to a production environment. As you only perform single user tests, the test environment doesn't need the same hardware resources, but make sure that the following is the same as in a production system:
  - Software releases of all software components involved in the stack
  - Settings of the application that influence its behavior, for example, Customizing settings that control internal data verification steps
- Moreover, prevent any concurrent workload that consumes a noticeable amount of resources during the test. Having some house-keeping jobs active in the background is unproblematic. You should, however, avoid that tests compete with other, resource-intensive business processes.
- The test environment should contain a defined amount of existing business data. The SAP HANA database can consume different amounts of resources in a system with no business data compared to a system with a significant amount of existing business data.
- All test cases should be executed with a specific test user. A dedicated test user makes it much easier to separate calls originating from the test case execution from other activities, for example, calls originating from measurement tools. This test user should have the same authorizations that a corresponding business user has in the relevant business process.
- Consider caching effects of the application. The initial load of an application can consume more resources than a later use of the same application. To ensure a measurement that considers caching effects, execute the business scenario once without capturing the workload and a second time with capturing it.

## 6.3.3.4.3.2 Defining a Capture Profile for Sizing

With the *Capture Request Statistics* app, you can capture request statistics to find out which activities are running in your ABAP system. For sizing, you can define a capture profile that records defined activities of a business user or business process.

### Prerequisites

You've defined one or multiple test cases to measure the workload of sizing-relevant business processes (see [Defining Test Cases for Sizing \[page 2733\]](#)).

### Context

With the definition and activation of a capture profile, you can capture system activities. Requests are recorded with technical information, such as response time, program name, or CPU time. The request statistics serve as input for ABAP system sizing using the *Perform System Sizing* app (see [Performing System Sizing \[page 2739\]](#)).

#### Note

In this documentation, the assumption is that workload for a particular business process is measured by capturing the request statistics generated by the activities of a business user who acts as a tester. With such a measurement approach, you define the profile that contains the technical user name of the tester and a time period reserved for testing.

### Procedure

1. In the SAP Fiori launchpad of the ABAP environment, under *Technical Monitoring*, choose the *Capture Request Statistics* tile.
2. Choose *Create*.
3. Enter the following data:

Field	What to enter
<i>Profile ID</i>	Enter a short, meaningful name for your profile. Don't use the prefix <code>SAP_</code> because this prefix is reserved for profiles predefined by SAP.
<i>Description</i>	If needed, you can enter a longer description of your profile.

Field	What to enter
<i>Start/End Time</i>	The start and end time specify when request statistics were captured by the app. These fields are automatically filled after you have activated the profile.
<i>Retention Time</i>	Select how long you want to keep the captured request statistics stored in the system, for example, 14 days.
<i>Record Limit</i>	<p>Enter the maximum number of records that you want the system to capture per minute, for example, 1,000 records.</p> <p>The record limit prevents that too much database memory is consumed by captured request statistics. The maximum possible record limit per minute is 1,000.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p><b>Note</b></p> <p>To get a realistic idea of the workload, consider a relatively high record limit. However, you must keep in mind that you generate load on your system while request statistics are captured.</p> </div>
<b>Sampling Rate</b>	<p>Enter a sampling rate, which is the probability of capturing one single ABAP statistics record in percent.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p><b>Note</b></p> <p>To get a realistic idea of the workload, consider a relatively high sampling rate, if possible 100. However, you must keep in mind that you generate load on your system while request statistics are captured.</p> </div>
<i>Target User Group</i>	Choose one of the target groups starting with <i>Customer</i> .
<i>Profile Type</i>	This field is automatically populated by the system. Only static profile types (with fixed values) are possible.
<i>Profile Owner</i>	The profile owner is automatically set to <i>Customer</i> when you create a new profile.

4. Choose *Create*.

The profile has been created, but is still inactive and has no filter conditions yet.

5. To define the filter conditions under which request statistics are captured, choose *Create*.

6. With *Field ID*, *Operator*, *High*, and *Low*, you can select a filter condition that determines what kind of data is captured.

For example, if you want to capture all request statistics relating to your tester, select *User ID* as field ID, *include equal to* as operator and the technical user name of the tester.

7. Choose *Create*.

8. To enable capturing request statistics using the profile, choose *Activate*.

If you use the capturing of request statistics to measure sizing, enter the planned start and end time of your test case.

### 6.3.3.4.3.3 Executing the Test Cases

Instruct your testers to perform the steps described in the test cases to measure the workload for sizing.

#### Prerequisites

Before testing starts, make sure that the following prerequisites are met:

- Testers have the authorizations that correspond to that of a business user.
- A capture profile exists, and it is set to *Active* (see also [Defining a Capture Profile for Sizing \[page 2736\]](#)).
- Testers perform their tests after the start time and before the end time defined in the capture profile.
- When you define and activate a profile, the start time of the profile must be later than or equal to now. The testers can start testing immediately. However, note that it takes up to two minutes before the records are processed by a collector job that runs in the background. Therefore, it can take up to two minutes until the first request statistics from your test are shown in the sizing app. In addition, it can take up to two minutes after the defined end time of the profile until all records have been processed and are shown in the sizing app.

#### Context

The testers' system activities are captured to estimate the workload as a basis for system sizing.

#### Procedure

1. Instruct your testers to execute the preparation steps as documented in [Defining Test Cases for Sizing \[page 2733\]](#).
2. Instruct your testers to execute the steps of the test case within the defined time period for testing.
3. After testing, wait for two minutes before you set the profile to *Inactive* again.

##### Note

If a profile is set to *Inactive* before the collector of the request statistics runs another time, all ABAP statistics records get lost that would have been captured with the last collector run.

#### Results

The ABAP statistics records relating to the tester activities in the ABAP system have been captured. To ensure stable results, consider defining multiple capture profiles with different test times for one test case and repeat the measurement 2-3 times.

## 6.3.3.4.4 Sizing

After you have prepared measurements for sizing and a tester has executed the relevant test cases, you can now perform system sizing for each relevant business process.

With the help of the [Perform System Sizing](#) app, you can get sizing results for individual test cases in ABAP compute units. If you combine your results for all business processes, you can get a sizing for the overall business scenario.

### 6.3.3.4.4.1 ABAP Compute Units

When you order an ABAP environment in SAP BTP, the ABAP system size is specified in ABAP compute units (ACUs). One ABAP compute unit comprises the total ABAP memory usable by applications, the ABAP work process time per minute, and the ABAP CPU time per minute.

When you create an ABAP system, you must decide on the system size in ABAP compute units. One ABAP compute unit represents 16 GB.

The system consists of at least 2 application servers of the size of 8 GB each.

When you order 4 ACUs or more, the system consists of at least 2 application servers of the size of 32 GB each.

The memory limit for a single session is 4 GB, independent of the application server size.

### 6.3.3.4.4.2 Performing System Sizing

With the [Perform System Sizing](#) app, you can calculate the required total ABAP memory, the work process time, and the ABAP CPU time in ABAP compute units for a custom application operated in the ABAP environment. You can use these calculations as a basis for ABAP system sizing.

## Prerequisites

Before you start a system sizing, you've used the [Capture Request Statistics](#) app to capture a sample of the expected workload of the custom application.

### Note

In the [Capture Request Statistics](#) app, you must create your own profile for capturing the relevant request statistics. For system sizing, you can't use the predefined SAP capture profiles.

## Context

You want to use the captured request statistics as a basis to perform the system sizing of a production system. The *Perform System Sizing* app uses the captured request statistics to calculate the required total ABAP memory, the work process time per minute, and the ABAP CPU time per minute for the custom application and translates these KPIs into ABAP compute units (ACUs).

## Procedure

1. In the SAP Fiori launchpad, under *Technical Monitoring*, choose the *Capture Request Statistics* app.
2. In the list of capture profiles, check whether the profile that you've defined before to capture the request statistics of the custom application is set to *Finished*.
3. Choose the profile from the list.

The profile with its settings is shown.

4. To navigate to the system sizing, choose the *Perform System Sizing* button.

The *Perform System Sizing* app opens with the captured request statistics of the profile that you've chosen.

When you open the app, all captured ABAP statistics records are selected for system sizing, and a system sizing for 10 parallel process executions is shown. Initially, one ABAP compute unit is entered as available, but you can also enter a higher number of available ABAP compute units.

5. Replace the default value of 10 parallel process executions with the expected volume as assumed in your sizing-relevant business process definition (see [Defining the Sizing-Relevant Business Processes \[page 2732\]](#)).

The process execution is the unit to describe the execution of a specific business process by a single business user.

6. Deselect ABAP statistics records from the table that aren't part of the test case definition (see [Defining Test Cases for Sizing \[page 2733\]](#)).

### Note

You can use the *User ID* field to deselect requests from users that you want to exclude from system sizing. By default, the field is hidden, but you can display it by choosing it in the table settings of the *ABAP Statistics Records* table.

7. Check whether the required ABAP compute units for total ABAP memory, work process time, and ABAP CPU time are still below acceptable thresholds.

If total ABAP memory, work process time, and ABAP CPU time consume more than 70% of the available ABAP compute units, a warning sign next to the calculated ABAP compute units is shown. If 100% or more is consumed, an error sign is shown.

8. If there are still warnings or errors, increase the number of available ABAP compute units until all error or warning signs disappear and the calculated ABAP compute units (ACUs) for total ABAP memory, work process time, and ABAP CPU time are displayed with a green OK sign.

### Note

If you notice an entry in the captured ABAP statistics records that is responsible for a high workload and considerable resource consumption, don't simply accept a high number of required ABAP

compute units for your business process. Consider reviewing the relevant request for optimization and, after the optimization, repeat the sizing.

## Results

Combine the results for multiple custom applications that run in the production system to get an idea of the required system size. After you have found the appropriate number of ABAP compute units for your business scenario, you can proceed with using this number for requesting an ABAP system for production.

## Related Information

[Combining System Sizing Results \[page 2741\]](#)

### 6.3.3.4.4.3 Combining System Sizing Results

After performing a system sizing for each business process, combine the results for multiple custom applications that are planned to run in the production system. As a result, you get an idea of its required system size in ABAP compute units (ACUs).

Let's use the flight reference scenario and let's assume you've performed system sizing for its business processes *Create a new travel request*, *Approve a travel request*, and *Calculate and send metrics for reporting*. After performing system sizing for each business process, the results can look as follows:

Flight Reference Scenario: Example Sizing Results

Business Process	ABAP Total Memory	Work Process Time	ABAP CPU Time	Process Executions/Minute
Create a new travel request	0.108 ACUs	0.306 ACUs	0.414 ACUs	180
Approve a travel request	0.072 ACUs	0.162 ACUs	0.234 ACUs	180
Calculate and send metrics for reporting	0.025 ACUs	0.331 ACUs	0.092 ACUs	1

The process execution is the unit to describe the execution of a specific business process by a single business user. In the flight reference scenario, we assume that up to 180 travel requests are created and approved each minute, and metrics are calculated and sent for reporting once a minute.

The workload generated by a business process can vary depending on the daytime. In the flight scenario example, let's assume that travel requests are only created and approved between 8 a.m. and 8 p.m., but the

reporting runs in the evening after 8 p.m. Combining the business processes with the volumes expected at different times of day, you can create a summary such as the following:

Here, the ABAP total memory consumption, the work process time, and the ABAP CPU time for the travel requests and approvals must be combined. They add up to more than 0.2 ACUs for ABAP total memory, almost 0.5 ACUs for work process time, and more than 0.6 ACUs for ABAP CPU time. The reporting runs after 8 p.m. and its sizing is lower than the sum of the figures for travel request and approvals. Consequently, the limiting resource for the overall business scenario is the ABAP CPU time, with a maximum requirement of 0.648 ACUs. This ABAP CPU time still fits into the smallest available service plan of the ABAP environment (while also reserving some space for smaller business processes considered irrelevant for sizing).

To simplify the consumption of the sizing formulas that you created, you can optionally define some feasible t-shirt sizes and precalculate their resource requirements. Remember, sizing targets a mean resource utilization of no more than 70%:

Flight Reference Scenario: T-Shirt Sizes

T-Shirt Size	Description	Required ABAP Compute Units
S	Up to 180 travels created and approved per minute	1
M	Up to 360 travels created and approved per minute	2
L	Up to 540 travels created and approved per minute	3

## 6.3.3.5 Resilience

The resilience of your ABAP Cloud applications and your data provided by a set of SAP BTP, ABAP environment features.

SAP BTP, ABAP environment provides the following set of features to increase the availability and resilience of your ABAP cloud applications and your data:

- Both the infrastructures for ABAP systems and SAP HANA Cloud databases are set up across multiple availability zones.
- The infrastructures offer automatic restarts for critical components of the Application Server for ABAP, the HANA Cloud database, and connectivity components.
- In case of hardware failures, components are automatically rescheduled to other hardware (subject to availability).
- Enqueue locks are stored redundantly.

### Note

SAP BTP ABAP Environment provides protection against denial-of-service attacks via various defense mechanisms. These are continuously improved to keep a decent protection level. However, a full protection against DoS attacks cannot be guaranteed.

## 6.3.3.6 Backups

The ABAP environment relies on backups from SAP HANA Cloud:

- Backups are retained up to 14 days.
- The recovery point objective (RPO), which is the maximum data loss, is no more than 15 minutes.
- Backups are stored encrypted and redundantly in different availability zones.

### Note

A point-in-time recovery requires a coordinated plan between you as a customer and SAP that clarifies the target point-in-time and the target time of execution.

You can initiate a restore via a service request by using component `BC-CP-ABA`. To perform a restore, please provide the following information:

- The ID (GUID) of the ABAP environment service instance
- The target point-in-time to which the instance should be restored specified in coordinated universal time (UTC)

### Caution

All data stored between the specified time and the time at which the service request is processed by SAP can't be retrieved.

#### ⚠ Caution

A point-in-time recovery changes data stored in the ABAP environment service database only. Other data will not be changed, which may lead to inconsistencies with communication integration configurations or integrated services.

#### ⚠ Restriction

In case of SAP-managed software updates that are part of scheduled maintenance, the target point-in-time can only be set after the last software update.

## 6.3.4 Troubleshoot Custom Apps

After developing or releasing an application to a test or productive system, you might need to troubleshoot your application, for example to debug your business logic, display data of your application, and to analyze short dumps as well as logs and traces.

### Prerequisites

As an administrator, assign business role `Application Support Engineer - Development Support` to a business user. With this role, you enable business users to troubleshoot applications. In addition to this business role, you might need to assign the business role of the application to be analyzed to the business user.

### Business Role Template `Application Support Engineer - Development Support`

Business role template `Application Support Engineer - Development Support` (`BR_APPL_SUP_ENG_DEV_SUP`) contains all the business catalogs that are required for troubleshooting activities, such as:

- Debugging capability
- Running the data preview
- Executing classrun
- Accessing Feed Reader
- SQL Trace Analysis & SQL Explain Analysis capability

### Business Catalogs

Business role template `Application Support Engineer - Development Support` includes the following business catalogs:

## Business Catalog

## Authorization

---

Development Support - Data Preview - Business Data  
(SAP\_A4C\_BC\_DAT\_PRV\_DFT\_PC)

This business catalog enables you to use the data preview in ABAP development tools for Eclipse for objects that are considered to contain business data, such as:

- CDS views in language version 5
- Client-dependent tables in language version 5 with delivery class A and L
- Data of CDS views that can be viewed with or without application of the DCL

---

Development Support - Data Preview - Cross-Client and Customizing Data (SAP\_A4C\_BC\_DAT\_PRV\_RDO\_PC)

This business catalog enables you to use the data preview in ABAP development tools for Eclipse for objects that are considered to contain customizing and cross-client data, such as:

- Client-independent tables in language version 5 with delivery class A and L
- Tables in language version 5 with delivery class S, E, and W (metadata)
- Tables in language version 5 with delivery class C and G (customizing)

---

Development - Class Runner Execution  
(SAP\_A4C\_BC\_DEV\_CLA\_RUN\_PC)

This business catalog enables you to execute class runners in ABAP development tools for Eclipse.

---

Development - Data Preview - Released Objects  
(SAP\_A4C\_BC\_DEV\_DAT\_PRV\_PC)

This business catalog enables you to use the data preview in ABAP development tools for Eclipse for objects that are released for language version 5:

- SAP-delivered CDS views
- CDS Views that are released for usage outside of their own software component
- Data of CDS views that can be viewed with or without application of the DCL

---

Development - Development Objects Display  
(SAP\_A4C\_BC\_DEV\_OBJ\_DIS\_PC)

This business catalog enables you to sign in to ABAP development tools for Eclipse and view development objects with read-only authorization.

---

Development - Analysis and Support  
(SAP\_A4C\_BC\_DEV\_SUP\_PC)

This business catalog gives you access to troubleshooting tools such as logs, traces, and the debugger.

Business user assigned to the business role `Development` or any kind of source code changes are not permitted. Nevertheless, business users can execute the class runner in a test or productive system, unless this is not restricted by the administrator.

---

## Connect to the System

As the Application Support Engineer, you have to connect to the ABAP system using ABAP development tools for Eclipse. This allows you to use the troubleshooting functionality and tools.

### Note

Certain analysis tools, such as the SQL Trace Analysis and SQL Explain SAP Fiori app are only accessible in SAP Fiori launchpad.

See [Connect to the ABAP System \[page 654\]](#).

## Troubleshoot Using Debugging

The most common use case for troubleshooting to analyze the implemented business logic is debugging. The following debugging scenarios exist:

- Debug your own user
- Debug another business user
- Debug a communication user

See [ABAP Debugger](#).

### Note

To find the business user and communication user ID for debugging, navigate to the [Debug Properties View](#) in ABAP development tools for Eclipse and search for business users (**CB\***) and communication users (**CC\***).

### Debug Your Own User

To debug the application with your own Application Support Engineer user, make sure that you have the business application role assigned.

### Debug Another Business User

To debug the application of another business user, you need to change the breakpoint settings in the debug properties view in ABAP development tools for Eclipse to the business user (**CB\***).

### Debug a Communication User

To debug the application of the communication user, you need to change the breakpoint settings in the debug properties view in ABAP development tools for Eclipse to the communication user (**CC\***).

## Related Information

[Troubleshooting Tools \[page 2747\]](#)

## 6.3.4.1 Troubleshooting Tools

Apart from debugging, you can also use other troubleshooting tools, such as the Feed Reader view in ABAP development tools for Eclipse, ABAP Profiler as well as the SQL Explain and SQL Trace Analysis SAP Fiori apps.

### Feed Reader

ABAP Development Tools provides a dedicated view, the Feed Reader View, for runtime errors (ABAP short dumps) and gateway errors. See [Feed Reader View](#).

### ABAP Profiler

#### ABAP Trace

The ABAP Profiler allows you to examine the performance of your implemented business logic by using function modules and global ABAP classes. You can use the ABAP trace, which is the result of the ABAP Profiler, to identify runtime-intensive statements and to follow the hierarchy of program calls. See [Profiling ABAP Code](#).

#### ABAP Cross Trace

If you develop OData services or other ABAP functionality related to the ABAP RESTful application programming model, the ABAP Cross Trace gives you insights into the ABAP RESTful Application Programming Model runtime framework. This includes the processing of OData requests, for example in SAP Fiori applications, and contains functionality similar to the payload trace of SAP Gateway trace in SAP GUI.

### SQL Trace Analysis SAP Fiori App

With the SQL Trace Analysis app, you can access and analyze SQL trace records after you have used the SQL trace function of the ABAP performance trace in ABAP development tools for Eclipse. See [SQL Trace Analysis \[page 2418\]](#).

## 6.4 Administration and Operations in the Kyma Environment

This is the managed offering of SAP BTP, Kyma runtime (based on the open-source project "Kyma"). The administrators of the Kyma environment take care of setting it up and make sure it is ready for developers to work with. Create your Kyma instance to build applications and extensions to SAP and third-party solutions, manage roles, have your Kubernetes objects backed up, and view metrics and logs.

## ⚠ Caution

Do not make changes in any Kyma-managed namespaces, the `<kube-system>` namespace, or to any resources marked with *Do Not Edit*. Changes to those resources could lead to exclusion or disruptions from the agreed SLA. If you decide to make changes despite this, consult support in advance, and proceed with caution.

### [Create the Kyma Instance \[page 2749\]](#)

Set up a Kubernetes cluster with project "Kyma" and use it to build applications and extensions to your SAP and third-party solutions.

### [Available Plans in the Kyma Environment \[page 2750\]](#)

Depending on your global account type, you have access to a different plan that specifies the cluster parameters for the Kyma environment.

### [Provisioning and Updating Parameters in the Kyma Environment \[page 2755\]](#)

You can configure the cluster parameters in the Kyma environment.

### [Add and Delete a Kyma Module \[page 2764\]](#)

To use a Kyma module, you must add it first. Use Kyma dashboard or Kyma CLI to do that. If you don't need the module anymore, delete it to save resources.

### [Assign Roles in the Kyma Environment \[page 2766\]](#)

Kyma uses roles to manage access within the cluster, which give the assigned users the permissions suitable for their purposes.

### [Access Kyma Application Logs \[page 2769\]](#)

Get insights into your applications, microservices, and Functions by viewing the respective logs. To check out real-time logs immediately, use the Kubernetes functionalities - either in Kyma dashboard, or with `kubectl`.

### [Kyma Environment Backup \[page 2770\]](#)

The user load on a Kyma cluster typically consists of various Kubernetes objects and volumes. The object backup process is automated, but you need to take care of volume backups so you can recover your customer data.

### [Kyma Modules' Sizing \[page 2771\]](#)

The following tables show the resource consumption, such as memory, CPU, and storage, of Kyma modules.

### [Change Storage Size in Kyma \[page 2774\]](#)

If the amount of data for the applications in your Kyma environment grows, you can expand the storage size for your customer data by resizing the respective Persistent Volume Claim (PVC).

## 6.4.1 Create the Kyma Instance

Set up a Kubernetes cluster with project "Kyma" and use it to build applications and extensions to your SAP and third-party solutions.

### Prerequisites

Your subaccount has entitlements for Kyma runtime configured. For more information, read [Managing Entitlements and Quotas Using the Cockpit \[page 1995\]](#).

### Context

To set up the Kyma environment on your subaccount, you must create an instance of it. You can easily create it from Service Marketplace, following the same wizard steps as for SAP services and applications. You can configure the instance by selecting the region in which you want to create the cluster and the number of virtual machines to run on it.

#### Note

The legacy method to set up a Kubernetes cluster is to select *Enable Kyma* in the *Kyma Environment* section of your subaccount overview. However, this way offers fewer configuration options, so we recommend the Service Marketplace.

### Procedure

1. In SAP BTP cockpit, navigate to your subaccount.
2. Go to ► *Services* ► *Service Marketplace* ► and select *Kyma Environment*.
3. Select *Create* either from actions in the upper-right corner of the tile or from the tile overview page, to which you get by clicking on the tile.
4. Change the instance name or keep the default name.

You see the default plan assigned to your account. The default plan and its specification can differ depending on your global account type.

5. To move to the plan configuration view, choose *Next*.
6. In the *Parameters* view, specify the required details. You can also configure your instance parameters by changing its region and the maximum or the minimum number of virtual machines to be created for it. You can also configure a custom identity provider.
7. Confirm changes by selecting *Create*.

## Results

You have created a Kyma environment instance.

### → Tip

For users who like to work in a terminal or want to automate operations using scripts, there's an alternative to the SAP BTP cockpit: You can create the Kyma environment with the SAP BTP command line interface (btp CLI).

To learn more, read [Creating SAP BTP, Kyma runtime via the SAP BTP cli](#).

## Next Steps

- To get the link to Kyma dashboard, navigate to the overview of the instance under *Instances and Subscriptions*.
- To manage access to the Kyma environment and Kyma dashboard, assign roles as needed.
- To use functionalities such as telemetry and eventing, or to use BTP services, add the respective Kyma module.

## Related Information

[Creating SAP BTP, Kyma runtime via the SAP BTP cli](#)

## 6.4.2 Available Plans in the Kyma Environment

Depending on your global account type, you have access to a different plan that specifies the cluster parameters for the Kyma environment.

### Trial

The technical name of the plan is `trial`. For details on the trial cluster specification, see [Scope and Limitations \[page 207\]](#).

## → Remember

The parameters marked with an asterisk "\*" are mandatory.

### Trial Plan Specification

Parameter	Description	Supported Operation	More Information
<i>Cluster Name*</i> btp CLI parameter: name	Defines the name of your cluster.	Provisioning	<a href="#">Cluster Name* [page 2757]</a>
<i>Modules</i> btp CLI parameter: modules	Defines which Kyma modules are provisioned in your cluster.	Provisioning	<a href="#">Modules [page 2758]</a>
<i>OpenID Connect</i> btp CLI parameter: oidc	Provides a custom Open ID Connect (OIDC) configuration.	Provisioning Updating	<a href="#">OpenID Connect (OIDC) [page 2761]</a>
<i>Administrators</i> btp CLI parameter: administrators	Specifies the list of runtime administrators.	Provisioning Updating	<a href="#">Administrators [page 2755]</a>

## Free

The technical name of the plan is `free`. Using the free service plans for Kyma allows you to try out services in global accounts without any additional cost for 30 days. However, the free model account has certain limitations.

- The free plan offers you a one-node cluster and is only available on AWS.
- Only community support is available for free tier service plans and these are not subject to SLAs.
- Before you enable the Kyma environment, you must first assign it as an entitlement to your subaccount.
- You have only one 30-day free service plan quota available per global account.
- The services you plan to use must be available in the same region as the subaccount for the Kyma runtime. If necessary, change the default subaccount region.
- The upgrade to the paid plan is not yet supported.

For more information, read [Using Free Service Plans \[page 72\]](#).

## → Remember

The parameters marked with an asterisk "\*" are mandatory.

## Free Plan Specification

Parameter	Description	Supported Operation	More Information
<i>Cluster Name*</i> btp CLI parameter: <code>name</code>	Defines the name of your cluster.	Provisioning	<a href="#">Cluster Name* [page 2757]</a>
<i>Region*</i> btp CLI parameter: <code>region</code>	Defines a region (set of data-centers) where your cluster runs.	Provisioning	<a href="#">Region* [page 2762]</a>
<i>Modules</i> btp CLI parameter: <code>modules</code>	Defines which Kyma modules are provisioned in your cluster.	Provisioning	<a href="#">Modules [page 2758]</a>
<i>Networking</i> btp CLI parameter: <code>networking</code>	Provides a custom IP range for worker nodes.	Provisioning	<a href="#">Networking [page 2760]</a>
<i>OpenID Connect</i> btp CLI parameter: <code>oidc</code>	Provides a custom Open ID Connect (OIDC) configuration.	Provisioning Updating	<a href="#">OpenID Connect (OIDC) [page 2761]</a>
<i>Administrators</i> btp CLI parameter: <code>administrators</code>	Specifies the list of runtime administrators.	Provisioning Updating	<a href="#">Administrators [page 2755]</a>

## Amazon Web Services, Google Cloud, and Microsoft Azure

The technical names of the enterprise plans are `aws`, `gcp`, and `azure`. They offer highly available Kubernetes clusters, where the Kubernetes and Kyma configurations are optimized for production use cases. The Kubernetes worker nodes are deployed in three availability zones of the respective [cloud region \[page 37\]](#), and thus can provide zone level failure tolerance for Kyma and applications deployed on Kyma runtime.

The [Kubernetes control plane](#)  is also hosted in three availability zones of the respective region.

While the high availability is guaranteed for Kubernetes and native Kyma components, by default it's not guaranteed for the customer's own applications. To guarantee high availability for your applications deployed on Kyma, you must manually configure these applications.

### → Remember

The parameters marked with an asterisk "\*" are mandatory.

Parameter	Description	Supported Operation	More Information
<i>Cluster Name*</i> btp CLI parameter: name	Defines the name of your cluster.	Provisioning	<a href="#">Cluster Name* [page 2757]</a>
<i>Region*</i> btp CLI parameter: region	Defines a region (set of data-centers) where your cluster runs.	Provisioning	<a href="#">Region* [page 2762]</a>
<i>Machine Type</i> btp CLI parameter: machineType	Specifies the provider-specific virtual machine type.	Provisioning Updating	<a href="#">Machine Type [page 2757]</a>
<i>Auto Scaler Min</i> btp CLI parameter: autoScalerMin	Specifies the minimum number of virtual machines to create.	Provisioning Updating	<a href="#">Auto Scaler Min [page 2756]</a>
<i>Auto Scaler Max</i> btp CLI parameter: autoScalerMax	Specifies the maximum number of virtual machines to create.	Provisioning Updating	<a href="#">Auto Scaler Max [page 2756]</a>
<i>Modules</i> btp CLI parameter: modules	Defines which Kyma modules are provisioned in your cluster.	Provisioning	<a href="#">Modules [page 2758]</a>
<i>Networking</i> btp CLI parameter: networking	Provides a custom IP range for worker nodes.	Provisioning	<a href="#">Networking [page 2760]</a>
<i>OpenID Connect</i> btp CLI parameter: oidc	Provides a custom Open ID Connect (OIDC) configuration.	Provisioning Updating	<a href="#">OpenID Connect (OIDC) [page 2761]</a>
<i>Administrators</i> btp CLI parameter: administrators	Specifies the list of runtime administrators.	Provisioning Updating	<a href="#">Administrators [page 2755]</a>

## Azure Lite

The technical name of the plan is `azure_lite`. The Azure Lite plan is offered to Partners, who can use it for testing, development, and demo purposes.

### → Remember

The parameters marked with an asterisk "\*" are mandatory.

## Azure Lite Plan Specification

Parameter	Description	Supported Operation	More Information
<i>Cluster Name*</i> btp CLI parameter: name	Defines the name of your cluster.	Provisioning	<a href="#">Cluster Name* [page 2757]</a>
<i>Region*</i> btp CLI parameter: region	Defines a region (set of data-centers) where your cluster runs.	Provisioning	<a href="#">Region* [page 2762]</a>
<i>Machine Type</i> btp CLI parameter: machineType	Specifies the provider-specific virtual machine type.	Provisioning Updating	<a href="#">Machine Type [page 2757]</a>
<i>Auto Scaler Min</i> btp CLI parameter: autoScalerMin	Specifies the minimum number of virtual machines to create.	Provisioning Updating	<a href="#">Auto Scaler Min [page 2756]</a>
<i>Auto Scaler Max</i> btp CLI parameter: autoScalerMax	Specifies the maximum number of virtual machines to create.	Provisioning Updating	<a href="#">Auto Scaler Max [page 2756]</a>
<i>Modules</i> btp CLI parameter: modules	Defines which Kyma modules are provisioned in your cluster.	Provisioning	<a href="#">Modules [page 2758]</a>
<i>Networking</i> btp CLI parameter: networking	Provides a custom IP range for worker nodes.	Provisioning	<a href="#">Networking [page 2760]</a>
<i>OpenID Connect</i> btp CLI parameter: oidc	Provides a custom Open ID Connect (OIDC) configuration.	Provisioning Updating	<a href="#">OpenID Connect (OIDC) [page 2761]</a>
<i>Administrators</i> btp CLI parameter: administrators	Specifies the list of runtime administrators.	Provisioning Updating	<a href="#">Administrators [page 2755]</a>

## Related Information

[Provisioning and Updating Parameters in the Kyma Environment \[page 2755\]](#)

[Regions for the Kyma Environment \[page 37\]](#)

[Kyma Modules \[page 57\]](#)

[Account Administration Using the SAP BTP Command Line Interface \(btp CLI\) \[page 2136\]](#)

## 6.4.3 Provisioning and Updating Parameters in the Kyma Environment

You can configure the cluster parameters in the Kyma environment.

### Overview

To configure the cluster parameters, you can use your preferred interface, the SAP BTP cockpit or the SAP BTP command line interface.

#### → Remember

The parameters marked with an asterisk "\*" are mandatory.

These are the configurable cluster parameters:

- [Administrators \[page 2755\]](#)
- [Auto Scaler Max \[page 2756\]](#)
- [Auto Scaler Min \[page 2756\]](#)
- [Cluster Name\\* \[page 2757\]](#)
- [Machine Type \[page 2757\]](#)
- [Modules \[page 2758\]](#)
- [Networking \[page 2760\]](#)
- [OpenID Connect \(OIDC\) \[page 2761\]](#)
- [Region\\* \[page 2762\]](#)

To see which parameters are available for configuration in a particular plan, go to [Available Plans in the Kyma Environment \[page 2750\]](#).

### Administrators

The *Administrators* (`administrators`) parameter is an array of strings. It is a provisioning and updating parameter, which specifies the list of runtime administrators. Complete the list with the administrators' email addresses as shown in this example:

```
"administrators": [  
  "example_1@mail.com",  
  "example_2@mail.com",  
  "example_3@mail.com"  
]
```

## Auto Scaler Max

The *Auto Scaler Max* (`autoScalerMax`) is an integer parameter, which specifies the maximum number of virtual machines you can create.

Auto Scaler Max Parameter

Plan	Supported Operation	Default Value	Maximum Value	Allowed Input
Amazon Web Services (technical name: <code>aws</code> )	Provisioning	20	80	Number between 3 and 80, but greater than or equal to <i>Auto Scaler Min</i> .
Google Cloud (technical name: <code>gcp</code> )	Updating			
Microsoft Azure (technical name: <code>azure</code> )				
Azure Lite (technical name: <code>azure_lite</code> )	Provisioning	10	40	Number between 2 and 40, but greater than or equal to <i>Auto Scaler Min</i> .
	Updating			

The default JSON input is:

```
"autoScalerMax": 20
```

## Auto Scaler Min

The *Auto Scaler Min* (`autoScalerMin`) is an integer parameter, which specifies the minimum number of virtual machines you can create.

Auto Scaler Min Parameter

Plan	Supported Operation	Default Value	Minimum Value	Allowed Input
Amazon Web Services (technical name: <code>aws</code> )	Provisioning	3	3	Number between 3 and the current value set in <i>Auto Scaler Max</i> .
Google Cloud (technical name: <code>gcp</code> )	Updating			
Microsoft Azure (technical name: <code>azure</code> )				
Azure Lite (technical name: <code>azure_lite</code> )	Provisioning	2	2	Number between 2 and the current value set in <i>Auto Scaler Max</i> .
	Updating			

Here is an example of the JSON input:

```
"autoScalerMin": 3
```

## Cluster Name\*

The *Cluster Name* (name) is a string, which provides the name of your cluster.

### → Remember

The parameters marked with an asterisk "\*" are mandatory.

#### Cluster Name Parameter

Parameter	Supported Operation	Default Value	Allowed Input
<i>Cluster Name</i> *	Provisioning	Automatically generated as your Subaccount's Subdomain.	Short string (up to 32 characters) that contains only alphanumeric characters (A-Z, a-z, 0-9), periods, underscores, and hyphens. It can't contain white spaces.
btp CLI parameter: name			
type: string			

## Machine Type

The *Machine Type* (machineType) parameter is a string, which specifies the provider-specific virtual machine type.

#### Machine Type Parameter

Plan	Supported Operation	Default Value	Allowed Input	Virtual Machine Size	
Amazon Web Services technical name: <code>aws</code>	Provisioning	<code>m6i.large</code>	<code>m6i.large</code>	2vCPU, 8GB RAM	
	Updating			<code>m6i.xlarge</code>	4vCPU, 16GB RAM
				<code>m6i.2xlarge</code>	8vCPU, 32GB RAM
				<code>m6i.4xlarge</code>	16vCPU, 64GB RAM
				<code>m6i.8xlarge</code>	32vCPU, 128GB RAM
				<code>m6i.12xlarge</code>	48vCPU, 192GB RAM
				<code>m5.large</code>	2vCPU, 8GB RAM
				<code>m5.xlarge</code>	4vCPU, 16GB RAM
				<code>m5.2xlarge</code>	8vCPU, 32GB RAM
				<code>m5.4xlarge</code>	16vCPU, 64GB RAM
				<code>m5.8xlarge</code>	32vCPU, 128GB RAM
				<code>m5.12xlarge</code>	48vCPU, 192GB RAM
		Google Cloud	Provisioning	<code>n2-standard-2</code>	<code>n2-standard-2</code>
Updating			<code>n2-standard-4</code>	4vCPU, 16GB RAM	

Plan	Supported Operation	Default Value	Allowed Input	Virtual Machine Size
			n2-standard-8	8vCPU, 32GB RAM
			n2-standard-16	16vCPU, 64GB RAM
			n2-standard-32	32vCPU, 128GB RAM
			n2-standard-48	48vCPU, 192B RAM
Microsoft Azure	Provisioning	Standard_D2s_v5	Standard_D2s_v5	2vCPU, 8GB RAM
technical name: azure	Updating		Standard_D4s_v5	4vCPU, 16GB RAM
			Standard_D8s_v5	8vCPU, 32GB RAM
			Standard_D16s_v5	16vCPU, 64GB RAM
			Standard_D32s_v5	32vCPU, 128GB RAM
			Standard_D48s_v5	48vCPU, 192GB RAM
			Standard_D64s_v5	64vCPU, 256GB RAM
			Standard_D4_v3	4vCPU, 16GB RAM
			Standard_D8_v3	8vCPU, 32GB RAM
			Standard_D16_v3	16vCPU, 64GB RAM
			Standard_D32_v3	32vCPU, 128GB RAM
			Standard_D48_v3	48vCPU, 192GB RAM
			Standard_D64_v3	64vCPU, 256GB RAM
Azure Lite	Provisioning	Standard_D4s_v5	Standard_D4s_v5	4vCPU, 16GB RAM
technical name: azure_lite	Updating		Standard_D4_v3	4vCPU, 16GB RAM

Here is an example of the input for the *Machine Type* parameter:

```
"machineType" : "m5.xlarge"
```

## Modules

With the *Modules* (`modules`) object, you can define which Kyma modules you want to provision in your cluster. You can also use it to create a cluster without any modules.

### Note

API for module configuration is built on the `oneOf` feature from the JSON schema. If the `modules` object is passed to API, it must have only one valid option: *Default* (`default`) or *Custom* (`list`). Even if you remove the `modules` object from the JSON schema, the default Kyma modules are provisioned in your cluster.

### → Remember

The parameters marked with an asterisk "\*" are mandatory.

#### Modules Parameters

Nested Parameter	Description	Supported Operation	Default Value
<i>Default</i> btp CLI parameter: <code>default</code> type: boolean	Defines whether to use the default list of Kyma modules. Check the <a href="#">Default Kyma Modules</a> to find out which modules are in the default modules list.	Provisioning	<code>true</code>
<i>Custom</i> btp CLI parameter: <code>list</code> type: array of objects	Defines a custom list of Kyma modules. Leave your custom list of Kyma modules empty if you don't want any modules provisioned.	Provisioning	<code>[]</code> (empty array)

The *Custom* (`list`) parameter includes three nested parameters: *Name\**, *Channel*, and *Custom Resource Policy*.

#### Custom list Parameters

Nested Parameter	Description	Supported Operation	Default Value
<i>Name*</i> btp CLI parameter: <code>name</code> type: string	Look up the available Kyma modules and their technical names at <a href="#">Kyma Modules [page 57]</a> .	Provisioning	n/a
<i>Channel</i> btp CLI parameter: <code>channel</code> type: string	Defines the preferred release channel. The default is <code>regular</code> . The other option is <code>fast</code> .	Provisioning	<code>""</code> (an empty string)

Nested Parameter	Description	Supported Operation	Default Value
<a href="#">Custom Resource Policy</a> btp CLI parameter: customResourcePolicy type: string	Defines how a module's custom resource configuration is handled during enablement and reconciliation.  By default, it is set to CreateAndDelete and allows the creation or deletion of a module's resource.  If you set it to Ignore, a module's resource is not created.	Provisioning	"" (an empty string)

You have the default Kyma modules provisioned in your cluster if you do not provide the `modules` object in the JSON payload, or if you use the following input:

```
"modules": {
  "default": true
}
```

Here is an example of JSON input for a custom list of Kyma modules:

```
"modules": {
  "list": [
    {
      "name": "btp-operator"
    },
    {
      "name": "keda",
      "customResourcePolicy": "CreateAndDelete",
      "channel": "fast"
    }
  ]
}
```

Applying the following values results in Kyma runtime provisioning without any Kyma modules.

```
"modules": {
  "list": []
}
```

```
"modules": {
  "default": false
}
```

## Networking

The [Networking](#) (`networking`) object provides networking configuration. These values are immutable and cannot be updated later.

## → Remember

The parameters marked with an asterisk "\*" are mandatory.

### Networking Parameters

Nested Parameter	Description	Supported Operation	Default Value	Allowed Input
<i>CIDR range for nodes</i> *	Defines a custom IP range for worker nodes.	Provisioning	10.250.0.0/22	CIDR range for nodes must not overlap with the following CIDRs: 10.96.0.0/13, 10.104.0.0/13, 10.243.128.0/17, 10.242.0.0/16, 10.243.0.0/17, 10.64.0.0/11, 10.254.0.0/16, 10.243.0.0/16
btp CLI parameter: nodes				
type: string				

Here is the default JSON input for *CIDR range for nodes*:

```
"networking": {  
  "nodes": "10.250.0.0/22"  
}
```

## OpenID Connect (OIDC)

The *OpenID Connect* (`oidc`) object allows you to provide OIDC configuration. If you do not provide the `oidc` object or any custom values in the provisioning request, the default OIDC configuration is used. If you do not provide the `oidc` object in the update request or leave all object's properties empty, the saved OIDC configuration remains unchanged.

## → Remember

The parameters marked with an asterisk "\*" are mandatory.

### OIDC Parameters

Nested Parameter	Description	Supported Operation	Default Value	Allowed Input
<i>Client ID</i> *	The client ID for the OpenID Connect client.	Provisioning	n/a	n/a
btp CLI parameter: clientID		Updating		
type: string				

Nested Parameter	Description	Supported Operation	Default Value	Allowed Input
<i>Issuer URL*</i> btp CLI parameter: is-suerURL type: string	Provides the URL of the OpenID issuer.	Provisioning Updating	n/a	n/a
<i>Groups Claim</i> btp CLI parameter: groupsClaim type: string	If provided, specifies the name of a custom OIDC claim for specifying user groups.	Provisioning Updating	groups	n/a
<i>Username Claim</i> btp CLI parameter: usernameClaim type: string	Provides the OpenID claim to use as the user name.	Provisioning Updating	n/a	Only HTTPS scheme is accepted.
<i>Signing Algs</i> btp CLI parameter: signingAlgs type: array	Provides the OIDC signing algorithms for Kyma runtime.	Provisioning Updating	RS256	Comma separated list of allowed JOSE asymmetric signing algorithms, for example, RS256, ES256.
<i>Username Prefix</i> btp CLI parameter: usernamePrefix type: string	Provides an OIDC user-name prefix for Kyma runtime.	Provisioning Updating	If not provided, user-name claims other than an email address are prefixed by the issuer URL to avoid clashes.	To skip any prefixing, provide the value "-" (dash character without additional characters).

The following example shows the default configuration of the *OIDC* parameter. When you want to revert your changes to the default settings, copy and paste the following values:

```
"oidc": {
  "clientID": "12b13a26-d993-4d0c-aa08-5f5852bbdff6",
  "groupsClaim": "groups",
  "issuerURL": "https://kyma.accounts.ondemand.com",
  "signingAlgs": ["RS256"],
  "usernameClaim": "sub",
  "usernamePrefix": "-"
}
```

## Region\*

*Region\** (*region*) is a mandatory string parameter, which defines a region where your cluster runs.

## Region Parameter

Plan	Supported Operation	Region Technical Key	Region Name
Amazon Web Services technical name: <code>aws</code> Free technical name: <code>free</code>	Provisioning	<code>eu-central-1</code>	Europe (Frankfurt)
		<code>eu-west-2</code>	Europe (London)
		<code>ca-central-1</code>	Canada (Montreal)
		<code>sa-east-1</code>	Brazil (São Paulo)
		<code>us-east-1</code>	US East (VA)
		<code>us-west-1</code>	US West (N. California)
		<code>ap-northeast-1</code>	Japan (Tokyo)
		<code>ap-northeast-2</code>	South Korea (Seoul)
		<code>ap-south-1</code>	India (Mumbai)
		<code>ap-southeast-1</code>	Singapore
Google Cloud technical name: <code>gcp</code>	Provisioning	<code>ap-southeast-2</code>	Australia (Sydney)
		<code>europa-west3</code>	Europe (Frankfurt)
		<code>asia-south1</code>	India (Mumbai)
		<code>us-central1</code>	US Central (IA)
		<code>asia-northeast2</code>	Japan (Osaka)
Microsoft Azure technical name: <code>azure</code> Azure Lite technical name: <code>azure_lite</code>	Provisioning	<code>me-central2</code>	KSA (Dammam)
		<code>eastus</code>	US East (VA)
		<code>centralus</code>	US Central (IA)
		<code>westus2</code>	US West (WA)
		<code>uksouth</code>	UK South (London)
		<code>northeurope</code>	North EU (Ireland)
		<code>westeurope</code>	Europe (Netherlands)
		<code>japaneast</code>	Japan (Tokyo)
		<code>southeastasia</code>	Singapore
<code>australiaeast</code>	Australia (Sydney)		

Here is an example of the JSON input for the [Region](#) parameter:

```
"region": "us-east-1"
```

## 6.4.4 Add and Delete a Kyma Module

To use a Kyma module, you must add it first. Use Kyma dashboard or Kyma CLI to do that. If you don't need the module anymore, delete it to save resources.

### 6.4.4.1 Add and Delete a Kyma Module Using Kyma Dashboard

Use Kyma dashboard to add and delete a Kyma module in the release channel of your choice.

#### Context

Follow this procedure to easily add a module from the dashboard's *Cluster Details* view.

#### Procedure

1. Log in to Kyma dashboard. The URL is in the *Overview* section of your subaccount.
2. Choose *Modify Modules*, and select *Edit*.
3. In *Kyma Default Channel*, you can change the release channel for all your modules at the Kyma custom resource (CR) level, or keep the default one.

#### Note

By default, Kyma modules are part of the regular channel. It allows for delivering the modules at a slower, predictable rate for production environments with minimal disturbance. You can change to the fast channel that offers the latest technical updates and features at a quicker pace. For more information about the release channels, see [Kyma Release Channels](#).

4. In the *Modules* section, check the modules you want to add.
5. **Optional:** At the module level, you can overwrite the release channel for the current module by choosing the available channel.
6. Select *Save*.

## Results

This process may take a while, depending on the number of modules. The operation was successful when the module status changes to `READY`.

## Next Steps

- To configure your module, use the module CR that you can find in the module repository.
- To delete a module, select [Edit](#) in [Modify Modules](#), uncheck the modules you want to delete, and choose [Save](#).

## 6.4.4.2 Add and Delete a Kyma Module Using Kyma CLI

Use Kyma CLI to add or delete a Kyma module in the release channel of your choice.

## Context

To add a module using [Kyma CLI](#) , perform the following steps:

## Procedure

1. Check which modules are available on your cluster. Run:

```
kyma alpha list module
```

You should get a result similar to this example:

```
operator.kyma-project.io/module-name   Domain Name (FQDN)
Channel      Version      Template      State
v0.0.24     cluster-ip   kyma-project.io/cluster-ip   fast
v0.0.24     kyma-system/moduletemplate-cluster-ip-fast <no value>
```

2. Add a module on your cluster in the release channel of your choice. Run:

```
kyma alpha add module {MODULE_NAME} --channel {CHANNEL_NAME} --kyma-name
default --wait
```

You should see the following message:

```
- Successfully connected to cluster
- Modules patched!
```

## Next Steps

- To configure your module, use the module CR that you can find in the module repository.
- To delete a module, run:

```
kyma alpha delete module {MODULE_NAME} --kyma-name default
```

## Related Information

[Kyma Modules \[page 57\]](#)

<https://github.com/kyma-project/cli> 

## 6.4.5 Assign Roles in the Kyma Environment

Kyma uses roles to manage access within the cluster, which give the assigned users the permissions suitable for their purposes.

### Prerequisites

The `cluster-admin` role is assigned to your account.

#### Note

After creating a Kyma cluster, you become an admin of this instance and the `cluster-admin` role is assigned to you by default. As the `cluster-admin`, you can assign roles to other users. Only the administrator who created the current subaccount can use the SAP BTP cockpit to assign the `cluster-admin` role to other members.

### Context

You can assign roles to a group of users only if you use a custom identity provider. Assigning roles in Kyma is based on the Kubernetes [role-based access control](#)  (RBAC). You can see the list of available roles in Kyma dashboard when you create a Role Binding. Once you become the admin, your user name is read from the SAP BTP (RBAC) concept and is passed to the Kyma provisioner to be bound to the `cluster-admin` role in Kyma.

## Procedure

1. Log in to Kyma dashboard. The URL is in the [Overview](#) section of your subaccount.
2. In Kyma dashboard, select or create the namespace in which you want to assign roles.
3. To create a role binding, go to ► [Configuration](#) ► [Role Bindings](#) ► [+ Create Role Binding](#) ►. Fill in the required fields:
  - a. As *Name*, insert the name of your binding.
  - b. As *Role Type*, choose *ClusterRole*.
  - c. As *Role*, choose the required role from the list.
  - d. As *Kind*, choose *User*.
  - e. As *User name*, insert the user email address.
4. Select [Create](#).

## Results

The users have the required permissions within the specified namespace. If the users don't have additional Cluster Role Binding to list the namespaces, they can still access the Kyma dashboard overview but must enter the required namespace name manually.

## Next Steps

If the permissions of the default role aren't sufficient, clone the role and add the missing resources.

## Related Information

[Role-Based Access Control \(RBAC\) in Kyma](#)

### 6.4.5.1 Overwrite Kyma Administrators

In some cases, you may need to overwrite usernames of the current administrators, for example, if they forget their password or leave the organization and nobody can access your Kyma runtime.

## Prerequisites

- You're the subaccount administrator.

## Context

To overwrite the names for the `cluster-admin` role, update the Kyma instance and provide a new value for the `administrators` field.

### ⚠ Caution

This procedure overwrites current administrators and shouldn't be used to add new ones. Treat it as an emergency self-service procedure in case of lost access. To provide access to new users, the `cluster-admin` should create a `RoleBinding` and/or a `ClusterRoleBinding` in the runtime. See [RoleBinding and ClusterRoleBinding](#) in the official Kubernetes documentation.

## Procedure

1. In the SAP BTP cockpit, go to your Kyma instance and select [Update](#).
2. Provide a new set of administrators' usernames as an array of strings.

### → Remember

Use administrators' email addresses as their usernames.

In a JSON file, use the following structure:

```
"administrators": [  
  "example_1@mail.com",  
  "example_2@mail.com",  
  "example_3@mail.com"  
]
```

3. Click [Update](#).

## Results

Your Kyma instance is updated with the new administrators' usernames.

## Related Information

[Provisioning and Updating Parameters in the Kyma Environment \[page 2755\]](#)

## 6.4.6 Access Kyma Application Logs

Get insights into your applications, microservices, and Functions by viewing the respective logs. To check out real-time logs immediately, use the Kubernetes functionalities - either in Kyma dashboard, or with kubectl.

### Context

- If you prefer to see the logs in your terminal, replace the placeholders in the following command and run it:

```
kubectl logs <{POD_NAME}> --namespace <{NAMESPACE_NAME}> --container  
<{CONTAINER_NAME}>
```

- To see real-time logs in Kyma dashboard, follow these steps:

### Procedure

1. Open Kyma dashboard and select the namespace.
2. Access the Pod.
3. Find the container and select [View Logs](#).

### Results

You have access to short-term logs of every container in your Kyma runtime.

### Next Steps

#### → Recommendation

If you want long-term storage of logs with advanced querying, dashboarding, and alerting capabilities, set up SAP Cloud Logging to ingest observability data with Kyma runtime.

### Related Information

[Auditing and Logging Information in Kyma \[page 2856\]](#)

[Create an SAP Cloud Logging Instance through SAP BTP Service Operator](#)

[SAP Cloud Logging: Ingest via Kyma Runtime](#)

## 6.4.7 Kyma Environment Backup

The user load on a Kyma cluster typically consists of various Kubernetes objects and volumes. The object backup process is automated, but you need to take care of volume backups so you can recover your customer data.

### Object Backup for Kubernetes Configuration

Kyma environment relies on the managed Kubernetes cluster for periodic backups of Kubernetes objects. Automatic backup doesn't include Kubernetes volumes.

For example, project "Gardener" uses etcd as the Kubernetes' backing store for all cluster data. This means that all Kubernetes objects are stored on etcd. Gardener uses periodic jobs to take major and minor snapshots of the etcd database. A major snapshot (including all the resources) takes place every day, and each minor snapshot (including only the changes in between) takes place every 5 minutes. If the etcd database experiences any problems, Gardener automatically restores the Kubernetes cluster using the latest snapshot.

### Volume Backup for Customer Data

Your customer data isn't backed up automatically. If you're using Kubernetes volumes to store data, we recommend that you use Kubernetes VolumeSnapshots to backup and recover your data. The backup and recovery using Kubernetes VolumeSnapshots are supported for AWS, Azure, and Google Cloud.

### Related Information

[Kyma: Create on-demand volume snapshots](#) 

[Change Storage Size in Kyma \[page 2774\]](#)

## 6.4.8 Kyma Modules' Sizing

The following tables show the resource consumption, such as memory, CPU, and storage, of Kyma modules.

### API Gateway

API Gateway Module's Sizing

Infrastructure size	Memory	CPU
Small cluster minimum	212Mi	0.03
Large cluster minimum	416Mi	0.34

### Istio

Istio Module's Sizing

Infrastructure size	Memory	CPU
Small cluster minimum	352Mi	0.08
Large cluster minimum	1984Mi	0.61

### Application Connector

Application Connector Module's Sizing

Infrastructure size	Memory	CPU
Minimum	64-128Mi	0.2-0.5

### SAP BTP Operator

SAP BTP Operator Module's Sizing

Infrastructure size	Memory	CPU
Minimum	53Mi	0.02
Maximum	328Mi	0.45

## Keda

Keda Module's Sizing

Infrastructure size	Memory	CPU
Minimum	692Mi	0.62
Maximum	928Mi	1.8

## Serverless

Serverless Module's Sizing

Infrastructure size	Memory	CPU	Storage
Minimum	400Mi	0.03	
Maximum	2300Mi	1.7	Up to 20000Mi (for PVC for internal Docker registry)

## Telemetry

Using the Telemetry module without further API usage results in the Telemetry Manager running with the footprint of:

Infrastructure size	Memory	CPU
Minimum	5Mi	0.01
Maximum	100Mi	0.1

Activation of the first LogPipeline will cause the deployment of the log agent running an instance per node:

Infrastructure size	Memory	CPU
Minimum per node	50Mi	0.1
Maximum per node	1000Mi	1

Activation of the first TracePipeline will cause the deployment of the trace gateway running with two replicas:

Infrastructure size	Memory	CPU
Minimum	2*32Mi	2*0.2
Maximum	2*2000Mi	2*1.2

Activation of the first MetricPipeline will cause the deployment of the metric gateway running with two replicas and the metric agent running per node:

Infrastructure size	Memory	CPU
Minimum	2*30Mi + 50Mi per node	2*0.01 + 0.01 per node
Maximum	2*1000Mi + 1200Mi per node	2*1.00 + 1 per node

## NATS

By default, the NATS module creates a NATS-cluster with three nodes for data safety reasons. The values are given per NATS-cluster node:

NATS Module's Sizing

Infrastructure size	Memory	CPU	Storage
Minimum	64Mi	0.04	1000Mi
Maximum	1000Mi	0.5	1000Mi

## Eventing

Eventing Manager's Sizing

Infrastructure size	Memory	CPU
Minimum	128Mi	0.01
Maximum	512Mi	0.5

Eventing Publisher Proxy's Sizing

Infrastructure size	Memory	CPU	Max Publisher instances
Low EPS (up to 200 Events per second)	64-512Mi	0.04-0.5	2 (second instance for high availability)
High EPS (up to 3000 Events per second)	64-512Mi	0.04-0.5	3

## Related Information

[Sizing](#)

## 6.4.9 Change Storage Size in Kyma

If the amount of data for the applications in your Kyma environment grows, you can expand the storage size for your customer data by resizing the respective Persistent Volume Claim (PVC).

### Prerequisites

- Your user has the authorizations to change PVC resources.
- Your workload uses a Persistent Volume, managed by a PVC.

### Context

In a Kubernetes cluster, your customer data is stored in volumes. A “Persistent Volume Claim” (PVC) manages that volume for you and defines the size of storage. As the amount of customer data grows, you must adjust the PVC accordingly.

### Procedure

1. Go to Kyma dashboard and select the correct namespace and workload.
2. Find the PVC you want to resize and enter the desired new size of the volume.
3. Save your changes.

The PVC shows the condition type *Resizing*. Wait until the PVC switches to condition type *FileSystemResizePending*. This may take a few minutes.

4. Restart your workload by restarting all related Pods.

### Results

The storage size for your customer data has been adjusted to your needs.

### Next Steps

Remember to back up your customer data.

## Related Information

[Kubernetes: Expanding Persistent Volumes Claims](#) 

[Kyma Environment Backup \[page 2770\]](#)

# 7 Security

Use the security features and functions of SAP BTP to support the security policies of your organization.

## Security Recommendations

We provide a list with our recommendations for the configuration of our services. These recommendations help you to meet your compliance goals and secure your business.

See [SAP BTP Security Recommendations](#).

Our customer success organization, uses these recommendations as a base to create a security baseline template.

For more information, go to <https://support.sap.com/sos> and choose ► [Media Library](#) ► [SAP CoE Security Services - Security Baseline Template](#) ►.

## User Model

SAP BTP distinguishes between **platform users** (account management, custom development, and operations) and **business users** (for the applications).

See [User and Member Management \[page 85\]](#).

## Authorizations

You can configure authorizations using **roles** and **role collections** for your global account, subaccount, directory, or individual applications.

See [Security Administration: Managing Authentication and Authorization \[page 2012\]](#).

## Identity Providers

All users of SAP BTP are stored in identity providers, either in the default or in a custom identity provider. SAP BTP needs a copy of the user, sometimes called a shadow user. You assign the shadow user authorizations to access resources in SAP BTP. When a user authenticates, SAP BTP forwards the request to the identity provider.

For more information, see [Trust and Federation with Identity Providers \[page 2014\]](#).

### Note

For China (Shanghai) region, a different default identity provider is used.

For more information, see this [blog article](#) on *SAP Community*.

## Default Identity Provider

We provide a default identity provider for both platform users and business users (in applications) at SAP BTP. The default identity provider enables single sign-on to your SAP applications and services.

Use the default identity provider as a preconfigured user store in your starter scenarios or for testing. You can also use the default identity provider as a backup identity provider if access to your custom identity provider fails.

See [Default Identity Provider \[page 2072\]](#).

## Identity Authentication Service

Identity Authentication service provides authentication and single sign-on in the cloud.

We recommend that you configure the Identity Authentication service as the identity provider and connect Identity Authentication to your own corporate identity provider. Identity Authentication provides features that the default identity provider doesn't, such as the ability to connect your corporate identity provider or to define security policies.

See [Trust and Federation with Identity Providers \[page 2014\]](#).

For more information about Identity Authentication, see [SAP Cloud Identity Services - Identity Authentication](#).

## Transport Layer Security (TLS) Connectivity Support

SAP BTP uses encrypted communication channels based on HTTPS/TLS, supporting TLS version 1.2 or higher.

### Note

TLS versions 1.0 and 1.1 are no longer supported.

Make sure you use HTTP clients (such as web browsers) that support TLS version 1.2 or higher for connecting to SAP BTP.

### Note

You can optionally use TLS 1.3 in the Custom Domain Manager. This option allows the use of TLS 1.3 with applications running on SAP BTP. It's not allowed to use TLS 1.3, for example for the SAP BTP cockpit or SAP Cloud Identity Services. These services are still using TLS 1.2.

See [What Is Custom Domain?](#).

## Audit Logging

Use the Audit Log Retrieval API to view the audit logs stored for your subaccount. Use the audit log viewer to display the audit logs for your Cloud Foundry account, produced by SAP applications and services you've subscribed to. See [Audit Logging in the Cloud Foundry Environment \[page 2303\]](#).

## Credential Store

SAP Credential Store provides a repository for passwords and keys for applications that are running on SAP BTP, Cloud Foundry environment. It enables the applications to retrieve credentials and use them for authentication to external services, or to perform cryptographic operations and TLS communication.

See [SAP Credential Store](#).

## Malware Scanning

Use SAP Malware Scanning service to scan business documents for malware. Integrate this service with your custom-developed apps running on the Cloud Foundry runtime. When your apps upload business documents, your apps can call the SAP Malware Scanning service to check for viruses or other malware.

For more information, see [SAP Malware Scanning Service](#).

## 7.1 SAP Authorization and Trust Management Service

The global account and subaccounts get their users from identity providers. Administrators make sure that users can only access their dedicated subaccount by making sure that there is a dedicated trust relationship

only between the identity providers and the respective subaccounts. Developers configure and deploy application-based security artifacts containing authorizations, and administrators assign these authorizations using the SAP BTP cockpit.

### Note

Before you start, make yourself familiar with the sections about authentication and authorization of the SAP BTP Planning and Lifecycle-Management Guide. See the [Setting Up Your Security and Compliance Model](#) section.

## Principal Propagation

Exchange user ID information between systems or environments in SAP BTP.

### In This Section

- [Principal Propagation from the Cloud Foundry to the Neo Environment \[page 2831\]](#)
- [Principal Propagation from the Neo to the Cloud Foundry Environment \[page 2824\]](#)

### Other Principal Propagation Scenarios

- [On-Premise User Store](#)
- [Principal Propagation to OAuth-Protected Applications](#)
- [Connectivity in the Cloud Foundry Environment: Principal Propagation](#)
- [Connectivity in the Neo Environment: Principal Propagation](#)

## Trust and Federation

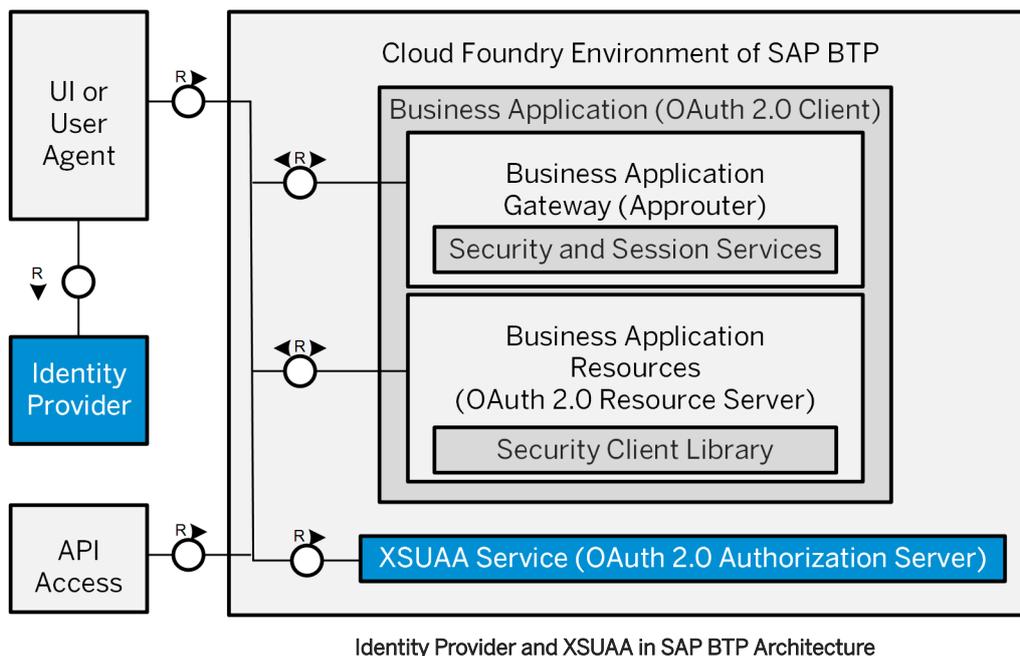

When setting up accounts you need to assign users. While we provide you with your first users to get you started, your organization has identity providers that you want to integrate.

SAP BTP supports identity federation, a concept of linking and reusing digital identities of a user base across loosely coupled systems. Identity federation frees applications on SAP BTP as well as the platform itself from the need to obtain and store the credentials of users and to authenticate them. Instead, the user base is reused from identity providers, which support the administration of digital user identities, authentication, and authorizations in a centralized and decoupled manner. To enable communication between SAP BTP and identity providers, you must cross-configure the communication endpoints of the involved systems, establishing a trust relationship between them.

## → Recommendation

We recommend that you always use SAP Cloud Identity Services - Identity Authentication as single identity provider for SAP BTP. If you use corporate identity providers, connect them to your Identity Authentication tenant, which then acts as a hub. We especially recommend this if you are using multiple corporate identity providers. For platform users, the use of SAP Cloud Identity Services - Identity Authentication is mandatory.

For more information, see [Corporate Identity Providers](#) and [Configure Conditional Authentication for an Application](#) in [What Is Identity Authentication](#) and [SAP Cloud Identity Services - Identity Authentication](#)

Identity Provider and XSUAA in SAP BTP Architecture

Identity Authentication is a multitenancy-enabled identity provider and authentication service for all applications powered by SAP BTP and optionally on-premise applications. The service provides capabilities for authentication, single sign-on, and on-premise integration as well as self-services like self-registration or password reset — for both the employees and the partners and customers of your organization. For administrators, the service offers features for user management and reporting capabilities in the administration console.

SAP has its own Identity Authentication tenant, SAP ID service. SAP ID service is the default identity provider of SAP BTP and where you register to get initial access to SAP BTP. Trust to SAP ID service is preconfigured by default.

We recommend that you request your own Identity Authentication tenant (see [Getting a Tenant](#)), but you can also use any other identity provider. To establish trust with your identity provider, perform one of the following procedures.

For business users:

- [Establish Trust and Federation Between SAP Authorization and Trust Management Service and Identity Authentication \[page 2015\]](#)
- [Manually Establish Trust and Federation Between SAP Authorization and Trust Management Service and Identity Authentication \[page 2035\]](#)

- [Establish Trust and Federation with UAA Using Any SAML Identity Provider \[page 2039\]](#)

For platform users:

- [Establish Trust and Federation of Custom Identity Providers for Platform Users in Multi-Environment Subaccounts \[Feature Set A\] \[page 2050\]](#)

For default identity provider:

- [Default Identity Provider](#)

### Note

How you assign users to their authorizations depends on the type of trust configuration. If you're using the default trust configuration via SAP ID service, you can assign users directly to role collections. For more information, see [Default Identity Provider \[page 2072\]](#).

However, if you're using a custom trust configuration as described in this topic, you can assign individual users or groups to role collections. Assigning users to their authorizations is part of application administration, which is described here. For more information, see [Mapping Role Collections in the Subaccount \[page 2094\]](#).

## Administration: Managing Authentication and Authorization

In the Cloud Foundry environment, application developers create and deploy application-based authorization artifacts for business users. Administrators use this information to assign roles, build role collections, and assign these collections to business users or user groups. In this way, they control the users' permissions.

Setting Up Authorization Artifacts (Administrators)

Task	User Role	Tool
Use an existing role or create a new one using role templates <a href="#">Add Roles to Role Collections on the Application Level [page 2107]</a>	Administrator of the Cloud Foundry environment	SAP BTP cockpit  Command line interface for SAP BTP

## Troubleshooting

This section provides information on troubleshooting-related activities for the SAP Authorization and Trust Management service in the Cloud Foundry environment.

### → Tip

We also recommend that you regularly check the SAP Notes and Knowledge Base for component `BC-CP-CF-SEC-IAM` in the [SAP Support Portal](#). These contain information about program corrections and provide additional information.

To help you troubleshoot your issue, we also recommend increasing the log verbosity of your application and application router. We provide a [script](#) to help you. If for some reason you can't use this script, increase the log verbosity manually, see related link.

To troubleshoot problems with tokens from Identity Authentication, see [Logging OpenID Connect Tokens](#) in the documentation for Identity Authentication.

Our troubleshooting information can be found in our Guided Answers [Troubleshooting for the SAP Authorization and Trust Management service in the Cloud Foundry environment](#). Guided Answers are a specialized format to guide you step by step through troubleshooting topics. Check the individual troubleshooting topics for your error message. If you can't find your problem, create an incident in the component `BC-CP-CF-SEC-IAM`. For more information, see the related link.

## Adding Authentication and Authorization

Developers create authorization information for business users in their environment and deploy this information in an application. They make this available to administrators, who complete the authorization setup and assign the authorizations to business users.

Developers store authorization information as design-time role templates in the `xs-security.json` security descriptor file. Using the cockpit, administrators of the environment assign the authorizations to business users.

The following sections contain the process of adding authentication and authorization checks for protecting your applications, links to a number of associated tutorials, extended tasks for creating authorization artifacts, as well as reference information, including the syntax required to set the properties and values defined in the application security descriptor file.

- [Protecting Your Application \[page 467\]](#)
- [Tutorials for the SAP Authorization and Trust Management Service \[page 493\]](#)
- [Application Security Descriptor Configuration Syntax \[page 511\]](#)

## Related Information

### 7.1.1 What Is the SAP Authorization and Trust Management Service?

Get a high-level overview of the concepts that underpin the SAP Authorization and Trust Management service for SAP BTP in the Cloud Foundry environment.

The SAP Authorization and Trust Management service lets you manage user authorizations and trust to identity providers. Identity providers are the user base for applications. We recommend that you use an IAS identity authentication tenant, an SAP on-premise system, or a custom corporate identity provider. User authorizations are managed using technical roles at the application level, which can be aggregated into business-level role collections for large-scale cloud scenarios.

## Environment

The SAP Authorization and Trust Management service is available for consumption in the following SAP BTP environments:

- Cloud Foundry
- Kyma
- Neo

### **Note**

This documentation refers to SAP BTP for multi-environment subaccounts.

If you're looking for documentation about the Neo environment, see [Authorization and Trust Management in the Neo Environment](#).

## Features

### **Use your corporate or a default IdP**

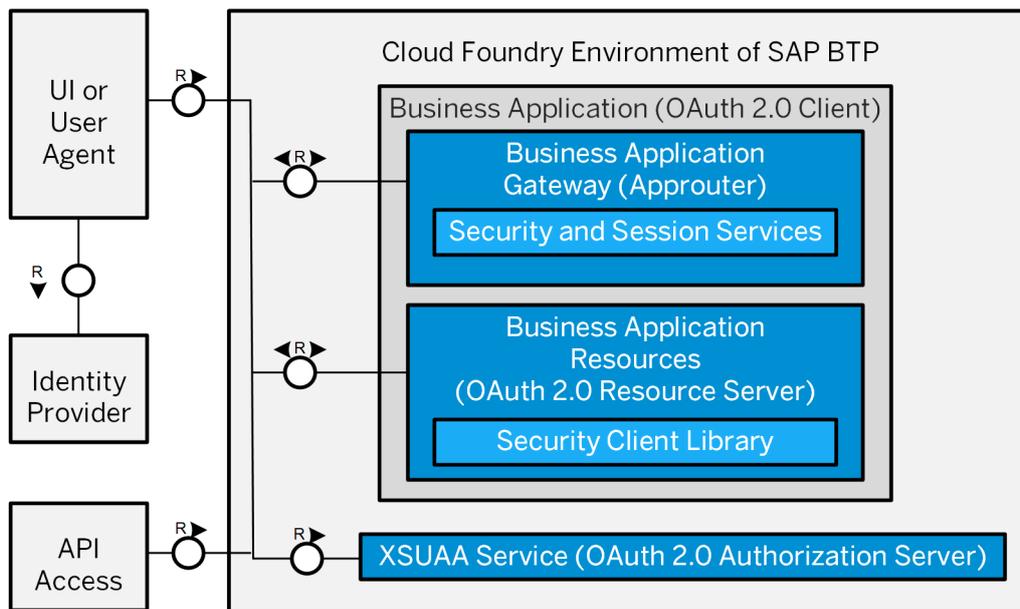

Enable user management for your applications by handling authentication to an external identity provider. Start with SAP ID service as a pre-configured easy-to-use identity provider. Switch to your corporate identity provider for customized user management.

### **Enable role-based access to applications**

Enable different privileges to users accessing your applications based on roles.

## Overview

The following figure shows a high-level overview of components, which comprise an SAP BTP business web applications and how these applications are embedded in the Cloud Foundry environment. Further details have been omitted for the sake of simplicity. It's further assumed that the Cloud Foundry environment is set up with basic configuration (that is, container-to-container networking isn't configured). The components and their interactions are depicted in the following block-diagram.

### Application, Microservice, and App

The components and their interactions are depicted in the previous block-diagram. It shows a runtime platform for business web applications. These are referred to as applications. An SAP BTP application is implemented in an architectural style that structures the application as a collection of loosely coupled components, termed microservices. Microservices can be deployed independently from one another. This eliminates the need to deploy the complete application if only a subset of its microservices have received new features or a bug fix. In the terminology of the Cloud Foundry environment of SAP BTP, microservices are referred to as apps.

### Application Architecture

The application consists of a distinct gateway app with at least one or more resource apps. The gateway serves as a reverse-proxy and provides functionality for security and session management. The application router app is a standard implementation of the gateway and is used as the single point-of-entry for the application. It also serves static content, initiates the authentication process, checks on cross-site request forgery (XSRF) attacks, and forwards requests to the resource apps while propagating user information.

The resource apps can use the security client library, which also provides security functionality. As stated in the previous section, all apps represent microservices, in the meaning of an app engineered and operated according to the 12-factor paradigm. All apps run in their dedicated runtime containers, which are hosted on the Cloud Foundry runtime platform.

### OAuth 2.0, Resource Owner, Client, Resource Server, and the SAP Authorization and Trust Management Service

The security functionality of SAP BTP is based on the OAuth 2.0 specification. OAuth 2.0 defines how a user - the OAuth 2.0 resource owner - can delegate all or a subset of the authorizations to a third-party application - the OAuth 2.0 client - without the third-party application needing to know the credentials of the user.

The Cloud Foundry environment uses a standard implementation of OAuth 2.0 to protect its platform resources (orgs, spaces, and platform operations on those entities).

However, the OAuth 2.0 specification is reused for SAP BTP with a proprietary implementation to protect the resources of business web applications powered by the Cloud Foundry environment. The proprietary implementation exchanges the responsibilities of the OAuth 2.0 entities, client and resource owner: the OAuth

2.0 client - represented by the application - holds all the authorizations. A set or sub-set of these authorizations is assigned to the user after authentication in the system. The application also acts as the OAuth 2.0 resource server because it contains the resource apps. All apps of an application operate under the same OAuth 2.0 client.

The SAP Authorization and Trust Management service (XSUAA) provides functionality for administrating and assigning application authorizations. It acts as the OAuth 2.0 authorization server and represents a typical reuse service. The SAP Authorization and Trust Management servicebroker creates a service instance for each application. Each app that wants to enforce authorizations with the security client library is then bound to this SAP Authorization and Trust Management serviceinstance of the corresponding application.

### Note

The Cloud Foundry environment also supports the following token grant types of Cloud Foundry.

- Authorization code grant
- Client credentials grant
- SAML 2.0 bearer grant

Refresh tokens are supported as well.

For more information, see the Cloud Foundry environment's API reference of the User Account and Authentication and the related link.

## Service, Service Broker, and Service Instance

A service is an app that includes service broker functionality. The service broker must implement the Open Service Broker API specification, for which the Cloud Foundry environment is a client. The service broker is responsible for advertising its service offerings and service plans to the Cloud Foundry environment of SAP BTP and acting on requests from the platform for provisioning, binding, unbinding, and deprovisioning.

A service instance represents a reserved resource and is an instantiation of a service offering for a service plan. The service offering is the advertisement of a service that the service broker supports. The service plan is a variant of the service offering and usually represents the costs and benefits of that plan.

The service broker binds the service instance to the consuming apps. The service binding contains information about the service (for example, URL, credentials), which the app uses to consume the service. Apps and services communicate with one another indirectly, using the Cloud Foundry router.

## Reuse Service, Backing Service

As a service is an app that includes service broker functionality, it can also run as a microservice component within an application. In this case, the service represents a reuse service. Services that don't represent components within applications, but rather run standalone, are referred to as backing services.

## Authentication Against Trusted Parties Only

The apps of the applications are accessed either using the UI of a user agent or the APIs that the app provides. All requests must first go through the Cloud Foundry router. Users of a user agent must first authenticate against a configured identity provider. The identity provider and the SAP Authorization and Trust Management service have a special trust relationship, which is established through crossover metadata configuration between the two systems (not depicted in the diagram above). Authentication is processed according to the SAML bearer assertion flow and initiated during the processing of the first request. A series of redirects leads to a request for authentication from the user agent towards the identity provider. After the user authenticates successfully, the identity provider responds with a SAML bearer assertion confirming the user's identity. This

SAML bearer assertion is presented to SAP Authorization and Trust Management service and the service determines the authorizations of that user. API clients receive their credentials directly from, and authenticate directly against, SAP Authorization and Trust Management service.

## JSON Web Tokens

A JSON web token (JWT) (according to RFC 7519) is an open standard that defines a compact token format for transmitting information between parties as a JSON object. This information can be verified and trusted because it is digitally signed. JWT tokens can be signed using a secret key pair (with HMAC algorithm) or a public/private key pair using RSA.

The JWT token contains header and claims information (for example, issuer, subject, expiration time, consumer-defined information), and is digitally signed with the private key of the authorization server (UAA service).

The cloud or business application has a trust relationship with the authorization server. The trust is configured in the `<VCAP_SERVICES>` environment variable for the application router and each microservice of the business application. `<VCAP_SERVICES>` contains a credentials string for the UAA, which is created by the respective service broker when the application router and/or the microservice is bound to the UAA service instance. The credentials string contains, among other things, the public key corresponding to the private key of the UAA. This public key is used to verify the token signature.

[Security in the Kyma Environment \[page 2849\]](#)

## 7.1.2 Web Access Control

The Cloud Foundry environment extends SAP BTP. It provides platform security functions such as business user authentication, authorization management, and other security functions for access to the applications in the runtime container. To access the runtime container, the business user can use a browser or a browser-based user interface.

The following diagram shows the architecture with the components that are responsible for business user authentication, authorization management, and security. It is not mandatory for applications to use the User Account and Authentication service and the application router.

The User Account and Authentication (UAA) component provides a programming model for business applications. It is the central infrastructure component of the runtime platform for business user authentication and authorization management. The users can be stored in the following identity providers:

- SAP ID service
- SAP Cloud Identity Services - Identity Authentication
- Any SAML 2.0 identity provider

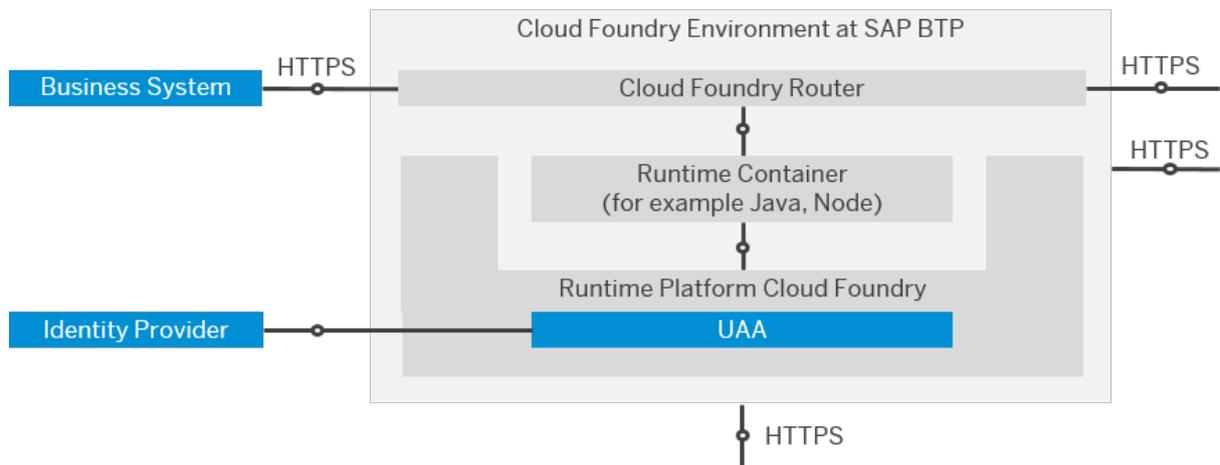

Applications authenticate using OAuth 2.0. When business users access an application, the application router acts as OAuth client and redirects their request to the OAuth authorization server for authentication (see the [Applications](#) section). Runtime containers act as resource servers, using the container security API of the relevant container (for example, Java) to validate the token issued by the OAuth authorization server.

### 7.1.3 API Access Control

The Cloud Foundry environment extends SAP BTP. It provides platform security functions such as business system authentication, authorization management, and other security functions to enable business systems to access the applications (for example, Java or Node.js) in the runtime container. Business systems use APIs to access the runtime container.

A business system uses APIs to directly access the resources in the runtime container.

The following diagram shows the architecture with the components that are responsible for business system authentication, authorization management, and security.

The User Account and Authentication (UAA) component is the central infrastructure component of the runtime platform for authentication and authorization management. The users can be stored in the following identity providers:

- Identity Authentication
- Any identity provider

Business system use APIs to directly access the resources in the runtime container. The UAA acts as an OAuth authorization server and issues an appropriate access token. It enables the business system to directly access an application in the runtime container. Runtime containers act as OAuth resource servers, using the container security API of the relevant container (for example, Java) to validate the token issued by the OAuth authorization server.

## 7.1.4 Authorization Entities

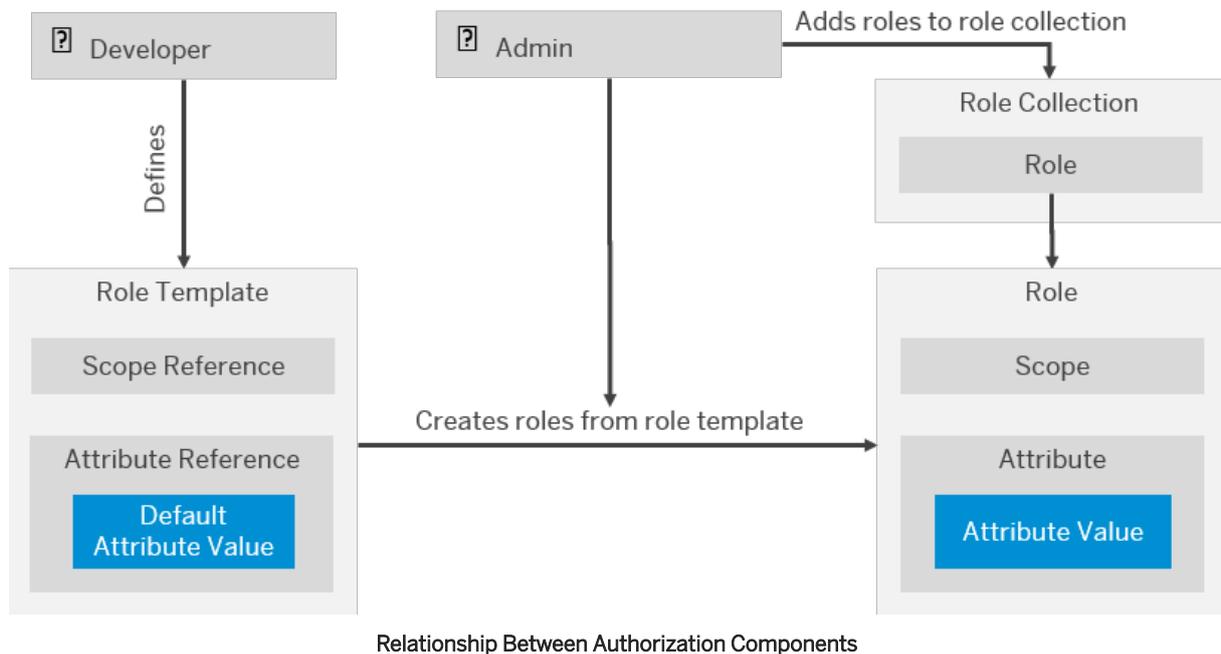

Business users in an application require different authorizations because they work in different jobs.

For example, in a leave request process, there are employees who want to create and submit leave requests, managers who approve or reject, and payroll administrators who need to see all approved leave requests to calculate the leave reserve. The authorization concept of a leave request application has to cover the needs of these employee groups. This authorization concept includes elements such as roles, scopes, and attributes.

A role is an instance of a role template; you can build a role based on a role template and assign the role to a role collection.

Role templates refer to attributes and scopes. The role templates contain the authorizations for activities, such as viewing, editing, or deleting data.

Information that is specific to the user is stored in attributes. For each attribute, administrators can specify the value that restricts data access. Static attributes are stored in the role, whereas in cases in which a custom identity provider provides the business users, you can dynamically reference all the attributes that come with the access token.

Relationship Between Authorization Components

## Scopes for Functional Authorization Checks

The application defines scopes, which describe the authorizations required by the application to execute functions such as editing, viewing, and deleting.

The application security descriptor file (`xs-security.json`) defines the scopes used by the application.

## Role Templates

A role template is a description of one or more roles (for example, employee or manager) and any attributes that apply to those roles.

If a role template contains attributes, the administrator must create different versions of the roles and fill in the attributes that are subject to customization; for example, one where country equals UK and another where country equals USA. This instantiates the role template. Else, the roles will have empty attributes (with no concrete values).

Role templates that contain only application-specific local scopes can be instantiated without the administrator having to do anything.

## Role Collections

Role collections reference role templates.

After the developer has created the role templates and deployed them to the relevant application, it's the administrator's task to use those role templates to build roles with the required attributes, aggregate the roles into role collections, and then assign the role collections to business users in the application.

## Attributes

Information retrieved from the user's identity (such as department or cost center) is stored in attributes. Attributes refine the authorizations of business users according to the attributes that come with the business users. For example, you can use static attribute values such as country equals USA, or dynamic attribute values from the access token or identity provider, such as group ID.

## 7.1.5 Monitoring and Troubleshooting

This section provides information on troubleshooting-related activities for the SAP Authorization and Trust Management service in the Cloud Foundry environment.

### → Tip

We also recommend that you regularly check the SAP Notes and Knowledge Base for component BC-CP-CF-SEC-IAM in the [SAP Support Portal](#). These contain information about program corrections and provide additional information.

To help you troubleshoot your issue, we also recommend increasing the log verbosity of your application and application router. We provide a [script](#) to help you. If for some reason you can't use this script, increase the log verbosity manually, see related link.

To troubleshoot problems with tokens from Identity Authentication, see [Logging OpenID Connect Tokens](#) in the documentation for Identity Authentication.

Our troubleshooting information can be found in our Guided Answers [Troubleshooting for the SAP Authorization and Trust Management service in the Cloud Foundry environment](#). Guided Answers are a specialized format to guide you step by step through troubleshooting topics. Check the individual troubleshooting topics for your error message. If you can't find your problem, create an incident in the component BC-CP-CF-SEC-IAM. For more information, see the related link.

### 7.1.5.1 Enable and Provide Application Logs

If there are authentication problems in your application, enable logging for the container security library in question, reproduce the problem, and attach the application logs. To obtain more details, set the environment variables for the application.

## Context

### → Tip

We also provide a [log collector script](#), that helps you to increase the log verbosity of your application and application router.

## Procedure

1. Open a command prompt.
2. Log on to your Cloud Foundry environment using the Cloud Foundry command line interface (CLI). For more information, see [Log On to the Cloud Foundry Environment Using the Cloud Foundry Command Line Interface \[page 2260\]](#).
3. Choose your organization.

### Note

The Cloud Foundry command line interface prompts you to choose an org. To find the org of your subaccount, use the SAP BTP cockpit to go to your subaccount. You find the org in the Cloud Foundry tile under *Organization* (see [Navigate to Orgs and Spaces \[page 2246\]](#)).

4. Choose the space where the application is located.
5. To route the log messages to the standard output, use the following command:

```
cf set-env <application_name> SAP_EXT_TRC stdout
```

### Example

```
cf set-env your-app SAP_EXT_TRC stdout
```

6. To set the log level, use the following command:

```
cf set-env <application_name> SAP_EXT_TRL 3
```

### Example

```
cf set-env your-app SAP_EXT_TRL 3
```

7. (For Node.js) To set detailed logs of the Security API for Node.js, use the following command:

```
cf set-env <application_name> DEBUG xssec*
```

### Example

```
cf set-env your-app DEBUG xssec*
```

8. Restage your application using the following command:

```
cf restage <application>
```

### Example

```
cf restage your-app
```

Restaging the application enables the display of the logs.

9. We recommend piping the output to a log file. Use the following command to do this:

```
cf logs <application> > <log_file_name>
```

### Example

```
cf logs your-app > your-app-log.txt
```

10. Reproduce the problem in your application. The events that occur in your application are logged in your local log file.

### Note

You can stop the recording of the log messages using `CTRL+C`. You can revert the environment variables using the following command:

```
cf unset-env <application> SAP_EXT_TRC
```

### ❖ Example

```
cf unset-env your-app SAP_EXT_TRC
```

Restage your application using the following command:

```
cf restage <application>
```

### ❖ Example

```
cf restage your-app
```

11. Use the [SAP Support Portal](#). For more information, see [Monitoring and Troubleshooting \[page 2793\]](#).
12. Attach the log files to the incident.

To obtain more details about the token validation, set the following environment variables of the container security library and Node.js (if applicable):

SAPSSOEXT Environment Variables

Environment Variables	Description
<code>SAP_EXT_TRC</code>	Enablement of logs
<code>SAP_EXT_TRL</code>	Log level ranging from off to high Values (integer): <ul style="list-style-type: none"><li>• 0 (off)</li><li>• 1 (default)</li><li>• 2 (medium)</li><li>• 3 (high)</li></ul>

Node.js Environment Variables

Environment Variables	Description
<code>DEBUG</code>	Detailed logs of the security API for Node.js Value (string): <code>xssec*</code>

## 7.1.5.2 Auditing and Logging Information for SAP Authorization and Trust Management Service

Here you can find a list of the security events that are logged by SAP Authorization and Trust Management service (XSUAA). These events are provided in addition to the events of the Cloud Foundry User Account and Authentication service (UAA).

## Security Events of the User Account and Authentication Service

For information about the security events of the UAA, see [UAA Audit Requirements](#) in the Cloud Foundry documentation.

## Security Events of the SAP Authorization and Trust Management Service

In cloud management tools feature set A, account management and role assignments, such as for the security administrator, are managed by SAP Authorization and Trust Management service in the Neo environment. For more information about audit logging in the Neo environment, see the related links at the end of this document.

In cloud management tools feature set B, SAP Authorization and Trust Management service uses role collections to handle account management.

SAP Authorization and Trust Management service records all its changes in its database tables and summarizes these changes in the audit log. The following table summarizes the audit log entries.

### Note

UNKNOWN\_USER in an audit log message is a placeholder, which usually appears when logs are written for flows that don't involve users, for example, client credential flows.

### Security Events Written in Audit Logs

Event grouping	What events are logged	How to identify related log events	Additional information
Identity provider management	Trust identity provider.	object with type "IdentityProvider" and id consisting of: crudType "CREATE"	Attributes of the identity provider.
		tableName "xs_tenant", crudType "UPDATE"	Trusting an identity provider using OpenID Connect triggers a change in the XSUAA tenant.
	Update trust with identity provider.	object with type "IdentityProvider" and id consisting of: crudType "UPDATE"	Old attributes of the identity provider and any attributes required to identify the changes.

Event grouping	What events are logged	How to identify related log events	Additional information
		<pre>tableName "xs_tenant", crudType "UPDATE"</pre>	Updating trust in an identity provider using OpenID Connect can trigger a change in the XSUAA tenant.
	Delete trust with identity provider.	<pre>object with type "IdentityProvider" and id consisting of: crudType "DELETE"</pre>	Attributes of the service instance.
		<pre>tableName "xs_tenant", crudType "UPDATE"</pre>	Removing trust in an identity provider using OpenID Connect triggers a change in the XSUAA tenant.
Instance management	Create instance.	<pre>Attribute with name "complete" and value "ServiceInstanceId : &lt;Instance_ID&gt; ... object with type "&lt;Instance_Name&gt;" and id consisting of: crudType "CREATE"</pre>	Attributes of the service instance.
	Update instance.	<pre>Attribute with name "complete" and value "ServiceInstanceId : &lt;Instance_ID&gt; ... object with type "&lt;Instance_Name&gt;" and id consisting of: crudType "UPDATE"</pre>	Old attributes of the service instance and any attributes required to identify the changes.

Event grouping	What events are logged	How to identify related log events	Additional information																												
	Delete instance.	Attribute with name "complete" and value "ServiceInstanceId": <code>&lt;Instance_ID&gt;</code>  ...  object with type " <code>&lt;Instance_Name&gt;</code> " and id consisting of: crudType "DELETE"	Attributes of the service instance.

## 7.1.6 Security Considerations for the SAP Authorization and Trust Management Service

Decisions you make when using or administrating the SAP Authorization and Trust Management service (XSUAA) can have an impact on the security of your applications. The information provided is meant to help you decide.

### Related Information

[Configuration Options for the SAP Authorization and Trust Management Service \[page 2808\]](#)

### 7.1.6.1 Implications of Using IFrames

By default, login pages of the SAP Authorization and Trust Management service can't be framed by other applications for security reasons.

As the security administrator of a subaccount, you can allow the embedding of the login page of the SAP Authorization and Trust Management service in an iFrame.

To configure the trusted domains, use one of the following methods:

- Enter trusted domains in SAP BTP cockpit.  
For more information, see [Configure Trusted Domains for SAP Authorization and Trust Management Service \[Feature Set B\] \[page 2129\]](#).
- Access the Security Settings API.

```
"iframeDomains": "https://store.example.com"
```

For more information, see [Security Settings API](#) on [SAP Business Accelerator Hub](#).

#### → Remember

To use iFrames with SAP Authorization and Trust Management service, configure the embedding of the login page of your identity provider. Not all identity providers support framing. This function only works if the identity provider supports framing and is configured, too.

To configure iFrames for SAP Cloud Identity Services - Identity Authentication, see [Configure Trusted Domains](#) in the Identity Authentication documentation.

When configured, the SAP Authorization and Trust Management service sends a content security policy header allowing framing of the login page of the service for the domains you specified.

For more information about content security policies, see the World Wide Web Consortium (W3C) recommendation [Content Security Policy](#).

This configuration has several security implications like:

- Clickjacking attacks on the login page as the URL of the login page isn't visible.

- JavaScript based cross site scripting vulnerabilities of older browser versions.
- 3rd party cookies are required when using different domains for authentication with the SAP Authorization and Trust Management service, the identity provider, and the application.

Ensure that no attacker can add malicious web pages or Javascript to any of the hosts allowed to frame the login page. This recommendation also includes hosts that act as reverse proxies, where an attacker can put their content on a different host behind the reverse proxy. Ensure that everything exposed by those framing hosts is safe.

## 7.1.6.2 Listing Allowed Redirect URIs

When developing your application, provide the list of the redirect URIs that the application needs when redirecting, for example during login or logout. Enter the list in the `redirect-uris` property of the application security descriptor (`xs-security.json`).

At runtime, the SAP Authorization and Trust Management service checks whether the redirect URI is listed in the property and rejects any other URIs. If your redirect isn't on this list, including wildcards, the service won't redirect users there.

The following is an example of a configuration of the `redirect-uris` property in an `xs-security.json`.

```
"oauth2-configuration": {
  ...
  "redirect-uris": [
    "https://myapplication.cfapps.eu10-004.hana.ondemand.com",
    "https://myapplication.cfapps.eu10-004.hana.ondemand.com/my/content",
    "https://myapplication.mydomain.com",
    "https://myapplication.mydomain.com/my/content "
  ],
  ...
}
```

### → Recommendation

Set the `redirect-uris` property to restrict access as much as possible.

We support explicit wildcards, namely domain relaxing and arbitrary paths. For example: `"https://*.mydomain.com/callback/**"`

### ⚠ Caution

If you use wildcards, we recommend that you make your URIs as specific as possible. By using wildcards, you open up the redirect for multiple websites. Wildcards increase the risk of redirecting to malicious websites.

### 📌 Note

In cloud landscapes, only `localhost` is always allowed by default as a redirect URI.

## Related Information

[Application Security Descriptor Configuration Syntax \[page 511\]](#)

[Configure Redirect URLs for Browser Logout \[page 501\]](#)

### 7.1.6.3 Rotating Secrets

By default, all bindings of a service instance of the SAP Authorization and Trust Management service share a single instance secret. (Exception: Service instances with the `apiaccess` plan use a secret per binding by default.) In the application security descriptor (`xs-security.json`), enable individual secrets for each binding of a service instance.

We recommend this configuration so that you can rotate the secret of a binding without affecting the other bindings of the service instance. We also recommend that you rotate secrets regularly.

For more information, see [Managing Secrets of the SAP Authorization and Trust Management Service \[page 2108\]](#).

```
"oauth2-configuration": {  
  ...  
  "credential-types": ["binding-secret"],  
  ...  
}
```

For more information about the application security descriptor, see [Application Security Descriptor Configuration Syntax \[page 511\]](#).

### 7.1.6.4 Setting Token Policy

By default, SAP Authorization and Trust Management service sets the validity of tokens as shown in the following table.

Default Validity of Tokens

Token Type	Validity
Access tokens	Default: 43200 seconds (12 hours)
Refresh tokens	Default: 604800 seconds (7 days)

On request, SAP Authorization and Trust Management service issues access and refresh tokens.

With a valid access token, you can access a protected resource. Once an access token expires, you can get new access tokens with a refresh token. Once the refresh token expires, you must reauthenticate and request new access and refresh tokens.

See also [Authorization](#) for information on how tokens affect authorizations.

## → Recommendation

Relaxing the token policy means that users reauthenticate less. However, increasing the token validity also means that if a malicious user manages to steal a token, that malicious user has access until the token expires. Keep token validity as short as possible, but not less than 30 minutes.

To change token validity, use one of the following methods:

- To target a specific instance of the service, change the values of the *token-validity* or *refresh-token-validity* parameters in the application security descriptor (`xs-security.json`).

```
"oauth2-configuration": {  
  ...  
  "token-validity": 1800,  
  "refresh-token-validity": 43200,  
  ...  
}
```

### ⓘ Note

This change applies to applications, which consume or subscribe to this instance. These values override the values set for the subaccount.

For more information about the application security descriptor, see [Application Security Descriptor Configuration Syntax \[page 511\]](#).

- To target the subaccount in general, access the Security Settings API.

```
"tokenPolicySettings": {  
  ...  
  "accessTokenValidity": 1800,  
  "refreshTokenValidity": 43200,  
  ...  
}
```

### ⓘ Note

This change applies to all service instances in the subaccount that haven't set a specific value in the application security descriptor (`xs-security.json`).

For more information, see [Security Settings API](#) on [SAP Business Accelerator Hub](#).

## 7.1.6.5 Access to REST APIs

The `apiaccess` plan provides administrator-level access to REST APIs of the SAP Authorization and Trust Management service. Ensure that only administrators have administrator access to Cloud Foundry spaces where service instances with this plan exist.

To use this service plan, create a separate Cloud Foundry space in your subaccount. Only assign administrator users the *Space Manager* and *Space Developer* roles in this space as well as the *Org Manager* role in the parent Cloud Foundry org. Use this Cloud Foundry space to create the `apiaccess` plan service instance.

Administrators are any SAP BTP cockpit users with the *User and Role Administrator* role. This role is part of the *Subaccount Administrator* role collection, but can be included in other role collections.

## Related Information

[About Roles in the Cloud Foundry Environment \[page 2244\]](#)

[Get Access to the APIs Using the apiaccess Service Plan \[page 2233\]](#)

[Default Role Collections of SAP BTP Cloud Foundry Environment \[Feature Set B\] \[page 2820\]](#)

### 7.1.6.6 Training Business Users How to Handle Session Timeouts

Administrators should make business users aware of a possible security risk after single logoff. A business user might get a message saying that this user is being logged off from the application although the identity provider session was not terminated.

The reason for this message comes from a timeout mismatch between the application and the SAP Authorization and Trust Management service. The timeout of the SAP Authorization and Trust Management service is currently 30 minutes. After the timeout, the SAP Authorization and Trust Management service does not forward the logoff request to the identity provider. This situation incurs a security risk.

#### → Recommendation

To remedy this security risk, advise the business users to access the application URL again, log on to the application, and log off right away, or log off directly from the identity provider.

### 7.1.7 Configuration Options for the SAP Authorization and Trust Management Service

The following configuration options enable you to manipulate the operation of the SAP Authorization and Trust Management service (XSUAA). Set these options in the application security descriptor (`xs-security.json`) at design time for your application.

## Related Information

[Security Considerations for the SAP Authorization and Trust Management Service \[page 2804\]](#)

## 7.1.7.1 Disabling System Attributes

Access tokens can become overloaded with too many SAML group or role collection attributes. By default, the SAP Authorization and Trust Management service includes all system attributes in the tokens the service issues.

If the number of attributes cause the token size to exceed 16k, you get HTTP error code 400. To avoid this problem, set the `system-attributes` parameter in the application security descriptor (`xs-security.json`).

```
"oauth2-configuration": {  
  ...  
  "system-attributes ": [],  
  ...  
}
```

For more information about the application security descriptor, see [Application Security Descriptor Configuration Syntax \[page 511\]](#).

See also [400 Error: Call to /oauth/token Was Not Successful](#) in *Guided Answers*.

## 7.1.7.2 Preconfigured Role Collections

In the application security descriptor (`xs-security.json`) of your application, you define the authorizations needed to access your application. You define these authorizations as scopes within roles and role templates. From these entities, the administrator can build role collections and assign the role collections to users.

We recommend that you also define role collections for administrators to consume with your application. Delivering role collections with your application has the following advantages:

- Time savings for the administrator.  
The administrator of the subaccount can consume your application more quickly.
- Offer examples of well-defined role collections.  
The administrator can learn from your example, the security model of your application and design his or her own role collections based upon that model.

For more information about authorizations, see [Authorization Entities \[page 2791\]](#).

```
"role-collections": [  
  {  
    "name": "Employee",  
    "description": "Employee roles",  
    "role-template-references": [  
      "$XSAPPNAME.Employee"  
    ]  
  }  
]
```

For more information about the application security descriptor, see [Application Security Descriptor Configuration Syntax \[page 511\]](#).

### 7.1.7.3 Asynchronous Processing for Multi-Tenant Applications

After your application has more than 50 subscriptions, the time required to update instances of SAP Authorization and Trust Management service bound to your application increases. This delay can run into the timeouts set by the Cloud Controller of Cloud Foundry and SAP Service Manager.

To avoid timeout, enable asynchronous processing in your application security descriptor (`xs-security.json`). To enable asynchronous processing, set the `xsenableasynservice` parameter to `true`.

```
"xsenableasynservice": "true"
```

For more information about the application security descriptor, see [Application Security Descriptor Configuration Syntax \[page 511\]](#).

## 7.1.8 Third-Party Cookies and SAP Authorization and Trust Management Service

Browser manufacturers are ending support for third-party cookies. This change can prevent embedded BTP applications and their logon screens from functioning.

To prevent your logon scenarios from failing, make sure that all multi-environment subaccounts, which contain these embedded applications, are configured to use a tenant of SAP Cloud Identity Services - Identity Authentication as the trusted identity provider.

#### Caution

Migrate your trust before the browser vendors deprecate support.

Trusting your Identity Authentication tenant enables your applications to integrate with the overall solution provided by SAP.

For more information about the overall solution, see [SAP BTP and Third-Party Cookies Deprecation](#)  and SAP Note [3409306](#) .

To migrate an existing trust configuration, see [Migration from SAML Trust to OpenID Connect Trust with Identity Authentication](#).

If your framing and framed applications run under different domains, you must still maintain trust between the domains as before. For more information, see [Configure Trusted Domains for SAP Authorization and Trust Management Service \[Feature Set B\]](#).

## Related Information

[Trust and Federation with Identity Providers \[page 2014\]](#)

## 7.1.9 Security Recommendations for SAP Authorization and Trust Management Service

This service contributes to a central list of security recommendations for SAP BTP.

See the [list of security recommendations](#) for the SAP Authorization and Trust Management service.

The following sections present an overview of these recommendations according to your role.

### Account Administrators

Account administrators manage access to SAP BTP for their organization. They also manage the apps to which their organization is subscribed.

Security Recommendations for Account Administrators

Summary	Recommendation
Use custom identity providers for better integration and policy enforcement.	<a href="#">BTP-UAA-0008</a>
Check your custom identity providers.	<a href="#">BTP-UAA-0015</a>
Synchronize the user data with a provisioning service.	<a href="#">BTP-UAA-0016</a>
Keep a few global account administrators from the default identity provider.	<a href="#">BTP-UAA-0009</a>
Check which users have critical roles.	<a href="#">BTP-UAA-0017</a>
Check that only administrators have access to REST APIs.	<a href="#">BTP-UAA-0022</a>
Remove users who haven't logged on for a long time.	<a href="#">BTP-UAA-0010</a>
Implement a data deletion strategy.	<a href="#">BTP-UAA-0011</a>
Check the validity configuration for access tokens.	<a href="#">BTP-UAA-0005</a>
Rotate the signing keys for access tokens.	<a href="#">BTP-UAA-0019</a>
Rotate the signing keys for the SAML protocol.	<a href="#">BTP-UAA-0020</a>
Ensure understandable links for identity providers on logon pages.	<a href="#">BTP-UAA-0018</a>
Archive audit log entries.	<a href="#">BTP-UAA-0012</a>
Integrate the audit log with your corporate event management system.	<a href="#">BTP-UAA-0013</a>

Summary	Recommendation
If you embed the login page of this service, check where you allow the page to be embedded.	<a href="#">BTP-UAA-0001</a>
Train business users how to handle session timeouts	<a href="#">BTP-UAA-0023</a>

## Developers

Developers create new applications for their organization.

Security Recommendations for Developers

Summary	Recommendation
Enable individual secrets for each binding of a service instance.	<a href="#">BTP-UAA-0003</a>
Set the <code>redirect-uris</code> parameter to restrict access as much as possible.	<a href="#">BTP-UAA-0002</a>
Check your custom code for updates to client libraries offered by SAP in your dependencies.	<a href="#">BTP-UAA-0021</a>

## Platform-as-a-Service Operators

Platform-as-a-service operators manage applications developed by their organization.

Security Recommendations for Platform-as-a-Service Operators

Summary	Recommendation
Automate your deployment process to cope with the lifetime of the X.509 certificates.	<a href="#">BTP-UAA-0014</a>

### 7.1.10 Rate Limiting

This section provides information on the rate limiting in the SAP Authorization and Trust Management service.

The SAP Authorization and Trust Management service acts as an OAuth authorization server and issues access tokens with a long validity. These tokens are meant to be reused. However, some OAuth clients don't reuse them and thus cause a high load. The SAP Authorization and Trust Management service is scaled per landscape to handle the load.

To protect the SAP Authorization and Trust Management service from overload of misbehaving OAuth clients, rate limiting has been introduced. The limit is per subaccount.

- Requests sent at a lower rate are processed directly.
- When the limit for a subaccount is exceeded, the requests are queued and sent to the SAP Authorization and Trust Management service at a maximum rate (see table). The response times increase because of the queuing.
- If too many requests are queued so that the response time due to queuing exceeds a certain time, the service sends an HTTP 429 response code. This response also contains the `http Retry-After` header, which indicates when the client can retry.

### → Recommendation

There might be company events that trigger a lot of users to log on and try to access one special resource, such as the launch of a special employee discount sale for a certain day. Therefore, it's very likely that a high load of users will try to log on to the special discount website at the announced time. This means that you can foresee that users might run into HTTP 429 error response codes.

- We recommend sending the announcement emails in waves. By doing so, you can avoid a situation where almost all users try to log on at about the same time.
- Additionally, it's helpful to handle the HTTP 429 error message by also sending a clear text message like `We are sorry, but the server is currently experiencing high demand. Please try again later.` Such a message gives the users guidance of what to do.

### 📌 Note

Since rate limiting is per subaccount, SaaS applications probably don't notice rate limiting because the load is distributed across different SaaS subaccounts.

### ⚠️ Restriction

The following table lists sizing restrictions when using APIs.

Sizing Restrictions

Element	Maximum Size
HTTP header	16 KB
POST body	1 MB

## Token Endpoint

The token endpoint enables you to authenticate with OAuth 2.0.

## Token Endpoint

Endpoint	Subaccount Limit	Effect
<code>https://&lt;subdomain&gt;.authentication.&lt;landscape&gt;/oauth/token</code>	Up to 60 requests per second	The requests are executed at once.
<code>https://&lt;subdomain&gt;.authentication.&lt;landscape&gt;/oauth/token</code>	Exceeding 60 requests per second	The requests are queued and then executed.
<code>https://&lt;subdomain&gt;.authentication.&lt;landscape&gt;/oauth/token</code>	Significantly exceeding 60 requests per second	An HTTP 429 Too Many Requests response status code is sent.
<code>https://&lt;subdomain&gt;.authentication.cert.&lt;landscape&gt;/oauth/token</code>	Up to 60 requests per second	The requests are executed at once.
<code>https://&lt;subdomain&gt;.authentication.cert.&lt;landscape&gt;/oauth/token</code>	Exceeding 60 requests per second	The requests are queued and then executed.
<code>https://&lt;subdomain&gt;.authentication.cert.&lt;landscape&gt;/oauth/token</code>	Significantly exceeding 60 requests per second	An HTTP 429 Too Many Requests response status code is sent.

## Authorization, Security Settings, and Identity Provider Management APIs

The authorization, security settings, and identity provider management APIs enable you to manage service instances, roles, role templates, role collections, and identity providers. You find the APIs of SAP Authorization and Trust Management service and of the security settings in the [SAP Business Accelerator Hub](#).

Authorization, Security Settings, and Identity Provider APIs

Endpoint	Subaccount Limit	Effect
<p><code>https://api.authentication.&lt;landsc&gt;ape&gt;/sap/rest/authorization/v2</code></p> <p>(Including all APIs with subpaths, for example <code>sap/rest/authorization/v2/apps</code>)</p>	Up to 45 requests per second	The requests are executed at once.
<p><code>https://api.authentication.&lt;landsc&gt;ape&gt;/sap/rest/authorization/v2</code></p> <p>(Including all APIs with subpaths, for example <code>sap/rest/authorization/v2/apps</code>)</p>	Exceeding 45 requests per second	The requests are queued and then executed.
<p><code>https://api.authentication.&lt;landsc&gt;ape&gt;/sap/rest/authorization/v2</code></p> <p>(Including all APIs with subpaths, for example <code>sap/rest/authorization/v2/apps</code>)</p>	Significantly exceeding 45 requests per second	An HTTP 429 Too Many Requests response status code is sent.
<p><code>https://api.authentication.&lt;landsc&gt;ape&gt;/sap/rest/identity-providers</code></p> <p>(Including all APIs with subpaths, for example <code>sap/rest/identity-providers/{id}</code>)</p>	Up to 30 requests per second	The requests are executed at once.
<p><code>https://api.authentication.&lt;landsc&gt;ape&gt;/sap/rest/identity-providers</code></p> <p>(Including all APIs with subpaths, for example <code>sap/rest/identity-providers/{id}</code>)</p>	Exceeding 30 requests per second	The requests are queued and then executed.

Endpoint	Subaccount Limit	Effect
<p><code>https://api.authentication.&lt;landsc&gt;ape&gt;/sap/rest/identity-providers</code></p> <p>(Including all APIs with subpaths, for example <code>sap/rest/identity-providers/{id}</code>)</p>	Significantly exceeding 30 requests per second	An HTTP 429 Too Many Requests response status code is sent.

## User Management (SCIM) APIs

The user management (SCIM) APIs enable you to manage shadow users and role collections. You find the APIs of SAP Authorization and Trust Management service in the [SAP API Business Hub](#).

User Management (SCIM) APIs

Endpoint	Subaccount Limit	Effect
<p><code>https://api.authentication.&lt;landsc&gt;ape&gt;/groups</code></p> <p>(Including all APIs with subpaths, for example <code>sap/rest/groups/{id}</code>)</p>	Up to 3 requests per second	The requests are executed at once.
<p><code>https://api.authentication.&lt;landsc&gt;ape&gt;/groups</code></p> <p>(Including all APIs with subpaths, for example <code>sap/rest/groups/{id}</code>)</p>	Exceeding 3 requests per second	The requests are queued and then executed.
<p><code>https://api.authentication.&lt;landsc&gt;ape&gt;/groups</code></p> <p>(Including all APIs with subpaths, for example <code>sap/rest/groups/{id}</code>)</p>	Significantly exceeding 3 requests per second	An HTTP 429 Too Many Requests response status code is sent.
<p><code>https://api.authentication.&lt;landsc&gt;ape&gt;/users</code></p> <p>(Including all APIs with subpaths, for example <code>sap/rest/users/{id}</code>)</p>	Up to 3 requests per second	The requests are executed at once.

Endpoint	Subaccount Limit	Effect
<a href="https://api.authentication.landscAPE/users">https://api.authentication.landscAPE/users</a> (Including all APIs with subpaths, for example <code>sap/rest/users/{id}</code> )	Exceeding 3 requests per second	The requests are queued and then executed.
<a href="https://api.authentication.landscAPE/users">https://api.authentication.landscAPE/users</a> (Including all APIs with subpaths, for example <code>sap/rest/users/{id}</code> )	Significantly exceeding 3 requests per second	An HTTP 429 Too Many Requests response status code is sent.

## Related Information

[Application Security Descriptor Configuration Syntax \[page 511\]](#)

[Accessing Administration Using APIs of the SAP Authorization and Trust Management Service \[page 2229\]](#)

## 7.1.11 Limits for Technical Artifacts of the SAP Authorization and Trust Management Service

To improve the resiliency of the SAP Authorization and Trust Management service, we have introduced limitations on technical artifacts of the service.

### Limits for the Service Broker

We allow a maximum of service instances per subaccount.

There is also a maximum of service bindings and service keys in total per service instance. The service rejects attempts to add more bindings or service keys. For more information, see [Service Instance Secrets \[page 2108\]](#).

Limits for the Service Broker

Service Broker Resource	Upper Limit
Service instances per subaccount	1000

Service Broker Resource	Upper Limit
Service bindings and service keys in total per service instances	1000

## Limits for the Application Security Descriptor

There are limits that apply when you define properties in the application security descriptor.

You define properties in the `xs-security.json` application security descriptor file for creating or updating service instances. Take care that you don't define more properties than specified in the table.

Limits for Properties

Property	Upper Limit
<code>attributes</code>	50
<code>role-collections</code>	250
<code>role-templates</code>	500
<code>scopes</code>	500
<code>scopes (granted)</code>	250

### Note

Granted means that the scope object refers to applications that are specified using `granted-apps` or `grant-as-authority-to-apps` properties

## Limits for the Global Account

It is possible to configure up to 3 custom identity providers for platform users in a global account.

## Limits for the Subaccount

There are limits that apply to the subaccount. Administrators can use application roles and create their own roles. They can create and manage role collections, add roles to them, and assign the role collections to business users.

For more information, see [Building Roles and Role Collections for Applications \[page 2098\]](#) and [Working with Role Collections \[page 2087\]](#).

## Limits for Security Artifacts

Security Artifact	Upper Limit
Roles created by administrators	2500
<b>Note</b> Roles that are automatically generated when a service instance was created or updated are not counted here.	
Role collections created by administrators	5000

When establishing trust, subaccount administrators must observe the limits for identity providers.

## Limits for Identity Providers

Identity Provider	Upper Limit
SAML identity providers	50
User attribute mappings defined in a subaccount	5000

## 7.1.12 Configuring Backup

For SAP Authorization and Trust Management Service, you can backup the service configuration, the authorizations, and the configuration of the identity provider using APIs.

For more information, see [Service Configurations Managed by Customers](#).

## 7.1.13 Accessibility Features in SAP Authorization and Trust Management Service

To optimize your experience of the SAP Authorization and Trust Management service, SAP Business Technology Platform provides features and settings that help you use the software efficiently.

### Note

SAP Authorization and Trust Management service runs on the SAP BTP cockpit. For this reason, accessibility features for SAP BTP cockpit apply. For more information, see the accessibility documentation for SAP BTP cockpit on SAP Help Portal in [Accessibility Features in SAP BTP cockpit \[page 1937\]](#).

For more information on screen reader support and keyboard shortcuts, see the [Accessibility for End Users](#).

## 7.2 Default Role Collections of SAP BTP Cloud Foundry Environment [Feature Set B]

The following table displays the default role collections available with cloud management tools feature set B after initially deploying your accounts. For more information, see the related links.

Default Role Collections Including Roles and Role Templates

Role Collection	Role Name	Role Template	App ID	Role Description
Global Account Administrator	Global Account Admin	GlobalAccount_Admin	cis-central!<suffix>	Role for global account members with read-write authorizations for core commercialization operations, such as updating global accounts, setting entitlements, and creating, updating, and deleting subaccounts.
Global Account Administrator	Global Account Usage Reporting Viewer	GlobalAccount_Usage_Reporting_Viewer	uas!<suffix>	Role for global account members with read-only authorizations for core commercialization operations, such as viewing global account usage information.
Global Account Administrator	User and Role Administrator	xsuaa_admin	xsuaa!<suffix>	Manage authorizations, trusted identity providers, and users.
Global Account Administrator	System Landscape Administrator	GlobalAccount_System_Landscape_Administrator	cmp!<suffix>	Administrative access to systems and scenario-related resources.
Global Account Viewer	System Landscape Viewer	GlobalAccount_System_Landscape_Viewer	extension-service-cmp!<suffix>	Viewer access to systems and scenario-related resources.
Subaccount Administrator	Cloud Connector Administrator	Cloud_Connector_Administrator	connectivity!<suffix>	Operate the data transmission tunnels used by the Cloud connector.
Subaccount Administrator	Destination Administrator	Destination_Administrator	destination-xsapp-name!<suffix>	Manage destination configurations, certificates and subaccount trust via the Destination editor in the SAP BTP cockpit.

Role Collection	Role Name	Role Template	App ID	Role Description
Subaccount Administrator	Subaccount Admin	Subaccount_Admin	cis-local!<suffix>	Role for subaccount members with read-write authorizations for core commercialization operations, such as viewing subaccount entitlements, and creating and deleting environment instances.
Subaccount Administrator	User and Role Administrator	xsuaa_admin	xsuaa!<suffix>	Manage authorizations, trusted identity providers, and users.
Subaccount Administrator	Subaccount Service Administrator	Subaccount_Service_Administrator	service-manager!<suffix>	Administrative access to service brokers and environments on a subaccount level.
Global Account Viewer	Global Account Viewer	GlobalAccount_Viewer	cis-central!<suffix>	Role for global account members with read-only authorizations for core commercialization operations, such as viewing global accounts, subaccounts, entitlements, and regions.
Global Account Viewer	Global Account Usage Reporting Viewer	GlobalAccount_Usage_Reporting_Viewer	uas!<suffix>	Role for global account members with read-only authorizations for core commercialization operations, such as viewing global account usage information.
Global Account Viewer	User and Role Auditor	xsuaa_auditor	xsuaa!<suffix>	Read-only access for authorizations, trusted identity providers, and users.
Subaccount Viewer	Cloud Connector Auditor	Cloud_Connector_Auditor	connectivity!<suffix>	View the data transmission tunnels used by the Cloud connector to communicate with back-end systems.
Subaccount Viewer	Destination Viewer	Destination_Viewer	destination-xsapp-name!<suffix>	View destination configurations, certificates and subaccount trust via the Destination editor in the SAP BTP cockpit.

Role Collection	Role Name	Role Template	App ID	Role Description
Subaccount Viewer	Subaccount Viewer	Subaccount_Viewer	cis-local!<suffix>	Role for subaccount members with read-only authorizations for core commercialization operations, such as viewing subaccount entitlements, details of environment instances, and job results.
Subaccount Viewer	User and Role Auditor	xsuaa_auditor	xsuaa!<suffix>	Read-only access for authorizations, trusted identity providers, and users.
Subaccount Viewer	Subaccount Service Auditor	Subaccount_Service_Auditor	service-manager!<suffix>	Read-only access to service brokers and environments on a subaccount level
Subaccount Service Administrator	Subaccount Service Administrator	Subaccount_Service_Administrator	service-manager!<suffix>	Administrative access to service brokers and environments on a subaccount level.
Cloud Connector Administrator	Cloud Connector Administrator	Cloud_Connector_Administrator	connectivity!<suffix>	Operate the data transmission tunnels used by the Cloud connector.
Destination Administrator	Destination Administrator	Destination_Administrator	destination-xsapp-name!<suffix>	Manage destination configurations, certificates and subaccount trust via the Destination editor in the SAP BTP cockpit.
Connectivity and Destination Administrator	Cloud Connector Administrator	Cloud_Connector_Administrator	connectivity!<suffix>	Operate the data transmission tunnels used by the Cloud connector.
Connectivity and Destination Administrator	Destination Administrator	Destination_Administrator	destination-xsapp-name!<suffix>	Manage destination configurations, certificates and subaccount trust via the Destination editor in the SAP BTP cockpit.

Role Collection	Role Name	Role Template	App ID	Role Description
Directory Administrator	Directory Admin	Directory_Admin	cis-central!<suffix>	Role for directory members with read-write authorizations for core commercialization operations, such as updating directories, setting entitlements, and creating, updating, and deleting subaccounts.
Directory Administrator	User and Role Administrator	xsuaa_admin	xsuaa!<suffix>	Manage authorizations, trusted identity providers, and users.
Directory Administrator	Directory Usage Reporting Viewer	Directory_Usage_Reporting_Viewer	uas!<suffix>	Role for directory members with read-only authorizations for core commercialization operations, such as viewing directory usage information.
Directory Viewer	Directory Viewer	Directory_Viewer	cis-central!<suffix>	Role for directory members with read-only authorizations for core commercialization operations, such as viewing directories, subaccounts, entitlements, and regions.
Directory Viewer	User and Role Auditor	xsuaa_auditor	xsuaa!<suffix>	Read-only access for authorizations, trusted identity providers, and users.
Directory Viewer	Directory Usage Reporting Viewer	Directory_Usage_Reporting_Viewer	uas!<suffix>	Role for directory members with read-only authorizations for core commercialization operations, such as viewing directory usage information.

## Related Information

[Cloud Management Tools — Feature Set Overview \[page 111\]](#)

## 7.3 Trusted Certificate Authentication

All components of SAP BTP rely on a list of trusted Certificate Authorities (CAs), which differ depending on the runtimes used.

For your scenarios with SAP BTP, be aware of this list of CAs to ensure that you can provide trusted certificates that are signed by a trusted CA.

A list of all root CAs approved by SAP Global Security is available in SAP Note [2801396](#) (SAP Global Trust List).

## 7.4 Principal Propagation

Exchange user ID information between systems or environments in SAP BTP.

### In This Section

- [Principal Propagation from the Cloud Foundry to the Neo Environment \[page 2831\]](#)
- [Principal Propagation from the Neo to the Cloud Foundry Environment \[page 2824\]](#)

### Other Principal Propagation Scenarios

- [On-Premise User Store](#)
- [Principal Propagation to OAuth-Protected Applications](#)

- [Connectivity in the Neo Environment: Principal Propagation](#)

## Related Information

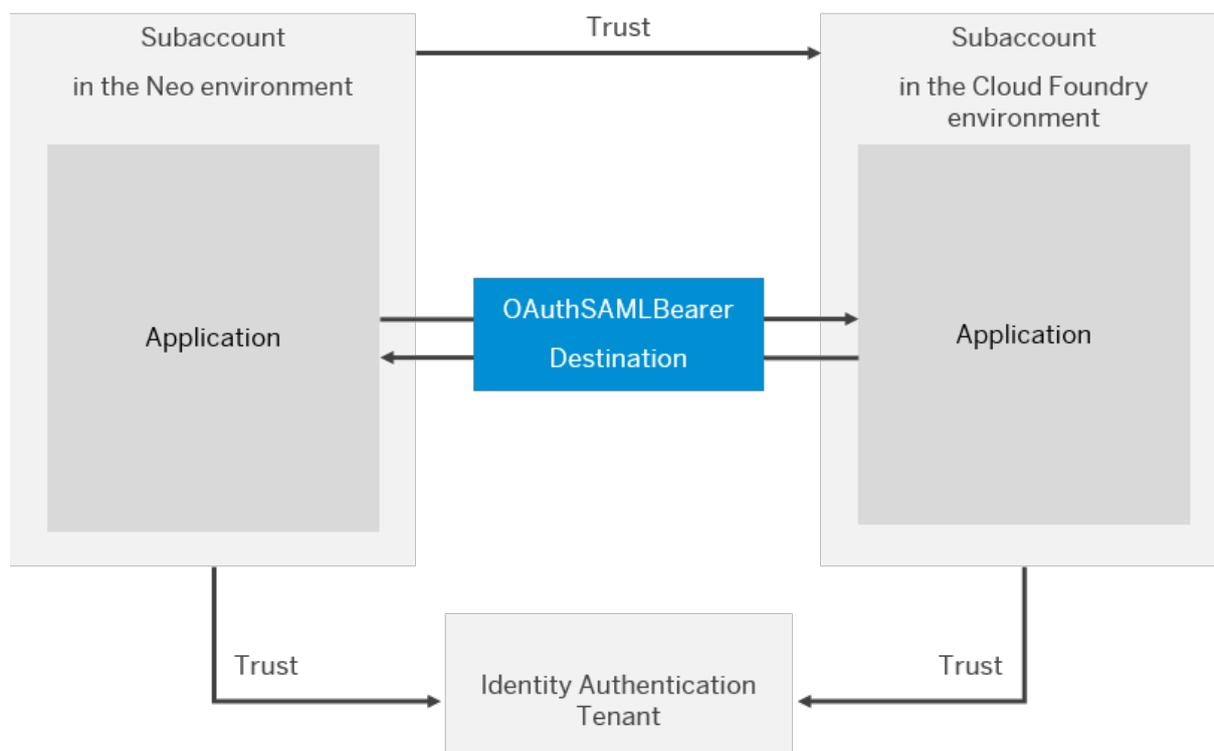

[Propagate User Information Between Applications or Services \[page 474\]](#)

### 7.4.1 Principal Propagation from the Neo to the Cloud Foundry Environment

Enable an application in your subaccount in the Neo environment to access another application in a subaccount in the Cloud Foundry environment without user login (and user interaction) in the second

application. For this scenario to work, the two subaccounts need to be in mutual trust, and in trust with the same Identity Authentication tenant. The second application will propagate its logged-in user to the first application using an OAuth2SAMLBearer destination.

The graphic below illustrates the overall setup of the scenario.

## Prerequisites

- You have a user account with *Administrator* role in both SAP BTP subaccounts. See [Managing Member Authorizations in the Neo Environment](#).
- You have a custom local service provider configuration (signing keys and certificates, etc.) in your subaccount in the Neo environment. See [Configure the Local Service Provider](#).
- Both accounts have a trust configuration to the same Identity Authentication tenant. See:
  - [Identity Authentication Tenant as an Application Identity Provider](#) (for the Neo environment)
  - [Manually Establish Trust and Federation Between SAP Authorization and Trust Management Service and Identity Authentication \[page 2035\]](#) (for the Cloud Foundry environment)
- You have developed and deployed both applications, each in the corresponding subaccount.

### Note

All configuration steps described in this tutorial are done using the cloud cockpit.

## Requirements to the Application in the Neo Environment

The application is running on a Java Web Tomcat 8 runtime.

In the source code, the application needs to reference the destination that we are about to create as a later step. The sample source code below illustrates a complete servlet working with the destination with name `pptest`.

```
package com.sap.cloud.samples;
import java.io.BufferedReader;
import java.io.IOException;
import java.io.InputStreamReader;
import java.net.URL;
import java.net.URLConnection;
import java.security.KeyStore;
import java.util.List;
import javax.naming.Context;
import javax.naming.InitialContext;
import javax.net.ssl.HttpURLConnection;
import javax.net.ssl.SSLContext;
import javax.net.ssl.SSLSocketFactory;
import javax.net.ssl.TrustManagerFactory;
import javax.servlet.ServletException;
import javax.servlet.annotation.WebServlet;
import javax.servlet.http.HttpServlet;
import javax.servlet.http.HttpServletRequest;
import javax.servlet.http.HttpServletResponse;
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import com.sap.core.connectivity.api.authentication.AuthenticationHeader;
import com.sap.core.connectivity.api.authentication.AuthenticationHeaderProvider;
import com.sap.core.connectivity.api.configuration.ConnectivityConfiguration;
import com.sap.core.connectivity.api.configuration.DestinationConfiguration;
@WebServlet("/neotocf")
public class NeoToCF extends HttpServlet {
    private static final long serialVersionUID = 1L;
    private static final Logger LOGGER = LoggerFactory.getLogger(NeoToCF.class);
    private static final String ON_PREMISE_PROXY = "OnPremise";
    protected void doGet(HttpServletRequest request, HttpServletResponse response)
        throws ServletException, IOException {
        response.getWriter().println("Served to: " +
            request.getUserPrincipal().getName());
        try {
            // Look up the connectivity configuration API
            Context ctx = new InitialContext();
            ConnectivityConfiguration configuration = (ConnectivityConfiguration) ctx
                .lookup("java:comp/env/connectivityConfiguration");
            // Get destination configuration
            DestinationConfiguration destConfiguration =
            configuration.getConfiguration("pptest");
            if (destConfiguration == null) {
                response.sendError(HttpServletResponse.SC_INTERNAL_SERVER_ERROR,
                    String.format(
                        "Destination %s is not found. Hint:" +
                        " Make sure to have the destination
            configured.",
                        "pptest"));
            }
            return;
        }

        AuthenticationHeaderProvider authHeaderProvider =
        (AuthenticationHeaderProvider) ctx
            .lookup("java:comp/env/myAuthHeaderProvider");
        // retrieve the authorization header for OAuth SAML Bearer principal
        propagation
```

```

    List<AuthenticationHeader> samlBearerHeader = authHeaderProvider
        .getOAuth2SAMLBearerAssertionHeaders(destConfiguration);
    LOGGER.debug("JWT token from CF XSUAA: " +
samlBearerHeader.get(1).getValue());

    // get the configured truststore
    KeyStore trustStore = destConfiguration.getTrustStore();

    // create sslcontext
    TrustManagerFactory tmf =
TrustManagerFactory.getInstance(TrustManagerFactory.getDefaultAlgorithm());
    tmf.init(trustStore);

    SSLContext sslcontext = SSLContext.getInstance("TLS");
    sslcontext.init(null, tmf.getTrustManagers(), null);
    SSLSocketFactory sslSocketFactory = sslcontext.getSocketFactory();

    // get the destination URL
    String value = destConfiguration.getProperty("URL");
    URL url = new URL(value);

    // use the sslcontext for url connection
    URLConnection urlConnection = url.openConnection();
    ((HttpsURLConnection) urlConnection).setSSLSocketFactory(sslSocketFactory);

    urlConnection.setRequestProperty(samlBearerHeader.get(0).getName(),
samlBearerHeader.get(0).getValue());
    urlConnection.setRequestProperty(samlBearerHeader.get(1).getName(),
samlBearerHeader.get(1).getValue());

    urlConnection.connect();
    response.getWriter().println("Received from CF:");

    BufferedReader in = new BufferedReader(new InputStreamReader(
urlConnection.getInputStream()));
    String inputLine;
    while ((inputLine = in.readLine()) != null)
        response.getWriter().append(inputLine);
    in.close();
} catch (Exception e) {
    // Connectivity operation failed
    String errorMessage = e.getMessage();
    LOGGER.error("Connectivity operation failed", e);
    response.sendError(HttpServletResponse.SC_INTERNAL_SERVER_ERROR,
errorMessage);
}
}
protected void doPost(HttpServletRequest request, HttpServletResponse response)
    throws ServletException, IOException {
    doGet(request, response);
}
}

```

## Requirements to the Application in the Cloud Foundry Environment

In the Cloud Foundry environment, you need an application following the XSA security model (protected with SAML, UAA service binding using JWT token needed, roles configured in the *xs-security.json*).

See:

- [Application Router \[page 377\]](#)
- [Building Roles and Role Collections for Applications \[page 2098\]](#)

### 📘 Note

You can use the [XSA Security Sample Application](#) in GitHub (instructions and code) to develop and deploy an application compliant with the above requirements.

## 7.4.1.1 Create a Destination

### Prerequisites

Before you create the required destination, you need to note down a few properties that will be used as values in the destination settings.

1. In the cloud cockpit, navigate to the subaccount in the Cloud Foundry environment.
2. Navigate to the application router.
3. Enter the *Environment Variables* section.
4. Note down somewhere the values of the following properties:
  - clientid
  - clientsecret
  - url

### Context

Connect the first subaccount to the second subaccount by describing the source connection properties in a destination. For more information see [Modeling Destinations](#).

### Procedure

1. Choose the global account and navigate to **Connectivity > Destinations**.
2. Choose *New Destination*.
3. In the new destination, provide the following information:

Field	Description
Name	Technical name of the destination. It can be used later on to get an instance of that destination. It must be unique for the global account.

### 📘 Note

For the purposes of the example listed in this document, use *pptest* as value.

Field	Description
URL	<p>The URL of the protected resource in the Cloud Foundry environment. See <a href="#">Configuring Application URLs</a>.</p> <p>Example: <code>https://&lt;tenant-specific-route-for-your-business-app&gt;.cfapps.eu10.hana.ondemand.com/</code></p>
Authentication	OAuth2SAMLBearerAssertion
Proxy Type	Internet
Audience	<p>Copy the value of <code>entityID</code> property of the SAML 2.0 metadata representing your subaccount in the Cloud Foundry environment.</p> <div style="background-color: #f0f0f0; padding: 10px; border: 1px solid #ccc;"> <p><b>→ Tip</b></p> <p>You can open the metadata of the subaccount in the Cloud Foundry environment using the following URL:</p> <pre>https://&lt;your subaccount's subdomain&gt;.authentication.&lt;region host&gt;/saml/metadata</pre> <p>Example:</p> <pre>https://demo.authentication.eu10.hana.ondemand.com/saml/metadata</pre> <p>For the <code>&lt;region host&gt;</code>, see <a href="#">Regions and API Endpoints Available for the Cloud Foundry Environment [page 20]</a>.</p> </div> <p>Example of audience/entityID:</p> <pre>demo.aws-live-eu10</pre>
Client Key	<p>In the cloud cockpit, navigate to the application in the Cloud Foundry environment (► <a href="#">&lt;path to your subaccount&gt;</a> ► <a href="#">Spaces</a> ► <a href="#">&lt;your space&gt;</a> ► <a href="#">Applications</a> ► <a href="#">&lt;your application&gt;</a> ►). Open <a href="#">Environment Variables</a>. Copy the value of the <code>clientid</code> property in ► <a href="#">VCAP_SERVICES</a> ► <a href="#">xsuaa</a> ► <a href="#">credentials</a> ►.</p>

Field	Description
Token Service URL	<p>Get the <b>token service URL</b> from the SAML 2.0 metadata representing your subaccount in the Cloud Foundry environment. The <b>token service URL</b> is defined in the <code>Location</code> attribute of the element marked as <code>AssertionConsumerService</code>, like this :</p> <pre>&lt;md:AssertionConsumerService Location="&lt;Token Service URL&gt;" Binding="urn:oasis:names:tc:SAML:2.0:bindings:URI" index="1"/&gt;</pre> <div style="background-color: #f0f0f0; padding: 10px; border: 1px solid #ccc;"> <p>→ Tip</p> <p>You can open the metadata of the subaccount in the Cloud Foundry environment using the following URL:</p> <pre>https://&lt;your subaccount's subdomain&gt;.authentication.&lt;region host&gt;/saml/metadata</pre> <p>Example:</p> <pre>https://demo.authentication.eu10.hana.ondemand.com/saml/metadata</pre> <p>For the <code>&lt;region host&gt;</code>, see <a href="#">Regions and API Endpoints Available for the Cloud Foundry Environment [page 20]</a>.</p> </div> <p>Example of token service URL:</p> <pre>https://demo.authentication.eu10.hana.ondemand.com/oauth/token/alias/demo.aws-live-eu10</pre>
Token Service User	<p>In the cloud cockpit, navigate to the application in the Cloud Foundry environment (▶ <i>&lt;path to your subaccount&gt;</i> ▶ <i>Spaces</i> ▶ <i>&lt;your space&gt;</i> ▶ <i>Applications</i> ▶ <i>&lt;your application&gt;</i> ▶). Open <i>Environment Variables</i>. Copy the value of the <i>clientid</i> property in ▶ <i>VCAP_SERVICES</i> ▶ <i>xsuaa</i> ▶ <i>credentials</i> ▶.</p>
Token Service Password	<p>In the cloud cockpit, navigate to the application in the Cloud Foundry environment (▶ <i>&lt;path to your subaccount&gt;</i> ▶ <i>Spaces</i> ▶ <i>&lt;your space&gt;</i> ▶ <i>Applications</i> ▶ <i>&lt;your application&gt;</i> ▶). Open <i>Environment Variables</i>. Copy the value of the <i>clientsecret</i> property in ▶ <i>VCAP_SERVICES</i> ▶ <i>xsuaa</i> ▶ <i>credentials</i> ▶.</p>
System User	Empty.

4. Save the changes.

## 7.4.1.2 Create Trust Between the Subaccounts

### Procedure

1. In the cloud cockpit, log on with the Administrator user.
2. Save locally the service provider metadata of the subaccount in the Neo environment.

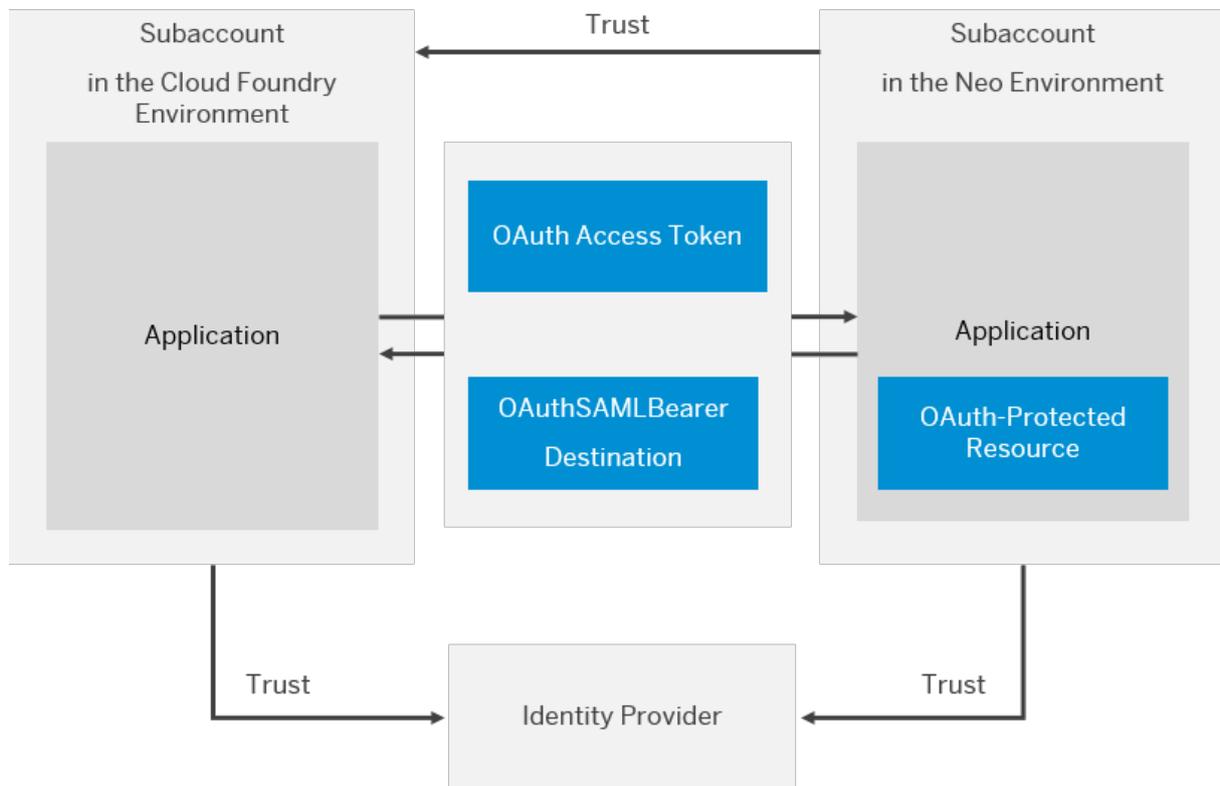

- a. In SAP BTP cockpit, navigate to the subaccount in the Neo environment. See [Navigate in the Cockpit \[page 1938\]](#)
  - b. Navigate to ► *Security* ► *Trust* ► *Local Service Provider* ►.
  - c. Choose *Get Metadata* and save the metadata file representing this subaccount.
3. In the subaccount in the Cloud Foundry environment, create trust to the subaccount in the Neo environment.
- a. Navigate to the subaccount in the Cloud Foundry environment.
  - b. Navigate to ► *Security* ► *Trust Configuration* ►
  - c. Choose *New Trust Configuration*.
  - d. In the *Metadata* field, choose the *Upload* button.
  - e. Upload the service provider metadata file representing the subaccount in the Neo environment.
  - f. Save the new trust configuration.

After this procedure, you can use the security context from the application in the Neo environment to the application in the Cloud Foundry environment. The assigned groups from the Neo environment can be used as role collections in the Cloud Foundry environment.

## 7.4.2 Principal Propagation from the Cloud Foundry to the Neo Environment

Enable an application in your subaccount in the Cloud Foundry environment to access an OAuth-protected application in a subaccount in the Neo environment without user login (and user interaction) in the second application. For this scenario to work, the two subaccounts need to be in mutual trust, and in trust with the same identity provider. The first application will propagate its logged-in user to the second application using an OAuth2SAMLBearer destination.

The graphic below illustrates the overall setup of the scenario.

## Prerequisites

- You have a user account with *Administrator* role in both SAP BTP subaccounts. See [Managing Member Authorizations in the Neo Environment](#).
- You have a *custom* local service provider configuration (this means in `cloud cockpit` `Security` `Trust` `Local Service Provider` you have chosen `Configuration Type` `Custom`) in your subaccount in the Neo environment. See [Configure the Local Service Provider](#).
- Both accounts have a trust configuration to the same identity provider. See:
  - [Configure Trust to the SAML Identity Provider](#) (for the Neo environment)
  - [Establish Trust with Any SAML 2.0 Identity Provider in a Subaccount \[page 2039\]](#) (for the Cloud Foundry environment)
- The application in the Neo environment is protected using OAuth 2.0. See [OAuth 2.0 Service](#).
- The application in the Cloud Foundry environment is bound to an instance of the following services:
  - *Destination Service*. See [Create and Bind a Destination Service Instance](#).
  - *xsuaa*
- You have deployed both applications, each in the corresponding subaccount.

### Note

All configuration steps described in this tutorial are done using the cloud cockpit.

## Contents

- [Create Trust Between the Subaccounts \[page 2833\]](#)
- [Create an OAuth Client \[page 2834\]](#)
- [Create a Destination \[page 2835\]](#)

### 7.4.2.1 Create Trust Between the Subaccounts

Exchange keys and certificates between the subaccounts, and configure trust between them. This will enable the subaccounts to communicate using HTTP destinations.

#### Procedure

1. In the cloud cockpit, log on with the Administrator user.
2. Save locally the identifying X509 certificate of the subaccount in the Cloud Foundry environment.
  - a. In SAP BTP cockpit, navigate to the subaccount in the Cloud Foundry environment.
  - b. Navigate to **Connectivity > Destinations**.
  - c. Choose **Download Trust** and save the X509 certificate identifying this subaccount.
3. In the subaccount in the Neo environment, create trust to the subaccount in the Cloud Foundry environment.
  - a. Navigate to the subaccount in the Neo environment.
  - b. Navigate to **Security > Trust > Application Identity Provider**.
  - c. Choose **Add Trusted Identity Provider** and configure the new trust configuration settings:

- In the *Name* field, enter the following:

<your Cloud Foundry domain host>/<Cloud Foundry subaccount ID>

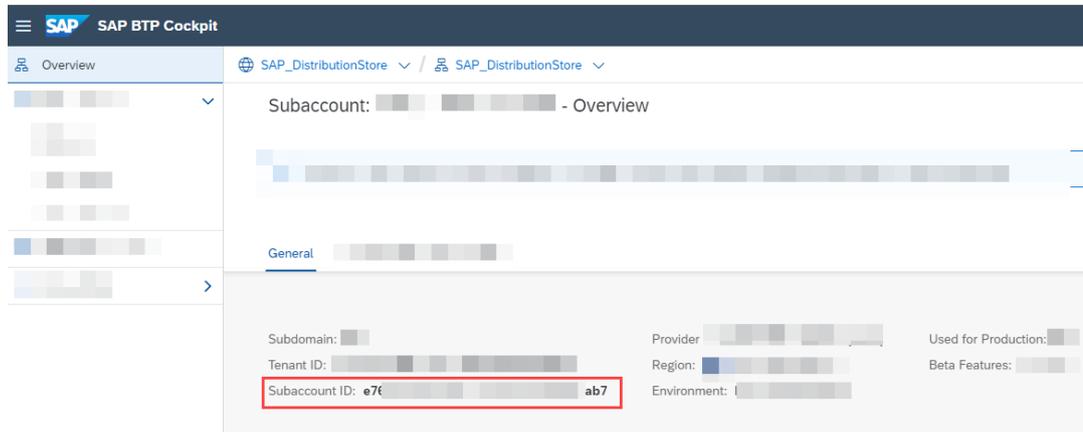

#### → Tip

You can view the **Cloud Foundry domain host** in **cockpit > <your global account> > <your subaccount> > <your space> > Routes**.

Host Name	Path	Domain	Mapped Applications	Route Service Instance	Route Service
		cfapps.eu10.hana.ondemand.com			

→ Tip

You can view the **subaccount ID** in ► *cockpit* ► *<your global account>* ► *<your subaccount>* ► *Overview* ►.

- In the *Signing Certificate* field, enter the X509 certificate of the Cloud Foundry account.

ⓘ Note

Make sure you remove the `BEGIN CERTIFICATE` and `END CERTIFICATE` parts.

- Mark the *Only for IDP-initiated SSO* option.
- d. Save the new trust configuration.

## 7.4.2.2 Create an OAuth Client

You need an OAuth client to get an access token for the OAuth-protected resources in the application in the Neo environment.

### Context

For more information about working with OAuth clients, see [Create an OAuth Client \[page 2834\]](#).

### Procedure

1. In the cockpit, navigate to the subaccount in the Neo environment.
2. Navigate to ► *Security* ► *OAuth* ► *Clients* ►, and choose *Register New Client*.
3. Create an OAuth client with the following configuration settings:

- *Name* - the OAuth client name. You will need to provide this name as value of the *Token Service User* property of the destination below.
  - *Authorization Grant* - choose the *Authorization Code* option.
  - Mark the *Confidential* option, and provide a secret (password).
4. Save the client.

#### ⓘ Note

When creating the required **OAuthSAMLBearer destination** later, you will need the following information from the OAuth client:

- *ID*
- *Secret*

## 7.4.2.3 Create a Destination

### Context

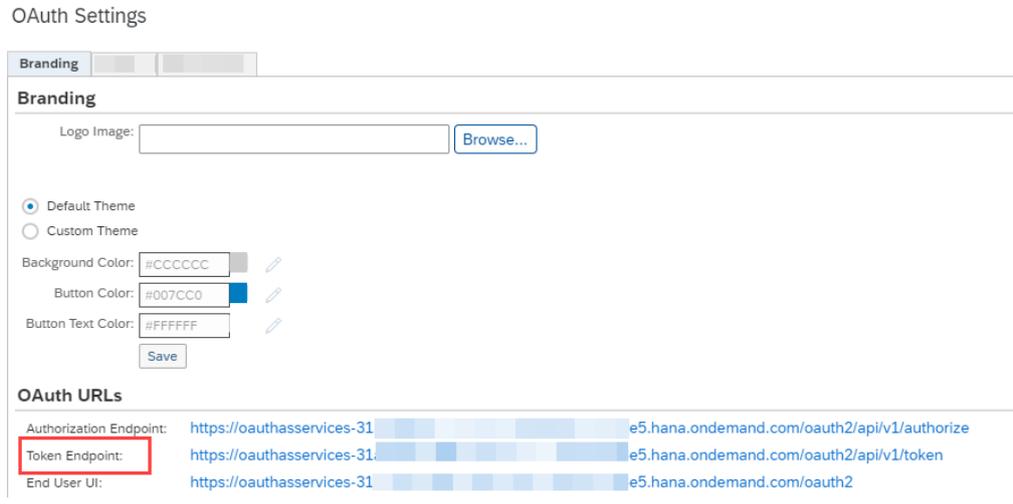

Connect the two subaccounts by describing the connection properties in a destination. For more information, see [Modeling Destinations](#).

### Procedure

1. Choose the subaccount in the Cloud Foundry environment, and navigate to ► [Connectivity](#) ► [Destinations](#) ▾.
2. Choose [New Destination](#).
3. In the new destination, provide the following information:

Field	Description
Name	Technical name of the destination. It can be used later on to get an instance of that destination. It must be unique for the global account.
Description	Free-text description.
Type	HTTP
URL	The URL of the protected resource in the Neo environment. Example: <code>https://myneoapp.hana.ondemand.com/myprotectedresource/</code>

Field	Description
Token Service URL	Copy the value of <i>Token Endpoint</i> from the following place: ► <i>cockpit</i> ► <i>&lt;your Neo subaccount&gt;</i> ► <i>Security</i> ► <i>OAuth</i> ► <i>Branding</i> ►
	<p>OAuth Settings</p> 
Token Service User	The ID of the OAuth client for the application in the Neo environment.
Token Service Password	The secret from the OAuth client.
System User	Empty.
authnContextClassRef	<i>urn:oasis:names:tc:SAML:2.0:ac:classes:PreviousSession</i>
nameIdFormat	<i>urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified</i> if the user ID will be propagated to the Neo application or <i>nameIdFormat = urn:oasis:names:tc:SAML:1.1:nameid-format:emailAddress</i> if the user email will be propagated to the Neo application.

Destination Configuration

*Name:	CFtoNeo	Additional Properties	
Type:	HTTP	nameIdFormat	urn:oasis:names:tc:SAML:...
Description:	Communication between the two environments (CF -> neo)	authnContextCla	jknhjnh
*URL:	https://myneoapp.hana.ondemand.com/myprotectedresource/	<input checked="" type="checkbox"/> Use default JDK truststore	
Proxy Type:	Internet		
Authentication:	OAuth2SAMLBearerAssertion		
*Audience:	https://hana.ondemand.com/myneosubaccount		
*Client Key:	.....		
*Token Service URL:	https://oathasservices-myneosubaccount.hana.ondemand.co		
Token Service User:	9377dt2-99cc-3983-a191-b16e88203c0b		
Token Service Password:	.....		
System User:			

4. Save the changes.

## 7.5 Data Protection and Privacy

Data protection is associated with numerous legal requirements and privacy concerns. In addition to compliance with general data protection and privacy acts, it is necessary to consider compliance with industry-specific legislation in different countries.

SAP provides specific features and functions to support compliance with regard to relevant legal requirements, including data protection. SAP does not give any advice on whether these features and functions are the best method to support company, industry, regional, or country-specific requirements. Furthermore, this information should not be taken as advice or a recommendation regarding additional features that would be required in specific IT environments. Decisions related to data protection must be made on a case-by-case basis, taking into consideration the given system landscape and the applicable legal requirements.

### Note

SAP does not provide legal advice in any form. SAP software supports data protection compliance by providing security features and specific data protection-relevant functions. In many cases, compliance with applicable data protection and privacy laws will not be covered by a product feature. Definitions and other terms used in this document are not taken from a particular legal source.

### Caution

The extent to which data protection is supported by technical means depends on secure system operation. Network security, security note implementation, adequate logging of system changes, and appropriate usage of the system are the basic technical requirements for compliance with data privacy legislation and other legislation.

## Generic Fields

You also need to make sure that no personal data enters the system in an uncontrolled or non-purpose related way, for example, in free-text fields, or customer extensions.

## ⚠ Caution

Please don't enter personal data in fields such as global and subaccount names, Cloud Foundry orgs and spaces names, database names, and tenant names. These fields aren't intended to process personal data, so our EU Access commitment doesn't apply to them. Personal data in such fields can be processed outside of the European Economic Area and Switzerland. The previous list of example fields is not complete.

## SAP BTP

This documentation covers personal data relating to SAP BTP accounts and data stored in databases by SAP BTP. SAP BTP offers a number of capabilities, that is, services, buildpacks, application, and so on. Here we cover the core platform. For more information about data protection and privacy for capabilities you have purchased, see the data protection and privacy documentation for those capabilities.

To view the services consumed by a global account:

1. Navigate to the global account to which you'd like to view members.  
For more information, see [Navigate to Orgs and Spaces \[page 2246\]](#).
2. In the navigation area, choose *Entitlements*.

This documentation is written with the data protection officer of a company in mind. The processes described here may be required for a data protection officer or an administrator of the user accounts for your tenants or even business users of the tenants. In particular the processes for business users are described here so that you in your role of data protection officer or account administrator can communicate them to your business users if required.

Users are stored in the platform identity provider.

- Global account users are stored in platform identity provider or a tenant of SAP Cloud Identity Services - Identity Authentication.
- Platform users are stored in platform identity provider, a tenant of SAP Cloud Identity Services - Identity Authentication, or your own identity provider.
- Business users are stored in a tenant of SAP Cloud Identity Services - Identity Authentication or your own identity provider.

## Related Information

[Glossary for Data Protection and Privacy \[page 2840\]](#)

[Deletion \[page 2843\]](#)

[Consent \[page 2849\]](#)

## 7.5.1 Glossary for Data Protection and Privacy

The following terms are general to SAP products. Not all terms may be relevant for SAP BTP.

Term	Definition
<b>Blocking</b>	A method of restricting access to data for which the primary business purpose has ended.
<b>Business purpose</b>	The legal, contractual, or in other form justified reason for the processing of personal data to complete an end-to-end business process. The personal data used to complete the process is predefined in a purpose, which is defined by the data controller. The process must be defined before the personal data required to fulfill the purpose can be determined.
<b>Consent</b>	The action of the data subject confirming that the usage of his or her personal data shall be allowed for a given purpose. A consent functionality allows the storage of a consent record in relation to a specific purpose and shows if a data subject has granted, withdrawn, or denied consent.
<b>Data subject</b>	Any information relating to an identified or identifiable natural person ("data subject"). An identifiable natural person is one who can be identified, directly or indirectly, in particular by reference to an identifier such as a name, an identification number, location data, an online identifier, or to one or more factors specific to the physical, physiological, genetic, mental, economic, cultural, or social identity of that natural person.
<b>Deletion</b>	Deletion of <b>personal data</b> so that the data is no longer available.
<b>End of business</b>	Defines the end of active business and the start of residence time and retention period.
<b>End of purpose (EoP)</b>	The point in time when the processing of a set of personal data is no longer required for the primary business purpose, for example, when a contract is fulfilled. After the EoP has been reached, the data is blocked and can only be accessed by users with special authorizations (for example, tax auditors).
<b>End of purpose (EoP) check</b>	A method of identifying the point in time for a data set when the processing of <b>personal data</b> is no longer required for the primary <b>business purpose</b> . After the <b>EoP</b> has been reached, the data is <b>blocked</b> and can only be accessed by users with special authorization, for example, tax auditors.

Term	Definition
<b>Personal data</b>	Any information relating to an identified or identifiable natural person ("data subject"). An identifiable natural person is one who can be identified, directly or indirectly, in particular by reference to an identifier such as a name, an identification number, location data, an online identifier, or to one or more factors specific to the physical, physiological, genetic, mental, economic, cultural, or social identity of that natural person.
<b>Purpose</b>	The information that specifies the reason and the goal for the processing of a specific set of personal data. As a rule, the purpose references the relevant legal basis for the processing of personal data.
<b>Residence period</b>	The period of time between the end of business and the end of purpose (EoP) for a data set during which the data remains in the database and can be used in case of subsequent processes related to the original purpose. At the end of the longest configured residence period, the data is blocked or deleted. The residence period is part of the overall retention period.
<b>Retention period</b>	The period of time between the end of the last business activity involving a specific object (for example, a business partner) and the deletion of the corresponding data, subject to applicable laws. The retention period is a combination of the residence period and the blocking period.
<b>Sensitive personal data</b>	<p data-bbox="804 1240 1385 1308">A category of personal data that usually includes the following type of information:</p> <ul data-bbox="815 1330 1385 1686" style="list-style-type: none"> <li data-bbox="815 1330 1385 1487">• Special categories of personal data, such as data revealing racial or ethnic origin, political opinions, religious or philosophical beliefs, trade union membership, genetic data, biometric data, data concerning health or sex life or sexual orientation.</li> <li data-bbox="815 1509 1385 1532">• Personal data subject to professional secrecy</li> <li data-bbox="815 1554 1385 1621">• Personal data relating to criminal or administrative offenses</li> <li data-bbox="815 1644 1385 1686">• Personal data concerning insurances and bank or credit card accounts</li> </ul>

Term	Definition
<b>Technical and organizational measures (TOM)</b>	<p>Some basic requirements that support data protection and privacy are often referred to as technical and organizational measures (TOM). The following topics are related to data protection and privacy and require appropriate TOMs, for example:</p> <ul style="list-style-type: none"> <li>• <b>Access control:</b> Authentication features</li> <li>• <b>Authorizations:</b> Authorization concept</li> <li>• <b>Read access logging</b></li> <li>• <b>Transmission control / Communication security</b></li> <li>• <b>Input control / Change logging</b></li> <li>• <b>Availability control</b></li> <li>• <b>Separation by purpose:</b> Is subject to the organizational model implemented and must be applied as part of the authorization concept.</li> </ul>

## 7.5.2 Change Logging and Read-Access Logging

Change logging records changes to personal data, while read-access logging records access to sensitive personal data. You may be required to gather this information for auditing purposes or legal requirements.

Use the appropriate API to retrieve logs.

- For the Cloud Foundry, see [Audit Log Retrieval API Usage for Subaccounts in the Cloud Foundry Environment \[page 2304\]](#).

### Note

For any applications you develop, you must ensure they include logging functions. SAP BTP does not provide audit logging functions for custom developments.

Logs are deleted regularly.

## 7.5.3 Personal Data Record

A personal data record is a collection of data relating to a data subject. A data privacy specialist may be required to provide such a record or an application may offer a self-service.

To see the personal data that is used for membership management within SAP BTP, access the cloud cockpit.

1. Navigate to the global account to which you'd like to view members.  
For more information, see [Navigate to Orgs and Spaces \[page 2246\]](#).
2. In the navigation area, choose *Members*.

To see the personal data that is used for application logging within SAP BTP, access the cloud cockpit.

For more information, see [Using Logs in the Cockpit](#) or [Analyze Logs from the Cockpit](#) in the Application Logging service documentation.

If you do not use your own identity provider for identity federation, you can view the profiles available in SAP Cloud Identity Services - Identity Authentication.

For more information, see [Information Report](#) in the SAP Cloud Identity Services - Identity Authentication documentation.

For SAP BTP Cloud Foundry environment, the User Account and Authentication service creates shadow users to issue tokens for their corresponding users.

For more information about viewing shadow users and their attributes, see the [User Management \(SCIM\) API](#) on [SAP Business Accelerator Hub](#).

For all other services, which persist data, such as databases or document services, retrieve the data you stored with the same APIs, protocols, or languages you used to store the data.

To view the services used in a global account, choose [Entitlements](#) in the navigation area.

## 7.5.4 Deletion

The processing of personal data is subject to applicable laws related to the deletion of this data when the specified, explicit, and legitimate purpose for processing this personal data has expired. If there is no longer a legitimate purpose that requires the retention and use of personal data, it must be deleted.

When deleting data in a data set, all referenced objects related to that data set must be deleted as well. Industry-specific legislation in different countries also needs to be taken into consideration in addition to general data protection laws. After the expiration of the longest retention period, the data must be deleted.

When accounts expire, we delete your data barring legal requirements that SAP retains your data. If your organization has separate retention requirements, you are responsible for saving this data before we terminate your account.

- For trial accounts in the Cloud Foundry environment, your account expires after 365 days.
- Productive accounts expire based on the terms of your contract.

To deactivate or delete users, see [Erasure](#) in the SAP Cloud Identity Services - Identity Authentication documentation.

For SAP BTP Cloud Foundry environment, the User Account and Authentication service creates shadow users to issue tokens for their corresponding users. Data privacy regulations or policies may require you to delete this data, for example, when the user has left your organization.

For more information about deleting shadow users, see:

- [Delete Shadow Users for Data Protection and Privacy Using the Cockpit \[page 2844\]](#)
- [Delete Shadow Users for Data Protection and Privacy Using APIs \[page 2847\]](#)

### → Remember

When you delete a user at the Cloud Foundry level, SAP BTP doesn't delete the corresponding shadow user at the subaccount level.

When you delete a user at the subaccount level, ensure that you delete the user at the Cloud Foundry level too. Otherwise, if the Cloud Foundry user logs on again, the system automatically creates the corresponding user at the subaccount level.

So ensure that you delete the shadow users on all levels.

For all other services which persist data, you can retrieve the data you stored with the same APIs, protocols, or languages which you used to store the data.

To view the services used in a global account, choose [Entitlements](#) in the navigation area.

SAP BTP Data Retention Manager is a service available for the Cloud Foundry environment that helps you to identify data subjects for deletion as well as maintain rules for residence and retention.

For more information, see [SAP BTP Data Retention Manager](#).

We maintain backups of the data for disaster recovery. When your account is deleted, we may have this data in our backup system for the length of our backup cycle.

#### Note

If your data is stored outside SAP BTP, we cannot guarantee that your data does not get reintegrated if you are pushing such data to our systems. You are responsible for terminating such integrations.

We cannot restore data you have in your local system.

## 7.5.4.1 Delete Shadow Users for Data Protection and Privacy Using the Cockpit

Data privacy regulations or policies may require you to delete this data, for example, when the user has left your organization. SAP BTP cockpit offers an application to select and delete shadow users.

### Prerequisites

You have the required authorizations.

For more information, see [Security Administration: Managing Authentication and Authorization \[page 2012\]](#) or [Role Collections and Roles in Global Accounts, Directories, and Subaccounts \[Feature Set B\] \[page 89\]](#).

### Context

#### Note

When handling personal data, consider the legislation in the various countries and regions where your organization operates. After the data has passed the end of purpose, regulations might require you to delete the data. For more information on data protection and privacy, see the related link.

The User Account and Authentication service stores user-related data records in the form of shadow users. The UAA uses the information of the shadow users to issue tokens that refer to the specific user. If automatic shadow user creation is enabled, the UAA creates the shadow users when the user authenticates. Otherwise, the UAA creates the shadow user as soon as you assign the user a role collection. These conditions apply to platform users and business users. For more information about shadow users, see the Cloud Foundry documentation.

### Note

You can also delete users using the User Management (SCIM) API.

For more information, see [Delete Shadow Users for Data Protection and Privacy Using APIs \[page 2847\]](#).

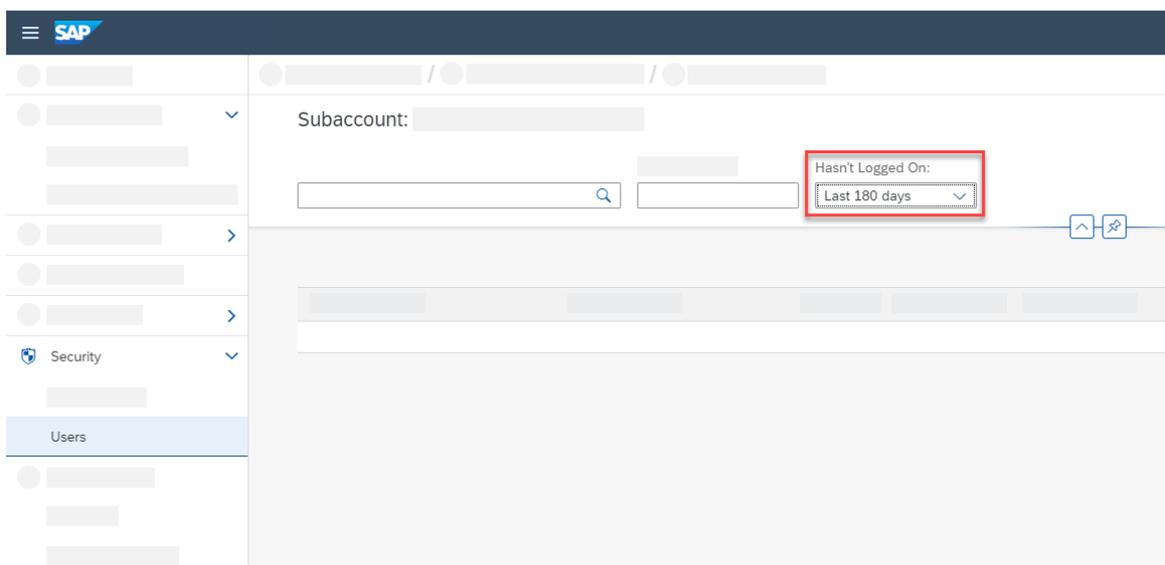

## Procedure

1. Open the SAP BTP cockpit.
2. Go to your global account, directory, or subaccount (see [Navigate in the Cockpit \[page 1938\]](#)).
3. Choose **Security > Users**.

### Note

For directories, choose *Users*. There is no *Security* menu item.

4. From the list of users, select the users to delete.

Filter for Users Who Haven't Logged On

### → Recommendation

Users, who have left your organization, haven't logged on recently. Use the *Hasn't Logged On* filter option to find users who haven't logged on in the last 180 days.

The last logon date you filter for varies from situation to situation. The filter value must meet the following requirements:

- Be long enough that the filter doesn't catch users who are simply on vacation or don't work regularly in the system.
- Not be so long that the filter no longer meets your data protection and privacy requirements.

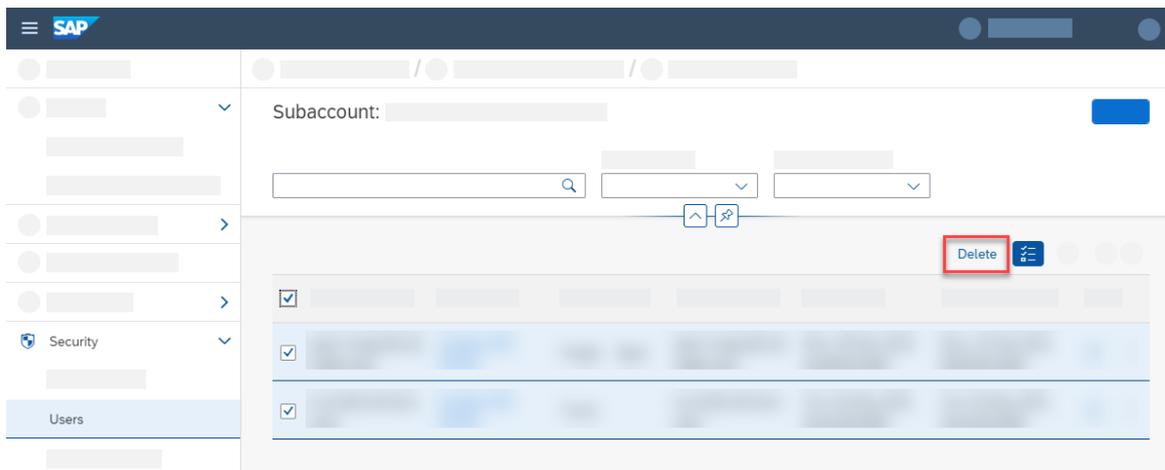

Think about users on parental leave or on a longer leave of absence, too.

### ⚠ Caution

You can't undo the deletion of a user. When you delete a user, you delete any direct assignments of role collections to that user. You also potentially invalidate any application referencing that user.

For example, an application saves some data relating to a user. When you delete the user, that data points to an ID that no longer exists. You can recreate the user, but the new user has a different ID, even though other attributes, such as e-mail, first name, and last name, are identical.

5. Delete the selected users.

Delete Selected Users

## Related Information

[Delete Users \[page 2086\]](#)

[Data Protection and Privacy \[page 2838\]](#)

[Switch Off Automatic Creation of Shadow Users \[page 2077\]](#)

[Shadow Users in the Cloud Foundry Documentation](#) ➔

## 7.5.4.2 Delete Shadow Users for Data Protection and Privacy Using APIs

Data privacy regulations or policies may require you to delete this data, for example, when the user has left your organization. To delete shadow users using APIs, set up access to the API and then use the SCIM REST APIs to retrieve and delete the users.

### Prerequisites

The security administrator must have the following scopes:

- `xs_user.read`
- `xs_user.write`

### Context

#### Note

When handling personal data, consider the legislation in the various countries and regions where your organization operates. After the data has passed the end of purpose, regulations might require you to delete the data. For more information on data protection and privacy, see the related link.

The User Account and Authentication service stores user-related data records in the form of shadow users. The UAA uses the information of the shadow users to issue tokens that refer to the specific user. If automatic shadow user creation is enabled, the UAA creates the shadow users when the user authenticates. Otherwise, the UAA creates the shadow user as soon as you assign the user a role collection. These conditions apply to platform users and business users. For more information about shadow users, see the Cloud Foundry documentation.

#### Note

Administrators can also delete users using the SAP BTP cockpit. For more information, see [Delete Users \[page 2086\]](#).

### Procedure

1. Enable API access to your subaccount.

For more information, see [Get Access to the APIs Using the apiaccess Service Plan \[page 2233\]](#).

2. Use the `GET` method for the User Management (SCIM) API of the SAP Authorization and Trust Management service to get a list of users.

For more information about the User Management (SCIM) API, see <https://api.sap.com/package/authtrustmgmt> on [SAP Business Accelerator Hub](#).

The API returns the list of users in JSON format.

3. Use your own tools to sort and identify the users in the JSON response to delete.

#### → Recommendation

Users, who have left your organization, haven't logged on recently. Use the `lastLogonTime` parameter to find users who haven't logged on in the last 180 days. The `lastLogonTime` parameter is in UNIX time.

The last logon time you filter for varies from situation to situation. The filter value must meet the following requirements:

- Be long enough that the filter doesn't catch users who are simply on vacation or don't work regularly in the system.
- Not be so long that the filter no longer meets your data protection and privacy requirements.

Account for users on parental leave or on a longer leave of absence, too.

#### ⚠ Caution

You can't undo the deletion of a user. When you delete a user, you delete any direct assignments of role collections to that user. You also potentially invalidate any application referencing that user.

For example, an application saves some data relating to a user. When you delete the user, that data points to an ID that no longer exists. You can recreate the user, but the new user has a different ID, even though other attributes, such as e-mail, first name, and last name, are identical.

4. Use the `DELETE` method and the list of user IDs to delete the shadow users one at a time.

For each user, call the `Users` endpoint with the delete method and include the user ID in the path. For example:

```
curl --location --request
DELETE 'https://api.authentication.eu20.hana.ondemand.com/Users/a0a67e6f-
c4b5-41e5-b871-6fa181d46599' \
--header 'Content-Type: application/x-www-form-urlencoded' \
--header 'Accept: application/json' \
--header 'Authorization: bearer eyJqdGkiOiJmZmZl...'
```

For more information about the User Management (SCIM) API, see <https://api.sap.com/package/authtrustmgmt> on [SAP Business Accelerator Hub](#).

## Related Information

[Data Protection and Privacy \[page 2838\]](#)

<https://docs.cloudfoundry.org/uaa/uaa-concepts.html#%23shadow>

[Switch Off Automatic Creation of Shadow Users \[page 2077\]](#)

[Delete Shadow Users for Data Protection and Privacy Using the Cockpit \[page 2844\]](#)

## 7.5.5 Consent

SAP BTP supports you in collecting and managing the consent of data subjects in the following ways:

SAP Cloud Identity Services - Identity Authentication provides tools to manage privacy policies and terms of use agreements.

For more information, see [Configuring Privacy Policies](#) and [Configuring Terms of Use](#) in the SAP Cloud Identity Services - Identity Authentication documentation.

See also [Consent](#) in the SAP Cloud Identity Services - Identity Authentication documentation.

## 7.6 Security in the Kyma Environment

The Kyma environment-specific security aspects include guidelines on personal data protection and details on processing and storing logs.

For general information on data protection and privacy, see [Data Protection and Privacy \[page 2838\]](#).

### 7.6.1 Kyma Security Measures

SAP BTP, Kyma runtime takes measures to ensure the security of the clusters and their underlying infrastructure on several levels, such as cloud infrastructure, Kubernetes control plane, worker nodes, network separation, authentication and authorization, high availability, and logging.

#### Cloud Infrastructure

All components required to run Kyma, namely Gardener, Kyma Control Plane, and a Kyma cluster, are deployed on SAP-managed hyperscaler accounts. SAP has strict guidelines to secure hyperscaler accounts and the resources deployed into them. The secure configuration is monitored regularly, and the following preventive controls are in place to revert critical configurations that weaken the security of the hyperscaler account.

##### Authentication

- A strict password policy is in place.
- Multi-factor authentication is enabled.

##### Authorization

- Permissions are assigned based on role-based access control (RBAC).
- The principle of least privilege is followed.

## Storage

- Storage services are not publicly accessible.
- Encryption using Advanced Encryption Standard (AES) with a key length of at least 256 is used.

## Kubernetes Control Plane

Kyma uses Gardener as its managed Kubernetes offering. With Gardener, the control plane of a Kubernetes cluster is hosted as a set of Pods in the Gardener environment. See the overview of the [Gardener architecture](#). In order to harden the Kubernetes control plane as well as the Kubernetes components on the worker nodes, Gardener sets up the cluster in accordance with the Defense Information Systems Agency (DISA) Security Technical Implementation Guides (STIGs) requirements (V1R6).

The Kubernetes control plane fulfills the following DISA STIGs requirements:

### General

- A kubectl version higher than 1.12.9 is used on the control plane (V-242396).
- The Kubernetes DynamicAuditing (V-242398) and DynamicKubeletConfig (V-242399) are disabled.
- Kubernetes manifests (V-242405), component manifests (V-242444), configuration files (V-242446), component PKI (V-242451), and kubeadm.conf (V-242454) are owned by root.
- The Kubernetes manifest files have restrictive file permissions following the least privileges principle (V-242408).
- Kubernetes doesn't store secrets as environment variables (V-242415).
- The role-based access control (RBAC) is activated to control access. (V-242435).
- Kubernetes is kept up to date with the latest patches, service packs, and hot fixes. A Patch Management process is in place (V-242443).
- The Kubernetes kubeadm.conf (V-242455), admin.conf (V-242460), and PKI CRT (V-242466) have restrictive file permissions.
- Access to the directory containing the Kubernetes PKI files is restricted (V-242467).
- Kubernetes endpoints use the approved organizational certificate and key pair to protect information in transit (V-245544).

### API Server

The Kubernetes kube-apiserver:

- Uses TLS 1.2, at a minimum, to protect the confidentiality of sensitive data during electronic dissemination (V-242378).
- Has the Alpha APIs (V-242400) disabled.
- Has the insecure bind address (V-242388) and insecure port (V-242386) not set, and a secure API server port (V-242389) configured.
- Has the approved SSL Certificate Authority (V-242419) set.
- Has configured only ports, protocols, and services (PPS) that adhere to the Ports, Protocols, and Services Management Category Assurance List (PPSM CAL) (V-242410).
- Uses approved cipher suites (V-242418).
- Has a certificate for communication (V-242422).

- Has the `validatingAdmissionWebhook` enabled (V-242436).
- Has appropriate timeouts set to limit attack surface (V-242438).
- Has restrictive file permissions for the configuration files of the Control Plane services (V-242458).
- Is configured to use only secure encryption protocols. SSL, TLS 1.0, and 1.1 are prohibited. (V-242468).

## Kubernetes Scheduler

The Kubernetes scheduler, namely, kube-scheduler:

- Uses TLS 1.2, at a minimum, to protect the confidentiality of sensitive data during electronic dissemination (V-242377).
- Has a secure binding to localhost (127.0.0.1) (V-242384).
- Has configured only ports, protocols, and services (PPS) that adhere to the Ports, Protocols, and Services Management Category Assurance List (PPSM CAL) (V-242411).

## Controller Manager

The Kubernetes Controller Manager:

- Uses TLS 1.2, at a minimum, to protect the confidentiality of sensitive data during electronic dissemination (V-242376).
- Has unique service accounts for each work payload (V-242381).
- Has a secure binding to localhost (127.0.0.1) (V-242385).
- Has profiling disabled (V-242409).
- Has the SSL Certificate Authority set (V-242421).
- Has configured only ports, protocols, and services (PPS) that adhere to the Ports, Protocols, and Services Management Category Assurance List (PPSM CAL) (V-242412).

## etcd

The Kubernetes etcd:

- The usage of self-signed certificates for client-to-server and server-to-server communication is prohibited (V-242379, V-242380).
- Has configured only ports, protocols, and services (PPS) that adhere to the Ports, Protocols, and Services Management Category Assurance List (PPSM CAL) (V-242413).
- Has certificate-base client authentication enabled (V-242423), (V-242426).
- Has TLS encrypted client-to-server and server-to-server communication configured (V-242427, V-242432, V-242433). The communication between the API server and etcd is encrypted with TLS (V-242431).
- Uses approved and valid certificates for the TLS encrypted connection between the API server and etcd (V-242428, V-242430). An SSL certificate authority is configured (V-242429).
- Files are owned by `etcd:etcd` (V-242445).
- Files have restrictive file permissions set. (V-242459).

## Kubernetes Worker Nodes

Kyma uses [Garden Linux](#)  as its node operating system. Garden Linux is a specially crafted Linux distribution with a minimal set of applications optimized for use in Gardener landscapes. Kubernetes worker nodes use a `kubectl` version higher than 1.12.9 (V-242396).

## kubelet

The Kubernetes kubelet:

- Has the read-only port flag (V-242387) and anonymous authentication (V-242391) disabled.
- Requires explicit authorization (V-242392).
- Denies hostname override (V-242404).
- Has an SSL certificate authority configured (V-242420).
- Has TLS enabled to enforce TLS encrypted communication sessions (V-242424, V-242425).
- Has kernel protection set (V-242434).
- Has a connection timeout set (V-245541).
- Has no staticPodPath configured (V-242397).
- The Kubernetes kubelet configuration file (V-242406), certificate authority (V-242450), and config (V-242453, V-242457) are owned by root.
- The Kubernetes kubelet configuration files (V-242407), certificate authority file (V-242449), config file (V-242452, V-242456) have restrictive file permissions set (V-242407).

## kube-proxy

The Kubernetes kube-proxy:

- Does not make use of a kubeconfig file (V-242447, V-242448).

## Network Separation

### Namespaces

Kyma components are deployed into the `kyma-system` and the `istio-system` namespaces. The default namespace is not used.

### Network Policies

The customer has full access to the cluster and can establish appropriate network policies to restrict network traffic. Because Istio is a default Kyma module, the customer can also establish PeerAuthentication policies to control the network traffic.

### Encryption

All communication in the Kyma cluster is encrypted using TLS 1.2.

## Authentication and Authorization

### Authentication at the API Server

By default, a SAP BTP, Kyma runtime cluster is deployed with a shared tenant of SAP Cloud Identity Services provided by SAP. This Identity Provider (IDP) uses OIDC tokens to authenticate and is configured to enforce Multi-Factor Authentication.

As a best practice, change the IDP to one controlled by the customer. This gives them control over the identity lifecycle of your accounts. Learn how to [Configure a Custom Identity Provider for Kyma \[page 2858\]](#).

Following DISA STIGs requirements, the Kubernetes API Server:

- Has anonymous authentication disabled (V-242390).
- Has basic authentication disabled to protect information in transit (V-245542).
- Has token authentication disabled to protect information in transit (V-245543).

## Role-based Access Control

RBAC is enabled on Kyma clusters. The Roles and ClusterRoles deployed by Kyma follow the principle of least privilege.

Following DISA STIGs requirements, the Kubernetes API server enables RBAC as the authorization mode (V-242382).

## High Availability

Kyma worker nodes are distributed over several availability zones in order to prevent outages of the cloud providers' availability zones.

## Logging

### Kubernetes-Native Audit Logging Configuration

Audit Logging of the Kubernetes API server is active and the logs are written to SAP Platform Logging Service for SAP BTP.

Following DISA STIGs requirements, the Kubernetes API server:

- Has an audit policy (V-242401), an audit log path (V-242402, V-242465), and audit log retention (V-242464) set.
- Generates audit records that provide information about the type of event that has occurred, the source of the event, the results of the event, any users and containers associated with the event (V-242403).
- Has audit logs enabled (V-242461).
- Has audit log maximum size (V-242462), and maximum backup configured (V-242463).

### Container Logging

Kyma components ship logs that contain information relevant to the containers.

## 7.6.2 Authentication and Authorization in the Kyma Environment

To authenticate in the Kyma environment, you can either use the default identity provider or set up a custom identity provider.

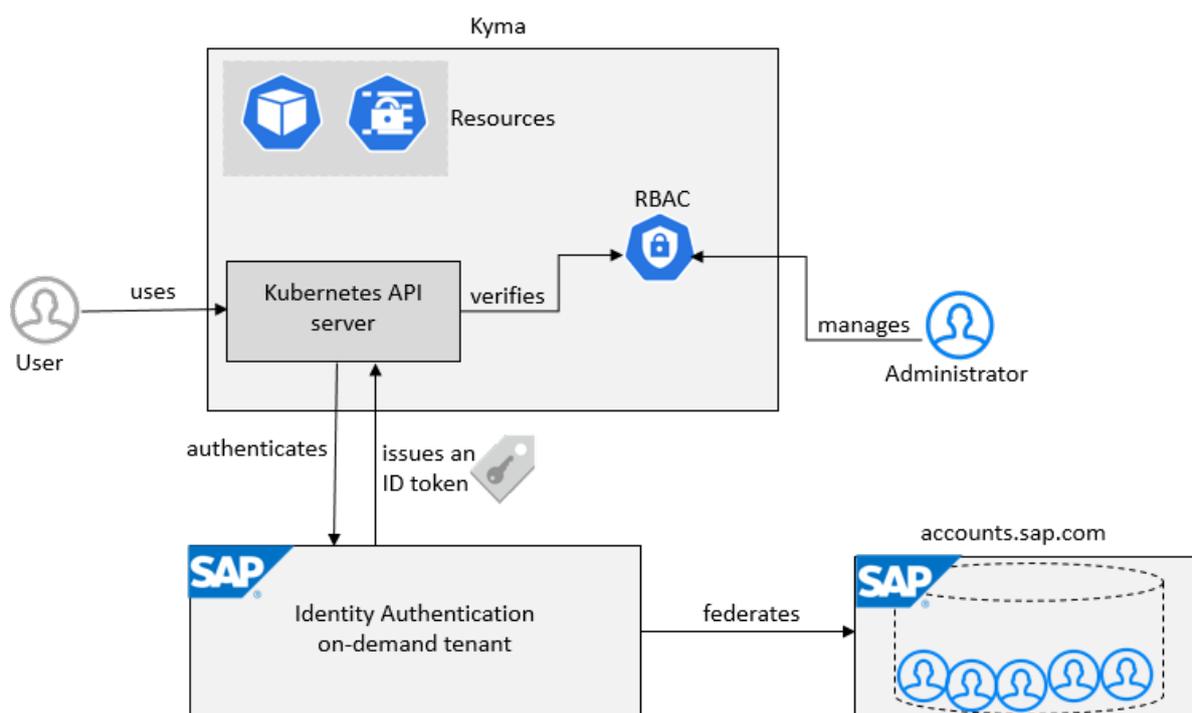

### Default Identity Provider for Kubernetes Access

Every managed Kyma runtime is configured to use a default Identity Provider (IdP). The default IdP configuration uses a specific SAP Cloud Identity Services - Identity Authentication on-demand tenant that is shared across all managed Kyma runtimes.

In managed Kyma, customers can't manage the tenant themselves, for example, make changes in user groups. In this setup, admins can assign roles only targeting users.

The Identity Authentication on-demand tenant uses SAP Corporate IdP as an upstream source of identities. Therefore, it recognizes everyone with an account at `accounts.sap.com` and issues a valid OIDC access token to any SAP customer or employee.

It doesn't mean that anybody with an account at `accounts.sap.com` has access to your Kyma runtime. The shared IdP validates identities, but permissions (roles and role bindings) are configured in your Kyma runtime, and not in the IdP or SAP BTP cockpit. Kyma uses Kubernetes Role Based Access Control (RBAC) and has the provisioning process that assures that a user who creates and owns a particular runtime is given the `cluster-admin` role. The `cluster-admin` can define any additional cluster roles or use those defined in Kyma and bind them to other users (by username) from Kyma dashboard or with the `kubectl` CLI tool.

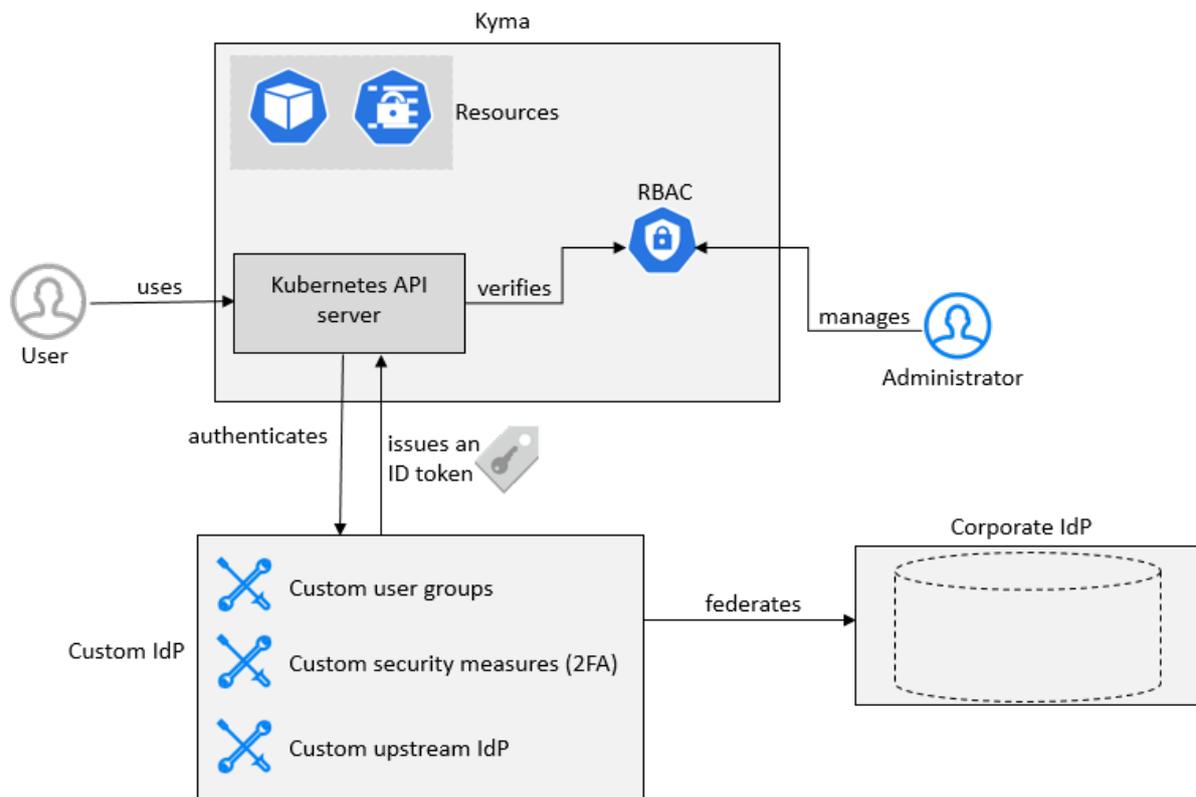

## Custom Identity Provider for Kubernetes Access

To benefit from more flexibility, we recommend that you use your own IdP. You can configure a custom identity provider during Kyma provisioning or updating an existing instance of your Kyma runtime.

You can choose any OpenID Connect compliant service. For example, you can use your own tenant of SAP Cloud Identity Services - Identity Authentication, which provides the following features:

- manage users
- manage user groups and bind cluster roles to the user groups instead of individual usernames in your Kyma runtime
- configure your own risk-based security measures, such as two-factor authentication, IP ranges, etc.
- delegate authentication to an upstream corporate IdP to prevent introducing redundant identities and to benefit from SSO, based on identity provided "centrally"

## Related Information

[Corporate Identity Providers](#)

[Configure a Custom Identity Provider for Kyma \[page 2858\]](#)

## 7.6.3 Auditing and Logging Information in Kyma

Kyma runtime collects audit and application logs.

### Audit Logs

Audit logs are records that provide evidence of events, actions, or operations. The audit log records the following data:

- Security and system events that include administrative activities, potential threats, and evidence in the case of a breach.
- Changes introduced to the system, applications, and components.

Kyma runtime collects audit logs for configuration changes to the runtime setup itself and Kubernetes resources managed by the Kubernetes API server of the runtime. Usually, those logs contain the user account (technical account or email address) and the client IP address of the subject who triggered the changes. No other personal data is stored in the audit logs. On average, the logs store the data for 90 days. If you want to store any other personal data, be cautious and bear in mind the recommendations provided in [Data Protection and Privacy \[page 2838\]](#).

### Retrieving Audit Log Entries

As a user, you don't have direct access to the audit logs. If you want to get information stored in the audit log system, open a [support ticket](#) .

### Events Written in Audit Logs

Here you can find a list of the security events that are logged by SAP BTP, Kyma runtime.

The table describes the following information:

- Event grouping - Events that are logged with a similar format or are related to the same entities.
- What events are logged - Description of the security or data protection and privacy-related event that is logged.
- Additional information - Any related information that can be helpful.

## Events Written in Audit Logs

Event grouping	What events are logged	Additional information
Secrets, ConfigMaps, and TokenReviews	CREATE, UPDATE, PATCH, and DELETE operations on the metadata level	<p>The payload is not logged.</p> <p>Resources:</p> <ul style="list-style-type: none"> <li>• "secrets"</li> <li>• "configmaps"</li> <li>• "tokenreviews"</li> </ul>
All standard Kubernetes resources in core and extensions	CREATE, UPDATE, PATCH, and DELETE operations on the request level	<p>Resource groups:</p> <ul style="list-style-type: none"> <li>• "" # core</li> <li>• "admissionregistration.k8s.io"</li> <li>• "apiextensions.k8s.io"</li> <li>• "apiregistration.k8s.io"</li> <li>• "apps"</li> <li>• "authentication.k8s.io"</li> <li>• "authorization.k8s.io"</li> <li>• "autoscaling"</li> <li>• "batch"</li> <li>• "certificates.k8s.io"</li> <li>• "coordination.k8s.io"</li> <li>• "extensions"</li> <li>• "metrics.k8s.io"</li> <li>• "networking.k8s.io"</li> <li>• "policy"</li> <li>• "rbac.authorization.k8s.io"</li> <li>• "scheduling.k8s.io"</li> <li>• "settings.k8s.io"</li> <li>• "storage.k8s.io"</li> </ul>
All Kyma resources	CREATE, UPDATE, PATCH, and DELETE operations on the request level	<p>Resource groups:</p> <ul style="list-style-type: none"> <li>• "applicationconnector.kyma-project.io"</li> <li>• "compass.kyma-project.io"</li> <li>• "eventing.kyma-project.io"</li> <li>• "gateway.kyma-project.io"</li> <li>• "serverless.kyma-project.io"</li> <li>• "telemetry.kyma-project.io"</li> <li>• "operator.kyma-project.io"</li> </ul>

Event grouping	What events are logged	Additional information
All resources of Kyma dependencies	CREATE, UPDATE, PATCH, and DELETE operations on the request level	Resource groups: <ul style="list-style-type: none"> <li>"cert.gardener.cloud"</li> <li>"ory.sh"</li> <li>"services.cloud.sap.com"</li> <li>"extensions.istio.io"</li> <li>"install.istio.io"</li> <li>"networking.istio.io"</li> <li>"security.istio.io"</li> <li>"telemetry.istio.io"</li> </ul>

## Application Logs of System Components

Kyma runtime collects application logs provided by the Kyma system components. Those logs reflect regular events that occurred in Kyma runtime and should not include any personal or sensitive data. These are typically system-related activities and operations you can analyze to get more information about performance or inspect potential problems.

## 7.6.4 Configure a Custom Identity Provider for Kyma

Enable the Kyma environment with a custom identity provider (IdP).

### Prerequisites

- Install [kubectl oidc-login](#) .

## Context

When you create a new instance in the SAP BTP cockpit from the Service Marketplace, you can configure your custom OpenID Connect IdP to authenticate users in your Kyma runtime.

If you've already created your Kyma environment, you can also apply the custom IdP configuration and set up administrators during your Kyma instance update operation by providing the details as an array of strings in the respective fields.

### → Tip

We recommend using SAP Cloud Identity Services - Identity Authentication as a custom IdP. It allows you to use Identity Authentication as a proxy to integrate your corporate identity provider. Additionally, you can configure Identity Authentication to use a third-party IdP such as Azure Active Directory or Auth0, among others. For more information, see [Integrating the Service with Microsoft Entra ID](#) and [Configure Auth0 for SAP BTP, Kyma runtime](#) .

## Procedure

1. In SAP BTP cockpit, navigate to your subaccount.
2. Go to **Services** > **Service Marketplace** and select *Kyma Environment*.
3. In the dialog box, fill in the following additional configuration fields:
  - *issuerURL* - the URL of the OpenID issuer (use the `https` schema)
  - *clientID* - the client ID for the OpenID client
  - *usernameClaim* - the name of a custom OpenID Connect claim for specifying a username
  - *groupsClaim* - the name of a custom OpenID Connect claim for specifying user groups
  - *signingAlgs* - the list of allowed cryptographic algorithms used for token signing. The allowed values are defined by [RFC 7518](#) .
  - *usernamePrefix* - the prefix for all usernames. If you don't provide it, username claims other than "email" are prefixed by the *issuerURL* to avoid clashes. To skip any prefixing, provide the value as `-`.
  - *administrators* - the list of usernames meant to be administrators. Users identified with those usernames get the role *cluster-admin* during provisioning of your Kyma runtime.

### Note

You can also provide the configuration as a JSON object:

```
"oidc": {
  "issuerURL": "{issuerURL}",
  "clientID": "{clientID}",
  "usernameClaim": "sub",
  "groupsClaim": "groups",
  "signingAlgs": ["RS256"],
  "usernamePrefix": "-"
},
"administrators": [
  "example_1@mail.com",
  "example_2@mail.com"
]
```

If you want to revert to the default settings, use the following configuration:

```
"oidc": {
  "issuerURL": "https://kyma.accounts.ondemand.com",
  "clientId": "12b13a26-d993-4d0c-aa08-5f5852bbdff6",
  "groupsClaim": "groups",
  "signingAlgs": ["RS256"],
  "usernamePrefix": "-",
  "usernameClaim": "sub"
},
"administrators": [
  "example_3@mail.com",
  "example_4@mail.com"
]
```

The email addresses must be recognised by `https://kyma.accounts.ondemand.com`.

4. Select *Create*.

## Results

Your Kyma environment is instantiated with a custom IdP.

## Next Steps

### ⚠ Caution

According to OAuth2 flows, IdPs have lists of allowed callback URLs. Configure the Kyma dashboard URL (`https://dashboard.kyma.cloud.sap`) and the localhost for kubectl authentication (`http://localhost:8000`) as allowed callback URLs at your IdP provider, so that authenticated users can be redirected back to the Kyma application.

Access to Kyma is realized using the authorization code flow with PKCE. Therefore, make sure that *Allow Public Client Flows* is enabled in your Identity Authentication tenant. For more information, see [Configure OpenID Connect Application for Authorization Code Flow](#), section *Next Steps*.

## Related Information

[Authentication and Authorization in the Kyma Environment \[page 2854\]](#)  
[Identity Authentication: Initial Setup](#)

## 7.6.5 Distributed Denial-of-Service Protection in Kyma

A distributed denial-of-service (DDoS) attack is a malicious attempt to disrupt the normal traffic of a targeted server, service or network by overwhelming the target or its surrounding infrastructure with a flood of Internet traffic.

With Kyma comes the default DDoS protection offered by the IaaS provider.

Default DDoS Protection

IaaS Provider	Default DDoS Protection
Microsoft Azure	Azure DDoS Protection Basic service
Amazon Web Services	AWS Shield Standard
Google Cloud	Standard network DDoS protection

### → Remember

Because these are cloud providers' default offerings, they are subject to change as per the cloud providers' terms and conditions.

## Web Application Firewalls

It is not possible to configure or enable web application firewalls in SAP BTP, Kyma runtime.

## 7.6.6 Security Vulnerability Management in the Kyma Environment

SAP employs a vulnerability management process to ensure the security of SAP BTP, Kyma runtime. Within this process, we identify, assess, prioritize, remedy, and monitor vulnerabilities. We also provide hotfixes between regular releases for critical vulnerabilities our security organization identifies.

Kyma development teams regularly scan SAP-owned code and the container images that are part of SAP BTP, Kyma runtime, Kyma Control Plane, and Kyma dashboard for known and potential vulnerabilities. The security scanning technologies in use are:

- Static Application Security Testing (SAST) for the proprietary code
- Open Source Vulnerability Management (OSVM) for open-source software that is part of Kyma runtime

### 📘 Note

SAP ensures security scans for Kyma runtime, and you, as a customer, are responsible for scanning your own workloads added to the Kyma cluster. For details, read [Operating Model in the Kyma Environment](#). [page 2875]

The scanning results are constantly monitored and addressed without undue delay. New vulnerabilities are assigned to responsible development teams for remediation. If an update is available, the vulnerability is fixed.

If not, the vulnerability is subject to further analysis to identify its associated risk and implement appropriate measures. For critical vulnerabilities identified by SAP's security organization, hotfixes are provided between regular releases.

#### → Remember

Kyma development teams analyze each vulnerability to assess its actual severity in the Kyma environment. Therefore, we may lower the severity score or identify it as false-positive.

# 8 Getting Support

To get assistance, use the available support channels provided by SAP for Me.

## Note

This section is applicable for all multicloud environments. To find which environments are available in your region, see [Regions \[page 17\]](#).

## Prerequisites

Before you report a case, ensure the following:

### Check Platform Status

- **Running on the AWS, Azure, or GCP regions:** visit [SAP Trust Center](#). You can check:
  - availability by service on [Cloud Status](#) tab page;
  - availability by region on the [Data Center](#) tab page.For more information about selected platform incidents, see [Root Cause Analyses](#).
- **Running on the China (Shanghai) region:** check <https://status.cn40.platform.sapcloud.cn/>.
- **Running on the Government Cloud (US) region:** planned downtimes and outage communication are sent through e-mail to the initial administrator of your global account.

### Check Tools Versions

Make sure that you've the latest versions of the tools you're using (recommended), or at least the versions you're using are still supported. For more information, see [SAP Development Tools](#).

## Note

Trial users (without an S-user) can ask for support by posting a question in [SAP Community](#). However, they should first check for answers in [SAP Community](#) and [Guided Answers](#).

### Try Out Built-In Support Within SAP BTP Cockpit

When using SAP BTP cockpit as an S-user, try Built-In Support to get customer help within the cockpit. See [Built-In Support](#).

### Learn the Best Practices and Offerings

Familiarize with the guidelines how to engage with support. See [Support from SAP Best Practices & Offerings](#).

## Procedure

To report a case in SAP for Me, proceed as follows:

1. Open [SAP for Me](#) and log on.
2. Open the [Services & Support](#) dashboard.
3. (Optional) You can use the [Knowledge Search](#) tab for existing solutions in:
  - SAP Notes & KBAs
  - SAP Community
  - SAP Support Portal
  - Product Documentation
  - Guided Answers
4. Use the [Get Support](#) application within SAP for Me to get assistance via the available support channels. For more information about the specifics of each support channel and to learn how to report technical issues, see [Get Support Application](#).  
For any other non-technical assistance, see [Customer Interaction Center](#).

## 8.1 Providing Details for SAP HANA Service Database Problems

If your problem is related to a SAP HANA service database, the details you need to provide differ depending on the environment or infrastructure provider the database is provisioned in.

Infrastructure Provider	Details You Need to Provide	How to Find the Details You Need
Azure regions <hr/> AWS regions (databases provisioned before June 4, 2018)	The URL of the space the database is provisioned in	<ol style="list-style-type: none"> <li>In the SAP BTP cockpit, navigate to the org and space the database is provisioned in.</li> <li>In the navigation area, go to <a href="#">SAP HANA &gt; Database Systems</a>.</li> <li>Choose the affected <i>Database System</i>.</li> <li>Copy the URL from the overview of the affected database system. Example URL: <code>https://account.hana.ondemand.com/cockpit#/globalaccount/&lt;id&gt;/subaccount/&lt;id&gt;/org/&lt;id&gt;/dbsystems/&lt;id&gt;/overview</code></li> </ol>
AWS regions (databases provisioned after June 4, 2018) <hr/> Google Cloud regions	The service instance ID	<ol style="list-style-type: none"> <li>In the SAP BTP cockpit, navigate to the space the SAP HANA service instance is provisioned in.</li> <li>In the navigation area, choose <a href="#">Services &gt; Service Instances</a>.</li> <li>In the list of available services, find your SAP HANA service instance and choose <a href="#">Open Dashboard</a> from the <i>Actions</i> column.</li> <li>Copy the service instance GUID under <a href="#">Details &gt; ID</a>. Example GUID: <code>ad539b83-39bd-4ff4-8b41-1a5dfdfca7ea</code></li> </ol>
China (Shanghai) region	See <a href="#">Getting Support</a>	
Government Cloud (US) region	Please contact your operator.	

## Related Information

[Providing Details for Database Problems in the Neo Environment](#)

## 8.2 Gather Support Information

The Eclipse tools come with a wizard for gathering support information in case you need help with a feature or operation (during deploying/debugging applications, logging, configurations, and so on).

### Context

The wizard collects the information in a ZIP file, which can be later sent to the support team. This way, the support developers can get better understanding of your environment and process the issue faster.

### Procedure

1. From the Eclipse IDE, choose **Help > Collect Support Information**.
2. The launched wizard lists the default components to be collected, depending on the tools you've installed. If you need the support team to look at specific resources, expand the *Additional Data* section and select the relevant items.

#### Note

If you select *Screenshot*, your currently open Eclipse windows and views are snapped as a picture and added to the ZIP file. Make sure you don't reveal sensitive information.

3. In the *File Name* field, specify the ZIP file name and location.
4. Choose *Finish*.

### Next Steps

You can create a support ticket, attach the files to it, and send it to the corresponding support team. For more information, see [Getting Support \[page 2863\]](#).

## 8.3 Platform Updates and Notifications

SAP BTP is a dynamic product, which has continuous production releases (updates). To get notifications for the new features and fixes every release, follow the community page at [SAP Business Technology Platform](#). Also, make sure you have enabled your account notifications as described at [Your Notification Settings](#).

### Reasons for Region Updates

Regions are updated in the following cases:

- **Biweekly updates** (standard) - aligned with the contractual obligations to customers and partners. Such updates usually don't affect productive applications, because most services support zero downtime maintenance. For more information about the biweekly updates, see [Consolidated Release Schedules for SAP BTP](#) and [Service Level Agreement for SAP Cloud Services](#).
- **Immediate updates** - fixes required for bugs that affect productive application operations, or due to urgent security fixes. In some cases, this might lead to downtime or application restart, for which the application groups receive a notification.
- **Major upgrades** - happen rarely, in a bigger maintenance window, up to four times per year. For the time frames of the services' major upgrades, see [Service Level Agreement for SAP Cloud Services](#). We let you know about these upgrades 4 weeks in advance.

### Announcements and Subscriptions [AWS, Azure, or GCP Regions]

You can follow the availability of the platform at [SAP Trust Center](#). You can check:

- the availability by service on the [Cloud Status](#) tab page;
- the availability by region on the [Data Center](#) tab page.

In addition, you can use [Cloud Availability Center](#) (CAC) to check what cloud products and services are assigned to your customer ID for notifications. CAC provides you with a personalized dashboard based on SAP Fiori. It's designed to give you quick access to relevant information about the cloud products that you own and their availability and maintenance status. For more information, see [CAC User Guide](#).

You can find information about the supported [Cloud Product](#) [Cloud Service](#) at [Supported Products](#).

The cloud products are tagged with  (orange check mark), while the cloud services with  (gray check mark).

Note: The foundational components of the platform are included in [SAP Extension Suite – Development Efficiency](#) [Foundational Services for SAP BTP](#).

To get notifications for updates and downtimes, subscribe at the [Cloud System Notification Subscriptions](#) application. Create a subscription by specifying Cloud Product, Cloud Service, and Notification Type. For more information, see [Cloud System Notification Subscriptions User Guide](#).

#### ❁ Example

To receive notifications about changes in the IP ranges of a region, subscribe to ► [SAP Extension Suite – Development Efficiency](#) ► [Foundational Services for SAP BTP](#) ►.

#### ❁ Example

To receive notifications about what application processes to restart to apply new security patches, subscribe to ► [SAP Extension Suite – Development Efficiency](#) ► [Foundational Services for SAP BTP](#) ►.

## Announcements and Subscriptions [China (Shanghai) Region]

You can follow the availability of the platform and the announcements about upcoming updates and downtimes at <https://status.cn40.platform.sapcloud.cn/> ►. Subscribe to the status page to get notifications for updates and downtimes.

## Announcements and Subscriptions [Government Cloud (US) Region]

Planned downtimes and outage communication are sent through e-mail to the initial administrator of your global account.

## Related Information

[What's New](#)

[Regions \[page 17\]](#)

## 8.4 Operating Model

An operating model clearly defines the separation of tasks between SAP and the customer during all phases of an integration project.

The environment and its services have been developed on the assumption that specific processes and tasks are the responsibility of the customer. The operating model contains all processes and tasks involved in operating the platform and the services and specifies how the responsibilities are divided between SAP and the customer for each individual task. It doesn't include the operation of systems and devices residing at operational facilities owned by the customer or any other third party, as these are the customer's responsibility.

Changes to the operating model defined for the services in scope are published using the *What's New* section of the platform. Customers and other interested parties must review the product documentation on a regular

basis. If critical changes are made to the operating model, which require action on the customer side, an explicit notification is sent by e-mail to the affected customers.

It isn't the intent of this document to supplement or modify the contractual agreement between SAP and the customer for the purchase of any of the services in scope. In the event of a conflict, the contractual agreement between SAP and the customer as set out in the Order Form, the General Terms and Conditions, the supplemental terms and conditions, and any resources referenced by those documents always takes precedence over this document.

#### [Operating Model in the Cloud Foundry Environment \[page 2869\]](#)

This operating model clearly defines the separation of tasks between SAP and the customer during all phases of a project.

#### [Operating Model in the Kyma Environment \[page 2875\]](#)

This operating model clearly defines the separation of tasks between SAP and the customer during all phases of a project.

#### [Comparison between the Operating Models of Kyma and Cloud Foundry Runtimes \[page 2882\]](#)

This operating model clearly defines the separation of tasks between SAP and the customer. It's relevant for all phases of a project for both environments.

## 8.4.1 Operating Model in the Cloud Foundry Environment

This operating model clearly defines the separation of tasks between SAP and the customer during all phases of a project.

The responsibilities for operating the Cloud Foundry environment are listed in the following service catalog.

Service Catalog

Process	Task	Responsibility
Communication Management	Appoint an English-speaking contact person and communicate the name to SAP. This is required to ensure timely processing of configuration change requests affecting the customer system, interacting with SAP for efficient incident processing, and other interaction between SAP and the customer.	Customer
Communication Management	Subscribe to the communication channels offered by SAP for receiving prompt information about any service disruptions, critical maintenance activities affecting the customer system, and change requests requiring action on the customer side.	Customer

Process	Task	Responsibility
Communication Management	Inform the customer about service disruptions and critical maintenance activities affecting the customer system.	SAP
Asset Management	Manage the hardware and infrastructure resources in the region, from acquisition through disposal. This includes the request and approval process, procurement management, lifecycle management, and disposal management.	SAP
Asset Management	Protect IT assets such as systems, network, and data from threats that arise from unauthorized physical access or physical influence on those assets.	SAP
Provisioning	Provision resources and systems to customers in accordance with the ordered package and subscriptions. This includes the allocation and provisioning of technical (physical and virtual) resources, such as storage, network, compute units, systems, and database hosts, the deployment of SAP's application software and the proper initial configuration of quotas, service subscriptions, permissions, and trust configuration.	SAP
Provisioning	Provide a quota according to the ordered package and subscriptions that can be used to enable resources and services (for example, subscribing to a service).	Customer

Process	Task	Responsibility
Change Management	Apply regular product increments, as well as corrections to the infrastructure, systems, and services to avoid incidents with minimal possible disruption of normal operations. Ensure that all platform changes (such as updates of the runtime or operating system patches, but not of the customer applications) are evaluated, authorized, prioritized, planned, tested, implemented, documented, and reviewed prior to implementation.	SAP
Change Management	Perform updates of the infrastructure, systems, and services in a biweekly cycle if required. Respectively, for selected services, offer self-services for applying controlled updates of new versions. Emergency changes, for example, triggered by Incident Management processes, have accelerated testing, approval, and implementation.	SAP
Change Management	<ul style="list-style-type: none"> <li>• Ensure prompt delivery of security patches via the Security Patch Management process.</li> <li>• Provision new database systems and Java applications with the latest patched versions.</li> <li>• Apply the security patches on live customer systems (application runtimes or databases), in case the patches don't require downtime, or if the vulnerable system puts at risk SAP or other customers.</li> <li>• Inform the customers about the availability of security patches.</li> </ul>	SAP
Change Management	Adopt the latest patches or updates via the available self-services and by restarting applications when necessary. For example, when a security issue arises.	Customer

Process	Task	Responsibility
Incident Management	Process incidents reported by the customer according to the Service Level Agreement. The incident is recorded and prioritized in the incident tracking system. Monitor the status and progress of the incident throughout its whole lifecycle and give regular status updates to the customer.	SAP
Incident Management	In the event of incidents, make reasonable effort to support end users and manage their incidents, to explore self-help tools to find already documented solutions, and to liaise with SAP support in the event of new problems to ensure timely processing of incidents affecting the resources in the customer account.	Customer
Incident Management	Confirm incident resolution in the incident tracking system.	Customer
Service Requests	Process service requests reported by the customer according to the Service Level Agreement. The service request is recorded and prioritized in the service request tracking system. Monitor the status and progress of the service request throughout its whole lifecycle and give regular status updates to the customer.	SAP
Service Requests	Confirm service request completion in the service request tracking system.	Customer
Backup & Restore	Perform a backup of the database systems hosted in the subaccount. A database log backup is done according to the Service Level Agreement and stored on the primary storage. The logs are transferred from primary to secondary storage according to the Service Level Agreement. Full data backup is done every day.	SAP

Process	Task	Responsibility
Backup & Restore	Restore previously backed-up data to recover to a consistent state. Note: For some database services, there is a self-service for the restore process. Verify the completeness of the restored data based on log files created during the recovery and smoke tests to verify the system's consistency.	SAP
Backup & Restore	Give regular status updates to the customer throughout the entire restore procedure.	SAP
Backup & Restore	Collaborate with SAP to ensure timely processing of data restores if required.	Customer
Backup & Restore	Validate logical integrity and consistency of the restored data.	Customer
User Access Management	Manage users, permissions, and security configurations within the subaccount.	Customer
System Monitoring	Ensure availability of the customer system according to the Service Level Agreements as agreed in the contractual agreement between SAP and the customer, by active monitoring, prompt issue detection, and incident prevention.	SAP
System Monitoring	Monitor the resource consumption (memory, CPU, storage) to detect issues in technical operations.	SAP
Malware Management	Ensure that the infrastructure and platform services are free of viruses, spam, spyware, and other malicious software. If malware is detected, an auto-notification is generated, which is assessed and resolved by SAP.	SAP

Process	Task	Responsibility
Application Management	Design, develop, deploy, configure, maintain, and operate the application within the subaccount. This includes maintaining a staged environment for application delivery (if required), application resource management, and managing application availability and performance.	Customer
Application Management	Provide infrastructure, tools, and application programming interfaces for the lifecycle management and operations of the application in the subaccount.	SAP
Application Management	Regularly adopt the latest versions of the tools for lifecycle management and operations offered at the <a href="#">SAP Development Tools site</a> .	Customer
Network Management	Manage the network isolation of the subaccounts provisioned to the customer.	SAP
Network Management	Operate the network infrastructure transparently for customers, ensuring elasticity, high availability, and security.	SAP
Network Management	Create and manage own Web domain for the application in the subaccount to ensure data isolation.	Customer
Penetration Testing	Inform SAP about any penetration testing that shall be performed for the customer account and ask for their approval. Testing isn't allowed on any resources shared with other customers. The results, if any, from the test are to be treated strictly as the confidential information of SAP and the customer aren't to be shared with any person or entity without explicit written authorization from SAP. Customers are required to share the results with SAP and work together with SAP's operations to mitigate or remedy any security issues.	Customer

Process	Task	Responsibility
Decommissioning	Ensure the secure deletion of data and hardware disposal. This includes the disassembling of systems along with peripherals and their removal from the region. Before dismantling and hand-over for further use or return to the vendor, the data is wiped securely from the system.	SAP

## 8.4.2 Operating Model in the Kyma Environment

This operating model clearly defines the separation of tasks between SAP and the customer during all phases of a project.

The responsibilities for operating the SAP BTP, Kyma runtime are listed in the following service catalog.

### Note

The following information is valid for the managed offering, SAP BTP, Kyma runtime, not for the open source project "Kyma".

Service Catalog

Process	Task	Responsibility
Communication Management	Appoint an English-speaking contact person and communicate the name to SAP. This is required to ensure timely processing of configuration change requests affecting the customer system, interacting with SAP for efficient incident processing, and other interaction between SAP and the customer.	Customer

Process	Task	Responsibility
Communication Management	Subscribe to the communication channels offered by SAP for receiving prompt information about any service disruptions, critical maintenance activities affecting the customer system, and change requests requiring action on the customer side.	Customer
Communication Management	Inform the customer about service disruptions and critical maintenance activities affecting the customer system.	SAP
Asset Management	Manage the hardware and infrastructure resources in the region, from acquisition through disposal. This includes the request and approval process, procurement management, lifecycle management, and disposal management.	SAP
Asset Management	Protect IT assets such as systems, network, and data from threats that arise from unauthorized physical access or physical influence on those assets.	SAP
Provisioning	Provision resources and systems to customers in accordance with the ordered package and subscriptions. This includes the allocation and provisioning of technical (physical and virtual) resources, such as storage, network, compute units, systems, and database hosts, the deployment of SAP's application software and the proper initial configuration of quotas, service subscriptions, permissions, and trust configuration.	SAP

Process	Task	Responsibility
Provisioning	<p>Provide a quota according to the ordered package and subscriptions that can be used to enable resources and services (for example, subscribing to a service).</p> <p>Kyma runtime offers a consumption-based service plan. Hence, you can limit the resources (and costs) by configuring the minimum and maximum VMs. Such a configuration impacts the resources (compute units) available for developers to deploy applications.</p>	Customer
Change Management	<p>Apply regular product increments, as well as corrections to the infrastructure, systems, and services to avoid incidents with minimal possible disruption of normal operations. Ensure that all platform changes (such as updates of the runtime or operating system patches, but not of the customer applications) are evaluated, authorized, prioritized, planned, tested, implemented, documented, and reviewed prior to implementation.</p>	SAP
Change Management	<p>Perform updates of the infrastructure, systems, and services if required. Respectively, for selected services, offer self-services for applying controlled updates of new versions. Emergency changes, for example, triggered by Incident Management processes, have accelerated testing, approval, and implementation.</p>	SAP

Process	Task	Responsibility
Change Management	<ul style="list-style-type: none"> <li>• Ensure prompt delivery of security patches via the Security Patch Management process.</li> <li>• Apply the security patches on live customer systems (application runtimes or databases), in case the patches don't require downtime, or if the vulnerable system puts at risk SAP or other customers.</li> <li>• Inform the customers about the availability of security patches.</li> </ul>	SAP
Change Management	<ul style="list-style-type: none"> <li>• Handle any security patches to Java or any other languages. You have to create a new Docker image and update the applications to use the new image.</li> <li>• Adopt the latest patches or updates by restarting applications when necessary. For example, when a security issue arises.</li> </ul>	Customer
Incident Management	Process incidents reported by the customer according to the Service Level Agreement. The incident is recorded and prioritized in the incident tracking system. Monitor the status and progress of the incident throughout its whole lifecycle and give regular status updates to the customer.	SAP
Incident Management	In the event of incidents, make reasonable effort to support end users and manage their incidents, to explore self-help tools to find already documented solutions, and to liaise with SAP support in the event of new problems to ensure timely processing of incidents affecting the resources in the customer account.	Customer
Incident Management	Confirm incident resolution in the incident tracking system.	Customer

Process	Task	Responsibility
Service Requests	Process service requests reported by the customer according to the Service Level Agreement. The service request is recorded and prioritized in the service request tracking system. Monitor the status and progress of the service request throughout its whole lifecycle and give regular status updates to the customer.	SAP
Service Requests	Confirm service request completion in the service request tracking system.	Customer
Backup & Restore	<p>Perform a backup of the database systems hosted in the subaccount. A database log backup is done according to the Service Level Agreement and stored on the primary storage. The logs are transferred from primary to secondary storage according to the Service Level Agreement. Full data backup is done every day.</p> <p>Note: If you as a customer deploy your custom databases, you're then responsible. See <a href="#">Volume Backup for Customer Data</a>.</p>	SAP Customer
Backup & Restore	<p>Restore previously backed-up data to recover to a consistent state. Note: For some database services, there is a self-service for the restore process. Verify the completeness of the restored data based on log files created during the recovery and smoke tests to verify the system's consistency.</p> <p>Note: If you as a customer deploy your custom databases, you're then responsible. See <a href="#">Volume Backup for Customer Data</a>.</p>	SAP Customer

Process	Task	Responsibility
Backup & Restore	<p>Give regular status updates to the customer throughout the entire restore procedure.</p> <p>This responsibility is applicable only for the SAP BTP database services.</p> <p>Note: If you as a customer deploy your custom databases, you're then responsible. See <a href="#">Volume Backup for Customer Data</a>.</p>	SAP Customer
Backup & Restore	<p>Collaborate with SAP to ensure timely processing of data restores if required.</p> <p>This responsibility is applicable only for the SAP BTP database services.</p>	Customer
Backup & Restore	<p>Validate logical integrity and consistency of the restored data.</p>	Customer
User Access Management	<p>Manage users, permissions, and security configurations within the subaccount.</p>	Customer
System Monitoring	<p>Ensure availability of the customer system according to the Service Level Agreements as agreed in the contractual agreement between SAP and the customer, by active monitoring, prompt issue detection, and incident prevention.</p>	SAP
System Monitoring	<p>Monitor the resource consumption (memory, CPU, storage) to detect issues in technical operations.</p>	SAP
Malware Management	<p>Ensure that the infrastructure and platform services are free of viruses, spam, spyware, and other malicious software. If malware is detected, an auto-notification is generated, which is assessed and resolved by SAP.</p> <p>Note: If your custom application has vulnerabilities, you as a customer are responsible to fix them, to build a new Docker image, and to update the application.</p>	SAP Customer

Process	Task	Responsibility
Application Management	Design, develop, deploy, configure, maintain, and operate the application within the subaccount. This includes maintaining a staged environment for application delivery (if required), application resource management, and managing application availability and performance.	Customer
Application Management	Provide infrastructure, tools, and application programming interfaces for the lifecycle management and operations of the application in the subaccount.	SAP
Application Management	Regularly adopt the latest versions of the tools for lifecycle management and operations offered at the <a href="#">SAP Development Tools site</a> .	Customer
Network Management	Manage the network isolation of the subaccounts provisioned to the customer.	SAP
Network Management	Operate the network infrastructure transparently for customers, ensuring elasticity, high availability, and security.	SAP
Network Management	Create and manage a custom Web domain for the application in the subaccount to ensure data isolation.	Customer
Network Management	Create and manage the default SAP Web domain for the application in the subaccount to ensure data isolation.	SAP

Process	Task	Responsibility
Penetration Testing	Inform SAP about any penetration testing that shall be performed for the customer account and ask for their approval. Testing isn't allowed on any resources shared with other customers. The results, if any, from the test are to be treated strictly as the confidential information of SAP and the customer aren't to be shared with any person or entity without explicit written authorization from SAP. ### 8.4.3 Comparison between the Operating Models of Kyma and Cloud Foundry Runtimes

This operating model clearly defines the separation of tasks between SAP and the customer. It's relevant for all phases of a project for both environments.

The responsibilities for operating the Cloud Foundry and Kyma runtimes are described in the following service catalog.

Service Catalog

Process	Task	Responsibility in Cloud Foundry	Responsibility in Kyma	Differences
Communication Management	Appoint an English-speaking contact person and communicate the name to SAP. This is required to ensure timely processing of configuration change requests affecting the customer system, interacting with SAP for efficient incident processing, and other interaction between SAP and the customer.	Customer	Customer	No
Communication Management	Subscribe to the communication channels offered by SAP for receiving prompt information about any service disruptions, critical maintenance activities affecting the customer system, and change requests requiring action on the customer side.	Customer	Customer	No
Communication Management	Inform the customer about service disruptions and critical maintenance activities affecting the customer system.	SAP	SAP	No
Asset Management	Manage the hardware and infrastructure resources in the region, from acquisition through disposal. This includes the request and approval process, procurement management, life-cycle management, and disposal management.	SAP	SAP	No

Process	Task	Responsibility in Cloud Foundry	Responsibility in Kyma	Differences
Asset Management	Protect IT assets such as systems, network, and data from threats that arise from unauthorized physical access or physical influence on those assets.	SAP	SAP	No
Provisioning	Provision resources and systems to customers in accordance with the ordered package and subscriptions. This includes the allocation and provisioning of technical (physical and virtual) resources, such as storage, network, compute units, systems, and database hosts, the deployment of SAP's application software and the proper initial configuration of quotas, service subscriptions, permissions, and trust configuration.	SAP	SAP	No

Process	Task	Responsibility in Cloud Foundry	Responsibility in Kyma	Differences
Provisioning	<p>Provide a quota according to the ordered package and subscriptions that can be used to enable resources and services (for example, subscribing to a service).</p> <p>Kyma runtime doesn't offer a subscription-based service plan, but a consumption-based one. However, you can limit the resources (and costs) in other ways. What you can still configure is the minimum and maximum VMs for a Kyma runtime. This impacts the resources (compute units) available in a Kyma runtime for developers to deploy applications.</p>	Customer	Customer	Yes
Change Management	<p>Apply regular product increments, as well as corrections to the infrastructure, systems, and services to avoid incidents with minimal possible disruption of normal operations. Ensure that all platform changes (such as updates of the runtime or operating system patches, but not of the customer applications) are evaluated, authorized, prioritized, planned, tested, implemented, documented, and reviewed prior to implementation.</p>	SAP	SAP	No

Process	Task	Responsibility in Cloud Foundry	Responsibility in Kyma	Differences
Change Management	<p>Perform updates of the infrastructure, systems, and services if required. Respectively, for selected services, offer self-services for applying controlled updates of new versions. Emergency changes, for example, triggered by Incident Management processes, have accelerated testing, approval, and implementation.</p> <p>The updates for the Cloud Foundry runtime are performed in bi-weekly cycles.</p>	SAP	SAP	Yes

Process	Task	Responsibility in Cloud Foundry	Responsibility in Kyma	Differences
Change Management	<ul style="list-style-type: none"> <li>Ensure prompt delivery of security patches via the Security Patch Management process.</li> <li>Provision new database systems and Java applications with the latest patched versions in the Cloud Foundry runtime. In the Kyma runtime, you as a customer are responsible for handling any security patches to Java or any other languages. You have to create a new Docker image and update the applications running in the Kyma runtime to use the new image.</li> <li>Apply the security patches on live customer systems (application runtimes or databases), in case the patches don't require downtime, or if the vulnerable system puts at risk SAP or other customers.</li> <li>Inform the customers about the availability of security patches.</li> </ul>	SAP	SAP Customer	Yes

Process	Task	Responsibility in Cloud Foundry	Responsibility in Kyma	Differences
Change Management	<p>Adopt the latest patches or updates by restarting applications when necessary. For example, when a security issue arises.</p> <p>In the Cloud Foundry runtime, you can also adopt the latest patches or updates via the available self-services.</p>	Customer	Customer	Yes
Incident Management	<p>Process incidents reported by the customer according to the Service Level Agreement. The incident is recorded and prioritized in the incident tracking system. Monitor the status and progress of the incident throughout its whole lifecycle and give regular status updates to the customer.</p>	SAP	SAP	No
Incident Management	<p>In the event of incidents, make reasonable effort to support end users and manage their incidents, to explore self-help tools to find already documented solutions, and to liaise with SAP support in the event of new problems to ensure timely processing of incidents affecting the resources in the customer account.</p>	Customer	Customer	No
Incident Management	<p>Confirm incident resolution in the incident tracking system.</p>	Customer	Customer	No

Process	Task	Responsibility in Cloud Foundry	Responsibility in Kyma	Differences
Service Requests	Process service requests reported by the customer according to the Service Level Agreement. The service request is recorded and prioritized in the service request tracking system. Monitor the status and progress of the service request throughout its whole lifecycle and give regular status updates to the customer.	SAP	SAP	No
Service Requests	Confirm service request completion in the service request tracking system.	Customer	Customer	No
Backup & Restore	<p>Perform a backup of the database systems hosted in the subaccount. A database log backup is done according to the Service Level Agreement and stored on the primary storage. The logs are transferred from primary to secondary storage according to the Service Level Agreement. Full data backup is done every day.</p> <p>Note: If you as a customer deploy your custom databases in the Kyma runtime, you're then responsible. See <a href="#">Volume Backup for Customer Data</a>.</p>	SAP	SAP Customer	Yes

Process	Task	Responsibility in Cloud Foundry	Responsibility in Kyma	Differences
Backup & Restore	<p>Restore previously backed-up data to recover to a consistent state. Note: For some database services, there's a self-service for the restore process. Verify the completeness of the restored data based on log files created during the recovery and smoke tests to verify the system's consistency.</p> <p>Note: If you as a customer deploy your custom databases in the Kyma runtime, you're then responsible. See <a href="#">Volume Backup for Customer Data</a>.</p>	SAP	SAP Customer	Yes
Backup & Restore	<p>Give regular status updates to the customer throughout the entire restore procedure.</p> <p>In the Kyma runtime, this responsibility is applicable only for the SAP BTP database services.</p> <p>Note: If you as a customer deploy your custom databases in the Kyma runtime, you're then responsible. See <a href="#">Volume Backup for Customer Data</a>.</p>	SAP	SAP Customer	Yes

Process	Task	Responsibility in Cloud Foundry	Responsibility in Kyma	Differences
Backup & Restore	<p>Collaborate with SAP to ensure timely processing of data restores if required.</p> <p>In the Kyma runtime, this responsibility is applicable only for the SAP BTP database services.</p>	Customer	Customer	Yes
Backup & Restore	Validate logical integrity and consistency of the restored data.	Customer	Customer	No
User Access Management	Manage users, permissions, and security configurations within the subaccount.	Customer	Customer	No
System Monitoring	Ensure availability of the customer system according to the Service Level Agreements as agreed in the contractual agreement between SAP and the customer, by active monitoring, prompt issue detection, and incident prevention.	SAP	SAP	No
System Monitoring	Monitor the resource consumption (memory, CPU, storage) to detect issues in technical operations.	SAP	SAP	No

Process	Task	Responsibility in Cloud Foundry	Responsibility in Kyma	Differences

Service Name	Short Description	Support Component	Environment	Infrastructure	Region	Available as Trial	Release Status
<a href="#">Redis, Hyperscaler Option</a>	Create and consume in-memory cache with Redis based on hyperscalers.	BC-CP-BSB-REDIS	Cloud Foundry	AWS	US East (VA) Japan (Tokyo) Europe (Frankfurt) EU Access Europe (Frankfurt) Canada (Montreal) US East (VA) Brazil (São Paulo) Singapore Australia (Sydney)	Yes	Available
<a href="#">Redis, Hyperscaler Option</a>	Create and consume in-memory cache with Redis based on hyperscalers.	BC-CP-BSB-REDIS	Cloud Foundry	Azure	US East (VA) US West (WA) Japan (Tokyo) Europe (Netherlands) Singapore Australia (Sydney)	Yes	Available
<a href="#">Web Analytics</a>	Analyze usage of your websites and web applications.	CA-SWA	Cloud Foundry	AWS	Europe (Frankfurt) US East (VA) Australia (Sydney) Brazil (São Paulo) Japan (Tokyo) Singapore	Yes	Available
<a href="#">Web Analytics</a>	Analyze usage of your websites and web applications.	CA-SWA	Cloud Foundry	Azure	Europe (Netherlands) US West (WA) US East (VA) Singapore Japan (Tokyo)	Yes	Available

Service Name	Short Description	Support Component	Environment	Infrastructure	Region	Available as Trial	Release Status
<a href="#">Personalized Recommendation</a>	Personalized Recommendation draws insights from user data to deliver highly personalized recommendations.	CA-ML-PR	Cloud Foundry	AWS	Europe (Frankfurt) US East (VA)	Yes	Available

## Additional Components

### Tools

Name	Support Component
SAP BTP Cockpit	BC-NEO-CPT [Feature Set A] BC-CP-CPT [Feature Set B] BC-CP-CF-CPT [Cloud Foundry environment UI]
SAP BTP Command Line Interface	BC-CP-TOOLS-CLI
SAP BTP Console Client	BC-NEO-CMDTOOL
SAP UI Development Toolkit for HTML5 (SAPUI5)	CA-WDE
SDK for SAP BTP, Neo Environment	BC-NEO-SDK
SAP HANA Cockpit 2.0	HAN-CLS-CPT

### Software Logistics

Name	Support Component
Deployment (Neo Environment)	BC-NEO-DPL
Deployment (Cloud Foundry Environment)	BC-XS-SL-DS

### Other

Name	Support Component
Infrastructure (Neo environment)	BC-NEO-IT-NW
SAP Cloud Management Service	BC-NEO-CIS
SAP Usage Data Management Service	BC-NEO-MET-REP

Name	Support Component
SAP Audit Log service	BC-NEO-AUDITLOG (Neo environment)
	BC-CP-CF-SEC-AUDITLG (Cloud Foundry environment)
SAP Streaming Analytics	HAN-SDS
SAP Cloud Application Programming Model (CAP)	BC-XS-CDX
	BC-XS-CDX-COR (Compiler and CDS Language)
	BC-XS-CDX-JAV (Java Runtime)
	BC-XS-CDX-NJS (Node.js Runtime)
	BC-XS-CDX-TLS (Tools, IDEs, Build, Deployment)

# 9 Glossary

SAP BTP Terminology

## A-G

application	Software hosted on SAP BTP and used by business users to fulfill certain tasks. Applications are created by developers and might make use of services offered on the platform.
<a href="#">application router [page 377]</a>	The single point-of-entry for an application running in the Cloud Foundry environment on SAP BTP. The application router is used to serve static content, authenticate users, rewrite URLs, and forward or proxy requests to other micro services while propagating user information.
availability	The durability and operational performance without failure of a system or component for an agreed amount of time, which is defined in the contract.
availability zone	A physically separate location with its own power supply, network, and cooling. Within a region, it serves as an individual failure domain. If one of the availability zones fails, the survival of the region is ensured.
<a href="#">boosters [page 240]</a>	A set of guided interactive steps that enable you to select, configure, and consume services on SAP BTP to achieve a specific technical goal.
<a href="#">buildpack [page 44]</a>	In the Cloud Foundry environment, buildpacks provide framework and runtime support for apps.
<a href="#">business service [page 425]</a>	Platform services that enable, facilitate, or accelerate the development of business process components and elements of an application.
<a href="#">cockpit [page 105]</a>	The central point of entry to key information about your accounts and applications, and for managing all activities associated with your account.
<a href="#">connectivity</a>	Provides a secure, reliable, and easy-to-consume access to business systems or remote services, running either on-premise or in the cloud.
Cloud Foundry CLI	The Cloud Foundry Command Line Interface (cf CLI) is used to deploy and manage your applications in the Cloud Foundry environment.
<a href="#">cloud connector</a>	Cloud Connector serves as the link between on-demand applications in SAP BTP and existing on-premise systems. It combines an easy setup with a clear configuration of the systems that are exposed to SAP BTP.

<a href="#">cloud management tools [page 111]</a>	Cloud management tools represent the group of technologies designed for managing SAP BTP.  Cloud management tools is a synonym for the internally used term Foundation.
disaster	An event declared by SAP when there is a loss of utilities and services, and uncertainty about whether they can be restored within a reasonable period of time. When a disaster is declared, a disaster recovery plan comes into action.
disaster recovery (DR)	A set of policies, tools, and procedures to protect applications by preserving and rapidly resuming their availability in case of a disaster.
durability	The ability of a system to permanently store data without loss or corruption.
<a href="#">enterprise account [page 65]</a>	An enterprise account is usually associated with one SAP customer or partner and is typically subject to charges. It groups together different subaccounts that an administrator makes available to users for deploying applications.
<a href="#">environment [page 42]</a>	Constitutes the SAP BTP actual Platform-as-a-Service offering that allows for the development and administration of applications. Each environment provides at least one application runtime, its own user and role management logic, and tools (for example, command line utility). Environments are integrated into the platform at the subaccount level.
failover	The automated or manually triggered process of switching from one system to another redundant system in case of an unexpected or planned downtime.
<a href="#">formation [page 1763]</a>	A logical grouping of SAP systems that can be extended in a single business scenario.
<a href="#">global account [page 75]</a>	The realization of a contract you made with SAP. A global account is region- and environment-independent, and it is used to manage subaccounts, members, entitlements and quotas.

## H-R

<a href="#">identity provider [page 2776]</a>	An authorization authority containing all user information and credentials. In SAP BTP, user information is provided by identity providers, not stored in SAP BTP itself.
<a href="#">member [page 85]</a>	Indicates a user's assignment to an account. As an account member, a user automatically has the permissions required to use the SAP BTP functionality within the scope of the respective account and as permitted by their account member roles.
OAuth	Widely adopted security protocol for protection of resources over the Internet. It is used by many social network providers and by corporate networks.
<a href="#">org [page 85]</a>	A hierarchical level in the account structure of SAP BTP using a Cloud Foundry subaccount. Each Cloud Foundry subaccount contains exactly one Cloud Foundry org. Within an org, you can create several spaces.

platform service	Software that enables, facilitates, or accelerates the development of applications and other platform services on SAP BTP. Platform services are integrated with applications and other cloud resources by developers. End users only interact with platform services via applications, never directly. All platform services provide an interface such as an API or a set of APIs. There are two types of platform services: business and technical services.
programming model	A set of concepts used to create applications on SAP BTP. For example, a programming model can include programming languages, runtimes, and APIs.
<a href="#">quota [page 81]</a>	A numeric quantity that defines the maximum allowed consumption of a specific technical asset/resource.
<a href="#">region [page 17]</a>	A geographical location that usually consists of two or more availability zones.
resilience	The ability to provide and maintain an acceptable level of service in the face of faults and challenges until normal operation is restored.
resilient software design	Building and preparing an application or service in a way that it can handle failures that occur during runtime. Its goal is not to reduce the probability of failure occurrence, but to maximize the availability of systems and system landscapes in such cases.
runtime	An engine or context for executing programs, such as Java Web Tomcat 8 or Node.js runtime.

## S-Z

<a href="#">SAP BTP, Cloud Foundry environment [page 44]</a>	An open Platform-as-a-Service, which provides a scalable runtime container and a choice of clouds, runtimes, and services.
<a href="#">SAP BTP, Neo environment [page 62]</a>	An enterprise Platform-as-a-Service, providing a range of services to our customers
<a href="#">SAP BTP, Kyma runtime [page 54]</a>	A runtime the developers can use to build cloud-native Kubernetes-based extensions to SAP by using microservices and serverless Functions.
<a href="#">Pay-As-You-Go for SAP BTP [page 68]</a>	A variant to the consumption-based commercial model of SAP BTP in which customers of SAP BTP are billed and are paying for the exact services used. This differs from the CPEA payment model where customers purchase a committed amount of services in advance.
<a href="#">btp CLI [page 2136]</a>	The command line tool for all tasks on global account, directory, and subaccount level, such as creating or updating subaccounts, authorization management, and working with service brokers and platforms.
<a href="#">SAP ID service [page 2776]</a>	The default identity provider for SAP BTP applications. It manages the user base for SAP Community Network and other SAP Web sites. SAP ID service is also used for authentication in the cockpit and operations such as deploying, updating, and so on.
<a href="#">SAPUI5 [page 355]</a>	A development toolkit providing UI controls for developing Web applications.

<a href="#">service broker [page 601]</a>	When a developer provisions and binds a service to an application, the service broker for that service is responsible for providing the service instance and for binding services to applications. For example, the HANA service broker allows any application running on Cloud Foundry to connect to an SAP HANA database.
<a href="#">service plan [page 81]</a>	A variant of a service; for example, a database may be configured with various "t-shirt sizes", each of which is a different service plan.
SAP Java Virtual Machine	SAP's own implementation of a Java Virtual Machine on which the SAP BTP infrastructure runs.
<a href="#">space [page 2251]</a>	In the Cloud Foundry environment, every application and service is scoped to a space. A space provides users with access to a shared location for application development, deployment, and maintenance. Each space role applies only to a particular space.
staging	The process in the Cloud Foundry environment by which the raw bits of an application are transformed into a droplet that is ready to execute.
<a href="#">subaccount [page 75]</a>	Lets you structure a global account according to customer requirements with regards to members, authorizations and quotas.  In the Cloud Foundry environment, a global account can have as many subaccounts as required; each subaccount can have an associated Cloud Foundry org.
<a href="#">subscription [page 71]</a>	One of the SAP BTP commercial models ("subscription-based"), where the customer subscribes to SAP BTP services for a certain amount of time and for a fixed price in order to get access to these services.
<a href="#">technical service [page 16]</a>	Platform services that enable, facilitate, or accelerate the generic development of an application, independent of the application's business process or task.
<a href="#">tool [page 105]</a>	A means for users to develop, configure, monitor and administer a service or entities managed by a service. A tool can be part of the platform or a service but is not a service by itself.
<a href="#">user-provided service instances [page 233]</a>	User-provided service instances enable you to use services that are not available in the marketplace with your applications running in the Cloud Foundry environment.

# Important Disclaimers and Legal Information

## Hyperlinks

Some links are classified by an icon and/or a mouseover text. These links provide additional information.

About the icons:

- Links with the icon : You are entering a Web site that is not hosted by SAP. By using such links, you agree (unless expressly stated otherwise in your agreements with SAP) to this:
  - The content of the linked-to site is not SAP documentation. You may not infer any product claims against SAP based on this information.
  - SAP does not agree or disagree with the content on the linked-to site, nor does SAP warrant the availability and correctness. SAP shall not be liable for any damages caused by the use of such content unless damages have been caused by SAP's gross negligence or willful misconduct.
- Links with the icon : You are leaving the documentation for that particular SAP product or service and are entering an SAP-hosted Web site. By using such links, you agree that (unless expressly stated otherwise in your agreements with SAP) you may not infer any product claims against SAP based on this information.

## Videos Hosted on External Platforms

Some videos may point to third-party video hosting platforms. SAP cannot guarantee the future availability of videos stored on these platforms. Furthermore, any advertisements or other content hosted on these platforms (for example, suggested videos or by navigating to other videos hosted on the same site), are not within the control or responsibility of SAP.

## Beta and Other Experimental Features

Experimental features are not part of the officially delivered scope that SAP guarantees for future releases. This means that experimental features may be changed by SAP at any time for any reason without notice. Experimental features are not for productive use. You may not demonstrate, test, examine, evaluate or otherwise use the experimental features in a live operating environment or with data that has not been sufficiently backed up.

The purpose of experimental features is to get feedback early on, allowing customers and partners to influence the future product accordingly. By providing your feedback (e.g. in the SAP Community), you accept that intellectual property rights of the contributions or derivative works shall remain the exclusive property of SAP.

## Example Code

Any software coding and/or code snippets are examples. They are not for productive use. The example code is only intended to better explain and visualize the syntax and phrasing rules. SAP does not warrant the correctness and completeness of the example code. SAP shall not be liable for errors or damages caused by the use of example code unless damages have been caused by SAP's gross negligence or willful misconduct.

## Bias-Free Language

SAP supports a culture of diversity and inclusion. Whenever possible, we use unbiased language in our documentation to refer to people of all cultures, ethnicities, genders, and abilities.
