# 1 SAP SuccessFactors Recruiting

The SAP SuccessFactors Recruiting helps companies attract, engage, and select the best talent.

Use SAP SuccessFactors Recruiting to create and advertise jobs, provide a great candidate experience, select the best candidate, make a job offer, and close out the recruiting process. You can configure the solution to meet the needs of your recruiting process.

To get the most out of SAP SuccessFactors Recruiting, we recommend the following major features:

- **Core Recruiting** features to open requisitions, process candidate applications, and select the best candidates.
- **Internal and external career sites** to engage and find the best talent in the marketplace.
- **Job Distribution** around the world to help you fill roles at a lower cost and in less time.

## 1.1 Retiring Features in Recruiting

Some older Recruiting features are planned for retirement.

### → Recommendation

Avoid using these features and instead consider adopting a newer solution.

We publish a complete list of migrating and retiring features on the SAP Help Portal. For the latest information about Recruiting features planned for retirement, refer to *SAP SuccessFactors What's New*, and filter your search to the following settings:

- **Product** – select **Recruiting**.
- **Lifecycle** – select **Deprecation** for features that are planned for retirement, and **Deleted** for features that have retired.

## 2 Getting Started with Recruiting Configuration

Learn where and how to begin the configuration process, depending on your scenario.

### Implementing SAP SuccessFactors Recruiting for a New SAP SuccessFactors Customer

If you're implementing Recruiting as part of the initial SAP SuccessFactors implementation for a new SAP SuccessFactors customer, then you first have to set up the core platform. The platform includes things like setting up permission roles, data model configuration, logon access, and other capabilities common to all implementations.

After you set up the platform, you can proceed to implement SAP SuccessFactors Recruiting. The next step is the initial core Recruiting configuration.

### Implementing SAP SuccessFactors Recruiting for an Existing SAP SuccessFactors Customer

If you're implementing Recruiting for an existing SAP SuccessFactors customer, it's likely that much of the platform is already set up. As you configure Recruiting, consider the impact of your changes on other solutions already in use.

The first step in implementing Recruiting is the **core Recruiting configuration**. Core configuration includes setting up job requisitions, candidate profiles, job applications, and job offers.

After you complete the core configuration, it's possible to start using Recruiting, with limited functionality.

Most customers, however, require additional configuration to meet their needs. For a more comprehensive recruiting solution, set up other important features, like career sites, candidate relationship management, and job board distribution.

The next step is setting up a career site.

### Setting Up Career Sites with SAP SuccessFactors Recruiting

Before you set up an external or internal career site, you first have to complete the core Recruiting configuration.

Most customers use Career Site Builder to do set up their career site. First, set up the integration with Career Site Builder. Then use it to create your career site.

After you set up your career site, you can proceed to set up candidate relationship management and job board distribution.

## **Setting Up Candidate Relationship Management with SAP SuccessFactors Recruiting**

Before you set up candidate relationship management, you first have to set up the integration with Career Site Builder and use it to create a career site.

To enable candidate relationship management, set up features such as talent pools, data capture forms, and email campaigns.

We recommend also setting up job distribution with Recruiting Posting.

## **Setting Up Distribution to Job Boards with SAP SuccessFactors Recruiting**

Before you set up distribution to job boards, you first have to complete the core Recruiting configuration.

Most customers use Recruiting Posting to distribution jobs to job boards. First, request a new Recruiting Posting instance and integrate it with your system. Then disable pre-existing job distribution methods that are no longer necessary, such as eQuest integration or the Job Marketing (formerly Marketing Central) feature.

We recommend also setting up candidate relationship management.

## **Other SAP SuccessFactors Recruiting Options**

SAP SuccessFactors Recruiting includes many more optional features that you can choose to enable, if needed. Optional features include interview tools, employee referral programs, advanced analytics, integration with other SAP SuccessFactors solutions or with third-party vendors, and much more.

Review the available options and enable ones that are appropriate for your recruiting process.

### 3 Consultant Checklist for a Recruiting Implementation Project

As an implementation consultant, take these steps before you get started with your implementation project.

| Task                                                             | More Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Load test users in the system.                 | <p>Before you start a Recruiting implementation, import some test users to the system, using the user data CSV import file.</p> <p><a href="#">Managing Basic User Information with a Data File</a></p> <div data-bbox="818 415 1425 617"> <p>→ Remember</p> <p>Basic user information management is a prerequisite to implementing SAP SuccessFactors Recruiting. Set up the basic user data definitions and user management tools in the system.</p> </div>                              |
| Ensure that you have access to Command Center. | <p>Before you can use Career Site Builder, enable it in your system with Command Center, a back-end provisioning tool only available to SAP employees and partners.</p> <p>As an implementation consultant, request access to Command Center for a given customer by visiting the <a href="#">SAP SuccessFactors HCM Cloud Operations portal</a> and going to <a href="#">Operations Requests</a> &gt; <a href="#">Request Forms</a> &gt; <a href="#">RMK Site Manager Assignment</a>.</p> |

## 4 SAP SuccessFactors Platform Configuration Resources

Before implementing SAP SuccessFactors Recruiting, both as an implementation consultant and as a Recruiting customer, you need to understand capabilities of the platform and how they impact Recruiting. You also need to understand how features you set up for Recruiting, impact other areas of the HCM suite.

Here are some resources to review before your implementation project.

| Feature                                                               | Why It's Important for Recruiting                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Role-Based Permissions</a>                                | Role-based permissions (RBP) are a suite-wide authorization concept that controls access to the SAP SuccessFactors system. Use it to control what users can see, edit, and do.                                                                                                                                                                                                                                                                                      |
| Language packs and translations<br><a href="#">Managing UI Labels</a> | <p>Language packs are a prerequisite to any implementation. Default languages are already set up in any new system, but you need to add more.</p> <p>Before you start a Recruiting implementation, make sure that all necessary recruiting languages are enabled.</p> <p>To see which languages are enabled in the system or to add more languages, go to ► <a href="#">Provisioning</a> ► <a href="#">Company Settings</a> ► <a href="#">Language Packs</a> ►.</p> |
| <a href="#">User Management</a><br>(accounts, data, passwords)        | User information management involves ongoing maintenance activities that are essential to keep the system running. These activities include adding users, managing user accounts, and updating user information.                                                                                                                                                                                                                                                    |
| <a href="#">Document Management</a>                                   | SAP SuccessFactors document management tools enable administrators to manage document attachments centrally for the HCM suite. Administrators can use document management tools to view and manage documents centrally and to configure document storage settings.                                                                                                                                                                                                  |
| <a href="#">Metadata Framework (MDF)</a>                              | The Metadata Framework (MDF) is a platform that can be used to build new applications, to add on to an existing solution, or to modify out-of-the-box solutions that are built on MDF.                                                                                                                                                                                                                                                                              |
| <a href="#">Picklists</a>                                             | A picklist is a dropdown that allows you to restrict the values that can be selected for a field. You can define "cascading picklists" that have a parent-child relationship, so that the picklist values in one dropdown change based on the value selected in another dropdown.                                                                                                                                                                                   |
| <a href="#">People Profile</a>                                        | People Profile is the latest version of the employee profile and SAP SuccessFactors Employee Central.                                                                                                                                                                                                                                                                                                                                                               |

| Feature                                                                                                                | Why It's Important for Recruiting                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Business Rules                                                                                                         | <p>You can configure the business rule logic for various modules and features using business rules. You can define business rules that the system executes during runtime.</p> <p>In Recruiting, you can use business rules on the job requisition, candidate profile, job application, and job offer templates.</p>                                                                                                                                                                                                                                                                                                                                                        |
| Job Profile Builder                                                                                                    | <p>Job Profile Builder allows users to build complete job profiles with multiple content types, and allows creation of individual performance profiles based on established master roles within Families and Roles. You can find candidates with the right fit for promotions and new positions, development strength, and more opportunities using more detailed job descriptions.</p> <div>  <b>Caution</b> <p>When using Job Profile Builder for integration between Recruiting and Position Management, the job code type <b>must</b> be JOBCLASSIFICATION and not JOBCODE.</p> </div> |
| Integration Center                                                                                                     | <p>Integration Center enables you to build, run, schedule, and monitor simple integrations. Integrations can be built quickly and easily through a guided workflow. Predefined templates are available and users can create their own templates.</p>                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check Tool                                                                                                             | <p>The check tool helps to identify and resolve issues when the system doesn't work as expected.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Setting up: <a href="#">Setting Up Intelligent Services</a><br>Managing: <a href="#">Managing Intelligent Services</a> | <p>Intelligent Services simplifies the user experience for employees, managers, and business partners by integrating individual transactions into a single experience. Intelligent Services links the HCM suite with external systems to allow seamless integration with third-party applications.</p> <p>The standard features for Recruiting can be found in Manage Recruiting Settings.</p>                                                                                                                                                                                                                                                                              |
| OData API                                                                                                              | <p>The the HCM suite OData API is the SAP SuccessFactors Web Services API. The API is data-oriented. The API is best used for frequent or real-time requests for small amounts of data. Large data requests are better handled by batch FTP processes. Each SAP SuccessFactors module can be accessed using its own set of API entities.</p> <p>When using the OData API for Recruiting, it's common to complete an OData refresh when fields have been added to the configuration.</p>                                                                                                                                                                                     |
| Home Page                                                                                                              | <p>The home page is the default start page of the HCM suite. It provides an overview of activity across the Suite and helps you to act quickly when necessary.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Feature                     | Why It's Important for Recruiting                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Data Protection and Privacy | <p>Companies store a wide range of personal data on people. To be compliant with data privacy laws, companies need to ensure that they process and protect this data correctly. Data protection and privacy features are best implemented together for the entire Suite so documentation is centralized in one place.</p> <p>As part of any Recruiting implementation, be sure to refer to the latest data protection and privacy documentation and enable the necessary functions for Recruiting.</p> |
| Proxy Management            | A proxy is a user who has been granted permission to act on behalf of another user for a particular process. Proxy assignments can be made on an individual basis by the user or a system administrator.                                                                                                                                                                                                                                                                                               |
| System Email Notifications  | For Recruiting, make sure that you use recruiting operators, not the platform operators, for notifications.                                                                                                                                                                                                                                                                                                                                                                                            |
| Families and Roles          | Roles are grouped into families. Family is the top level. We bind roles to a family.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Route Maps                  | In Recruiting, route maps are only used on the job requisition.                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# 5 Core Recruiting Configuration

Implementing Recruiting begins with the configuration of a core set of essential features and capabilities to get your recruiting process up and running.

Before you begin configuring a core Recruiting configuration for the first time, be sure that essential SAP SuccessFactors platform functions, like role-based permissions and user management, are set up first. As an implementation consultant, also make sure you've access to all the systems you need, with the necessary permissions and an understanding of the customer requirements.

When you're ready to begin implementing, start with these core configuration tasks:

- [Enabling SAP SuccessFactors Recruiting in Provisioning \[page 26\]](#)
- [Configuring Internal and External Applicant Search Settings \[page 41\]](#)
- [Recruiting Configuration in Admin Center \[page 44\]](#)
- [Setting Up Role-Based Permissions for Recruiting \[page 75\]](#)
- [Configuring the Base Status Set \[page 1037\]](#)
- [Creating an Applicant Status Set \[page 1039\]](#)
- [Creating and Editing Recruiting Groups \[page 46\]](#)
- [Configuring the Job Requisition Template \[page 151\]](#)
- [Configuring the Candidate Profile Template \[page 886\]](#)
- [Configuring the Job Application Template in Provisioning \[page 1076\]](#)

The core configuration gets you started but it's likely that more configuration is required. For example, if you use other SAP SuccessFactors solutions, like Onboarding 1.0 and Employee Central, you need to integrate them with Recruiting. After core Recruiting configuration is complete, set up integrations and enable add-on features, as required by your organization's recruiting process. We recommend enabling major features, like career sites and job distribution to job boards, to get the most out of your Recruiting solution.

# 6 Enabling SAP SuccessFactors Recruiting in Provisioning

Enable baseline feature settings for Recruiting in Provisioning so that you can start setting up of Recruiting from Admin Center.

## Prerequisites

- You have access to Provisioning.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Context

It isn't necessary to complete all of these steps. Depending on current configuration of the system and when you join the implementation project, some feature settings may already be enabled. However, go through each step to ensure it's completed properly.

## Procedure

1. Log in to Provisioning.
2. Go to [Company Settings](#).
3. Ensure that the following prerequisite features are enabled.
  - [Role-Based Permission](#), the standard permission model.
  - [Enable the Attachment Manager](#), a prerequisite to the Metadata Framework (MDF).
  - [Enable Generic Objects](#), enables the Metadata Framework (MDF), which is a technical prerequisite too many important features across the suite.

### ⓘ Note

If prerequisite features aren't enabled, **STOP** and consult the relevant documentation to learn more about them before you proceed.

### → Tip

When the prerequisite features are collectively enabled, SAP SuccessFactors Recruiting maintains the currency and country/region data in the Currency and Country Generic Objects respectively.

- For existing customers, if you haven't maintained the data in the corresponding Generic Object, the data is auto-populated. If you've already maintained some or all information, the entries remain the same. You've to manually add the missing currencies to the instance from the [Manage Data](#) page in Admin Center.
- For new customers, the data is auto-populated in the corresponding Generic Object.

4. Find and select [Question Object Management](#), a prerequisite setting for Recruiting that isn't enabled in all systems.
5. Find and select [Recruiting](#) setting to enable the core Recruiting solution.
6. Find and select the following important feature settings.

| Setting                                                | Description                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Competency Library Management Suite</a>    | Competencies are used across the suite. For Recruiting, they're used in job requisition templates, Interview Central, and Job Profile Builder. Competencies are used across the suite. For Recruiting, they're used in Job Requisition templates and Interview Central. If Job Profile Builder is enabled, you don't need to enable the <a href="#">Competency Library Management Suite</a> option. |
| <a href="#">Enable Relative Dates For Form Routing</a> | Allows job requisition approvals to appear as a to-do item on the home page, with a due date.                                                                                                                                                                                                                                                                                                       |
| <a href="#">Document Attachment</a>                    | These settings can be configured in Provisioning or in Admin Center. As an implementation consultant, you can use Provisioning to increase the total attachment storage allocation to more than 100 GB. Storage limits over 100 GB aren't available in Admin Center.                                                                                                                                |

7. Go to ► [Company Settings](#) ► [Recruiting](#) ► and enable other optional settings, as needed.

### → Tip

If you're not sure yet which optional settings you need, you always can come back and enable them later.

8. Save your changes.

## 6.2 Configuring Document Attachment Settings

Use document attachment settings to optimize usage and stay within storage limits.

### Prerequisites

You have the [Company System and Logo Settings](#) permission.

The allocation is set for you in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Context

Document attachment settings in the Admin Center are only relevant if you use SAP SuccessFactors for attachment storage. If you use a third-party storage vendor, such as OpenText, configure your settings in the third-party vendor application.

As an implementation consultant, you can configure **some** document attachment settings in Provisioning. We document how to proceed in Admin Center.

By default, a tenant has 500 GB of attachment storage. Additional document storage space can be purchased if needed.

## Procedure

1. Go to ► [Admin Center](#) ► [Company System and Logo Settings](#) ► [Document Attachments](#) ►.
2. Look at [Attachment Storage Allocation](#) to check your current SAP SuccessFactors storage allocation.  
By default, you are allocated 500 GB. You can increase your allocation for a fee.
3. Set limits to help your company stay within its attachment storage allocation.

| Option                                                                                                                                                                                        | Description                                                                                                                                                                                                                                                      |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Attachment User Limit</a>                                                                                                                                                         | The storage allocated to each user in your system. Consider the employees who will add attachments and divide your allocation by those users. Think about the size of their attachments. <b>Default: No Limit.</b>                                               |
| <a href="#">Define users who should be excluded from the attachment user limit (username separated by semicolon). Please note that these users will have the user limit set to "No Limit"</a> | If you have employees who must have additional storage, add their user names here. Separate the user names with a semicolon. When you add their user names, their <a href="#">Attachment User Limit</a> is set, in the background, to <a href="#">No Limit</a> . |
| <a href="#">Attachment Max File Size</a>                                                                                                                                                      | The maximum allowable file size of any one attachment. If users try to exceed the limit, they receive an error and cannot store the attachment. The max file size applies even to users who are excluded from the attachment user limit. <b>Default: 5 MB.</b>   |

4. Set notifications to warn a team to check attachments and stay within your purchased allocation.

### ❗ Note

Notifications are sent to users with the ► [Administrator Permissions](#) ► [Manage Document Categories](#) ► [Document Category Access](#) ► [All](#) ► permission. Proxy users are included. Users with other administrative permissions will not receive these emails.

| Option                                                       | Description                                                                                                                                                                          |
|--------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Enable alerts for Attachment Storage</a>         | Select to turn on alerts. Turn on alerts to help you stay within your purchased allocation.                                                                                          |
| <a href="#">Attachment Limit Notification Monitor Period</a> | Set the frequency for the monitoring job to run. A shorter period checks your storage more often. A longer period checks your storage less often. Most customers can set the monitor |

| Option                                                                                                       | Description                                                                                                                                                                                                                                                   |
|--------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                              | period to seven days. If you frequently run near the limit of your allocation, however, consider a shorter period. <b>Default: 7 Days.</b>                                                                                                                    |
| <i>Start sending alerts when the storage usage reaches the following percentage of the total allocation</i>  | Choose when you want to start receiving alerts, as a percentage of your allocation. For example, if you set the threshold to 75% and if your allocation is 500 GB, then the monitor starts sending alerts when you reach 375 GB or more. <b>Default: 75%.</b> |
| <i>Additional Recipient List for Attachment Storage Alerts (maximum 5 recipients separated by semicolon)</i> | Notifications go to users with all document category access permissions. If you want additional users to receive the alerts, add them, separated by a semicolon. You can add a maximum of five additional recipients.                                         |
| <i>Recipient List for Attachment Virus Scan Alerts (maximum 5 recipients separated by semicolon)</i>         | Set up to five users to receive alerts triggered by virus scans. Choose people at your company who can manage security issues.                                                                                                                                |

5. Save your changes.

## 6.3 Configuring Internal and External Applicant Search Settings

Configure the Internal and External Applicant Search Settings to control the fields that applicants can use as search criteria when searching for requisitions. Configure them **before** you upload a Job Requisition template that uses filter fields or mfields.

### Prerequisites

You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

If the system contains multiple Job Requisition templates, avoid conflicts by ensuring that they use the same filter and mfield definitions, including the same field labels and picklists.

If a Job Requisition template doesn't use a filter or mfield, you can remove permission from all recruiting operators.

## Procedure

1. Go to ► [Provisioning](#) ► [Managing Recruiting](#) ► [Internal and External Applicant Search Settings](#) ►.
2. Configure settings as needed.

### Internal and External Applicant Search Settings

| Setting                                               | Behavior                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum number of fields displayed for each row       | Specifies how many fields are displayed, left to right, in the search results before the information wraps to the next line.                                                                                                                                                                                                                                                                                                  |
| Maximum number of characters displayed for each field | Specifies how many characters are shown before the data trails off into an ellipsis (...).                                                                                                                                                                                                                                                                                                                                    |
| Default sort by Column                                | Specifies the field search results are sorted by when they're first returned. Candidates can select any other filter field to sort.                                                                                                                                                                                                                                                                                           |
| Visible (on standard fields)                          | Specifies whether a standard field displays as a search option to candidates.                                                                                                                                                                                                                                                                                                                                                 |
| Grid Order                                            | Specifies if a searchable field also appears in the search results table and if so, in what order (from left to right). Setting this field to zero causes it to be omitted from the search results table.                                                                                                                                                                                                                     |
| Field Label                                           | Specifies the field label that is displayed in Requisition Details and the Career Site search options.                                                                                                                                                                                                                                                                                                                        |
| Search Order                                          | Specifies whether a field is displayed in the Career Site search options and if so, in what order (from top to bottom). Setting this field to zero causes it to be omitted from the search options.                                                                                                                                                                                                                           |
| Picklist ID                                           | Specifies to which picklist the field is associated. The picklist association in the Job Requisition template is mostly ignored. The picklist association must be made in this spot in order for the Job Requisition template to load correctly in Provisioning. The picklist association in the template must exist in any case, to ensure proper reporting data.                                                            |
| Parent Picklist ID                                    | If the field is a cascading (child) field, this setting specifies to which parent picklist the field is associated. The picklist association in the Job Requisition template is mostly ignored. The picklist association must be made in this spot in order for the Requisition template to load correctly in Provisioning. The picklist association in the template must exist in any case, to ensure proper reporting data. |
| Person to Display in Search Results internal site     | Specifies which, if any, operator is listed as the contact person on the job posting for internal candidates conducting a job search. This option isn't available for external candidates.                                                                                                                                                                                                                                    |

### → Remember

Maintain the picklist IDs of filter and mfields fields in both external and internal sites. This action prevents the requisition page from loading incompletely when more than nine filter fields are used in the requisition template during its creation.

### ⚠ Caution

If the configuration is changed, candidate saved searches and job alerts that rely on that field configuration can cease to function. Be sure of these configurations when removing or changing the picklists associated to a filter or mfield.

## Next Steps

You can now configure Job Requisition templates to use filter fields or mfields.

# 7 Recruiting Configuration in Admin Center

After core features are enabled in Provisioning, you can enable many more features and functionalities in Admin Center, as required.

Here is an overview of some of the most important Admin Center settings.

| Task                                                                                               | Description                                                                                                                            |
|----------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Choosing Recruiting Languages [page 44]</a>                                            | Choose the languages you use in your recruiting process.                                                                               |
| <a href="#">Creating and Editing Recruiting Groups [page 46]</a>                                   | Create and edit groups of users, so that you can give them certain roles and permissions in your recruiting process.                   |
| <a href="#">Recruiting Settings in Admin Center [page 48]</a>                                      | Configure various features and functionality in the Recruiting system.                                                                 |
| <a href="#">Enabling Company System and Logo Settings for Recruiting in Admin Center [page 69]</a> | Ensure that a company system and logo settings related to Recruiting are configured correctly.                                         |
| <a href="#">Picklists for Recruiting [page 69]</a>                                                 | Configure the picklists required for your recruiting process.                                                                          |
| <a href="#">Adding Recruiting Custom Help Text [page 70]</a>                                       | You can choose to provide custom help text for users of your Recruiting system.                                                        |
| <a href="#">Setting Up the Mapping of Custom Fields to Standard Fields [page 71]</a>               | If you're using features that require it, configure the field mapping of custom fields to standard fields, for Candidate Profile data. |

## 7.1 Choosing Recruiting Languages

Select the languages you want to use in the recruiting process.

### Prerequisites

- You have [Manage Recruiting Languages](#) permission.
- You have access to Career Site Builder.

### Context

Recruiting languages are languages used in your recruiting process, such as for job requisitions and applicant statuses or on external career sites. You don't necessarily have to use every language in your system for recruiting.

For example, if you have employees in many countries, there might be dozens of language packs enabled in your system. But, as an organization, you might choose to conduct only recruiting activities in a few of the more popular languages, like English and German. As part of Recruiting implementation, you need to select which languages you want to use in the recruiting process.

#### Note

If you're using a new Recruiting instance and there's no default language set, then make sure to assign a default language to the instance.

## Procedure

1. Go to ► [Admin Center](#) ► [Recruiting](#) ► [Manage Recruiting Languages](#) ► to select the languages used in most recruiting processes.

You see a default language and a list of all the languages enabled in your system.

#### Note

The supported data types for the default language are [Text](#) and [Text Area](#). Note that [Picklist](#) is not a supported data type for the default language.

2. Select the languages you want to use for recruiting, such as for job requisitions and applicant statuses, and choose [Save Changes](#).
3. Go to ► [Admin Center](#) ► [Manage Career Site Builder](#) ► [Settings](#) ► [Site Configuration](#) ► to select languages used on career sites.
4. Choose [Site Locales](#) tab, select the locales you want to enable in your site and save the changes.

## 7.2 Creating and Editing Recruiting Groups

Create and edit recruiting groups used in the Job Requisition XML to restrict the users who can be picked from primary operator and recruiting team fields on a requisition.

### Prerequisites

- You have permission to manage recruiting groups.
- You have access to the Succession Data Model XML in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

Each group can include multiple people pools, which are defined by the filtering criteria they contain.

For instance, a people pool can include users with a **Department** value of "Sales" and a **Location** value of "San Francisco." Use one people pool for AND conditions, such as all employees is Sales **and** in San Francisco. Use multiple pools for OR conditions, such as all employees who are **either** in Sales (one people pool) **or** in San Francisco (another people pool).

While creating and updating a job requisition XML template, you can only include a valid group in the *group-name* attribute for the *Standard Operator Type* or *Standard Operator Team* fields. The group's name exactly match a valid (not deleted) group name available in *Admin Center*, *Manage Recruiting Groups*, or in *Provisioning*. Additionally, you can't delete recruiting groups while using active requisition templates or inactive job requisition templates with open job requisitions created.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Groups](#) ►.
2. Select a group from the [Choose a Group](#) dropdown list and choose [Edit](#). Alternatively, choose [Create](#) to create a group.

The *Group Definition* dialog displays.

3. Select your inclusion and exclusion categories per people pool.

Categories are defined in the Succession Data Model XML in Provisioning. The field type to configure categories is filter-module.

### → Tip

If the **filter-module** configuration is changed after you define a group using that filter or category, an error can occur asking you to delete the group and re-create it. To fix this error, restore the filter-module configuration, edit the group, remove the dependence on that **filter-module** value, and then change the data model XML again to remove that filter-module.

## Results

Connect the group to the appropriate role in Job Requisition Data Model. For example, associate recruiting group with the operator field definition for the Recruiter role. The role is now limited to the users that are members of the group.

## Next Steps

After you've done the necessary modification to the Job Requisition Data Model, upload the XML to Provisioning.

### 7.2.1 People Pools in Recruiting Groups

Each group can include multiple People Pools, and these are defined by the filtering criteria they contain.

For instance, a People Pool can include users where the Employee Profile contains a Department value of Sales and a Location value of San Francisco. Use one pool for AND conditions, such as all Sales employees who are also in a San Francisco location. Use multiple pools for broader OR conditions, such as including all Sales staff (one People Pool) OR staff located in the San Francisco location (additional People Pool).

Recruiting Groups are only visible to the user who creates them, so you must always proxy in as a dummy admin user when creating or managing groups. If the proxy isn't done, it would be possible for a Recruiting Group to be created under a real user who may later be subject to inactivation. This inactivation would render the group inaccessible for future edits.

### 7.2.2 Editing or Creating Recruiting Groups

Follow the steps to edit or create a recruiting group.

## Prerequisites

- You've defined the categories of recruiting groups in the succession data model XML in Provisioning (with the field type to configure categories as filter-module).

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- You're proxied in as a dummy admin user.

## Procedure

1. In **Admin Center** > **Recruiting** > **Manage Recruiting Groups**, Select your group from *Choose a Group* and click *Edit*.

If you click *Create* instead, you can create a new group.

2. In the group edit window, use *Choose Group Members* to specify your inclusion categories, and *Exclude these people from the group* for your exclusion categories, per people pool.

### Note

Changing the filter-module configuration after you specify your inclusion and exclusion categories can result in this error message:

The filter specification of this group cannot be restored. This can be caused by a new data model or internal changes. Please delete this group and re-create it.

To fix this error, restore the filter-module configuration, edit the group, remove the dependence on that filter-module value, and then change the data-model XML to again remove that filter-module.

## 7.3 Recruiting Settings in Admin Center

Learn about Recruiting feature settings in Admin Center and the leading practice on how to set them.

Go to **Admin Center** > **Manage Recruiting Settings** to enable or disable the following settings.

| <a href="#">▶ Job Requisition</a><br><a href="#">▶ Enable private postings of jobs</a>                                          | No       | <p>When a requisition is posted internally or externally, it's available in the search results for any searching candidate on the relevant internal or external site. You may want to distribute a job to a potential applicant without making the job searchable, such as inviting the candidate to apply.</p> <p>By configuring the private posting options in the Requisition XML (link to the Requisition XML config instructions) and enabling this setting, it's possible for an end user to post a job privately. This means that the job posting will not return in the search results but will have a custom-created URL that can be sent out to applicants via email or copied and pasted elsewhere and be accessible to only selected potential applicants.</p> <p>Choose the copy link icon to copy the URL to the clipboard to share the job posting URL with the applicants.</p> | Enabled             |
| <a href="#">▶ Job Requisition</a> <a href="#">▶ Show job description to Applicants even after the job posting is taken down</a> | No       | <p>When a candidate applies to a job they are able to return to their Job Applications/Job Management tab (internal versus external naming) and are able to view the job description details by clicking the job title as long as the job is still posted. By default, if the job is unposted the candidate will no longer have access to view the job description.</p> <p>If this setting is enabled, the applicant will be able to return to their Job Applications/Job Management tag and may choose to view the job description by clicking the job title even after the posting has been removed.</p> <p>Attempts to access the job posting by any other means (email link, link from third party job board, and so on) will be unsuccessful.</p>                                                                                                                                         | No leading practice |

| <a href="#">Job Requisition</a> > <a href="#">Job Requisition Template</a><br><a href="#">&lt;template&gt;</a> | No       | <p>Choose a requisition template from the dropdown menu. Jobs created with this template can be assigned to a default status based on requisition state (preapproved and approved). When the job requisition is created, the default status assigned to the preapproved state will prepopulate on the req. When the job requisition is approved, the default status assigned to the approved state prepopulates on the req. Users can override default statuses in either state by picking a new option from the picklist as required.</p> <div> <p>→ Recommendation</p> <p>The default requisition status per state feature only works if the same picklist is used for requisition status on all templates in the instance. The habit of configuring different picklists for the same field on various templates is a bad configuration practice and may cause data issues in reporting.</p> <p>There's no substitute field for "status." You must use the standard field with <b>id="status"</b> on all requisition templates, and use the same picklist on every template. Also note, you can only prepopulate values from the FIRST requisition status picklist associated with this field. If the field used to be associated to one of the other picklists, change it back to the original picklist I.D. in the template and add the new picklist options to the original picklist, and deactivate the old options by making them OBSOLETE or DELETED.</p> <p>It is not a good habit to replace picklist Ids with new picklist Ids – if the picklist options change then you should always disable all the old options (in whichever way is fit per the picklist configuration instructions) and add the new options required for the list.</p> </div> | No leading practice |

## 7.3.1 Help with Recruiting Settings

Find the right place to get help with configuring Recruiting settings.

The [Manage Recruiting Settings](#) page contains a variety of settings that you can use to configure or enable features in SAP SuccessFactors Recruiting. You don't often change these settings, but they're a good place to start when troubleshooting some problems. It's also a good idea to review them from time to time, to ensure your system is configured properly.

You can learn more about them here: [Recruiting Settings in Admin Center \[page 48\]](#)

### Can't enable Microsoft Teams integration

If you're trying to enable the Microsoft Teams integration on the [Manage Recruiting Settings](#) page and it doesn't save correctly, there are several possible causes.

First, ensure that the admin Outlook account (the Service Account used in [Work Tech Configuration](#) and the Email ID used in the Outlook integration settings) has the necessary permissions. For more, see [Required Permissions for Microsoft Teams Online Meetings](#) and [Configurations and Requirements for the Microsoft Teams Integration \[page 1153\]](#).

Second, ensure that [Work Tech Configuration](#) is complete and correct. Go to ► [Admin Center](#) ► [Work Tech Configuration](#) ► [Settings](#) ► [Outlook and Teams for Online Meetings](#) ► and check that the connection status is [Connected](#). For more, see [Enabling Microsoft Outlook and Teams Online Meetings for SAP SuccessFactors Processes](#).

After you've confirmed that these prerequisite configurations are correct, try enabling the Microsoft Teams integration again. Go to ► [Manage Recruiting Settings](#) ► [Interview Settings](#) ► [Microsoft Integrations with Interview Scheduling](#) ► and choose [Verify and Connect](#). Then select the [Enable Microsoft Teams Integration](#) setting and save.

### Can't move candidate in Withdrawn status to a different status

If you're using the latest Applicant Workbench and you try to move a candidate in the Withdrawn status to a different status, you may encounter the following error: "You can't move the candidate to the next status because a status comment is required for job application ID XXXX."

It may be that you haven't enabled comments for status changes. With the latest Applicant Workbench,

For more, see: [Enabling or Disabling Status Change Comments \[page 1070\]](#).

## Can't save location settings for face-to-face interviews

If you're trying to configure [Set face-to-face interview locations](#) settings on the [Manage Recruiting Settings](#) page and it doesn't save correctly and takes you to a blank page instead, it might be due to a data issue in your location picklists.

Here's a workaround:

1. Go to ► [Manage Recruiting Settings](#) ► [Interview Settings](#) ► [Set face-to-face interview locations](#) ►.
2. Use the [Change Language](#) menu to select a language that doesn't have any picklist configured (such as the troubleshooting locale English Debug).
3. For [Picklist ID](#), choose "No Selection". For [Picklist Label](#), clear the field so there's no value.
4. Save.
5. Use the [Change Language](#) menu to select the language you want to set picklists for.

Now, you should be able to configure and save the settings.

For more, see: [Selecting Locations for Face-To-Face Interviews \[page 1164\]](#).

## Error when using OData API to update entities related to interviewing

If you use the OData API to create/update/upsert the `JobApplicationInterview` entity or related navigational properties, like `interviewer` or `interviewOverallAssessment`, you may encounter the following error in the API response: "Interview Scheduling is enabled in Admin Center -> Manage Recruiting Settings".

If Interview Scheduling is enabled on the [Manage Recruiting Settings](#) page, the OData API isn't supported for interview-related entities or navigational properties. If Interview Scheduling is enabled, you can use the UI to manage interview records (such as scheduling interviews or providing ratings). Otherwise, if usage of the OData API is required by your organization, you can disable the Interview Scheduling feature.

For more, see: [Configuring Interview Scheduling \[page 1142\]](#).

## No settings available for SAP Customer Data Cloud for Recruiting

If you're trying to enable SAP Customer Data Cloud for Recruiting or migrate Recruiting data to SAP Customer Data Cloud, you need to use settings in the [Career Site with SAP Customer Data Cloud for External Candidates](#) section on the [Manage Recruiting Settings](#) page. If that section isn't visible, here are some potential causes.

First, it may be that the [Use email as external applicant user ID](#) option isn't enabled in Provisioning. This option is required for using SAP Customer Data Cloud.

For more, see: [Initiating Setup and Candidate Data Migration for SAP Customer Data Cloud \[page 129\]](#) and [Configuring an External Candidate Account \[page 690\]](#).

Second, it may be that SAP Customer Data Cloud isn't available yet in the data center where your Recruiting system is hosted.

For more, see: [Mapping SAP Customer Data Cloud Data Center \[page 131\]](#).

## 7.4 Enabling Company System and Logo Settings for Recruiting in Admin Center

Some company settings in Admin Center impact Recruiting.

### Procedure

1. Go to ► [Admin Center](#) ► [Company System and Logo Settings](#) ►.
2. Set up the company logo by going to ► [Logo Requirement](#) ► [URL of the Company Logo](#) ►, entering the URL of your image file, and clicking [Set Company Logo URL](#) to save your changes.

#### Note

Upload images to the same data center as your instance. Allow an hour for changes to take effect.

Your logo appears in the global page header.

It also appears in several places for SAP SuccessFactors Recruiting . It appears on the microsites by default, but can be overridden. It appears on emails and offer letter templates where the `[[LOGO]]` token is used, as well as in some hard-coded email templates such as the [Send Job to Friend](#) email.

3. Disable [Outlook Calendar Integration](#) if you plan to use Interview Scheduling.

This setting isn't a full-fledged interview scheduling integration. It only provides a [Create Meeting](#) icon on the application page, which you can use to open an `.ics` file with the applicant's name populated in the Subject line.

When you use this `.ics` file to create an appointment, no additional data (such as interviewers, dates/times, or applicant data) flows into the appointment record. Acceptance data isn't passed from the appointment into Recruiting.

In most cases, you want to disable this setting and set up Interview Scheduling instead.

## 7.5 Picklists for Recruiting

A picklist is an enumerated list that defines the selections that appear in lists.

SAP SuccessFactors Recruiting uses picklists in many places, including Job Requisitions, Candidate Profiles, Job Applications, and Job Offers. In SAP SuccessFactors Recruiting configuration templates, you can configure fields to use a picklist, referenced by the picklist ID. Create the picklists you need **before** uploading a template that references them.

Picklist configuration is a standard part of any SAP SuccessFactors system and you can use the standard procedure to set them up for Recruiting. To set up picklists, go to ► [Admin Center](#) ► [Picklist Center](#) ►.

## ⓘ Note

Recruiting uses a special picklist configuration to define the status of a job requisition. When setting up picklists for a new Recruiting implementation, be sure to include the configurations for Closed Status (99999) and Hold Status (88888) in the job requisition status picklist.

Considerations:

- In Recruiting, the list of supported countries/regions is provided in the country/region picklist. To add a country/region to the country/region picklist, it must be in U.S. English locale and must match with the country/region in the country/region picklist.
- You can search a candidate based on a country/region in the [Candidate Search](#) page only if the country/region is specified in U.S. English locale, and matches the default value in the country/region MDF Generic Object.
- If multiple languages are used in Recruiting, ensure that all picklists have a translated value in all those languages. Not doing so can cause issues with fields appearing as blank.
- Translate picklists into other languages with care; some symbols can cause load errors.
- The standard and custom picklist fields on the Candidate Profile and the Job Application pages support the typeahead feature. The feature is supported only for fields whose type is defined as picklist in the Candidate Profile and Job Application templates.

Typeahead functionality is not supported in the following:

- Recruiter-facing pages, such as the redesigned Applicant Management and the legacy Candidate Workbench.
- Create Account page.
- Job Search page.
- The [Country](#) field when using Quick Apply. The other fields where their type is defined as picklist do support Typeahead.

[Implementing Picklists](#)

## 7.6 Adding Recruiting Custom Help Text

Provide additional information in custom help text to help users better understand the purpose of a field when they input data into a field.

### Prerequisites

- You have set recruiting languages.

- You have [Manage Recruiting Custom Help Text](#) permission.

## Context

Additional configuration is required to allow users to use the header and footer templates.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Custom Help Text](#) ►.
2. Choose from the following object tabs that support custom help text:
  - [Job Requisition](#)
  - [Job Application: Candidate View](#)
  - [Job Application: Recruiter View](#)
  - [Candidate Profile](#)
  - [Offer Detail](#)
  - [Offer Approval](#)
3. Choose [Select Fields](#) to select one or more field names to add fields to the left pane for which you're providing the custom help text.
4. Select [OK](#).
5. Choose the field on the left pane and provide the text in the text box that you want to see in the help text bubble.
6. Save your changes.

## 7.7 Setting Up the Mapping of Custom Fields to Standard Fields

Map those standard fields that are used by functionalities such as Resume Parsing, Apply with LinkedIn, and Career Site Builder Social Apply.

## Prerequisites

You have [Configure Standardization Mapping](#) permission.

## Context

Certain functionalities, such as Resume Parsing, Apply with LinkedIn, and Career Site Builder Social Apply, require a third party to know exactly where data is placed upon receipt. Third-party sources are mapped to standardized fields. Map these standardized fields to the client's configuration.

Standardization mapping isn't required if these features are used.

Not all fields need to be mapped. If there are more standardized fields than fields the client has chosen to configure, those fields can be left unmapped.

All configured fields are available to be mapped, but the system does ensure that fields can only be mapped to their same type. That is, only date fields can be mapped to dates. You can't map a text field to a date field, and so on.

It's not possible to map any field type to a picklist field, even if it displays as an option.

## Procedure

1. Go to ► [Admin Center](#) ► [Configure Standardization Mapping](#) ►.
2. Select an object.

Only the Candidate Profile is supported for standardization mapping.

The standardized fields and background elements display.

3. Select a configured field from each dropdown list.
4. If picklist value mapping is also necessary, select a configured picklist value from each dropdown list.

### Note

When the selected answer to *Is this present employer?* is *Yes*, the current employer end date field is read-only.

## 8 Recruiting Roles and Permissions

Before you set up core Recruiting configuration, understand the various roles and permissions that control access data and functionality in Recruiting. Then use a combination of Recruiting operators, Recruiting teams, Recruiting groups, and platform role-based permissions to define who can do what.

### Recruiting Operators

In SAP SuccessFactors Recruiting, the people in common recruiting roles are called "operators." There's a set of predefined set of Recruiting operators that define roles such as recruiter, sourcer, coordinator, or manager. Recruiting operators are used in configuration templates to determine what people in each role can see and do.

### Recruiting Teams

Recruiting teams are groups of people in the same role. They're used in association with operators and take on the same permissions as the corresponding operator. For example, hiring manager teams have the same permission as an individual hiring manager. They are called "operatorTeams" in configuration templates.

### Recruiting Groups

Recruiting groups can be used in two ways. First, they're used in the Job Requisition template to restrict users who can be selected from the primary operator field (operator) and the recruiting team field (operatorTeam) on a requisition. Second, they can be used along with recruiting teams to allow a group of users to take an operator role.

Dynamic Recruiting Groups are used in the Candidate Profile template to define who can edit fields on the profile.

### Role-Based Permissions for Recruiting

Role-based permission (RBP) is used throughout SAP SuccessFactors to define what people in different roles are allowed to see and do. To view or update fields that are common to the suite, such as Location, Legal Entity, Department, and Division, users require role-based permission at the suite level, in addition to operator permission in Recruiting.

## Related Information

[Recruiting Operators \[page 80\]](#)

## 9 Setting Up Role-Based Permissions for Recruiting

Set up role-based permissions required for Recruiting.

### Procedure

1. Look up the relevant role-based permissions in *Using Role-Based Permissions* documentation.
  - a. To find a list of role-based permissions across the suite, refer to the online (not PDF) version of role-based documentation on the SAP Help Portal.
  - b. Filter the list for the solutions **Recruiting** and **Platform** to find permissions relevant to Recruiting.
2. Grant permissions, as needed, to the appropriate permission roles in your organization.

#### Caution

If you select all three job requisition hide permissions, then the [Create New](#) option in the *Job Requisitions* details page becomes invisible.

### Related Information

[Using Role-Based Permissions](#)

# 10 Hiding Recruiting in the Main Navigation Menu

Use role-based permission to hide SAP SuccessFactors Recruiting in the main navigation menu of the HCM suite.

## Context

The HCM suite offers 2 solutions for your applicant tracking system (ATS), Recruiting and SmartRecruiters.

Some organizations may choose to use both solutions side-by-side in the same system. For example, you might want to use SmartRecruiters in some regions and Recruiting in others. In this scenario, you can use role-based permission to hide the *Recruiting* option in the main navigation menu, for a specified role or group.

## Procedure

1. Go to ► *Admin Center* ► *Manage Permission Roles* ►.
2. Find and edit the role for which you want to hide *Recruiting* in the main navigation menu. Then select the following permission: ► *User Permissions* ► *Recruiting Permissions* ► *Hide Recruiting in Main Navigation Menu* ►.
3. Save.

# 11 Recruiting Configuration Templates

Many essential Recruiting capabilities are based on configuration templates. Use configuration templates to define the appearance and behavior of job requisitions, job applications, job offers, and the candidate profile.

Recruiting configuration templates can be configured in two ways, in Provisioning or in Admin Center. For minor changes, the [Manage Templates](#) tool in Admin Center is probably easier. As an implementation consultant familiar with the XML, you might find the Provisioning method faster for making many changes at once.

## → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

The four primary Recruiting configuration templates include:

- Job Requisition template
- Candidate Profile template
- Job Application template
- Offer Detail template

Each Recruiting system has only one candidate profile template. The number of job requisition templates, job application templates, and job offer detail templates varies based on the recruiting process.

Each job requisition template can reference only one job application template, but a job application template can be referenced by more than one job requisition template.

## Related Information

# 12 Validating Country Codes for Country Label Customization

You can export Country data, find missing or invalid 2-letter codes, and update country records so you can safely enable the [Enable Country Label Customization](#) feature. You can prevent system blockers by ensuring each country has a correct ISO-standard 2-letter code in the Country/Region Code (2 char) field.

## Prerequisites

Ensure that you have [Manage Recruiting Settings](#) permission.

## Context

Enabling country label customization while countries have missing or invalid 2-letter codes can cause system blockers. It is necessary to ensure that all missing or invalid codes are updated to the correct ISO-standard 2-letter codes.

## Procedure

1. Go to ► [Admin Center](#) ► [Import and Export Data](#) ► [Export Data](#) ►.
2. Select [Generic Object \(Country\)](#) and choose [Export](#).  
The file Region.csv downloads.
3. Open Region.csv.
4. Review the [twoCharCountryCode](#) column to identify countries with blank or invalid values.
5. Go to ► [Admin Center](#) ► [Manage Data](#) ► [Country](#) ►.
6. Update the [Country/Region Code \(2 char\)](#) field with the correct ISO-standard 2-letter country code for those countries.
7. Choose [Save](#).

## Results

All countries have valid ISO 2-letter codes in the Country/Region field.

# 13 Recruiting Operators

Recruiting operators define the relationship of a user to a job requisition or job application. Many permissions and routing capabilities are controlled by the operators used in XML configuration templates and route maps.

## Where Operators Are Used

- Job Requisition Route Maps
- Job Requisition XML field-permission
- Job Requisition XML feature-permission
- Job Requisition XML button-permission
- Job Application XML field-permission
- Job Application XML button-permission

Operators are central to configuration of the system, so decide early in your implementation project how you are going to use them. Many configuration decisions cannot be made until the customer identifies the users involved in the recruiting process.

### Note

Custom Operators are not supported in job requisitions.

## Role Operators

A predetermined list of operator fields is supported, and each operator field has a related designator.

Operator designators determine permissions for users listed in both the operator fields and the operatorTeam fields.

Determine how this list of operators is used in your business process. Then go to [Provisioning](#) > [Job Requisition System Field Labels](#) to set up the operator fields with the appropriate labels.

### Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

Recruiting Operator Fields and Designators

| <i>Operator Field ID</i> | <i>Designator</i> | <i>Dependent Operator Team</i> |
|--------------------------|-------------------|--------------------------------|
|--------------------------|-------------------|--------------------------------|

## Baseline permissions (no field ID)

V

The **V** designator defines the baseline permissions a recruiting user receives when viewing the record, if the system cannot identify another operator association for them. For example, if the Job Requisition is routed to an unrelated user to approve, that approval user would receive **V** permissions.

Whatever permissions you've assigned to the **V role** are also automatically assigned to all other roles. For example, if the **V** has permission to write to the internal title, then the **O role**, **G role**, and all other roles automatically have that permission, without any additional configuration.

vTeam

- **V role:** The **V** role is the Approver role. It is assigned to all users who are on the Job Requisition route map for approving the Job Requisition. This is in addition to any other role they may have on the Job Requisition. So Originator **O** always also has the **V** role.
- **vTeam:** Simply assigns the **V** role to anyone who is added as part of the team. It works as any other operator team role.  
This allows users who are added to this group, the permissions to see Job Requisitions and associated fields permission for the **V** role, with the user selection limited to the group specified.

|                                                         |   |                     |
|---------------------------------------------------------|---|---------------------|
| originatorName                                          | O | originatorTeam      |
| hiringManagerName                                       | G | hiringManagerTeam   |
| recruiterName                                           | R | recruiterTeam       |
| coordinatorName                                         | T | coordinatorTeam     |
| sourcerName                                             | S | sourcerTeam         |
| secondRecruiterName                                     | W | secondRecruiterTeam |
| vpOfStaffingName                                        | Q | vpOfStaffingTeam    |
| <candidate (no field id)>                               | C | None                |
| <b>Used only in multistage application environments</b> |   |                     |

## Relational Operators

In addition to the operator fields, you can set up permissions and routing to users who have a defined relationship to the operator users. These relationships are derived from relationships established in the user data. The following table shows supported relationships to the operator fields and the corresponding designator for each relationship.

### Note

The relational operators do not have access to requisition unless they are a part of the route map.

Most operator designators (R) can be appended with a relationship designator (M) to indicate a relational operator (RM). The exception is V, which cannot be set up relationally, because it does not hold a single user but defines baseline permissions for users who are not in a specific operator or team field.

## Relational Recruiting Operators

| <i>Operator Relationship</i>      | <i>Designator</i> |
|-----------------------------------|-------------------|
| Operator's Manager                | xM                |
| Operator's Manager's Manager      | xMM               |
| Operator's Management Chain       | xM+               |
| Operator's Direct Report          | xD                |
| Operator's Direct Report's Report | xDD               |
| Operator's HR Contact             | xH                |
| Operator's Matrix Manager         | xX                |
| Operator's Custom Relationship    | xC                |

# 14 Global Calendar

The "global calendar" is a set of features that improve the experience of selecting and viewing calendar dates in the system, for people who use a calendar other than the default Gregorian calendar.

## Global Calendar Features

The system supports the use of three calendars:

- Gregorian (default)
- Buddhist
- Hijri (Islamic)

If your organization uses the Buddhist or Hijri calendar, or if some people in your organization might prefer one of these calendars (such as some users of Thai or Arabic), you can enable the following features to improve the calendar experience:

- Dual Calendar (enabled by default)
- Personal Calendar Settings (disabled by default)

## How the Global Calendar Features Interact

Global calendar features are designed to work together. Here's how they interact:

| If...                                                                                                                           | Then...                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"><li>• Personal Calendar Settings is <b>ON</b></li><li>• Dual Calendar is <b>ON</b></li></ul>  | <ul style="list-style-type: none"><li>• Everyone can choose a primary calendar. By default, it's Gregorian for most people. For users of Thai, it's Buddhist.</li><li>• Everyone can choose whether to use the dual calendar view and select a secondary calendar. By default, it's turned off for most people. For users of Arabic, it's turned on and the secondary calendar is Hijri.</li><li>• Dates are displayed based on your primary calendar.</li></ul> |
| <ul style="list-style-type: none"><li>• Personal Calendar Settings is <b>ON</b></li><li>• Dual Calendar is <b>OFF</b></li></ul> | <ul style="list-style-type: none"><li>• Everyone can choose one calendar only. | If...                                                                                                                           | Then...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>Personal Calendar Settings is <b>OFF</b></li> <li>Dual Calendar is <b>ON</b></li> </ul>  | <ul style="list-style-type: none"> <li>No one can choose their calendar preference. It's based on their language preference instead..</li> <li>Users of Arabic or Thai see the dual calendar view, showing the Gregorian calendar as primary and their local calendar (Hijri or Buddhist, respectively) as secondary.</li> <li>Users of other languages only see the Gregorian calendar.</li> <li>Dates are displayed based on the Gregorian calendar.</li> </ul>                                                              |
| <ul style="list-style-type: none"> <li>Personal Calendar Settings is <b>OFF</b></li> <li>Dual Calendar is <b>OFF</b></li> </ul> | <ul style="list-style-type: none"> <li>No one can choose their calendar preference. User experience varies on different pages. In some places, it's based on language preference instead. In other places, it's always Gregorian.</li> <li>Users of Arabic or Thai see their local calendar (Hijri or Buddhist, respectively) in some places and the Gregorian calendar in others.</li> <li>Users of other languages only see the Gregorian calendar.</li> <li>Dates are displayed based on the Gregorian calendar.</li> </ul> |

#### [Dual Calendar \[page 84\]](#)

The Dual Calendar feature provides a "dual calendar" experience in most places where you select dates from a calendar. People who use two supported calendars (Gregorian, Buddhist, Hijri) can see the dates of both calendars in one combined view.

#### [Disabling the Dual Calendar \[page 85\]](#)

Disable the dual calendar experience so that people only see one primary calendar, in places where you select a date.

#### [Personal Calendar Settings \[page 86\]](#)

The Personal Calendar Settings feature enables you to set your own calendar preferences in your account settings.

#### [Enabling Personal Calendar Settings \[page 88\]](#)

Enable the Personal Calendar Settings feature so that people can choose their preferred calendar or calendars.

## 14.1 Dual Calendar

The Dual Calendar feature provides a "dual calendar" experience in most places where you select dates from a calendar. People who use two supported calendars (Gregorian, Buddhist, Hijri) can see the dates of both calendars in one combined view.

The dual calendar is **enabled by default** for users of the Arabic or Thai language. People who use Arabic see both Hijri and Gregorian dates. People who use Thai see both Buddhist and Gregorian calendar dates. If the Personal Calendar Settings feature is also enabled, anyone can use the dual calendar, regardless of language, and can choose the calendars they see.

## Note

The dual calendar only affects the **selection** of dates on a calendar, such as when you enter a date in blank field. It doesn't affect how dates are **displayed** after they're selected.

On the dual calendar, the days, months, and years of your "primary" calendar are shown on top, in larger font. The days, months, and years of your "secondary" calendar are shown underneath, in smaller font. Here's an example, showing the dual calendar view in Arabic, with both Gregorian and Hijri calendar dates.

Dual Calendar Experience in Arabic, with Gregorian and Hijri Calendars

## 14.2 Disabling the Dual Calendar

Disable the dual calendar experience so that people only see one primary calendar, in places where you select a date.

### Prerequisites

- You have the [Company System and Logo Settings](#) permission.
- If personal calendar settings are disabled:** You've decided not to use any calendar other than Gregorian in your organization **or** you've verified that the local calendar is already supported on the screens where you need it and you don't want the Gregorian calendar to be visible on those screens.
- If personal calendar settings are enabled:** You've decided that people in your organization can only use **one** calendar to select dates. They can choose their preferred calendar in their personal settings.

## Context

The dual calendar experience is enabled by default, in most places where you select a date on a calendar, for users of Thai or Arabic. If the Personal Calendar Settings feature is also enabled, anyone can use it.

## Procedure

1. Go to ► [Admin Center](#) ► [Company System and Logo Settings](#) ►.
2. Deselect [Enable Dual Calendar](#).
3. Save your changes.

## Results

The dual calendar experience is disabled. People can only see one calendar in places where you select a date.

- **If personal calendar settings are disabled:** The experience is inconsistent, but most people only see the Gregorian calendar in most places.
- **If personal calendar settings are enabled:** People can choose their preferred calendar in their personal settings.

## 14.3 Personal Calendar Settings

The Personal Calendar Settings feature enables you to set your own calendar preferences in your account settings.

Personal calendar settings are **disabled by default**. If the Dual Calendar feature is also enabled, you can select both a primary and a secondary calendar. If it isn't, you can only select a primary calendar.

The Personal Calendar Settings feature decouples your language preference from your calendar preference. For example, an English-speaker can choose to use the Hijri calendar even if your language preference is English. Or a Thai-speaker can choose to use the Gregorian calendar, instead of the Buddhist calendar, even if your language preference is Thai.

You can set your calendar preferences on the [Calendar](#) tab in your account settings. You can see a preview of how calendars appear, based on your preferences..

### 📘 Note

Personal calendar settings affect both the **selection** and **display** of dates in the system. In places that support this feature, dates are **selected from a calendar that reflects your preferences** and **displayed based on your primary calendar**.

Here's an example, showing a preview of the dual calendar experience with the Hijri calendar primary and the Gregorian calendar secondary.

## Calendar

Choose the calendar you want to use to select dates.

Select a calendar:

☐ Gregorian

☐ Buddhist

☒ Hijri

Show Secondary Calendar: ☒

☒ Gregorian

☐ Buddhist

☐ Hijri

Preview:

## Feature Scope

The Personal Calendar Settings feature provides much more consistency in the way dates are displayed, but it's not used everywhere. Your calendar preferences are reflected in **most** places, but not in the following areas.

### Out of Scope

Some product areas are **intentionally out of scope**. Personal calendar settings don't affect these areas and they aren't intended to.

For example, your calendar preferences don't affect:

- Dates in data export files
- Validation of dates in data import files
- Dates in audit logs
- Dates in an API response
- Display of dates when you're acting as a proxy, on behalf of someone else. Dates are displayed based on the target account holder's calendar preferences, not yours.

### Not in Current Scope

Some product areas are **currently not in scope**. You can use the Personal Calendar Settings feature in conjunction with the following product areas, but calendar preferences currently aren't reflected, so you may see some inconsistency.

- SAP SuccessFactors Learning uses the Gregorian calendar in most places. In some places, users of the Arabic language see the Hijri calendar.
- SAP SuccessFactors People Analytics always uses the Gregorian calendar.
- SAP SuccessFactors Mobile always uses the Gregorian calendar.

In SAP SuccessFactors Recruiting, personal calendar settings are reflected in most places, but not everywhere. In the following places, the Gregorian calendar is always shown:

- Some (but not all) dates in administration tools, such as [Manage Templates](#), [Manage Recruiting Email Templates](#), [Edit Applicant Status Configuration](#), [Restore Deleted Job Requisitions](#), [Mass Delete of Job Requisitions](#), and [Create Job Requisition](#).
- Interview Scheduling and My Interviews
- Job Offer Letter
- Reports generated with [Manage Recruiting Posting Reports](#)
- Application Status email trigger
- Custom tokens in email notification templates

#### Note

All supported standard tokens for an email trigger is resolved in global calendar settings.

- Most career site pages (except for Candidate Profile and Application flow, where the calendar preference is reflected)

## 14.4 Enabling Personal Calendar Settings

Enable the Personal Calendar Settings feature so that people can choose their preferred calendar or calendars.

### Prerequisites

- Some people in the organization need or prefer to use the Hijri or Buddhist calendar.
- You have the [Company System and Logo Settings](#) permission.

### Procedure

1. Go to  [Admin Center](#)  [Company System and Logo Settings](#) .
2. Select [Enable Personal Calendar Settings](#).
3. Save your changes.

### Results

In product areas that support it, dates are displayed based on your personal calendar preferences.

People can go to the [Calendar](#) tab in their personal account settings to choose their primary calendar. If the Dual Calendar feature is enabled, they can also choose their secondary calendar.

- For users of the Thai language, the Buddhist calendar is primary by default. If the Dual Calendar feature is enabled, the secondary calendar is **off** by default, so only the Buddhist calendar is shown.
- For users of the Arabic language, the Gregorian calendar is primary by default. If the Dual Calendar feature is enabled, the secondary calendar is **on** by default and the Hijri calendar is secondary.
- For users of any other language, the Gregorian calendar is primary. If the Dual Calendar feature is enabled, the secondary calendar is **off** by default, so only the Gregorian calendar is shown.

# 15 Adoption of General Display Name in Recruiting

Enabling General Display Name in SAP SuccessFactors results in the following for Recruiting:

- Recruiting users — which can include administrators, recruiters, hiring managers, and internal candidates — see their chosen names in all interactions where a legal or formal name isn't required.
- Administrators, HR business partners, and any other users with access to a user's legal name can access it when needed.

General Display Name isn't adopted on the following user interfaces:

- **Shared pool with users:** Although you can search for people by their General Display Name when adding them to the Shared list, the General Display Name isn't supported in the [Search for First Name in Shared List](#) and [Search for Last Name in Shared List](#) fields when looking for those who are already on the Shared list.
- **Adding a candidate to an email campaign:** You can only perform an internal candidate search of manually added recipients by their legal names. If General Display Name is enabled, however, the search returns their display names.
- **Message Center:** The Search field in the Message Center doesn't support General Display Name.
- **SFAPI and OData APIs response only expose Legal Name.**
- **Table and Story reports** for Recruiting.
- **The [Manage Templates](#) page in [Admin Center](#)** for Job Requisitions, Job Applications, Candidate Profile, and Offer Detail pages, and adhoc reports don't adopt General Display Name.

## 📘 Note

- In the Job Requisition Change History (Job Requisition Field Audit), the records created for the change history before you enabled the Enable Adoption of general display name option will still display the legal name. Only the records created after enabling the [Enable adoption of General Display Name](#) option adopts the display name.
- In talent pools, you can search for people by their General Display Name when adding them to the Shared list, but the General Display Name isn't supported in the [Search for First Name in Shared List](#) and [Search for Last Name in Shared List](#) fields when looking for those who are already on the Shared list.
- The email templates created before enabling the [Enable adoption of General Display Name](#) option, the [CC](#), [and BCC](#) fields won't resolve the display name for the [By Employee name](#) option. So, you need to resave the email template to view the display name.
- When creating new email campaigns, the [Search First Name](#) and [Search Last Name](#) fields in the [Manually Added Recipients](#) dialog for candidates don't support General Display Name.
- The [from](#) and [reply-to](#) fields in an email trigger always adopt the display name from the value configured in [Admin Center > Manage Recruiting Settings](#). If no values are configured in [Admin Center > Manage Recruiting Settings](#), the [from](#) and [reply-to](#) fields in an email trigger adopt the value from V4admin.
- When the display name is enabled, it doesn't reflect in Recruiting Posting immediately. Instead, the changes are reflected only after user synchronization updates.
- Recruiting Posting doesn't send a display name to the job board while sending the job posting data.

- Contact information on the [Field Completion Rules](#) page in Recruiting Posting doesn't support the General Display Name.

To see General Display Name with Recruiting UI pages, select the [Enable adoption of General Display Name](#) option available in ► [Admin Center](#) ► [Company System and Logo Settings](#) ►.

Refer to [Enabling the Adoption of General Display Name](#) for instructions, and [Important Notes About General Display Name Adoption](#) for a list of SAP SuccessFactors modules and features that support General Display Name.

## Related Information

[Enabling the Adoption of General Display Name](#)

[Important Notes About General Display Name Adoption](#)

## 15.1 Email Tokens Impacted by General Display Name

With the adoption of General Display Name, understand the behavioral change in certain email tokens.

- The full name of all operators and internal candidates will now get resolved to Display Name.
- There's no change in the behavior for the first name, middle name, and last name of internal and external candidates.

| Heading                                              | Token                          | Notes                                                                                                                                                                                                                                                                                             |

# 16 Premium AI Features for Recruiting

Premium AI features are available throughout the recruiting process—for candidates, applicants, interviewers, hiring managers, and recruiters.

Generative AI capabilities help people create job descriptions or interview questions. AI-assisted skill analysis capabilities help match the right people to the right jobs.

With Premium AI features for Recruiting:

- Candidates can better find jobs that match their skills.
- Applicants can better highlight their skills when they apply for a job.
- Interviewers can prepare for interviews more easily.
- Recruiters and hiring managers can easily create job descriptions, then use AI-assisted skill matching to screen applicants and make more informed hiring decisions.

## 📘 Note

All Premium AI features in the SAP SuccessFactors HCM suite are summarized in the following table. You can filter by [Recruiting](#) in the [Module](#) column to find features related to SAP SuccessFactors Recruiting. Follow the links provided for details about how to set up each feature.

## 16.1 Premium AI Features in SAP SuccessFactors

Premium AI focuses on AI-assisted capabilities that involve complex tasks, intelligent business insights, and measurable business outcomes.

Premium AI capabilities require purchasing of AI units license. All features using generative AI capabilities and Joule messages that exceed a customer's annual usage allocation are considered to be Premium AI.

## 📘 Note

For information about the AI services available for use and the applicable capacity unit values, refer to [SAP AI Services List](#).

## 📘 Note

Using AI features may involve international transfers of Customer Data. For a current list of SAP SuccessFactors data center locations where Customer Data are transferred to use AI features, refer to [SAP SuccessFactors Generative AI Availability](#). By enabling AI features, you acknowledge these transfers.

## 📘 Note

For more information about the underlying architecture and services that support generative AI capabilities, refer to [Generative AI on SAP BTP](#) on the SAP Architecture Center.

## 16.2 AI-Assisted Writing in Recruiting

The AI-assisted writing tool is an interactive tool that uses generative AI capabilities to assist employees with their writing tasks. While writing content in the SAP SuccessFactors applications, employees can leverage the features of the AI-assisted writing tool to enhance multiple aspects of their writing, such as clarity, conciseness, and tone.

In Recruiting, the tool is available for all fields that support the Rich Text Editor, such as, Job Description fields (With or without Job Profile), offer letters, scheduling interviews, contacting candidates, job posting (agency comments), and all email functionalities.

The following is a summary of the capabilities offered by the AI-assisted writing tool:

- Uses language processing capabilities to understand the context of a sentence and suggest enhancements in grammar, spelling, vocabulary choices, and phrasing.
- Ensures improved readability and a consistent tone (professional, personable, or constructive) to suit the communication needs for different audience groups in the organization.
- Provides the options to communicate a message in fewer or more words and transform paragraphs to bulleted lists.
- Provides additional actions in the context of the tasks that users perform in their SAP SuccessFactors applications.

The following table outlines the available actions in the AI-assisted writing tool.

| Action             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enhance Writing    | Suggests enhancements in grammar, spelling, vocabulary choices, and phrasing in the context of the selected line or paragraph.                                                                                                                                                                                                                                                                                                             |
| Change Tone        | Provides options to change the tone of the selected line or paragraph to professional, personable, or constructive to suit the communication needs for different audience groups in the organization.                                                                                                                                                                                                                                      |
| Make Shorter       | Shortens a selected line or paragraph to convey the message more concisely.                                                                                                                                                                                                                                                                                                                                                                |
| Make Longer        | Rewrites a selected line or paragraph by adding more words to provide a detailed explanation based on the original content.                                                                                                                                                                                                                                                                                                                |
| Make Bulleted List | Converts a selected line or paragraph into a bulleted list to simplify complex information, and enhance readability by breaking it down into easy-to-read points.                                                                                                                                                                                                                                                                          |
| Analyze Text       | Performs a safety scan on each text box, prompt entry, or Generative AI output in order to detect bias, and suggest replacement text for any language flagged as potentially biased, discriminatory, or harmful.                                                                                                                                                                                                                           |
| Translate          | <p>Translates the written text into the target language chosen by the user. The following capabilities are supported with this action:</p> <ul style="list-style-type: none"> <li>• Translation from en-US (US English) to all 46 languages supported in SAP SuccessFactors.</li> <li>• Full translation between the following languages: English (US), German, French, Spanish, Portuguese, Chinese (Simplified) and Japanese.</li> </ul> |

#### Note

For information about the languages supported by the AI-assisted writing tool, refer to SAP Note [3396784](#) .

## 16.3 Supported Languages for AI-Assisted Skills

Before you start using an AI-assisted skills feature, review the following information about support languages and determine how they impact your system.

SAP SuccessFactors AI-assisted skills features use AI to identify skills in a text source, such as a job profile, job description, or resume. The AI technology we use may not fully support all of the languages that are available in your SAP SuccessFactors system.

The following languages are fully supported. These languages include complete translations for all skills, along with comprehensive skill synonyms. For example, a skill such as Java may also be recognized by synonyms like Java Programming or J2EE.

- Dutch
- English
- French
- German
- Italian
- Spanish (all variants)

The following languages are partially supported. These languages offer translation for all the common skills and the synonyms for skills are less comprehensive.

- Chinese (Simplified)
- Chinese (Traditional)
- Croatian
- Czech
- Danish
- Finnish
- Greek
- Hebrew
- Hungarian
- Japanese
- Norwegian
- Polish
- Portuguese (all variants)
- Romanian
- Russian
- Slovak
- Slovenian
- Swedish
- Turkish

## 16.4 Enabling AI-Assisted Features on Career Sites

Enable AI-assisted features in Career Site Builder that enable candidates visiting your career site to find jobs that match their skills.

### Prerequisites

- You've purchased the **AI units** license. For more information about **AI units** license, please contact your Account Executive.
- You've prepared your Recruiting system and enabled the Unified Data Model, at ► [Settings](#) ► [Site Configuration](#) ► [Enable Unified Data Model](#) ►.

### Procedure

1. Set up the system so that it uses AI to extract skills from job descriptions, so that we can better match candidates to job postings.  
[Extracting Skills from Job Descriptions with AI \[page 281\]](#)
2. To enable AI-assisted skills matching on your career site, go to ► [Career Site Builder](#) ► [Layouts](#) ► [Search Results](#) ► [Settings](#) ► and enable **Enable AI-Assisted Skills Matching for Resumes**. You can also choose to present candidates with a consent agreement before they use the Skills Matching feature.  
[Configuring Layout of Search Results for the Unified Data Model \[page 514\]](#)
3. **Optional:** Consider adding the [Upload Resume](#) component to your career site's home page, or to other pages.  
[Upload Resume Component Settings in Career Site Builder \[page 587\]](#)
4. **Optional:** Consider adding the [Skills Cloud](#) component to the job layout.
5. Review the following style setting to ensure that the new Skills Matching features are consistent with your branding.

| Option                                                                                                                                                              | Description                                                                                                                                                                                                 |

# 17 SAP Customer Data Cloud based Authentication in Recruiting

SAP Customer Data Cloud provides a general framework for setting and enforcing authentication methods for external candidates applying for jobs within the Career Site.

## Benefits of using SAP Customer Data Cloud

- Utilize a product specifically designed for user authentication, offering enhanced security and robustness.
- Enable candidates to efficiently create or log into accounts using social networks with minimal steps, ensuring a seamless user experience.
- Provide candidates with the ability to register via phone number, social network accounts and one-time password (OTP), not limiting to email-based registration.
- Supports Two-Factor Authentication to secure your user logins and profile updates using verification via a secondary authentication.
- Leverage a product that supports customization of the login and registration workflow to align with specific business needs.
- Doesn't Require an additional license to enable SAP Customer Data Cloud in your instance.

## 17.1 Initiating Setup and Candidate Data Migration for SAP Customer Data Cloud

Learn how you can migrate candidate data and configure an instance in SAP Customer Data Cloud to enable its functionality within your SAP SuccessFactors Recruiting instance.

### Prerequisites

- Ensure you've enabled [Use email as external applicant user ID](#) from ► [Provisioning](#) ► [Company Settings](#) ►
- You've enabled Mobile Apply.
- Ensure Data Segmentation is disabled.
- Ensure DPCS 2.0 is enabled.

#### ⓘ Note

SAP Customer Data Cloud cannot be enabled in instances that either have Data Segmentation enabled or DPCS 2.0 disabled.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

This process sets up an instance and migrates all external candidate data onto a SAP Customer Data Cloud data center located in the nearest country or region: Europe, United States, Australia or China.

As part of the migration, both configuration settings (such as Email Templates, Password Policies, and Data Privacy Statements) and candidate data (including First Name, Last Name, Email ID, etc.) are transferred to the CDC instance. The process also supports real-time synchronization of candidate data, ensuring seamless integration and up-to-date information across systems.

#### ⓘ Note

Login-related Email Templates such as Password Reset, can only be configured in the SAP Customer Data Cloud console, and not in SAP SuccessFactors Recruiting.

Setting up an instance in SAP Customer Data Cloud and migrating configurations into it is the first step toward enabling SAP Customer Data Cloud in your SAP SuccessFactors Recruiting instance.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Settings](#) ►.
2. Under ► [Career Site with SAP Customer Data Cloud for External Candidates](#) ► [Setting Up Configuration and Data Migration](#) ► section, choose *Initiate*.

By choosing this option:

- The migration process cannot be interrupted or reversed.
- Upon successful completion, you will receive an email notification.

### Note

- The setup and candidate data migration process may take up to 96 hours (4 days), depending on the size of the data being migrated.
- If a migration issue occurs and results in a failure, an email notification is automatically sent to the appropriate support team. They will be alerted immediately and begin investigating the issue. Once resolved, the migration will resume from the point of interruption and continue until completion.

3. Choose *Confirm*.

## Results

Setup and Candidate data migration has been completed and an email notification is sent.

### Note

For SAP Customer Data Cloud, candidate phone numbers must be in a valid format, including the country code, and must be unique. Any newly created candidates will be subject to these validations for the cell phone field.

## Next Steps

Enable the **Manage Configurations in Recruiting for SAP Customer Data Cloud Authentication** role-based permission. This provides access to the [Manage Console Integration and External Candidate Authentication](#) page in Recruiting.

## 17.1.2 Inviting Console Users

Learn how to invite users who can access the SAP Customer Data Cloud console to configure Career Site registration and authentication options.

### Prerequisites

- You're an Admin and you have access to [Manage Console Integration and External Candidate Authentication](#).
- A secure SSO connection has been established between SAP Customer Data Cloud and Recruiting.
- As an administrator, you must have console access to manage SAP Customer Data Cloud configurations.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Console Integration and External Candidate Authentication](#) ►.
2. Choose the [Console Users](#) tab.
3. Use the  [value picker](#) icon to select users.  
The [Find Employee](#) modal is displayed.
4. Use the name fields to search for users you want to find. You can also use the [Advanced Search Options](#) for an extensive search.
5. Choose [Search](#).  
The [Search Results](#) modal is displayed.
6. Select users that you wish to invite.
7. Choose [Select](#).  
The selected users are now displayed in your search field. You can use the **x** to remove users from the list.
8. Choose [Invite](#).
  - The successful invitees are added to the [Users](#) table.
  - Partial success scenario: This scenario occurs where the invites were sent only to some of the selected users. You can retry sending the invite to the remaining users. If issue persists, contact your System Administrator for assistance.
9. For a selected user, to revoke their access to the SAP Customer Data Cloud console, choose **X** icon from the [Revoke Access](#) column.

### Results

An email invite with an access link is sent to all successful invitees. The access link redirects users to the SAP Customer Data Cloud login page, where they can enter the credentials and access the console. These users are automatically assigned to a permission group.

## Next Steps

Now that you've added users who can access the console, we will need to set up necessary configurations in SAP Customer Data Cloud console.

### 17.1.2.1 Scope of Access for Console Users

The following table describes the scope of access for console users configuring their career site.

| Console Group     | Console Function         | Access |
|-------------------|--------------------------|--------|
| Partner Dashboard | Partner Dashboard        | Edit   |
| Sites             | Site Selector            | View   |
| Sites             | Site Settings            | View   |
| Identity Access   | Profiles                 | Edit   |
| User Interfacing  | UI Builder               | Edit   |
| User Interfacing  | Email Templates          | Edit   |
| User Interfacing  | SMS Templates            | Edit   |
| User Interfacing  | Hosted Pages             | View   |
| Identity          | Connect                  | Edit   |
| Identity          | Security                 | Edit   |
| Advanced          | Site Groups              | Edit   |
| Advanced          | Account Schema           | View   |
| Advanced          | Site-Level SMS Providers | Edit   |
| Advanced          | Certificate Provisioning | Edit   |
| Advanced          | Copy Configuration       | View   |
| Administration    | SMS Providers            | Edit   |

## 17.1.3 Configuring SAP Customer Data Cloud Console for External Candidate Authentication

As a console user, you need to set up a list of configurations that enable authentication for external candidates within the Career Site.

### Prerequisites

You need access to the SAP Customer Data Cloud console.

### Context

You are using SAP Customer Data Cloud features such as [UI Builder](#), [Screen Sets](#), [SMS Templates](#), [Email Templates](#), and social media log in options through [Identity](#) > [Connect](#) , to set up the landing page where candidates can create an account or sign-in.

### Procedure

1. Log in to the SAP Customer Data Cloud console.
2. Use the features listed in the table to perform the configurations as described in their respective links.

| Feature                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">UI Builder</a> | <p>The <b>UI Builder</b> for <b>Screen-Sets</b> is a powerful web-based tool for creating and implementing candidate management workflows on your site.</p> <p>The UI Builder comes with an easy to use drag-and-drop interface for building and editing login and registration screens. The UI Builder gives you the flexibility to match the look-and-feel of your site and to tailor your implementation in terms of design, structure, fields, and content. | <a href="#">SMS Providers</a>  | <p>Configure the SMS provider that you want to use to send SMS to your candidates.</p> <p><a href="#">SMS Providers</a></p>                                                                                                                                                                                                                                                                                 |

## Results

On successful configuration, candidates are presented with the SAP Customer Data Cloud registration page when exploring jobs within the Career Site.

## Next Steps

Now that you've successfully configured external candidate authentication using SAP Customer Data Cloud and created the landing authentication page for the Career Site, you need to map the configured Screen-Sets in Recruiting.

## Related Information

[Console Overview](#)

[Screen-Sets](#)

[Mapping Screen Sets \[page 138\]](#)

## 17.1.3.1 Important Notes for Console Users

Manage authentication and security settings for candidates and agencies using SAP Customer Data Cloud. This includes password policies, email templates, SMS Providers and SMS Template verification to ensure secure access and compliance.

### UI Builder

Console users have access to edit several screen-sets from ► [User Interfacing](#) ► [UI Builder](#) ►. The following guidelines ensure a smooth integration between SAP Customer Data Cloud and SAP SuccessFactors Recruiting.

- The screen style can be modified as per your requirement using the CSS option.
- The screen layout can be modified as per your requirement. However, the Screen Behavior must not be modified. A change in screen behavior can lead to unsuccessful career site login or registrations.
  - You can rearrange fields on the screen as needed, but shouldn't add new fields or delete existing ones.

#### ❖ Example

The Registration screen handles candidate account creation via email and password. On this screen, the [Make my profile visible to:](#) field is mandatory and should not be removed, while the phone-number login field is not relevant and should not be added.

- The following screen attributes should not be modified:
  - Screen ID
  - Success Screen
  - Mapped Field
  - Visibility
  - Required
- Choices for dropdown and radio-button fields should not be modified.
- Screen attribute for links should not be modified.
- Force Account Linking attribute for social widget should not be modified.

### Password Policy

- To update the password policy for candidates, make changes in the SAP Customer Data Cloud console under ► [Identity](#) ► [Security](#) ► [Authentication](#) ►. These settings are no longer configurable in Recruiting when SAP Customer Data Cloud is enabled in your instance.
- For agencies, the password policy settings are managed in ► [Admin Center](#) ► [Password & Login Policy Settings: Applied to Agencies](#) ►. No configurations are needed in the SAP Customer Data Cloud console.

### Email Templates

Login-related Email Templates such as Password Reset can only be configured in the SAP Customer Data Cloud console, and not in SAP SuccessFactors Recruiting.

### Email Verification

As a best practice, select the [Use Code verification](#) option for email verification.

### Phone Number

- Phone number-based registration or authentication involves verification of the phone number.

- Once the verification is completed, the details are stored in the SAP Customer Data Cloud system. If the verification is not completed, phone number based registration or authentication during login will not be available.

## 17.1.4 Mapping Screen Sets

Learn how to map the Screen-Sets that you have configured in the SAP Customer Data Cloud console.

### Prerequisites

Ensure you've configured the Registration, Login and Reset Password screens in the SAP Customer Data Cloud console.

### Context

Mapping screen sets ensures that candidate data captured in the SAP Customer Data Cloud screen is seamlessly synced with Recruiting Management.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Console Integration and External Candidate Authentication](#) ►.
2. Choose [Screen Mapping](#) tab.
3. Choose [Edit](#).
4. In the [Login screen](#) field, enter the value of the Screen ID as displayed in ► [UI Builder](#) ► [Properties](#) ► [Screen ID](#) ► from the SAP Customer Data Cloud console.
5. In the [Registration screen](#) field, enter the value of the Screen ID as displayed in ► [UI Builder](#) ► [Properties](#) ► [Screen ID](#) ► from the SAP Customer Data Cloud console.
6. In the [Reset password](#) field, enter the value of the Screen ID as displayed in ► [UI Builder](#) ► [Properties](#) ► [Screen ID](#) ► from the SAP Customer Data Cloud console.
7. [Optional] Choose [Allow candidates to create an account using their phone number](#) to enable phone number based registration.

#### → Remember

- Ensure that you have enabled Short Message Service (SMS) in ► [Admin Center](#) ► [Manage Recruiting Settings](#) ►.
- Configure the SMS Provider settings in the SAP Customer Data Cloud console.

- To allow candidates to register using their phone number without an email, ensure that the **Email** field in **Candidate Profile Template** has been made optional.

#### Note

- Candidate phone numbers must be in a valid format, including the country code, and must be unique. Any newly created candidates will be subject to these validations for the cell phone field.
- Either a phone number or an email address is required. If a candidate does not register with a phone number, a valid email address must be provided.

#### Caution

Once this setting is enabled, disabling it later may disrupt the candidate login flow for users who have registered using only their phone number without an email address.

8. Choose [Save](#) to save your changes.

## Results

The Screen-Sets in SAP Customer Data Cloud and in Recruiting have been mapped.

## 17.1.5 Enabling Two-Factor Authentication in SAP Customer Data Cloud

Learn how to secure your user logins and profile updates using verification via a secondary authentication.

## Context

Two-Factor Authentication (alias: TFA) adds an additional layer of security to your user authentication flows. After the user enters their credentials, SAP Customer Data Cloud generates a code and sends it to the user via phone (voice message/SMS) or Authenticator App. The user then enters this code to complete their authentication.

The Two-Factor Authentication method used for an authentication session depends on the Risk-Based Authentication (RBA) rules configured by the Admin in the SAP Customer Data Cloud console.

## Procedure

1. Log into your SAP Customer Data Cloud console.
2. Go to [Identity](#) > [Security](#).

3. Choose [Save](#).
4. Choose the [Authentication](#) tab.
5. In the [Verification Methods](#) section, enable [SMS/Phone](#) and [Authenticator App](#).
6. Choose [Save](#).

## Next Steps

Create a new risk-based authentication rule to define the implementation of two-factor authentication.

## Related Information

[Creating a Risk-Based Authentication Rule \[page 140\]](#)

[Admin RBA Actions](#)

[User Profile](#)

## 17.1.5.1 Creating a Risk-Based Authentication Rule

Learn how to create risk-based authentication (RBA) rules that correspond to the authentication levels of Phone and TOTP via Authenticator App.

## Prerequisites

Ensure you've enabled Two-Factor Authentication in your SAP Customer Data Cloud console.

## Context

Now that you've enabled two-factor authentication, you will need to define the scope of where this authentication will be applicable using a RBA rule. During the candidate's account registration, the two-factor authentication screens will be displayed appropriately based on the rule configuration.

## Procedure

1. Log into your SAP Customer Data Cloud console.

2. Go to ► [Identity](#) ► [Security](#) ►.
3. Choose the [Risk-Based Authentication](#) tab.
4. Choose [Create New Rule](#).
5. In the [Templates](#) section, choose [Enforce TFA for every login](#) and then choose [Next](#).
6. In the [Flow](#) tab, provide a name for your rule in the [Name](#) field, and add a description in the [Description](#) field.
  - a. Choose [Password Login](#) as the flow for which the rule will apply to.
  - b. Choose [Next](#).
7. In the [Action](#) tab, configure as instructed below:
  - a. For [Rule Type](#), choose [Global Rule](#)
  - b. For [Criteria Relationship](#), choose [And](#)
  - c. for [Choose your criteria below \(maximum of 3\)](#), choose [On device change](#)
  - d. For ► [Define the RBA action to occur](#) ► [Enforce TFA via at a minimum](#) ►, choose [20 -SMS, TOTP](#)

#### ⓘ Note

If a candidate logs in using a phone number, they automatically meet the minimum authentication requirement of Level 20 and will not be prompted for second-factor authentication.

- e. Choose [Next](#).
8. In the [Scope](#) tab, choose [Whole Group](#), to apply the rule to all your sites.
  - a. Choose [Next](#).
9. In the [Rule Overview](#) tab, after you review the rule, choose [Save](#).
  - a. Toggle the slider to [Active](#) to activate the rule.

## Results

You've successfully created an RBA rule. Two-factor authentication will be required for every login when this RBA rule is triggered.

Candidates can register for two-factor authentication using a phone number with SMS or voice message, TOTP or through an authenticator app.

If a candidate cannot authenticate due to unsuccessful attempts or a lost device, admins can perform a TFA unlock or reset, allowing them to set up two-factor authentication again. For more details, see **Related Information**.

## 17.2 Enabling Role-Based Permission to Manage Configurations for SAP Customer Data Cloud Authentication

Set the role-based permission required to manage configurations in recruiting for SAP Customer Data Cloud based authentication.

### Prerequisites

Ensure the instance setup in SAP Customer Data Cloud, and the migration of configurations has been completed.

### Context

Setting the role-based permission provides you access to the [Manage Console Integration and External Candidate Authentication](#) tool. This tool allows you to manage user access to the SAP Customer Data Cloud console, map UI Builder screens, and establish a secure single sign-on connection between Recruiting and SAP Customer Data Cloud using metadata information.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Permission Roles](#) ► [Administrator Permission](#) ▼.
2. Under [Manage Recruiting](#), choose [Manage Configurations in Recruiting for SAP Customer Data Cloud Authentication](#).
3. Choose [Save](#).

### Results

You've successfully set the role-based permission and gained access to the [Manage Console Integration and External Candidate Authentication](#) tool.

### Next Steps

Enable SAP Customer Data Cloud in your SAP SuccessFactors Recruiting instance.

## Related Information

[Enable SAP Customer Data Cloud for Recruiting \[page 143\]](#)

## 17.3 Enable SAP Customer Data Cloud for Recruiting

Learn how to enable SAP Customer Data Cloud in your Recruiting instance.

### Prerequisites

- Ensure the instance setup in SAP Customer Data Cloud and the migration of configurations have been completed.
- You have the ► [Administrator Permission](#) ► [Manage Recruiting](#) ► [Manage Configurations in Recruiting for SAP Customer Data Cloud Authentication](#) ► permission enabled.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Settings](#) ►.
2. Under ► [Career Site with SAP Customer Data Cloud for External Candidates](#) ► [Enable SAP Customer Data Cloud based Authentication](#) ►, choose [Enable](#).

### Results

You've successfully enabled SAP Customer Data Cloud in your instance.

#### Note

SAP Customer Data Cloud requires the email to be valid and unique. Once candidate migration begins, any newly created candidates must meet these validations for the contact email field.

#### Caution

When you enable this feature, candidate passwords are secured by SAP Customer Data Cloud. If you disable this feature:

- Candidates who created accounts while the feature was enabled will no longer have their password information available in Recruiting. They will need to reset their password to log in.
- Candidates who registered using only a phone number will not be able to log in unless an email is added to their account and their password is reset.

## Next Steps

Establish a connection for integrating SAP Customer Data Cloud and Recruiting.

## Related Information

[Regenerating Metadata for Console Integration \[page 144\]](#)

# 17.4 Regenerating Metadata for Console Integration

Learn how to regenerate metadata to maintain a seamless integration between SAP Customer Data Cloud console and Recruiting

## Context

As part of **Initiating Setup and Candidate Data Migration for SAP Customer Data Cloud** procedure, the generation and export of metadata is completed automatically.

### ❗ Note

You will need this procedure only when you want to regenerate and export your metadata information, if required.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Console Integration and External Candidate Authentication](#) ►.
2. Choose [Console Integration](#) tab.
3. Under [Export Metadata](#), choose [Generate and Export](#).

The generated metadata is exported to SAP Customer Data Cloud console. This step initiates a connection with SAP Customer Data Cloud console from Recruiting.

Export Metadata Details

| Section Element                | Description                                                |
|--------------------------------|------------------------------------------------------------|
| <a href="#">Generated Date</a> | The date on which the metadata was generated and exported. |

| Section Element                 | Description                                                                                                                                                                                                                      |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Expiration Date</a> | The date on which the metadata will expire.                                                                                                                                                                                      |
| <a href="#">Status</a>          | <ul style="list-style-type: none"> <li>• <a href="#">Valid</a>: Indicates if the metadata is currently being used.</li> <li>• <a href="#">Invalid</a>: Indicates if the metadata has expired or no longer being used.</li> </ul> |

4. To view the exported metadata information, choose [View Metadata](#).

5. [Optional]: If you want to regenerate and export new metadata, choose [Regenerate and Export](#).

The existing metadata will be replaced with the newly generated metadata, and exported to SAP Customer Data Cloud console.

6. Under [Import Metadata](#), choose [Import](#).

The metadata is imported from the SAP Customer Data Cloud console to Recruiting. This step establishes a secure SSO connection between them.

Import Metadata Details

| Section Element                 | Description                                                                                                                                                                                                                      |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Imported Date</a>   | The date on which the metadata was imported.                                                                                                                                                                                     |
| <a href="#">Expiration Date</a> | The date on which the metadata will expire.                                                                                                                                                                                      |
| <a href="#">Status</a>          | <ul style="list-style-type: none"> <li>• <a href="#">Valid</a>: Indicates if the metadata is currently being used.</li> <li>• <a href="#">Invalid</a>: Indicates if the metadata has expired or no longer being used.</li> </ul> |

7. To view the imported metadata information, choose [View Metadata](#).

8. [Optional]: If you want to reimport metadata, choose [Import](#).

The existing metadata will be replaced with the newly imported metadata.

## Results

You've generated and exported metadata to maintain a seamless integration between SAP Customer Data Cloud console and Recruiting .

## Related Information

[Initiating Setup and Candidate Data Migration for SAP Customer Data Cloud \[page 129\]](#)

## 17.5 Applicant Processing without E-mail

As recruiting administrators, when you've enabled SAP Customer Data Cloud for authenticating external candidates, you can allow candidates to create or sign in to their account quickly using only their phone number without requiring their e-mail.

### → Remember

- Ensure that you've enabled Short Message Service (SMS) in ► [Admin Center](#) ► [Manage Recruiting Settings](#) ►.
- When a candidate chooses to provide only their phone number, they must opt in to receive SMS notifications. If they don't opt in, they're prompted to provide an e-mail as an alternative. If neither option is configured, no communications are sent. Additionally, external candidates won't be able to save their profile changes unless they provide an e-mail or opt in to SMS notifications.
- The [Contact Candidate](#) option for a candidate in the candidate search results, also supports SMS capability. There are no permissions that can be applied for sending an ad-hoc SMS notification to a candidate. The option to send an e-mail or an SMS is available to all operators who can access a candidate using candidate search.

In the [Recruiting Email Triggers](#) page, multiple triggers have been supported with the Short Message Service (SMS) capability that can be enabled based on your requirement. The supported triggers are:

- Forward as Applicant
- Candidate Merge Notification
- Imminent Candidate Purge Notification
- Invite Candidate to Apply
- Recruiting Manual Candidate Creation Notification
- Complete and Submit Your Job Application
- Interview Confirmation to Candidate
- Candidate Deleted from Interview
- Interview Delete Notification
- Booked Interview Cancellation to Candidate
- Booked Interview Reschedule e-mail to Candidate
- Email Notification to Candidates for Rescheduled or Updated Interview
- Notification to Cancel Interview Notification
- Booked Candidate Interview Update
- Online Offer Canceled by Sender Candidate Notification
- Candidate Merge Notification - Primary Candidate Record

Candidate profiles that are created only based on phone numbers aren't supported with the following functionalities:

- Candidate Relationship Management - Talent Pools and so on.
- Job Alerts - Candidates can create job alerts but won't receive any e-mail notifications. This behavior applies only when **RMK** is enabled. If **RMK** is disabled, external candidates won't be able to create job alerts using the non-mobile apply UI.

- You can't send job offers to candidates, except for verbal communication.
- Candidate assessments and background verification with vendors who require an e-mail.
- Message Center.

## Related Information

[Available Email Triggers in Recruiting \[page 1450\]](#)

## 17.6 SAP Customer Data Cloud and External Candidate Authentication – FAQ

**Is extra licensing needed for SAP Customer Data Cloud when the external authentication feature is enabled?**

No, SAP Customer Data Cloud does not require any additional licensing for this feature.

**Does SAP SuccessFactors cover the cost of SMS messages sent to external candidates?**

No. SMS messaging is not a core function of SAP SuccessFactors. You'll need to subscribe to an SMS provider separately and integrate it with the system. SAP SuccessFactors is not involved in your contract with the SMS provider.

**What SMS providers can be used to enable the feature?**

- **SAP SuccessFactors Recruiting:** supports only **Sinch**.
- **SAP Customer Data Cloud:** Supports **Twilio**, **Livelink**, **Inch**, and **Karaden** by default.  
For consistency and to avoid additional costs, it is recommended to use **Sinch** across both Recruiting and SAP Customer Data Cloud.

**Is Quick Apply supported with Candidate Authentication using SAP Customer Data Cloud?**

Quick Apply is technically possible. However, after completing Two-Factor Authentication (2FA), candidates are redirected to the Candidate Profile page instead of the Job Application page.

**Can SAP Customer Data Cloud be turned off after it has been enabled?**

Disabling SAP Customer Data Cloud is not recommended. If disabled:

- Passwords for candidates who registered while SAP Customer Data Cloud was active will no longer be stored in Recruiting.
- These candidates must reset their passwords to log in.
- Candidates who registered using a phone number must have provided an email address to regain access.

**What steps are needed to set up the Authenticator App as the verification method?**

Enable Social Login and 2FA for External Candidates in SAP SuccessFactors via SAP Customer Data Cloud.

**How do I add Social Login providers?**

By default, Social Login providers are not enabled when SAP Customer Data Cloud is turned on. SAP SuccessFactors supports **Facebook**, **Google**, and **LinkedIn**.

**Are candidates prompted for 2FA when using Social Login?**

Yes, candidates are prompted for 2FA during account creation when Social Login is configured.

**Does 2FA apply to existing candidates or only new ones?**

2FA applies to **all candidates**. Existing users will use their current password for the first step, followed by 2FA.

**Is SAP Customer Data Cloud to customers with controlled access environments?**

No. SAP Customer Data Cloud is not available to customers with controlled access environments

**How can I find out which SAP Customer Data Cloud Data Center is linked to my SAP SuccessFactors Data Center?**

Refer **Related Information** for details.

**What downstream processes are impacted by phone login?**

Some processes, such as **Applicant Processing**, may require an email address.

**Does the data migration process cover both internal and external candidates?**

No, it covers only external candidates.

**What emails are sent from SAP Customer Data Cloud?**

SAP Customer Data Cloud sends **Password Reset** and **Activation URL** emails.

**Where can I update email templates or SMS content after migration?**

These are managed in the SAP Customer Data Cloud console.

**How do we proceed if there is an error in the data migration?**

Raise a ticket with the **Technical Support** team.

**Is the Admin notified when the migration is completed?**

Yes, a notification is sent to the Admin.

**Can authentication be done using National ID (for example, Austria or EU Login)?**

No, this is not supported.

**What is the recommended method for identity verification?**

**Code verification** is the suggested method.

**Where can I edit the email templates after migration?**

Email templates can be edited in the SAP Customer Data Cloud console.

# 18 Job Requisitions in SAP SuccessFactors

Job requisitions kick off the recruiting process. In SAP SuccessFactors Recruiting, requisitions are primarily based on configuration templates and route maps.

Different people see different information in a job requisition, depending its state (preapproved, approved, or closed) and on the permissions they've been given. For example, a hiring manager may be able to edit the title field and provide interview feedback on applicants while the requisition is in the Approved state but not in a Closed state.

## Know Before You Start

- The Job Requisition template defines fields that appear in a job requisition and who can view them. It also controls which fields someone can view on a job application.
- The job requisition approval process is defined by a route map. There is one route map for each Job Requisition template.
- Job families and roles are defined at a platform-level for the HCM suite. They are used to group job codes so you can find them easier when creating a job requisition.
- Competencies and assessment scales defined in the Job Requisition template can be rated during the interview feedback process.
- There is a limited number of pre-defined recruiting roles who you can include in the recruiting process, using Recruiting operators in the Job Requisition template.
- If you use Position Management with Employee Central, you can pre-populate fields in the job requisition with position data.

## Leading Practices

- You need one Job Requisition template for each major recruiting process.
  - To create a new process with different job requisition approvals or a different applicant status set, you need a new Job Requisition template. For example, you might have a different recruiting process for salaried workers and hourly workers.
  - To vary job applications in different countries/regions, use country/region overrides in the Job Application template, **not** a different Job Requisition template for each country/region.
- Recruiting configuration templates can be configured in two ways. For minor changes, the [Manage Templates](#) tool in Admin Center is usually easier. As an implementation consultant familiar with Recruiting XML, you may find it easier to use the XML export/import function in Provisioning when making many changes at once.
- If you need to store job descriptions in multiple languages, define them using Job Profile Builder.
- To enable job requisition approval on mobile devices, you can configure Mobile Fields in the Job Requisition template.
- To reference fields in a job requisition using tokens (variables) in job descriptions, headers, and footers, you can configure Listing Fields in the Job Requisition template.

- If you use Position Management with Employee Central, be sure the field types in the job requisition template are the same as in Position Management, when possible.

## 18.1 Sections Displayed on Job Requisitions

There are three "states" of a job requisition: preapproved, approved, and closed. The requisition displays different elements depending on its state.

The state of a job requisition interacts with the permissions model to control the fields and features available to a recruiting user. For example, a hiring manager might be able to edit the title field and provide interview feedback on applicants while the requisition is in the Approved state but not once the requisition is changed to the Closed state.

### Pre-Approved Requisition

The recruiting user view of a preapproved job requisition contains the following sections:

| Section                                | Description                                                                                                                                                                                                                                                                                                    |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Requisition form type and title</i> | Displays the requisition form template name, a colon, and the internal title of the requisition.                                                                                                                                                                                                               |
| <i>Forms toolbar</i>                   | Displays buttons used to interact with the requisition form. This is derived from the Performance Management forms toolbar. Some of the options can be enabled or disabled in <a href="#">Admin Center &gt; Manage Form Templates</a> . Some options that can be enabled might not apply to requisition forms. |
| <i>Route Map</i>                       | The approval path for the requisition, with the current approval step highlighted in green.                                                                                                                                                                                                                    |
| <i>Route Map Buttons</i>               | Buttons that allow the user to interact with the route map and route the form.                                                                                                                                                                                                                                 |
| <i>Form Section Navigation</i>         | These gray buttons are derived from the Performance Management form and don't serve a great deal of purpose on a requisition. Currently, these buttons can't be disabled.                                                                                                                                      |

#### Note

This section isn't supported in Recruiting.

| Section                                                               | Description                                                                                      |
|-----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| <a href="#">Internal Posting Preview and External Posting Preview</a> | Links to preview the job details as a candidate would see them.                                  |
| <a href="#">Requisition Details</a>                                   | The fields defined on the Requisition XML with permissions for the current user to view or edit. |
| <a href="#">Form Management buttons</a>                               | The route map buttons and buttons to save the form or close without saving.                      |

## Approved or Closed Requisitions

The recruiting user view of the approved or closed requisition record contains the following sections:

| Section                                                               | Description                                                                                                                               |
|-----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Requisition title</a>                                     | Displays the internal title of the requisition. The form template name can't be shown on approved requisitions except in the audit trail. |
| <a href="#">Mini Forms toolbar</a>                                    | Displays the Print Preview and Audit buttons. Full form template button options aren't available in approved requisitions.                |
| <a href="#">Requisition Navigation Options</a>                        | Displays links to navigate between the job requisition detail, candidate list, job postings, and a requisition-related candidate search.  |
| <a href="#">Internal Posting Preview and External Posting Preview</a> | Links to preview the job details as a candidate would see them.                                                                           |
| <a href="#">Language toggle</a>                                       | If a requisition is posted in multiple languages, a dropdown appears that allows user to set up the requisition in multiple languages.    |
| <a href="#">Requisition Details</a>                                   | The fields defined on the Requisition XML with permissions for the current user to view or edit.                                          |
| <a href="#">Form Management buttons</a>                               | The buttons to save the form or close/re-open the requisition.                                                                            |

## 18.2 Configuring the Job Requisition Template

Configure the Job Requisition XML template to set up job requisitions for your recruiting process.

### Prerequisites

- Recruiting is enabled in Provisioning.
- All recruiting languages are selected.
- At least one applicant status set is created.

- Necessary picklists for job requisitions have been created.
- All necessary countries/regions and states or provinces are selected in ► [Admin Center](#) ► [Set Up Job Board Options](#) ► [Country/Region and State/Province Values Set up](#) ►. Refer to *Setting Up Job Board Options* from the **Related Information** on this page.
- You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Context

- You can't delete requisition templates after they've been created, but they can be disabled.
- Changes made to the Job Requisition template apply retroactively to existing job requisitions.
- When you update HTML content in field labels, you must set the content to be rendered as HTML in the job requisition. However, you can't update `mime-type="text-html"` on the [Manage Templates](#) page.
- Make sure that the job requisition template is available in OData Dictionary as well as JobRequisition Entity.

## Procedure

1. Go to ► [Provisioning](#) ► [Managing Recruiting](#) ► [Import/Update/Export Job Requisition Template](#) ►.
2. Copy and paste the entire code from the Job Requisition Template form to an XML editor.
3. Make two copies of the XML code and save them. Mark one copy as the original and archive it. Then work with the second copy.

**Always create two copies of the XML file.** This way, you can revert to the original code at any point if something goes wrong in your working copy.

4. Configure the following sections of the template
  - Template name
  - Supported languages
  - Field definitions
  - Button permissions
  - Section Name and Signature
  - Listing fields
  - Mobile fields
  - Assessment Scale
  - Application Status Set
  - Application Template Name
  - Candidate E-mail Permission

5. If you use the Offer Approval feature (*Enable Offer Approval* is enabled in Provisioning), remove the `<offer-letter-fields>` element from the Job Requisition template to avoid a validation error on import. Only use this element if you do **not** use Offer Approval.
6. Save the template.
7. Go to ► [Provisioning](#) ► [Managing Recruiting](#) ► [Import/Update/Export Job Requisition Template](#) ►.
8. Copy the modified code from your configured template and paste it into the Job Requisition Template form.
9. Choose [Save Form](#).

## 18.2.1 Job Requisition Element: Template Name

In the job requisition XML, the **template-name** tag defines the template name. Use a descriptive name to define the template.

Include these elements right after the DOCTYPE element. You can change the CDATA content if desired. The CDATA content displays prominently in the instance. Admins and recruiting users who use the default locale of the instance can interact with it.

- **job-req-template:** The declaration of the template type and attributes. Without providing a template name, you can't upload the job requisition template.
- **template-name:** The unique ID of the XML template and name that appears for the requisition in the user interface that is set in the default language of the instance.

If the template name changes, uploading the template in Provisioning creates a requisition form. There's no way to change a template name once the requisition form has been created. If you have to change the template name, you have to disable the old requisition form and a new requisition form must go through the whole process of setup again.

If the instance has multiple-language packs enabled, then template names can be localized.

The base template name does not support special characters such as Ü, é, à. Using special characters in the base template name results in system issues. Unlike the base template name, the template name supports special characters for translation.

- **template-desc:** A template description element is used to provide descriptive text.
- **template-lastmodified:** The last modification date of the template. Primarily, consultants working with the XML uses this tag to track their pattern of changes. It must be manually updated to ensure accuracy.
- **CDATA:** The template-name CDATA can contain any English or non-English characters in any UTF-8 character set. Spaces are allowed. Avoid special characters like Windows apostrophes (curly like ' instead of a straight ') since they can cause errors.  
The CDATA value of template-desc isn't useful. It only shows up in some browsers and only on the [Form Templates](#) page in [Admin Center](#).

#### Sample Code

```
<job-req-template type="jobReq" spell-check="true" min-posting-days="0" min-internal-lead-days="0">
  <template-name>
    <![CDATA[New - Net Addition to Headcount]]>
  </template-name>
  <template-desc><![CDATA[]]></template-desc>
  <template-lastmodified>3/5/06 12:00 AM</template-lastmodified>
```

#### Note

SAP recommends that you configure the template name of a job requisition with same text for default locale and default template name. In the following example, en\_US is the default locale and has the same text as of default template name:

#### Sample Code

```
<template-name><![CDATA[Permanent Employees]]></template-name>
<template-name lang="de_DE"><![CDATA[Festeinstellungen & Zeitarbeitskräfte]]></template-name>
<template-name lang="en_US"><![CDATA[Permanent Employees]]></template-name>
```

Following are the **job-req-template** elements:

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type             | Set the type to jobReq.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| spell-check      | Spellcheck on a form level doesn't function in the Recruiting product.                                                                                                                                                                                                                                                                                                                                                                                                            |
| min-posting-days | <p>You can set this attribute to 0 or a positive number. If set, the application doesn't accept postings of length less than x number of days and doesn't allow users to remove the posting manually until x number of days have passed.</p> <p>If the customer uses this attribute, it's recommended to include an instructional field on the job requisition details explaining what the posting settings are, so recruiting users know what restrictions have been set up.</p> |

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| min-internal-lead-days | <p>You can set this attribute to 0 or a positive number. If set, the requisition must be posted for x number days internally before external posting is allowed.</p> <p>If the customer uses this attribute, it's recommended to include an instructional field on the job requisition details explaining what the posting settings are, so recruiting users know what restrictions have been set up.</p> |

## 18.2.2 Job Requisition Element: Supported Languages

Requisitions can be configured to post in multiple languages. The Requisition XML must contain a declaration of allowable language packs.

Only language packs that are enabled both in [Provisioning > Company Settings](#) and [Admin Center > Recruiting Languages](#) should be set up as supported languages in the Requisition XML.

The supported languages populate the [Post Job in Languages](#) field on the Job Requisition details page.

### Sample Code

```
<supported-languages>
  <lang><![CDATA[en_US]]></lang>
  <lang><![CDATA[fr_FR]]></lang>
</supported-languages>
```

Each lang element declared identifies a language pack supported in the requisition posting languages. You can declare multiple lang elements, but you should declare at least one lang element. The CDATA value in the lang element must exactly match a language pack that was enabled for the instance.

## 18.2.3 Job Requisition Element: Field Definition

The field-definition elements in the Job Requisition XML define the field list and the behavior of each field. It depends on the customer as to what field they want to include in a Job Requisition.

### Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Sample Code

```
<field-definition id="title" type="text" required="true" custom="false">
  <field-label mime-type="text-plain"><![CDATA[Internal Business Title]]></field-label>
```

```
</field-definition>
```

### 18.2.3.1 ID Attribute in Field Definition for Job Requisition

The ID must be unique within the Job Requisition XML template. Certain field-definition IDs are predefined in the product as standard.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

```
<field-definition id="title" type="text" required="true" custom="false">
```

#### 📘 Note

When implementing Recruiting operator roles for the first time, besides adding the field definition, ensure you enable the Operator Team role for a job requisition in Manage Recruiting Team Settings.

#### → Tip

- You can't define a default value for any fields except `defaultLanguage` and on the currency Job Requisition.

#### 📘 Note

On a job requisition, the "Parent and child are multiselect fields" and "Parent and child are single select fields" combination of cascading picklist are supported.

- The system views the configured **id** as a custom field if it doesn't follow the standard field list. If you change the field-id, it will be considered as a new system field even if you keep the same label. Using the same label for the field-id doesn't transfer historical data to the new field, but creates a new field with no value.

#### 📘 Note

When you use derived fields on a requisition that have only read permissions, they display a highlighted box around the fields. These fields can't be edited.

## Special Requisition Standard Fields

| Standard Field ID | Field Type | Special Functionality                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id                | text       | <ul style="list-style-type: none"> <li>• System-issued unique numeric identifier for the requisition record.</li> <li>• Customers can't import IDs. Specify either an alternate pattern to the ID or the starting number for new IDs.</li> <li>• IDs are roughly sequential, but other objects besides requisitions could contribute to the sequence, making a sequence of requisitions numbered 38, 39, 42 normal and expected.</li> <li>• Can be made searchable on candidate-facing career sites.</li> <li>• Appears in multiple places on the user interface. Examples include the Job Requisitions tab, Job Search results, and filter options.</li> <li>• Must be configured and have read permission to all users.</li> <li>• Don't apply write permissions to this field.</li> </ul>                                                                                                                                                                                                                                         |
| status            | picklist   | <ul style="list-style-type: none"> <li>• Appears in multiple places on the user interface, such as Job Requisitions tab and Reports.</li> <li>• Contains any picklist values the customer requires to use.</li> <li>• Could be defined in such a way as to interact with the Requisition Closed state.</li> <li>• Avoid labeling this field <i>Requisition Status</i>. Instead, use a label such as <i>Recruiting Status</i> to clearly differentiate it from the requisition state.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| country           | derived    | <ul style="list-style-type: none"> <li>• Always configure in all requisitions.</li> <li>• Always set as required and grant write permissions to an operator in the route map to ensure that the field receives a value before the approval.</li> <li>• Values are managed in <a href="#">Admin Center</a> <a href="#">Set Up Job Board Options</a>.</li> <li>• The value in this field interacts with the overrides in the Application XML to control those fields that are conditionally exposed to applicants.</li> <li>• As with the most nonfilter fields, candidates can't search this field, resulting in defining both this country field and a second searchable country field on the Requisition XML.</li> <li>• Limited to 256 characters.</li> <li>• You can't configure a default value for this field.</li> <li>• The dropdown values of the "country" field do not list "N/A" even though it is selected as an option in the <a href="#">Set Up Job Board Options</a> page in <a href="#">Admin Center</a>.</li> </ul> |
| title             | text       | <ul style="list-style-type: none"> <li>• Appears on the user interface as the clickable link to open the requisition record.</li> <li>• Searchable on candidate-facing career sites.</li> <li>• If records are created using <a href="#">Browse Families &amp; Roles</a>, the value autopopulates from the <i>Families and Roles</i> library.</li> <li>• Appears as an editable field on the short requisition create page regardless of the read/write permissions of users.</li> <li>• Appears on the internal job posting.</li> <li>• Limited to 100 characters.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| department<br>division<br>location | enum         | <ul style="list-style-type: none"> <li>The system automatically assembles values for these fields. The system bases the values on the corresponding field values in the application user database for active and inactive users.</li> <li>Can be made searchable on candidate-facing career sites.</li> <li>As with all fields other than <b>mfields</b>, multiple values can't be selected.</li> <li>We strongly recommend configuring in the Requisition XML.</li> <li>These fields display in many places on the user interface (such as requisition Display Options and Filter Options, ad-hoc reports, Offer Letter and Recruiting e-mail token lists) regardless of whether they're configured. If unconfigured, they appear blank to users.</li> <li>There's no way to add or remove a value from these fields other than adjusting the data stored on application user profiles. Some customers create dummy user accounts so that they can specify new values, and make special arrangements to clear out the values for inactive application users to avoid inactive values appearing.</li> <li>The standard recruiting reports use these fields, but you can remap them to use other fields if necessary.</li> <li>Because of the dependencies and limitations on these fields, some users configure these fields and a duplicate set of fields. The duplicate set stores the same set of business data, but with more functional field types such as <b>mfields</b> or jobCode fields.</li> <li>If there are more than 100 values for these fields, the <b>[Custom Select]</b> option appears next to the field. The system displays this option automatically based on the number of values in the field. This applies only to the standard enum fields. You can't configure this field.</li> <li>Relabeling is managed on a suite-wide level in the Succession Data Model or <a href="#">Admin Center</a> &gt; <a href="#">Text Replacement</a>. Changes affect other modules besides Recruiting.</li> </ul> |

### 18.2.3.2 Type Attribute in Field Definition for Job Requisition

The type attribute defines the type of data that the system accepts in the field that carries the type attribute.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

```
<field-definition id="title" type="text" required="true" custom="false">
```

## ⓘ Note

For fields of the type `multiattachmentselection`, the value for the `<field-definition id>` cannot contain any special characters, such as hyphens, underscores, or spaces.

## → Recommendation

Do not change the field type of a field. This can cause application errors on existing records storing data that do not match the new field type.

The `type` attribute defines the data that the system accepts in the field. It consists of the following options:

### Type Attribute Field Definitions

| Option          | Description                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| text            | A single line of alphanumeric text with a 100-character limit (character limit and display are non-configurable). Each text field can store one value per locale, allowing the user to toggle between languages to enter data in various locales.                                                                                                                               |
| textarea        | Multiple lines of alphanumeric text with a 256-character limit, displayed as a 100-character-wide box (character limit and display are non-configurable). Each textarea field can store one value per locale, allowing the user to toggle between languages to enter data in various locales.                                                                                   |
| date            | You can manually enter a date or select from calendar dropdown. Displays <code>mmddyyyy</code> or <code>ddmmyyyy</code> according to selected language pack.                                                                                                                                                                                                                    |
| percent         | A percent value with one decimal.                                                                                                                                                                                                                                                                                                                                               |
| bool            | True or false (shown as a checkbox). Should not be made required because if necessary; always needs to be selected.                                                                                                                                                                                                                                                             |
| enum            | An enumerated type (shown as a dropdown list) where values are defined in the XML.                                                                                                                                                                                                                                                                                              |
| number          | A number value with two decimal places, formatted by locale.                                                                                                                                                                                                                                                                                                                    |
| currency        | A currency value, where the field ID <b>"currency"</b> determines the currency symbol.                                                                                                                                                                                                                                                                                          |
| picklist        | Field options come from a picklist defined in Admin Center (shown as a dropdown list).                                                                                                                                                                                                                                                                                          |
| derived         | A dropdown or <b>"find value"</b> field (depending on length of list) where values are automatically determined from another area of the system.                                                                                                                                                                                                                                |
| instruction     | A non-editable field that stretches left to right across the screen, used to display messages to users. Cannot be made reportable or writable; otherwise results in an error.                                                                                                                                                                                                   |
| multiattachment | A field that can have multiple documents uploaded and attached to it.                                                                                                                                                                                                                                                                                                           |
| richText        | Alphanumeric lines with about a 32,000-character limit, which includes hidden characters used to define HTML formatting (character limit and display are non-configurable.) Each <b>richText</b> field can store one value per locale. allowing the user to toggle between languages to enter data in various locales.                                                          |
| jobCode         | A field that can have data autopopulated from the Job Classification Foundation Object when a requisition is created using <a href="#">Browse Families and Roles</a> .                                                                                                                                                                                                          |
| questions       | A special field type that can only be defined once per requisition template and only on the <b>"questions"</b> field ID. Place the pre-screen questions section onto the requisition. The <b>question-Response</b> for cascading questions shows answers in all the locales configured in the Job Requisition. The symbol, ' ' separates the answers of the individual locales. |

| Option       | Description                                                                                                                                                                                       |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| competencies | A special field type that can only be defined once per requisition template and only on the <b>"competencies"</b> field ID. Place the competencies section onto the requisition.                  |
| operator     | A special field type that can only be defined on a particular predefined list of field ids.                                                                                                       |
| operatorTeam | A special field type that can be defined only on a particular predefined list of field ids. A field of this type on a job requisition enables the auto-populate feature for recruiting operators. |

### 18.2.3.3 Required Attribute in Field Definition for Job Requisition

The **required** attribute defines whether a field is required for completion of a requisition record. The field requirement is only enforced if users editing the requisition can write to the field during their edit.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

```
<field-definition id="title" type="text" required="true" custom="false">
```

If the field is hidden or read-only to the user during editing, the blank field doesn't prevent the user from saving the requisition.

Allowable values for the required field are **true** or **false**. You can't make fields conditionally required on the requisition record. You can't hide, display, or require fields based on the answer to an earlier field. You can't ask a question like, *Is this a replacement requisition?* and then display or require a **<Person Being Replaced>** field, if the recruiting user selects **Yes**. The suggested workarounds are:

- Make the **<Person Being Replaced>** field optional, and rename it to something like *If yes, specify the Person Being Replaced*.
- Make the **<Person Being Replaced>** field required and rename it something like *If yes, specify the person being replaced (enter N/A if not applicable)*.

## 18.2.3.4 Custom Attribute in Field Definition for Job Requisition

There are some field IDs that are reserved as standard fields. It is not required to include them in the XML configuration, but if used, they must have the appropriate corresponding field type and be marked as `custom="false"`. All other field IDs should be marked `custom="true"`.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

```
<field-definition id="title" type="text" required="true" custom="false">
```

If you incorrectly configure a custom field as `custom="false"`, you can upload the XML without causing an error, but this misconfigured field impacts other features. Specifically, misconfiguration of custom fields prevents these fields from displaying in the API data dictionary. Custom fields used in integrations and not available in the data dictionary create an error that the field does not exist.

## 18.2.3.5 Group Name Attribute in Field Definition for Job Requisition

The `group-name` attribute enables you to define recruiting groups for sets of users.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

```
<field-definition  
  id="recruiterName" type="operator" required="true" custom="false" group-  
  name="Recruiters">
```

On operator and operatorTeam field types, consider preventing Recruiting users to selecting from any active Recruiting user. By specifying a `group-name` attribute, you limit the available users in this field to only users defined in this Recruiting Group.

There are exceptions to this when an Admin is setting up operatorTeam defaults.

The `group-name` attribute is an optional attribute and is supported only on fields that are `type="operator"` or `type="operatorTeam"`.

### 📌 Note

To respect the Recruiting Group limitation, disable the Person-Employment-User setting at ► [Provisioning](#) ► [Company Settings](#) ► [Person-Employment-User V1 \[Not Ready for Sales/Production\]](#) ►.

## 18.2.3.6 Field Label Element in Field Definition for Job Requisition

The `field-label` element usually controls the appearance of the field name in the user interface. However, this label element does not control all field labels on the user interface. On certain fields, the Succession Data Model controls the field label or on other fields there are Provisioning settings that control the label used in the system.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

```
<field-label mime-type="text-plain"><![CDATA[Business Title]]></field-label>
```

The label element is not conditional. This means, it is not possible for one field to display one label to hiring managers and a different label to recruiters.

The field-definition element must contain at least one field-label element.

### → Recommendation

Ensure that the field-label used is unique.

## mime-type Attribute

```
<field-label mime-type="text-plain"><![CDATA[Business Title]]></field-label>
```

Mime-type determines whether or not the system renders html tags defined in the CDATA content. The two supported mime types are as follows:

- `text-plain`: Unformatted plain text.
- `text-html`: HTML-formatted text.

## CDATA Content

```
<field-label mime-type="text-plain"><![CDATA[Business Title]]></field-label>
```

The CDATA content is configurable to contain the preferred text of the customer.

### → Tip

Use the following HTML in the CDATA value to define a table with a background color to separate sections of the requisition. Replace the background color hex color code with the preferred brand color of the customer and replace the field label as appropriate to the field.

```
<table frame="border" width="100%"> <tr><td style="background-color:#6699FF">
```

```
valign="bottom"><b>FIELD LABEL</b></td></tr> </table>
```

## 18.2.4 Job Requisition Element: Field Permission

Field permissions determine which fields a recruiting user sees in a specific requisition state.

Field permissions are read and applied top to bottom in the order they appear in the XML template, meaning the later permissions override the former if there is conflict. For example, you can define all the read permissions for all operators first and the write permissions after all read permissions are set up. That way if there are any conflicts between permissions, the greater permissions rule.

The best practice is to set up a separate permission block for each operator, defining the appropriate permissions, even if two operators have the same permission set. Permission structures that group field permissions together for different operators are significantly more difficult to maintain.

### Note

Three permission blocks for the **J** recruiting operator are automatically added to all Requisition XML templates upon upload into Provisioning. The **J** recruiting operator is used to ensure that the report schemas have the appropriate permissions to the fields.

### Sample Code

```
<field-permission type="write">
  <description><![CDATA[Hiring Manager and Upline Edit Permissions]]></
description>
  <role-name><![CDATA[G]]></role-name>
  <role-name><![CDATA[GM+]]></role-name>
  <status><![CDATA[pre-approved]]></status>
  <field refid="jobPostLanguage"/>
  <field refid="title"/>
  <field refid="replacementFor"/>
</field-permission>
```

### 18.2.4.1 Job Requisition Field Permissions

The field-permission element defines what fields can recruiting users can access. The field-permission element contains various attributes such as **type**, **description**, **role-name**, **status**, **field** element, and **refid**.

#### type Attribute

### Sample Code

```
<field-permission type="read">
```

The type attribute of the field permission element determines what kind of permissions are applied in the permissions block.

The type attribute must be set to one of the following types:

| Type  | Description                                                                                                                    |
|-------|--------------------------------------------------------------------------------------------------------------------------------|
| read  | Internal and external users in the specified roles can read this field. This is applicable only for the open Job Requisitions. |
| write | The user can read and write the fields after the Job Requisition is open                                                       |

There is no "none" or "hide" type. To remove a field from view, omit it from any permission blocks.

## description Element

This is an optional element. The description element is most useful as a brief description of what the field permission block is intended to do. Only one description element can be contained within the `field-permission` element.

### Sample Code

```
<description><![CDATA[Hiring Manager and Upline Edit Permissions]]></description>
```

## role-name Element

The role-name element defines which operators are impacted by the permission block. Multiple role elements are supported within each permission block. The role-name CDATA content must contain only valid roles and relational roles such as O, R, RM, GH, and so on.

### Sample Code

```
<role-name><![CDATA[G]]></role-name>
```

## status Element

The only conditional control available over field permission is through the requisition state, where field permissions can be adjusted based on whether the requisition is pending approval, has already been closed, and so on. Currently, there is no way to change field permission based on route map step or other variables.

Allowable status CDATA values are:

- pre-approved

- approved
- closed

## field Element and refid Attribute

Specify all field IDs that the permission block should impact.

### Sample Code

```
<field refid="title"/>
```

## 18.2.5 Job Requisition Element: Button Permission

The button-permission element defines who can access and use these buttons in the user interface. It is only possible to permission the Close and Reopen requisition buttons.

Permission the [Close Job Requisition](#) button in the Job Requisition template so that the [Cancel Job Requisition](#) button appears in the Pre-approved job requisitions and [Close Job Requisition](#) button appears in the Approved job requisitions.

The Close button natively only appears in the requisition state of **approved** and the Reopen button only appears in the requisition state of **closed**, so there is no status element supported in button-permissions.

### Sample Code

```
<button-permission>
<description><![CDATA[]]></description>
<role-name><![CDATA[R]]></role-name>
<role-name><![CDATA[T]]></role-name>
<role-name><![CDATA[W]]></role-name>
<button-id><![CDATA[closeReq]]></button-id>
<button-id><![CDATA[reopenReq]]></button-id>
</button-permission>
```

## 18.2.5.1 Job Requisition Button Permissions

The `button-permission` element defines who can use buttons on the UI. The `button-permission` element contains various attributes such as **description**, **role-name**, **status**, and **button-id**.

### description Element

This is an optional element. The description element is most useful as a brief description of what the button permission block is intended to do. Only one description element can be contained within the `button-permission` element.

#### Sample Code

```
<description><![CDATA[Allow recruiters to close reqs]]></description>
```

### role-name Element

The `role-name` element defines which operators are impacted by the button permission block. Each permission block supports multiple role elements. The `role-name` CDATA content must contain only valid roles and relational roles such as O, R, RM, GH, and so on.

### button-id Element

Specify all button IDs that the permission block should impact.

#### Sample Code

```
<button-id><![CDATA[reopenReq]]></button-id>
```

## 18.2.6 Job Requisition Element: Section Name and Signature

The `job-req-section-name` element defines the string for the Job Requisition section header and the `signature-section-name` element defines the string for the signature section.

#### Sample Code

```
<job-req-section-name><![CDATA[New - Net Addition to Headcount]]>
</job-req-section-name>
<signature-section-name><![CDATA[this is the signature-section-name element]>
```

```
</signature-section-name>
```

#### 📌 Note

You cannot add or modify a section name after creating a template. To modify an existing section name or create a section, upload the Requisition XML and change the template name in the `template-name` and `template-name-lang` elements.

## 18.2.7 Job Requisition Element: Listing Fields

Listing fields are fields in a job requisition that you want to reference with tokens (variables) in job descriptions, headers, and footers. Add field IDs to the listing-fields element in the Job Requisition template so that you can reference them elsewhere with tokens.

Only one listing-fields section is supported in the Requisition XML.

#### 📄 Sample Code

```
<listing-fields>
<field refid="title"/>
<field refid="jobCode"/>
<field refid="customString1"/>
<field refid="customString2"/>
<field refid="customString3"/>
<field refid="customString4"/>
<field refid="customString5"/>
<field refid="customString6"/>
<field refid="classificationTime"/>
</listing-fields>
```

### field Element and refid Attribute

Specify all field IDs that the listing fields block impacts. The listing-field block supports multiple field elements.

#### 📄 Sample Code

```
<field refid="title"/>
```

## 18.2.8 Job Requisition Element: Mobile Fields

For an approver to review and approve a requisition through the Mobile application, you must define the fields available in the mobile view in the Job Requisition XML.

The mobile-fields element defines the fields that show on the mobile screen during Job Requisition approval. Job Requisition viewing on a mobile device does not support Job Code Entity fields.

#### Sample Code

```
<mobile-fields>
  <field refid="id"/>
  <field refid="hiringManagerName"/>
  <field refid="title"/>
  <field refid="customString2"/>
  <field refid="location"/>
  <field refid="costCenterId"/>
  <field refid="addReplace"/>
  <field refid="replacementFor"/>
  <field refid="budgetSal"/>
  <field refid="targetedSal"/>
  <field refid="targetBonusPercent"/>
</mobile-fields>
```

## mobile-fields Element

The Job Requisition XML supports only one mobile-fields section.

#### Sample Code

```
<mobile-fields>
```

## field Element and refid Attribute

Specify all field IDs that mobile fields block impacts. Mobile-fields support multiple field elements. If more than 50 fields are configured in this section, you might experience errors with the mobile application, but the functional limit is much lower than 50 as a large number of fields creates a lot of scrolling and becomes unmanageable.

#### Sample Code

```
<field refid="title"/>
```

## 18.2.9 Job Requisition Element: Offer Approval Permission

To access Offer Detail records and features, add an Offer Approval feature permission in the Requisition XML in all the stages where users require access to offer information.

#### Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

#### Sample Code

```
<feature-permission type="offerApproval">
  <description><![CDATA[R can launch offer letters during statuses
    with an Offer category.]]></description>
  <role-name><![CDATA[T]]></role-name>
  <role-name><![CDATA[R]]></role-name>
  <status><![CDATA[Offer Negotiation]]></status>
</feature-permission>
```

#### Recommendation

Configure the offer letter or approval feature in all steps where users need access to the offer information. For example, if you allow users to create an offer approval at the Offer Approval stage, give them access to related subsequent steps, such as Offer Extended, Background Check, and Hired. If the feature isn't enabled for the additional steps, users can't access the Offer Detail on the UI.

## 18.2.10 Job Requisition Element: Assessment Scale

The assessment scale element defines the rating scale that is used to assess all applicants interviewed on this Job Requisition using Interview Central.

Recruiters can rate applicants on competencies as part of the Interview Central process.

### reverse-scale Attribute

Some customers have their instances set up such that the rating scales are reversed. For example, 1 is the highest possible rating instead of the lowest. For such a customer, the reverse-scale attribute ensures that Interview Central follows that same logic.

#### Sample Code

```
<assessment-scale reverse-scale="false">
```

### scale-id Element

Associates a rating scale to the Job Requisition to determine what rating numbers and labels are used in Interview Central. As a prerequisite, you must configure rating scale in the instance. The exact name of the rating scale, including correct capitalization, spacing, and punctuation must be used. Avoid special characters.

#### Sample Code

```
<scale-id><![CDATA[Interview Scale]]></scale-id>
```

## 18.2.11 Job Requisition Element: Offer Letter Fields

The offer letter field section defines the fields that appear on the left side of the offer letter generation screen for input and use as tokens in the offer letter.

The offer letter section comes into the picture when *Enable Offer Approval* isn't selected in ► *Provisioning* ► *Company Settings* .

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### { } Sample Code

```
<offer-letter-fields>
<field refid="title"/>
</offer-letter-fields>
```

## field Element and refid Attribute

Specify all field IDs that the `offer-letter-fields` block should impact.

### { } Sample Code

```
<field refid="title"/>
```

## 18.2.12 Job Requisition Element: Application Status Set

The application-status-config element defines the applicant status set for Job Requisitions created from this XML template. The applicant status set manages the steps through which applicants are routed during the hiring process and manages the interaction between statuses and feature permissions.

In multistage application environments, the applicant status set manages the interaction between statuses and application field-permissions.

When configuring multistage application, all statuses in the status set has to be defined in the candidate permissions model, or else the candidate can't view all fields.

### ⓘ Note

If you change the application status set within the XML of a Job Requisition, this change affects only new requisitions. Existing jobs continue using the original status set.

SAP SuccessFactors recommends not to change the application status set in the Job Requisition template after a job requisition is created. Doing this can break the association between the job requisition and

application status set, which associates and controls permissions with respect to field visibility, feature enablement, and also candidate association with various statuses of job requisition.

#### Sample Code

```
<application-status-config>
  <application-status-set name="Candidate Workflow"/>
  <field-permission type="write">
    <description><![CDATA[Write Permissions]]></description>
    <role-name><![CDATA[R]]></role-name>
    <role-name><![CDATA[G]]></role-name>
    <status><![CDATA[Default]]></status>
    <status><![CDATA[Interview]]></status>
    <status><![CDATA[Hired]]></status>
    <field application-field-id="recruiterPhoneScreenDate"/>
    <field application-field-id="screeningNotes"/>
  </field-permission>
  <feature-permission type="interviewAssessment">
    <description><![CDATA[Users can launch interview assessment]]></description>
    <role-name><![CDATA[R]]></role-name>
    <role-name><![CDATA[G]]></role-name>
    <status><![CDATA[Interview]]></status>
  </feature-permission>
</application-status-config>
```

### 18.2.12.1 Job Requisition Application Status: Name

Specify the applicant status set name to use on Job Requisitions created with this Job Requisition XML template.

#### Sample Code

```
<application-status-set name="Candidate Workflow"/>
```

### 18.2.12.2 Job Requisition Application Status: Field Permission

Field permission elements are declared within the `application-status-set` element if the instance is set up with the multistage application feature.

Select [Enable Multi Stage Application](#) in [Provisioning](#) > [Company Settings](#) > [Recruiting](#).

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- If this option is not selected, the permissions are read out of the Application XML.
- If this option is selected, all field permissions in the Application XML should be commented out or removed except for the write permissions to the `statusId`, `resume`, `coverLetter`, and `application comments` permissions fields.

- If contradicting field permissions are specified in both the Application XML and Requisition XML, the permissions might not be rendered correctly for Recruiting users.

An unlimited number of field permission elements can be included in the Job Requisition XML.

When configuring multistage applications, all statuses in the status set should be defined in the candidate permissions model, or else the candidate can view all fields.

#### Sample Code

```
<field-permission type="write">
  <description><![CDATA[Write Permissions]]></description>
  <role-name><![CDATA[R]]></role-name>
  <role-name><![CDATA[G]]></role-name>
  <status><![CDATA[Default]]></status>
  <status><![CDATA[Interview]]></status>
  <status><![CDATA[Hired]]></status>
  <field application-field-id="recruiterPhoneScreenDate"/>
  <field application-field-id="screeningNotes"/>
</field-permission>
```

## type Attribute

The **type** attribute of the field permission element determines what kind of permissions are applied in the permissions block.

Set the **type** attribute to one of the following:

| Type  | Description                                                                                                               |
|-------|---------------------------------------------------------------------------------------------------------------------------|
| Read  | Internal and external users in the specified roles can read this field. This is only applicable to open Job Requisitions. |
| Write | The user may both read and write the fields after the requisition is open.                                                |

There is no "none" or "hide" type. To remove a field from view, omit it from any permission blocks.

#### Sample Code

```
<field-permission type="read">
```

## description Element

This is an optional element. The description element is most useful as a brief description of what the permission type is intended to do.

#### Sample Code

```
<description><![CDATA[Write Permissions]]></description>
```

## role-name Element

The role-name element defines which operators are impacted by the permission block. Each permission block supports multiple role elements. The role-name CDATA content must contain only valid roles and relational roles such as O, R, RM, GH, and so on.

You can use the `<field application-field-id="*">` to configure a field permission block for all fields.

## status Element

In a multi-stage application environment, field permissions can be adjusted based on whether the applicant is in Interview, Offer, or some other state. There is no way to change field permission or hide/display fields based on application or requisition data.

Each permission block supports multiple status elements.

### Note

All statuses defined in the Applicant Status Workflow must be declared in the XML.

The status CDATA must be set to the Name of Status value set up in ► [Admin Center](#) ► [Edit Applicant Status](#) ►. Attempting to use the Internal Label or Candidate label from that same screen does not work.

### Sample Code

```
<status><![CDATA[Default]]></status>
<status><![CDATA[Interview]]></status>
<status><![CDATA[Hired]]></status>
```

## field Element and application-field-id Attribute

Specify all field IDs that the permission block should impact. The asterisk is also supported to indicate all fields.

### Sample Code

```
<field application-field-id="recruiterPhoneScreenDate"/>
<field application-field-id="screeningNotes"/>
```

## required Element

Certain fields might not be required and some might be made as available in most statuses, but then become required at a certain point in the status workflow. The required attribute can be added to the field application-field-id element to specify that the ordinarily non-required field should be required in that status.

#### Sample Code

```
<field application-field-id="baseSalary" required="true"/>
```

### 18.2.12.3 Job Requisition Application Status: Feature Permission

Feature permissions define operator access to certain special functionalities. An unlimited number of feature-permission elements can be included in the Requisition XML.

#### Sample Code

```
<feature-permission type="interviewAssessment">
  <description><![CDATA[Users can launch interview assessment]]></description>
  <role-name><![CDATA[R]]></role-name>
  <role-name><![CDATA[G]]></role-name>
  <status><![CDATA[Interview]]></status>
</feature-permission>
```

### type Attribute

The type attribute of the feature permission element determines what kind of functionalities can be accessed.

#### Sample Code

```
<feature-permission type="interviewAssessment">
```

| Type                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| assessmentIntegration | Provides access to the assessment integration portlet on the application page.                                                                                                                                                                                                                                                                                                                                                 |
| candQuestions         | In multi-stage application environments, this type must be permitted to the C operator in the Default status to allow the applicant to be able to answer the pre-screening questions during the initial application process. You can configure the feature-permission element for multiple statuses for prescreening questions. After submission, this permission allows the applicant to "read" their answers but not "edit". |

#### Note

You don't need to configure candQuestions in single-stage environments.

| Type                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| historicalAssessmentResults      | Provides access to the Assessment integration historical results portlet on the application page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| historicalBackgroundCheckResults | Provides access to the Background Check historical results portlet on the application page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| historicalQuestionAnswers        | Provides access to the Questions and Answer historical results portlet on the application page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| interviewAssessment              | Provides access to the Interviewers portlet on the application page, including the ability to set up interviewers and view all ratings after interview assessments are completed.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| lateStageApp                     | In late stage application environments, this type causes an <i>Invite to Apply</i> option to appear on the application page, and an <i>Invite to Late-Stage Application</i> option to appear in the <i>Actions</i> menu for applicants who have been forwarded and then added to the requisition, but have not yet completed an application.                                                                                                                                                                                                                                                      |
| offerApproval                    | Provides access to the <i>Offer Approval</i> action in the <i>Offer</i> menu on the application page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| offerLetter                      | <p>Provides access to the <i>Offer Letter</i> action in the <i>Offer</i> menu on the application page.</p> <p>When offerLetter isn't assigned to an operator on the template, then all operators on the requisition have access to the <i>Offer Letter</i> portlet. In order to restrict to usage of the <i>Offer Letter</i> portlet, at least one operator role will have to be configured in order for the feature permission to take effect. Once the permissions are defined for one operator, then operators who don't have permission will not be able to see the offer letter portlet.</p> |
| offerLetterPortlet               | <p>Provides access to the <i>Offer Letter</i> portlet but doesn't allow the creation of an offer letter.</p> <p>If <b>offerLetterPortlet</b> isn't configured, then everyone can view the portlet regardless of status.</p> <p>The feature permission <b>offerLetter</b> gives the user the ability to create an offer letter; that is, the action.</p> <p>This means that if an operator role has <b>offerLetter</b> permission, they then automatically get a view of the portlet as well.</p>                                                                                                  |

| Type       | Description                                                        |
|------------|--------------------------------------------------------------------|
| onboarding | Provides access to the Onboarding portlet on the application page. |

**Note**

You can allow Recruiting users to be able to see the Onboarding portlet without the ability to initiate onboarding by controlling their [Onboarding Initiate Permission](#) role-based permission. Refer to *Permission Settings for Onboarding Portlet and Initiate Onboarding* for details.

## description Element

This is an optional element. The description element is most useful as a brief description of what the feature permission block is intended to do. Only one description element can be contained within the feature-permission element.

### Sample Code

```
<description><![CDATA[Interview Permissions]]></description>
```

## role-name Element

The role-name element defines which operators are impacted by the permission block. Each permission block supports multiple role elements. You can use the `<field application-field-id="*">` to configure a field permission block for all fields.

The role-name CDATA content must contain only valid roles and relational roles such as O, R, RM, GH, and so on.

### Sample Code

```
<role-name><![CDATA[R]]></role-name>
<role-name><![CDATA[G]]></role-name>
```

## status Element

The only conditional control available over feature-permission is through the applicant status, where field permissions can be adjusted based on whether the applicant is in Interview, Offer, or any other state. There is no way to change field permissioning based on other application or requisition data.

Each permission block supports multiple status elements.

The status CDATA must be set to the Name of Status value set up in ► [Admin Center](#) ► [Edit Applicant Status](#) ►. Attempting to use the Internal Label or Candidate label from that same screen does not work.

#### Sample Code

```
<status><![CDATA[Default]]></status>  
<status><![CDATA[Interview]]></status>  
<status><![CDATA[Hired]]></status>
```

## 18.2.13 Job Requisition Element: Application Template Name

The application template name element defines which Application XML template is displayed to candidates and recruiting users when managing applications on Job Requisitions created from this Job Requisition XML template.

After the Job Requisition XML is created, the application template name should not be changed or it may cause errors on existing and new records.

#### Sample Code

```
<application-template-name name="Candidate Detail Info Template"/>
```

## 18.2.14 Job Requisition Element: Candidate Email Permission

All operators can access the Email option on the application record. If you have to restrict certain operators from accessing the email option, `candidate-email-permission` element can be added to the Requisition XML and only permission the users with access to the Email option.

This can only be declared once in the Requisition XML template and cannot be permissioned by status.

#### Sample Code

```
<candidate-email-permission type="candidateEmail">  
  <description><![CDATA[Recruiters can email candidate.]]></description>  
  <role-name><![CDATA[R]]></role-name>  
</candidate-email-permission>
```

## description Element

This is an optional element. The `description` element is most useful as a brief description of what the field permission block is intended to do. Only one description element can be contained within the field-permission element.

### Sample Code

```
<description><![CDATA[Interview Permissions]]></description>
```

## role-name Element

The `role-name` element defines which operators are impacted by the permission block. Each permission block supports multiple role elements. The role-name CDATA content must contain only valid roles and relational roles such as O, R, RM, GH, and so on.

### Sample Code

```
<role-name><![CDATA[R]]></role-name>  
<role-name><![CDATA[G]]></role-name>
```

## 18.2.15 Job Requisition Standard Field Guide

List of field IDs and their corresponding field types in Job Requisition.

You need access to Provisioning to configure the Job Requisition XML.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## 18.2.16 Job Requisition Standard Field Types Guide

Review the descriptions of the standard field types for job requisitions.

| Field Type | Description of Field Type                                                                                                                                                                                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| text       | A single line of alphanumeric text with a 100-character limit (character limit and display are non-configurable). Each text field can store one value per locale, allowing the user to toggle between languages to enter data in various locales.                                               |
| textarea   | Multiple lines of alphanumeric text with a 4000 character limit, displayed as a 100-character-wide box (character limit and display are non-configurable). Each text area field can store one value per locale, allowing the user to toggle between languages to enter data in various locales. |
| date       | A date manually entered by the user, or selected from the calendar pull-down. Displays mmddyyyy or ddmmyyyy according to user's chosen language pack.                                                                                                                                           |
| percent    | A percent value with one decimal.                                                                                                                                                                                                                                                               |
| bool       | True or false (shown as a checkbox). Should not be made required, because if required it always needs to be checked.                                                                                                                                                                            |
| enum       | An enumerated type (shown as a pull-down list) where values are defined in the XML.                                                                                                                                                                                                             |
| number     | A number value with two decimal places, formatted by locale.                                                                                                                                                                                                                                    |
| currency   | A currency value, where currency symbol is determined by the field id "currency".                                                                                                                                                                                                               |
| picklist   | Field options come from a picklist defined in admin (shown as a pull-down list).                                                                                                                                                                                                                |

| Field Type      | Description of Field Type                                                                                                                                                                                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| derived         | A pull-down or "find value" field (depending on length of list) where values are automatically determined from another area of the system.                                                                                                                                                                       |
| instruction     | A non-editable field that stretches left-to-right across the screen that is used to display messages to users. Cannot be made reportable or writable or an error will result.                                                                                                                                    |
| multiattachment | A field that can have multiple documents uploaded and attached to it.                                                                                                                                                                                                                                            |
| richText        | Alphanumeric lines with about a 32,000 character limit, which includes hidden characters used to define HTML formatting (character limit and display are non-configurable). Each rich-Text field can store one value per locale, allowing the user to toggle between languages to enter data in various locales. |
| jobcode         | Field that can have autopopulated data on a new requisition from the Job Classification Foundation Object via Browse Families and Roles.                                                                                                                                                                         |
| questions       | Requisition prescreen questions. Special field type that can only be defined once per requisition template and only on the <a href="#">Questions</a> field ID. Places the prescreen questions section onto the requisition.                                                                                      |
| competencies    | Used by Interview Central. Special field type that can only be defined once per requisition template and only on the <a href="#">Competencies</a> field ID. Places the competencies section onto the requisition.                                                                                                |
| operator        | Recruiting operators. Special field type that can only be defined on a particular predefined list of field ids.                                                                                                                                                                                                  |
| operatorTeam    | Recruiting teams. Special field type that can only be defined on a particular predefined list of field ids.                                                                                                                                                                                                      |
| assessment      | Assessment Integration packages.                                                                                                                                                                                                                                                                                 |

## 18.2.17 Enabling Quick Apply in Job Requisition Template

Quick Apply allows candidates to complete an application without needing to fill out a full profile thus saving time and effort.

### Prerequisites

You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Context

Quick apply is a standard field that you have to define in the Job Requisition template along with all the necessary read or write permissions. All existing properties of standard fields are applicable to Quick Apply fields as well. Once this field is defined, it appears as an option in the Job Requisition template that you can enable or disable as per the usage. By default, this option is displayed as disabled.

With Quick Apply, recruiting users can create a quick apply requisition and generate a potential list of candidates. It's possible for them to enable or disable Quick Apply at any point of time in the Job Requisitions.

When Quick Apply is enabled from job requisition, the workflow to apply for a job on the job portal for the candidates changes. If the candidate applies to the Quick Apply enabled jobs, the candidates see account creation fields and application fields arranged in a logical order that helps them to fill out the details. This feature allows candidates to complete a job application in the fewest clicks possible, without having to fill out a complete profile, by displaying one-page view of for the account creation and application fields.

Account creation fields are only displayed to the new or nonsigned in candidates. Candidates only see the application fields if they're a returning user or a logged-on candidate.

### → Tip

While enabling Quick Apply, SAP SuccessFactors recommends you to create a new application template with minimal set of fields, enough to screen the candidate. Enabling quick apply for an existing application template would let the candidate fill out the complete profile, defeating the purpose of quick apply.

### ⓘ Note

The ordering of the account creation fields can't be changed. For application fields, the order is as defined in the application template.

## Procedure

1. Go to ► [Provisioning](#) ► [Managing Recruiting](#) ► [Import/Update/Export Job Requisition Template](#) ►.
2. Copy and paste the entire code from the job requisition template form to an XML editor.
3. Make two copies of the XML code and save them. Mark one copy as the original and archive it. Then work with the second copy.

### ⓘ Note

Always create two copies of the XML file. This action allows you to revert to the original code at any point if something goes wrong in your working copy.

4. Add the standard field **quickApply** in the job requisition template. For example,

### 🔗 Sample Code

```
<field-definition id="quickApply" type="bool" required="false" custom="false">
<field-label><![CDATA[Quick Apply]]></field-label>
<field-description><![CDATA[Quick Apply]]></field-description>
</field-definition>
```

5. Configure **quickApply** in the job requisition template with relevant read/write permissions for operators in [Manage Templates](#) or [Provisioning](#).
6. Save the template.
7. Go to ► [Provisioning](#) ► [Managing Recruiting](#) ► [Import/Update/Export Job Requisition Template](#) ►.
8. Copy the modified code from your configured template and paste it into the job requisition template form.
9. Choose [Save Form](#).

## Results

You can see the [Quick Apply](#) field as an option in the job requisition.

## Related Information

[Important Notes Related to Quick Apply \[page 195\]](#)

### 18.2.17.1 Important Notes Related to Quick Apply

Learn more details on the features that are related to Quick Apply.

#### 📘 Note

- Quick Apply isn't supported for Internal Career Sites. Internal candidates are directed to the normal application flow instead of the Quick Apply page, allowing them to apply successfully.
  - Resume Parsing is currently not supported for Quick Apply job application.
  - Ensure that country/region field uses the standard country picklist, if the field is mandatory and defined on the application template. If you don't configure the standard country/region picklist in either job application or Data Privacy Consent Statement (DPCS), the country/region field appears twice. The Country and Region of Residence both appears in the Quick Apply screen.
- When you use [Apply with LinkedIn](#) feature, certain application fields such as [First Name](#), [Last Name](#), and [Email](#) that are supported with Quick Apply are auto-populated. These are the regular fields that always appear on the Quick Apply screen.
  - Business Rules are supported in the Job Requisition pages irrespective of Quick Apply. However, the application templates that are used for the Quick Apply job requisitions and the candidate facing pages for Quick Apply do not support business rules.
  - [Quick Apply](#) supports OTP-based email verification when external candidates apply for Quick Apply enabled job requisitions. If OTP-based email verification is enabled, candidates can submit their applications only after they verify a one-time password.

#### 📘 Note

OTP-based email verification isn't applicable for logged on candidates.

- Multidocument attachment is only applicable for signed-in candidates.
- Assessment initiation is applicable for signed-in candidates only.
- If you use the standard country/region picklist configuration in the application template and DPCS, only the country/region field from Application template is considered in Quick Apply screen. The DPCS defers to the country/region selection in the application template. The standard country/region picklist must be an exact match to the system country/region picklist, both in the number of values and the English US labels.
- Ensure that the values in the country/region picklist match with the values shown in the [Country/Region of Residence](#) dropdown. If they're different, the country/region field shows up twice on the page.
- The contact email address field doesn't show up on the user interface. It's defaulted to the email provided for account creation. The candidate can edit contact email address from the profile page.
- If you've disabled the OTP-based email verification in ► [Admin Center](#) ► [Manage Recruiting Settings](#) ► and enabled the [Career Site E-Mail Notification](#) email trigger in ► [Admin Center](#) ► [Recruiting Email Triggers](#) ►, system doesn't follow the Quick Apply flow for job application; the normal apply process takes effect.
- If there is a change or update to the DPCS statements, an existing candidate can accept or reject the statement as a part of the application flow in the Quick Apply UI itself.
- If the [Welcome Email](#) and [Thanks for Apply](#) triggers are enabled when the candidate creates an account and applies for Quick Apply enabled job, they receive both the Welcome and Thanks for Apply emails. An existing or signed-in candidate applying for Quick Apply jobs when the triggers are enabled receives only the Thanks for Apply email.

## 18.2.18 Configuring Form Templates for Recruiting

Configuring the form templates lets you associate the route map that helps in approving the Job Requisition created from the template.

### Prerequisites

- Recruiting is enabled.
- You have [Form Templates](#) permission.
- The route map that you intend to use with the form has been configured.

## Context

Form templates are the basis for all forms in SAP SuccessFactors, and define the behavior of forms that span across multiple modules. Form templates contain the layout, sections, and workflow for each form based on that template.

The form templates that your company is using were uploaded for you when SAP SuccessFactors was implemented. Many modules use the form template area, so along with Job Requisition templates, you also see form templates that aren't relevant to Recruiting.

## Procedure

1. Go to ► [Admin Center](#) ► [Form Template Settings](#) ►.

The [Managing Form Templates](#) page appears, and you see all the templates that are enabled and disabled, as well as the route map associated with the template.

2. Select the form that you want to edit.

The form page appears.

3. Select the route map to use for requisition approvals.

The template name gets populated automatically from the XML.

4. Configure these recommended form template settings for Recruiting, ignoring any option that's not listed and which doesn't apply to Recruiting:

| Option                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default Due Date</b>                         | Must be set to Relative and defaulted to X days from the Form Create Date. It's based on your preference as to for how long to wait before the Document Due email notification reminders begin going out.                                                                                                                                                                                                    |
| <b>Default Late Notification Date (in days)</b> | <p>Specifies the timeframe in which an email notification is sent to users informing them that the form is late.</p> <p>The timeframe is determined with the form's due date. For example, you can specify that a notice is sent 7 days after the form was due.</p> <p>Enter a number in this field. For example, enter <b>7</b>, if you want the email notice to be sent 7 days after the form was due.</p> |
| <b>Default Due Notification Date (in days)</b>  | Set the interval in days between document due notification emails.                                                                                                                                                                                                                                                                                                                                           |
| <b>Template Status</b>                          | Set to Enable unless the requisition form is being retired.                                                                                                                                                                                                                                                                                                                                                  |
| <b>Disable Spell Check on Route</b>             | Always select this option. Spellcheck on the route is designed to check Performance Form content and while it does pop up the spell checker, it doesn't properly check the content of Requisition fields.                                                                                                                                                                                                    |
| <b>Disable Legal Scan on Route</b>              | Always select this option. Legal Scan on the route is designed to check Performance Form content and while it does pop up the Legal Scan, it doesn't properly check the content of job requisition fields.                                                                                                                                                                                                   |
| <b>Disable Ask for Comment Routing</b>          | Always select this option to avoid errors while sending a job requisition for approval.                                                                                                                                                                                                                                                                                                                      |

| Option                                                                                                                                                                                                                                                                                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Disable Ask for Edit Routing</b>                                                                                                                                                                                                                                                                                          | <p>Always select this option.</p> <div> <p><b>Note</b></p> <p>Disabling this option enables the <a href="#">Get Feedback</a> link in the route map. The <a href="#">Get Feedback</a> feature is partially supported in Recruiting and has a few limitations. For example, the <a href="#">currently with user</a> feature displays a blank value on the job requisition summary page.</p> </div> |
| <b>Allow Add Modifier</b>                                                                                                                                                                                                                                                                                                    | Select this option if the client prefers to allow an approver to add more users into the route map. After a new route map step is added, it can't be removed. All approvers can add other approvers. The permission can't be restricted to only certain operators.                                                                                                                               |
| <b>Hide Add Signer buttons</b>                                                                                                                                                                                                                                                                                               | Always select this option. Signature steps aren't supported in Recruiting route maps.                                                                                                                                                                                                                                                                                                            |
| <b>Disable All Toolbar Buttons</b>                                                                                                                                                                                                                                                                                           | Select this option if the client prefers to limit user access to toolbar options. Most of the buttons aren't supported in recruiting.                                                                                                                                                                                                                                                            |
| <b>Disable Print Button</b>                                                                                                                                                                                                                                                                                                  | Set this option as per your preference.                                                                                                                                                                                                                                                                                                                                                          |
| <b>Disable Delete button</b>                                                                                                                                                                                                                                                                                                 | If this option isn't selected, the originators for preapproved state requisitions can delete requisitions. Set the field as per the customer's preference.                                                                                                                                                                                                                                       |
| <b>Disable Note button</b>                                                                                                                                                                                                                                                                                                   | Select this option.                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Disable Info button</b>                                                                                                                                                                                                                                                                                                   | Clear this option.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Disable Due Notification</b>                                                                                                                                                                                                                                                                                              | Clear this option unless the client prefers to avoid Document Due Notifications.                                                                                                                                                                                                                                                                                                                 |
| <b>Enable form routing to previous step</b>                                                                                                                                                                                                                                                                                  | Recommended. Improves workflow options allowing a person to send the Job Requisition back to the previous step when data is missing or extra information is desired.                                                                                                                                                                                                                             |
| <div> <p><b>Note</b></p> <p>The following options under the <a href="#">Template Flag</a> heading don't apply to Recruiting forms:</p> <ul style="list-style-type: none"> <li>• <a href="#">Do Not Transfer Documents</a>.</li> <li>• <a href="#">Automatic Manager Transfer</a> and its child checkboxes.</li> </ul> </div> |                                                                                                                                                                                                                                                                                                                                                                                                  |

## Next Steps

Configure route maps to determine the approval path of a new requisition.

## Related Information

[Using Role-Based Permissions](#)

## 18.2.19 Configuring a Route Map for Recruiting

A route map specifies the order in which a form moves from one user to another and what users can do during each step. Recruiting uses route maps to determine the approval path of a new requisition.

### Prerequisites

- The Job Requisition XML is configured with the appropriate operator fields.
- Ensure that you've enabled the [Routing Maps](#) role-based permission.
- Ensure that you've enabled [Workflow](#) in [Provisioning](#).
- Ensure that you've set [Enable Relative Dates For Form Routing](#) option in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

The user who creates the requisition completes the initial data and then sends the requisition to the user who owns the next step. That user reviews the requisition, may add or adjust requisition data based on permissions and then sends the requisition to the user who owns the next step.

#### 📘 Note

Route maps are a Platform feature, so not all route map functionality applies to Recruiting.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Route Maps](#) ►.

The [Route Map List](#) page is displayed.

2. Click [Add New Route Map](#) to build your own route map.
3. If you're building your own route map, select [Build Your Own](#) from [Add New Route Map](#) option.

The new routing map has three stages - Modify, Signature, and Completion. Specify the users who receive the form and set other options for this step. You can also add more steps for each of the stages.

4. Select the following options accordingly:

| Option                                                                        | Description                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| I want to personalize the evaluation stage in a 360 review route map          | Select if you want to use this workflow for 360 reviews. This allows you to edit what your users see in the evaluation stage of a 360 review. The evaluation stage is where others enter their feedback about the individual being evaluated.                                                                                                            |
| Only create iterative and collaborative steps when all roles exist for a user | Select if you want SAP SuccessFactors to determine which user in the system should receive a copy of the form in their inbox based on the roles you've selected. For any iterative or collaborative step you define, SAP SuccessFactors eliminates the step in the form creation process, if the team member doesn't have any one of the roles assigned. |
| Use relative dates for form routing                                           | Select if you want to specify start, exit, or due dates based on the number of days before or after another activity in your process, such as the form creation date or form due date, instead of having to enter exact calendar dates.                                                                                                                  |

 **Note**  
By selecting this option, all your route map dates will become relative.

- To add step to a [Modify Stage](#), click [Add Step](#).

In the [Create A New Modification Step](#) dialog, enter a new step name and click [OK](#).

- Enter the following information for each step you created.

The table lists all fields. Some of the fields don't apply to all steps and don't appear in the list for those steps.

| In this field... | Enter or select...                                                                                                                             |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Step Name        | The Step Name that is displayed in the route map within the form.                                                                              |
| Step Description | The description that gives more context on the action that you're about to take. This description appears in the To Do List on your home page. |

In this field...

Enter or select...

Step Type

- **Single Role** when you want the form to be sent to a single approver.  
Example: You want the requisition to be sent only to the Hiring Manager (G Role).
- **Iterative step**: This allows several users to work on a step. In this type of step, the form is sent to one user at a time, and that user sends the form to the other users specified in the step. This step type is the most commonly used when several users work on the step. If you use this type of step, you must also specify the roles to participate in the step. For example, G and GM, this is the Hiring Manager and the Hiring Manager's Manager. These two roles will be able to make edits and send the form back and forth to each other before routing to the next step.  
If you use the Iterative step, we recommend that you also specify the Entry User and Exit User.
- **Collaborative**: This allows several users to work on a step. In this type of step, the form is sent to all users at the same time. The form appears in all user's Inboxes, but only one user can work on it at a time. If you use this type of step, you must also specify the roles to participate in the step. For example, G and GM, this specifies a collaborative step between the Hiring Manager and the Hiring Manager's Manager. Both of them can access the form for an executive review.  
If you use the Collaborative step, we recommend that you also specify the Entry User and Exit User.

| In this field... | Enter or select...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Roles            | <p>The roles assigned to the user from the dropdown menu. The route map you're defining uses the roles assigned to these users to figure out who to send the processed form to. There are standard system roles in the dropdown menu, but there's a custom option if your needs are more advanced.</p> <p>All Recruiting roles (O, G, R, S, T, W, and Q) are supported in route maps, along with relational roles (GM, RH, and so on.). Employee-centric roles (E) aren't supported.</p> <p>If you want to specify a specific user instead of a role, enter U in this field then enter the username in the Username field.</p> <p>Examples of custom codes include:</p> <ul style="list-style-type: none"> <li>• R - Recruiter in Recruiting</li> <li>• W - Second recruiter in Recruiting</li> <li>• Q - VP of staffing in Recruiting</li> <li>• T - Primary coordinator in Recruiting</li> <li>• G - Hiring manager in Recruiting</li> <li>• S - Sourcer in Recruiting</li> </ul> |
| Entry User       | <p>This field is used only for iterative and collaborative step types and is optional for those step types. In the Entry User field, you can specify which of the roles specified in the Step Type field receives the form first. Specify a role already specified in the Step Type.</p> <p>You might specify an Entry User and Exit User in a situation when three users are specified in a step, but only two are required. For example, in the following step:</p> <p>Step Type = I R G GM</p> <p>Entry User = R</p> <p>Exit User = GM</p> <p>The recruiter (R) and hiring manager's manager (GM) must work on the step, but the hiring manager (G) is optional.</p>                                                                                                                                                                                                                                                                                                             |

| In this field...                   | Enter or select...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

It isn't the order of the step in the routing map.</p> <div> <p>ⓘ Note</p> <p>Step Id shouldn't contain spaces or accented characters.</p> </div>                                                                                                                            |
| Start of Review                                                                                                                                                                                       | Don't use in Recruiting route maps.                                                                                                                                                                                                                                                                                                          |
| Out of Turn Access                                                                                                                                                                                    | Don't use in Recruiting route maps.                                                                                                                                                                                                                                                                                                          |
| 1:1 Meeting                                                                                                                                                                                           | Don't use in Recruiting route maps.                                                                                                                                                                                                                                                                                                          |
| <div> <p>ⓘ Note</p> <p>It's possible to translate the step names, exit text, and so on. However, translations are only shown for newly created requisitions and not for the existing ones.</p> </div> |                                                                                                                                                                                                                                                                                                                                              |

- Click [Save](#) at the top of the page to save the route map.

## Results

Your new route map is saved and you see a confirmation message.

## Next Steps

To use the new route map, you must associate it with a form template.

## 18.2.19.1 Stages in Route Maps for Recruiting

The stages in the route map specify the type of action employees can perform. You can specify which employees receive the form at each stage and what the employee is expected to accomplish when they receive the form.

The Route Map can designate a specific job role involved in the review process and the order in which the employees receive the form. For example, you can specify that the employee first gets, followed by the employee's manager, and finally, the employee's HR manager. You can also specify that the form must move back and forth between the employee and manager for planning purposes, before the form can move to the employee's HR manager.

Forms go through three main stages.

## Route Map Stage

## What Employees Can Do

### Modify Stage

Employees typically provide a Self-Assessment on the Performance Management form, Managers review, assess, and evaluate the content of the form.

The [Start of Review](#) option under [Show advanced option](#) indicates that the performance review process starts from this step. All following steps, including this step, are shown on the [Team Overview](#) page.

#### Note

In a route map, only one step can be marked as [Start of Review](#).

You can also configure [Out of Turn Access](#) feature in this stage to allow reviewers to access a copy of the form through [Team Overview](#) page to provide their ratings before the form officially reaches them.

#### Note

The [Start of Review](#) option has to be enabled before enabling the [Out of Turn Access](#). Enabling the [Start of Review](#) option on a particular step allows users to see the form from that step within the [Team Overview](#) page.

Finally, you can enable [1:1 Meeting](#) option in the Modify stage of the Route Map. After you've enabled this option, a [Confirm 1:1 Meeting](#) option is displayed on the [Team Overview](#) page. You can click this option to route the form directly to the signature stage or the completion stage, without having to open the form.

#### Note

- EM is the recommended role for 1:1 Meeting.
- Only the last step in the Modify stage can be set as 1:1 Meeting step.
- The 1:1 Meeting has to be selected for a [Single Role](#) step between a manager and an employee. It doesn't support iterative and collaborative steps.

### Signature Stage

In this stage, employees typically sign or approve the form or acknowledge that the form has been completed. The Signature Stage typically comes after the Modify Stage.

## Route Map Stage

## What Employees Can Do

### Completion Stage

In this stage, the form is moved to the employees' Completed folder. This is the final stage of the form.

#### Note

The `[[DOC_ACCESS_URL]]` token isn't supported for the Completion stage.

## 18.2.19.2 Short Requisition with Route Map

The short requisition create page displays the title and due date.

There's no way to have other fields appear on this page and reorder those fields other than reordering the route map steps.

## 18.2.19.3 Currently With User Manages the Requisition

The Currently With user can send the requisition back one step in the route map. This applies for all route map step types and users. If a Currently With user sends back a requisition, the action will be captured in the audit trail, including any comments.

The requisition originator completes the [Requisition Create](#) page and then the [Requisition Details](#) page loads. The route map is shown at the top of the [Requisition Details](#) page as long as the requisition is in the pre-approved state. The form toolbar also appears while the requisition is in the pre-approved state.

If the form has an iterative step, and the entry user is defined in the route map, the user can choose the entry user to have the form returned to them. If the entry user is not defined in the route map, the system will allow the user to choose any user within 1 step to send the form back to them.

After the button is clicked, the system sends a notification to the step user(s) of the prior step letting them know of the availability of the form (document routing notification). If a collaborative step is being used as the step the form is being sent back, then all users in that step will receive the document routing notification.

Only one user holds the requisition form at a time. This user is referred to as the Currently With user.

The user's field visibility and permissions are defined in the Requisition XML. Even if other users can open the requisition and have field level permissions, they cannot make changes to the [Requisition Details](#) page unless they are the Currently With user.

By default, a pre-approved requisition record is only available to users to whom it has been sent in the route map. It can be made available to any user associated with the requisition record via ► [Admin Center](#) ► [Recruiting](#) ► [Manage Recruiting Settings](#) ►. Scroll down to the Job Requisition section, and check the box [Allow users to view pre-approved requisitions without regard to route map status](#). Once this box is enabled, users can view the job requisition in the pre-approved state.

## 18.2.19.4 Route Requisition to Next Step

When users are satisfied with the field content, they select the option to route the requisition to the next step.

A confirmation page displays where the user can enter comments. The user is required to confirm the requisition step change. Requisitions can also be approved or rejected/declined using the SAP SuccessFactors mobile application if the setup is available in the Job Requisition XML template and the feature enabled in Provisioning. **Rejected/declined** in the roadmap actually means sending a requisition to the previous step. *Reject* and *Approve* are only labels for **send to previous step** as the route map action.

When a requisition is moved between routing steps, the system sends the receiving user an email notification using the template in ► *Admin Center* ► *Company Settings* ► *E-Mail Notification Templates Settings* ► *Document Routing Notification* ►. If this e-mail template includes a [ [DOC\_COMMENT] ] token the user will be able to enter comments during the step change that are included in the email notification sent to the next step owner, and will be included in the requisition audit trail.

The *Document Routing Notification* can be adjusted so that each form template uses a different set of e-mail language. The email notification can also be adjusted through *Customize Settings* for *Form Templates* so that document routing notifications for some form templates are disabled, consolidated and/or have Additional Recipients. Only Recruiting-related operators must be selected as additional recipients on Recruiting-related document routing notifications.

If you select *Consolidate emails* in *Document routing email notification* of *Admin Center*, these e-mails are sent by a Provisioning job called *Process Batched Emails* that must be scheduled and running.

## 18.2.19.5 Requisition Approval Reminders

The Due Date field on the short requisition create page interacts with the settings in ► *Admin Center* ► *Company Settings* ► *Form Templates Settings* ►.

This triggers e-mail reminders about pending requisition approvals using ► *Admin Center* ► *Company Settings* ► *E-Mail Notification Templates Settings* ► *Document Due Notification* ►.

## 18.2.19.6 Requisition Completed Notification

When a requisition has passed through all route map steps, the requisition state changes from pre-approved to approved.

When this happens, it is possible to configure an e-mail notification using the ► *Admin Center* ► *Company Settings* ► *E-Mail Notification Templates Settings* ► *Document Completed Notification* ►. There is no way at present to de-select the roles in the Recipients box; in this case *Employee = G*, *Manager = GM*.

## 18.3 Job Location Generic Objects on Job Requisition

The Job Location generic object provides granularity in configuring the job locations to post on career sites.

The Job Location generic object provides structured location data on the job requisition to facilitate a card view of search results, faceted search using the Google Map component, and posting a job to multiple locations for candidates to find on the career site.

### Note

The Google Maps component doesn't work in China, so the job location coordinates are not populated for Chinese customers when a job location is created or updated.

Update the following attribute values for a specified job location in ► [Admin Center](#) ► [Manage Data](#) ► [Job Locations](#) ⌵:

- Location Code
- Location Name
- FO Location
- Job Location Long Format  
An address format for the location information of a country/region displayed for the job requisition when a candidate searches for or opens the job requisition. Note that only one Job Location long Format is allowed for a country/region. If no address format is created, a default format is displayed as the location information of a posted job. Thus, a [Job Location Long Format](#) is address representation per country/region format standards. The [Job Location Long Format](#) address is displayed in multiple lines as part of the job requisition details.
- Address 1
- Address 2
- Address 3
- Address 4
- Subdivision/Neighborhood
- City
- Metropolitan Area/ Market
- Country/Region
- State/Province  
The State/Province field is associated with the State/Province Generic Object to have a parent-child relationship between county and state.
- Flexible/Sales Region
- ZIP/Postal Code
- Location Search Synonyms  
Similar names of the locations to search for jobs.
- Latitude
- Longitude  
Career Site Builder uses [Latitude](#) and [Longitude](#) coordinates from the Google Map component to display pinned locations of the jobs on a map.

## Note

The Google Maps component doesn't work in China, so the job location coordinates are not populated for Chinese customers when a job location is created or updated.

- **Override Coordinates**  
Set the value to Yes to manually provide coordinates to show a specific and accurate location of the posted job on the map.
  - Override Latitude
  - Override Longitude
- **Effective Start Date**

Configure the `sfstd_jobLocation_obj` as the standard Field-ID, and configure the Field Label and Object Type as `JobLocation` in a job requisition XML template in ► [Admin Center](#) ► [Manage Templates](#) ► [Job Requisition Template](#) .

Here's a sample field definition:

### Sample Code

```
<field-definition id="sfstd_jobLocation_obj " type="object" required="false"
custom="false" object-type="JobLocation">
  <field-label><![CDATA[Job Location]]></field-label>
  <field-label lang="en_US"><![CDATA[Job Location]]></field-label>
  <field-description><![CDATA[]]></field-description>
  <field-description lang="en_US"><![CDATA[Location data used for Career Site
Builder]]></field-description>
</field-definition>
```

If you want to be able to select multiple job locations for a requisition, you can set the multiselect attribute to "true":

### Sample Code

```
<field-definition id="sfstd_jobLocation_obj " type="object" required="false"
custom="false" object-type="JobLocation" multiselect="true">
```

You can configure the OnSave and OnChange business rules on the job requisition XML template for the Job Location Generic Object. Note that a job requisition that supports posting jobs on multiple locations doesn't support business rules.

The template-level and role-based permissions for the Job Location Generic Object are similar to any generic object field. For a job requisition, the template role permissions, object-level permissions, and target population permissions are carried out in a specific sequence. At any point in time, if one of the three permissions fails, the next set of permissions isn't completed.

Associating the Job Location Generic Object with job requisitions using a job requisition XML template displays [Job Location](#) field on the [Job Requisition Details](#) page.

## 18.3.1 Job Location Long Format Generic Object

Job Location Long format represents a multiline address format suitable for placement within the description. It represents the full street address of a job location displayed when a candidate searches for job requisitions on the career site.

The Job Location Long Format Generic Object is available on the [Configure Object Definitions](#) page in [Admin Center](#). Update the following attribute values for a specified job location in [Admin Center](#) > [Manage Data](#) > [Job Location Long Format](#) :

- externalCode
- name
- country

Note that only one job location long format is allowed for a country/region. A default job location format is displayed if no address format is created. The default format for Job Location Long Format object is as follows:

### Sample Code

```
[address1]<br/>
[address2]<br/>
[city], [state_name] [postal_code]<br/>
[country_name]<br/>
```

You can select any of the following attributes to create a job location long format:

Use separators (commas, spaces, hyphens, new lines, semicolons, pipes, underscores, slashes, and colons) to distinguish among the field attributes.

- Address 1
- Address 2
- Address 3
- Address 4
- City
- County/Region Abbreviation
- County/Region Name
- Flexible/Sales Region
- Location Search Synonyms  
Similar names of the locations to search for jobs.
- Metropolitan Area/Market
- State Abbreviation
- State Name
- Subdivision/Neighbourhood
- Zip/Postal Code

While populating a Job Location Generic Object in [Admin Center](#), [Manage Data](#), selecting a Location FO populates the city, state/province, country/region, and ZIP/postal code values. Saving the Job Location Generic Object populates the Job Location Long format based on the country.

## 18.3.2 Job Location Short Format Generic Object

Job Location Short format represents a short address format suitable for placement in search result sets beneath the job title on the posting detail pages on the career site.

On the *Job Requisition Details* page, set the *Job Location Short Format*, a flexible naming of a location for marketing the jobs. Thus, the *Job Location Short Format* gives textual hints and clues of the locations that candidates can interpret quickly in a card or list view of a job. The *Job Location Short Format* address is displayed in a single line as part of the job requisition details. Note that the job location short format isn't associated with a country, and you can create many *Job Location Short Format* addresses to visualize them on the job cards.

Define the Job Location Short Format Object on the *Configure Object Definitions* page in *Admin Center* with `externalCode` and `name`. Update the following attribute values for a specified Job Location Short Format Object in

► *Admin Center* ► *Manage Data* ► *Job Location Short Format* ✎:

- Address 1
- Address 2
- Address 3
- Address 4
- City
- County/Region Abbreviation
- County/Region Name
- Flexible/Sales Region
- Location Search Synonyms  
Similar names of the locations to search for jobs.
- Metropolitan Area/Market
- State Abbreviation
- State Name
- Subdivision/Neighbourhood
- Zip/Postal Code

Use separators (commas, spaces, hyphens, new lines, semicolons, pipes, underscores, slashes, and colons) to distinguish among the field attributes. A default job location format is displayed if no address format is created. The default format for the Job Location Short Format object is as follows:

```
[city], [state_abbreviation], [country_abbreviation], [postal_code]
```

Configure the `sfstd_jobLocationShortFormat_obj` as the standard Field-ID, and configure the Field Label and Object Type as `JobLocationShortFormat` and Multiselect field set to `False` in a job requisition XML template in

► *Admin Center* ► *Manage Templates* ► *Job Requisition Template* ✎. You can configure the `OnSave` and `OnChange` business rules on the job requisition XML template for the Job Location Short Format Generic Object.

The sample field definition is as follows:

### Sample Code

```
<field-definition id="sfstd_jobLocationShortFormat_obj " type="object"
required="false" custom="false" object-type="JobLocationShortFormat">
  <field-label><![CDATA[Location Formatting]]></field-label>
  <field-label lang="en_US"><![CDATA[Location Formatting]]></field-label>
  <field-description><![CDATA[]]></field-description>
```

```
<field-description lang="en_US"><![CDATA[]]></field-description>
</field-definition>
```

For *Job Location Short Format*, you can use separators (commas, spaces, hyphens, new lines, semicolons, pipes, underscores, slashes, and colons) to distinguish the field attributes. You can select any of the following attributes to display them as part of the *Job Location Short Format*:

- State/Province  
The State/Province field is associated with the State/Province Generic Object to have a parent-child relationship between county and state.
- Flexible/Sales Region
- ZIP/Postal Code
- Location Search Synonyms  
Similar names of the locations to search for jobs.
- Latitude
- Longitude
- Override Coordinates
- Override Latitude
- Override Longitude

Associating the Job Location Short Format Generic Object with job requisitions using a job requisition XML template displays the *Job Location Short Format* field on the *Job Requisition Details* page. If OnSave and OnChange business rules are set for the Job Location Short Format Object, then selecting job locations on the *Job Requisition Details* page populate the associated *Job Location Short Format*.

### 18.3.3 State/Province Generic Objects on Job Requisition

Support for State/Province Location generic object on job requisition to specify state and province information.

The State/Province object stores the ISO country codes and state codes associated with them are configured in the `Recruiting_Country_States.text` file. The existing state/province data is migrated to the State/Province generic object, or "GO", using the *State Province GO Migration Job*.

Administrators can select state associated with the countries so that corresponding states are utilised in the Job Location Long Format or Job Location Short Format.

### 18.3.4 OData Support for Job Location Generic Object

Using a JobRequisition OData v2 entity, you can query, insert, and upsert job location object, job location short format object to a job requisition.

The payload format for Job Location is as follows:

#### Sample Code

```
"sfstd_postingLocation_objlist": [
  {
```

```

        "__metadata": {
          "uri": "JobReqGOJobLocation",
          "type": "SFODData.JobReqGOJobLocation"
        },
        "isPrimary": true,
        "value": {
          "__metadata": {
            "uri":
"PostingLocation(code='85207776',effectiveStartDate=datetime'2021-10-15T00:00:00Z
')",
            "type": "SFODData.PostingLocation"
          }
        }
      }
    ]

```

Similarly, the payload for the Job Location Short Format:

#### Sample Code

```

"sfstd_postingLocationShortFormat_obj": {
  "sfstd_postingLocationShortFormat_obj": {
    "externalCode"="ARG"
  },
  {
    "__metadata": {
      "uri": "JobRequisition(737L)",
      "type": "SFODData.JobRequisition"
    },
    "sfstd_postingLocationShortFormat_obj": {"externalCode": "INDShortFormat"}
  }
}

```

## 18.4 Marketing Brand Generic Objects on Job Requisition

Support for Marketing Brand Generic Object on Job Requisitions.

Brand configured on the Career Site Builder provides flexibility to a parent company to have different designs and layouts for its subsidiaries. Brands are created and managed in Career Site Builder, and currently, there is no standard way to configure brands on the job requisitions. Today users maintain the data in a picklist or on a plain text field on the job requisition and later map this field to the brand. Recruiting Marketing then reads the data from this field to post jobs to a specific brand.

A Marketing Brand Generic Object is introduced to help Recruiters create job requisitions with a marketing brand and save the brand information on the job requisitions. The Recruiting Marketing users can post brand-specific jobs on the career site without having to map the requisition brand to Recruiting Marketing.

The requisitions with a marketing brand that matches the brand label created in Career Site Builder ensure that the jobs are posted and are searchable for a specific brand on the external career site.

#### Note

The Marketing Brand Object is unsupported in the email and offer letter template tokens.

#### Permissions for Marketing Brand

The template-level and Role-Based Permissions for the Marketing Brand Generic Object work like any other Generic Object field. For a job requisition, the template role permissions, object-level permissions, and target population permissions are executed in a specific sequence. At any point in time, if one of the three permissions fails, the next set of permissions isn't applied.

### Labels Derivation for Marketing Brand Object on Job Requisition

You can configure the labels for Marketing Object on the [Job Requisition System Labels](#) page, and the labels on the [Job Requisition Details](#) page, [Job Requisition Summary](#) page [Set Up Recruiting Marketing Job Field Mapping Configuration](#) page, Story reports, and Table reports are fetched like any other standard fields.

### Unsupported Features of the Marketing Brand Generic Object

This section lists the unsupported features for the Marketing Brand object:

- The field criteria are unsupported for the Marketing Brand object on the job requisition. Thus, you can't define field criteria on the Marketing Brand object.
- The Marketing Brand generic object is unsupported in SAP SuccessFactors API.
- In the [Table Reports](#), the detailed reporting filter feature isn't enabled for the Marketing Brand generic object.

### OData API for the Marketing Brand Object

The Marketing Brand Generic Object fields that are defined in the Job Requisition template are available for OData API operations. For OData operations on Marketing Object, see the "generic object fields" information in the OData Operations for Job Requisitions topic listed in the Related Information section.

### Support for Table Reports

While generating Table reports in the SAP SuccessFactors HCM suite, you can now include the Marketing Brand Generic Object fields defined in the job requisition template. For information, see about the Foundation Object and Generic Object Fields in Table Reports for Job Requisitions section.

#### Note

The detailed reporting filter feature isn't enabled for the Marketing Brand generic object.

### Career Site Builder Integration

The Marketing Brand Generic Object is supported for Career Site Builder integration and the [Set Up Recruiting Marketing Job Field Mapping](#) page in [Admin Center](#) page supports the mapping of fields of type Marketing Brand Generic Object. The administrator who has permission to the [Set Up Recruiting Marketing Job Field Mapping](#) page can map the Marketing Brand Generic Object to any Recruiting Marketing field for a job requisition.

The recommended JRDM for Recruiting Management is described in Data Recommendations for Recruiting Management topic listed in the Related Information section. In addition to this, you can also map the Marketing Brand object field to any field on Recruiting Marketing. Whenever the field is mapped to any field in Recruiting Marketing, the mapping is resolved to brandURL and is passed to Recruiting Marketing.

### Business Rules

You can configure the business rules on the job requisition template with the Marketing Brand Generic Object.

### Support for Story Reports

The marketing Brand generic object is reportable in Story reports. Data in the report is fetched in the brandName (marketingBrandId) format for Marketing Brand generic object data stored on the job requisition. The filter and sort options are supported on the Marketing Brand field. Data is fetched based on template-level field permissions, and generic object permissions. You can generate report for the [brandURL](#) along with external code, default, and

name of the Marketing Brand object. Note that you cannot report on the micrositeID from the Marketing Brand Object in the Embedded Analytics reports. The label for the Embedded Analytics report is fetched from the [Job Requisition System Labels](#) page.

## Related Information

### 18.4.1 Usage of Legacy Brand Field on the Set Up Recruiting Marketing Job Field Mapping Page

During the migration of the Marketing Brand object, the administrator is intimated about the usage of the legacy brand field on the [Set Up Recruiting Marketing Job Field Mapping](#) page, in the business rules of the job requisitions, and offer templates, offer approval templates, Integration Centers. The administrator can then map the sfstd\_marketingBrand\_obj field to the brand field.

#### Note

You can map the “sfstd\_marketingBrand\_obj” field to the brand field only for the active job requisition templates.

Additionally, if the field for the brand is configured in the following places, consider replacing it with the sfstd\_marketingBrand\_obj field:

- Adhoc reports
- Embedded Analytics reports
- OData queries
- Job requisition external and internal posting description
- Job requisition external and internal posting header and footer content

### 18.4.2 Configure the Standard Marketing Brand Field on Job Requisition Templates

You can configure the standard Marketing Brand field on job requisition templates so that job requisitions include brand information.

Typically, brand information is only useful to include on job requisitions if there are multiple brands within your organization and you want to associate different jobs with different brands. If this is your scenario and you're

planning to adopt the Unified Data Model, you can use the scheduled job [Migrate Brand to Marketing Brand on Job Requisition](#) to add the field, instead of adding it manually.

#### Note

**Don't** run the [Migrate Brand to Marketing Brand on Job Requisition](#) job in the following scenarios:

- If you're only using the default brand and no additional brands in Career Site Builder.
- If you've already configured and started using the standard Marketing Brand object.

If you're only using the default brand, but still want to include brand information in job requisition templates, you can add it manually. You can maintain the job requisition template for the Generic Object field types using [Manage Templates](#).

The following sample code shows the definition for the standard field Marketing Brand (sfstd\_marketingBrand), of the type "object", in a job requisition template. The XML attribute `object - type` defines the generic object that's associated with the field, the Marketing Brand object..

#### Sample Code

```
<field-definition id="sfstd_marketingBrand_obj" type="object" required="false"
custom="false" object-type="MarketingBrand">
  <field-label><![CDATA[Marketing Brand]]></field-label>
  <field-label lang="de_DE"><![CDATA[Marketing Brand]]></field-label>
  <field-description><![CDATA[Marketing Brand]]></field-description>
</field-definition>
```

## 18.4.3 Marketing Brand Object on Job Requisition Summary Page

The Marketing Brand Generic Object Fields on the [Job Requisition Summary](#) page is supported on the [Filter Options](#) and [Display Options](#).

### Prerequisites

To view [Marketing Brand Object](#) on the job requisition, ensure to enable the following options:

- The [Enable Career Site Builder](#) option in [Provisioning > Company Settings](#) to view the [Enable Marketing Brand Object](#) option.
- The [Enable Marketing Brand Object](#) option in [Admin Center > Manage Recruiting Settings > Generic Object / Foundation Object \(GO/FO\) field types](#) to view the [Marketing Brand](#) object in the [Filter Options](#) and [Display Options](#).

#### Note

Disabling the [Career Site Builder](#) option removes the [Marketing Brand Object](#) option from the [Job Requisition Summary](#) page, [Filter Options](#) and [Display Options](#).

- The [Recruiting V2](#) option in [Provisioning > Company Settings](#).

#### 📌 Note

You cannot sort job requisitions based on the *Marketing Brand Object* column on the *Job Requisition Summary* page.

#### 📌 Note

The Marketing brand object is a non-effective dated object. The option *Allow users to select only those instances that are active as of the date in the Job Start Date field in the Job Requisition and Offer Detail pages* in *Admin Center, Manage Recruiting* does not apply to the Marketing Brand Object.

## 18.4.4 OData Support for Marketing Brand on Job Requisition

Using a JobRequisition OData v2 entity, you can query, insert, and upsert Marketing Brand Object to a job requisition.

You can use the Marketing Brand entity only when the Marketing Brand object field is defined on the Job Requisition XML template. The payload format is as follows:

#### 🔗 Sample Code

```
https://<api-server>//odata/v2/  
JobRequisition(10591L)?  
$format=json&$select=sfstd_marketingBrand_obj&$expand=  
sfstd_marketingBrand_obj
```

## 18.5 Setting Up the Basic Job Data Model

The Job Data Model (Families and Roles) is required to establish a job hierarchy based on the idea of job families (for example, Accounting), roles within families (for example, Senior Accountant), and optional job codes associated with that role.

### Context

The **Families and Roles** in Recruiting allows you to browse the library of roles, select one or more roles or job codes, and prepopulate some data when creating a Job Requisition.

## Procedure

1. Go to ► [Admin Center](#) ► [Families and Roles](#) ► or ► [Admin Center](#) ► [Manage Job Roles](#) ►.

The list of families and roles page is displayed.

2. Click [Add New Family](#) and select [Add New Family](#).
3. Enter the [Family Name](#) and [Job Family Expert](#). The Job Family Expert is optional.
4. Click [Save Edits](#).

The list of families and roles page is displayed.

5. Click the family you created to create or edit a role for it.

The manage families and roles page is displayed.

6. You can either create a role or edit the existing role.
  - To create a role, click [Create New Role](#) and enter the appropriate details, such as, Role Name, Talent Pool, Job Code, and Description in the [Create New Role](#) page. Click [Save and Close](#).

### Note

If you select a job code, you should select [Default](#) for [Usage](#).

- To edit the existing role, click the role and then click [Edit Properties](#). Make the necessary changes to the role, such as editing the role name, adding or removing job codes, or changing the description. Click [Save and Close](#) after the modification.

## 18.5.1 Creating Job Families and Roles Using File Import

If you already have a long list of families and roles in place, you should use import to make changes to the existing families and roles or to create families and roles.

## Context

This alternate approach uses file import to import families and roles.

## Procedure

1. Go to ► [Admin Center](#) ► [Import Job Roles](#) ►.

The [Job Family/Roles/Competency Mapping Import](#) page displays.

2. Select mapping data type as [jobCode](#).
3. Import the file by selecting [Choose File](#), and select your CSV file containing families and roles.

### Note

Family and Role import files have no header row.

| Column   | Description of Content                                                                                                                                                            | Allowable Values         | Sample Content                                                                                          |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|---------------------------------------------------------------------------------------------------------|
| Column A | Declare the type of item you are importing.                                                                                                                                       | FAMILY<br>ROLE           | FAMILY                                                                                                  |
| Column B | Family name                                                                                                                                                                       | Text                     | Accounting                                                                                              |
| Column C | If the row type is FAMILY, leave blank.<br><br>If the row type is ROLE, populate with the role name.                                                                              | Text                     | Senior Director, Accounting                                                                             |
| Column D | If the row type is FAMILY, leave blank.<br><br>If the row type is ROLE, populate with the job description (optional; if no job description is required, leave this column blank). | 4,000 characters of text | This job involves...<br><br>Skills and qualifications are...<br><br>You should apply with us, if you... |
| Column E | If the row type is FAMILY, leave blank.<br><br>If the row type is ROLE and the client has a one to one role to job code ratio, populate with the job code.                        | Short Text               | ACTDIR001                                                                                               |

- If you want to associate multiple job codes with a single role, a second file load is required. Upload the file with the additional job codes to [Import Job Roles](#) after the initial Families and Roles file is successfully imported.

| Header  | Description of Content                                                                                                                                                                                    | Allowable Values | Sample Content |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|----------------|
| JOBCODE | Populate with a job code. This job code may appear multiple times in the file if it is associated with different families and roles, but can only appear once within a given family and role combination. | Short Text       | ACTDIR001      |
| FAMILY  | Populate with the Family associated with this job code. The same family can appear multiple times in this file.                                                                                           | Text             | Accounting     |

| Header | Description of Content                                                                                           | Allowable Values | Sample Content              |
|--------|------------------------------------------------------------------------------------------------------------------|------------------|-----------------------------|
| ROLE   | Populate with the role name associated with this job code. The same role can appear multiple times in this file. | Text             | Senior Director, Accounting |
| MODULE | For the purposes of Recruiting, always declare this as Default                                                   |                  | Default                     |

5. Select the appropriate data management options.

If you want to keep the families and roles existing in the system and add the new ones from the file, select the *do not delete them* and *merge the new content mappings with existing content mappings* options. These choices add new families and roles, but don't delete those that already exist.

#### ⚠ Caution

Be careful when deleting families and roles. These are used by other modules, such as Compensation and Performance Management. No module can use families and roles after they are deleted.

6. Select *Import*.

If you have access to Provisioning, you can schedule a job to import family and roles by selecting the *Job Type* as *Family And Role Mapping Import*.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

For more information on how to schedule a job, see the **Related Information** section.

## Results

The Families and Roles page displays the list of families and roles that you have imported.

## Related Information

[Setting Up the Basic Job Data Model \[page 219\]](#)

## 18.5.2 Deleting Families and Roles

You delete families and roles only when they are obsolete or no longer needed.

### Context

#### ⚠ Caution

Before you delete job families and roles, ensure that other modules are not using them. Deletion is done centrally, so consider the impacts to other modules when deleting families and roles.

### Procedure

1. Go to ► [Admin Center](#) ► [Families and Roles](#) ► or go to ► [Admin Center](#) ► [Manage Job Roles](#) ►.

The list of families and roles page is displayed.

2. Click the family.

The manage families and roles page is displayed.

3. Select the check the box next to the role.
4. Click [Delete](#).
5. Go back to the to list of families and roles page.
6. Open the family you want to delete.
7. Select the check the box next to the family.
8. Click [Delete](#).

## 18.6 Rating Scale

Recruiting uses rating scales to rate competencies on the Interview Assessment, or select or create prescreen questions on a Job Requisition.

You can either create or edit a rating scale. In order to edit an existing rating scale, click the rating scale name and modify the values.

#### 📘 Note

If languages are used within Recruiting, SAP SuccessFactors recommends that translations are provided for all the necessary rating scales. System can have issues in case you fail to provide translations.

[Go to the Performance Management guide to learn more about creating a Rating Scale.](#)

## 18.7 Job Requisition with HR Master Data

Job Requisition in Recruiting provides the capability to reuse HR Master data (data defined in other modules) using Foundation Object and Generic Object. If you are not looking for implementing Job Requisition with HR Master data, you can skip this section.

### 18.7.1 Job Requisition Template Configuration

The XML attribute **object-type** defines Foundation Object and Generic Object field types in the Job Requisition template.

To enable Foundation Object and Generic Object field types in the Job Requisition template, contact SAP Cloud Support.

#### Note

It's possible to maintain Job Requisition Template for Foundation Object and Generic Object field types using [Manage Templates](#).

Here,

- **object-type** is the type of Foundation Object or Generic Object.
- The attribute type is always set to **object**.

For example, this snippet shows the definition for an object of type **Department**.

```
<field-definition id="department_obj" type="object" required="false" custom="false"
object-type="Department">
  <field-label><![CDATA[Department Object]]></field-label>
  <field-label lang="de_DE"><![CDATA[Department Object]]></field-label>
  <field-description><![CDATA[Department Object]]></field-description>
</field-definition>
```

There are seven standard Foundation Object and Generic Object type fields available for Requisition. These fields are derived from the standard org-structure delivered with Employee Central.

Value of the object-type Field and Object with the Corresponding Field ID

| Value of object-type Field | Object | Field ID        |
|----------------------------|--------|-----------------|
| Legal Entity               | GO     | legalEntity_obj |

| Value of object-type Field | Object | Field ID         |
|----------------------------|--------|------------------|
| Business Unit              | GO     | businessUnit_obj |
| Department                 | GO     | department_obj   |
| Division                   | GO     | division_obj     |
| Cost Center                | GO     | costCenter_obj   |
| Location                   | FO     | location_obj     |
| Position                   | GO     | std_position_obj |

The new standard fields of type Foundation Object and Generic Object for **Division**, **Department**, and **Location** aren't a replacement of the existing **Division**, **Department**, and **Location** non-Foundation Object and non-Generic Object type standard fields in Job Requisition and Offer. The older non-Foundation Object and Generic Object fields continue to coexist, until one of them is explicitly disabled. For example, if you're using the new **Division** Generic Object field (**division\_obj**) for Recruiting Management, it's recommended to disable the old **Division** field (**division**) which is defined as type **enum** or **derived** in the Requisition template. This is also true for **Department** and **Location** fields, as they're new standard field.

The non-Foundation Object and non-Generic Object **Division**, **Department**, and **Location** fields can be disabled on the UI with the existing Admin Center option. To do this, select ► [Manage Recruiting Settings](#) ► [Job Requisition](#) ► [Disable Department, Division, and Location filter options on Job Requisition Tab](#) ►.

It's also possible to define custom fields of type Foundation Object and Generic Object. Here, the objects can be both standard and custom Generic Objects or standard Foundation Objects.

#### 📘 Note

- For configuring the standard Position object field in Job Requisition, one of the following options must be enabled from Provisioning:
  - Enable Position Management
  - Succession Management
  - JDM v2.0/Skills Management
- Position Generic Object isn't supported for Recruiting Events.
- You can't anonymize a Position Generic Object, meaning you can't set `anonymize=true` for [std\\_position\\_obj](#) field.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## 18.7.2 Multiselection Enablement for the Location and Position Fields

The [Location](#) and [Position](#) fields can be configured to be multiselectable. This means you can select more than one value for the [Location](#) and [Position](#) field.

This can be done by adding the attribute `multiselect="true"` to the field definition in the Job Requisition template.

The following XML explains how this can be done:

```
<field-definition id="location_obj" type="object" required="true" custom="false"
object-type="location" multiselect="true">
  <field-label><![CDATA[Location ]]></field-label>
  <field-description><![CDATA[Location]]></field-description>
</field-definition>
```

### 📌 Note

- Currently, it's only possible to make the **Location** and **Position** fields multiselectable. Also, it's possible to enable multiselection of the Location and Position fields through [Manage Templates](#).
- The [Select All](#) function in the multiselect component only selects the first 200 values out of the available list of objects. Users need to scroll to select the remaining values.
- When the **Location** or **Position** field is marked as `multiselect="true"` in the Job Requisition template, it's **not** possible to define Business Rules on these fields. In Manage Rules in recruiting, when such a template is chosen, the field isn't displayed in the dropdown in the [onChange](#) rules section.
- Use `externalCode` as a new property in the Job Position Object list (`std_position_obj` list) to update the position data using the Integration Center. This capability is available only when the `std_position_obj` field is configured as a `multiselect= false` in a job requisition XML template. The external code will also be available as a property in the `JobReqGoPosition` OData metadata. For non Integration Center-related usages, use either the `Value` or the `externalCode` fields to update the position data.
- You cannot update multiple values for the Job Location and Location Foundation data objects using Integration Center. Only one value can be updated using Integration Center, and that's the primary value.
- The quickcard is **not** displayed on the Job Requisition Details page in the following cases and hence it isn't possible to view the details of the object.
  - When Location is configured as either `singleselect` or `multiselect` in the Job Requisition template.
  - When Position is configured as `multiselect="true"` in the Job Requisition template.

## 18.7.3 Effective-Dated Foundation Objects and Generic Objects for Job Requisition

It's possible to create a Job Requisition with fields of type Foundation Objects and Generic Objects whose values are currently inactive, but will become active in future.

For example, a Hiring Manager can start the hiring process for a new Location **Bangalore**, which will become active on a future date (which is currently inactive). A Job Requisition can be created for the Location **Bangalore** provided it's active as of the Job Requisition field [jobStartDate](#).

The *jobStartDate* field is used to identify the date on which to validate, if the value is active or not. It ensures that the validation isn't restricted to the current system date.

Location = "Bangalore"

In the preceding example, to create a Job Requisition for the Location **Bangalore**, the *jobStartDate* field should have a value greater than or equal to 1st of March.

At the time of saving the Job Requisition, the system validates to see if the entered values for Foundation Objects and Generic Objects fields are active as of the *jobStartDate*. If the fields are inactive on the *jobStartDate*, it returns an error and it won't be possible to save the Job Requisition.

To validate the Foundation Objects and Generic Objects fields on the jobStartDate, go to ► [Admin Center](#) ► [Manage Recruiting Settings](#) ► [Generic Object / Foundation Object \(GO/FO\) field types](#) ► [Allow users to select only those instances that are active as of the date in the Job Start Date field in the Job Requisition and Offer Detail pages](#) ►.

#### ⓘ Note

You can create a Job Requisition for a future dated Position based on the jobStartDate. The [Allow users to select only those instances that are active as of the date in the Job Start Date field in the Job Requisition and Offer Detail pages](#) option lets the recruiting users fetch only the active and valid positions as of the *jobStartDate* and get displayed on the job requisition based on the job start date.

## 18.7.3.1 Behavior of Effective Dating When Location or Position Field is Single and Multiselectable

When the option [Allow users to select only those instances that are active as of the date in the Job Start Date field in the Job Requisition and Offer Detail pages](#) is enabled in ► [Admin Center](#) ► [Manage Recruiting Settings](#) ► [Generic Object / Foundation Object \(GO/FO\) field types](#) ►, and for you to be able to change the jobStartDate, you need edit permission on both the jobStartDate field and the [Location](#) or [Position](#) field.

When you try to change the jobStartDate field, one of the following two scenarios can occur:

- If you have Edit permission on the [Location](#) or [Position](#) field, a dialog displays a warning message indicating that the Location or Position values are deleted accordingly.
  - If you confirm the action, the value will be deleted and you have to save the Job Requisition for the changes to persist.
  - If you cancel the action, the jobStartDate will be reset to the previous value (meaning it can't be changed), and the Location or Position value won't be affected.

- If you have read-only permission on the [Location](#) or [Position](#) field, a dialog displays a warning message indicating that the jobStartDate field can't be changed due to a configuration issue and you have to contact the system administrator.  
The configuration issue here is that it's required for you to have edit permission on both jobStartDate and the Location or Position fields.

## Related Information

[Multiselection Enablement for the Location and Position Fields \[page 226\]](#)

### 18.7.4 Field Criteria Definition in Job Requisition

Just like cascading picklists are used to filter or restrict values on a field based on the value selected for another related field, Field Criteria is used to filter on objects (Foundation Object and Generic Object).

To apply field criteria, the objects need to be associated in the object definition in MDF. This is done using the [Configure Object Definitions](#) page.

A sample definition is as shown. Here, the child object has an association defined to the parent object. You'll only see the **Business Units** that are under the **Legal Entity** that you've selected earlier, that is, **BusinessUnit** is a child of **Legal Entity**.

## Object Definition: Business Unit (BusinessUnit)

|                     |                                                                                                   |
|---------------------|---------------------------------------------------------------------------------------------------|
| * Code              | BusinessUnit                                                                                      |
| * Effective Dating  | Basic                                                                                             |
| API Visibility      | Editable                                                                                          |
| * Status            | Active                                                                                            |
| MDF Version History | Delete History                                                                                    |
| Default Screen      |                                                                                                   |
| Label               | Business Unit  |
| Description         |                                                                                                   |
| API Sub Version     | No Selection                                                                                      |
| Subject User Field  |                                                                                                   |
| Workflow Routing    |                                                                                                   |
| Pending Data        | No                                                                                                |
| Todo Category       | Generic Object Change Requests                                                                    |

### Associations

| Name               | Multiplicity | Destination Object | Type       | (12) More |
|--------------------|--------------|--------------------|------------|-----------|
| cust_toLegalEntity | One To Many  | Legal Entity       | Valid When | Details   |
| cust_paygradeW     | One To One   | Pay Grade Wrapper  | Composite  | Details   |

Employee Central maintains field criteria in the Succession Data Model (SDM). To use associations in Recruiting Management, field criteria has to be defined in the Job Requisition template. Associations defined in the Succession Data Model aren't automatically copied to the Job Requisition template.

Field criteria can only be defined for fields of **type="object"**.

Field criteria is applicable in all the scenarios. For example,

- UI
- OData
- SFAPI
- Job Requisition Imports

#### Note

- If the *Location* and *Position* fields support multiselect (`multiselect="true"`), it can be defined as a child field or as a parent field.
- We don't recommend the following configuration for any operator:
  - Parent field - Editable
  - Child field - Read Only or Hidden

If such a configuration is used, you are prevented from changing the child field value. The system displays an error message informing that such an action isn't possible due to configuration issues. This is applicable when the *Location* or *Position* field is both single select and multiselect.

An XML attribute **field-criteria** in Job Requisition template is defined from the child field to the parent as a child to parent relationship. For example, if **Location** is the parent field and **Legal Entity** is the child field, the field criteria should be included in the Legal Entity definition.

```
<field-definition id="legalEntity_obj" type="object" required="false"
custom="false" object-type="LegalEntity">
  <field-label><![CDATA[Legal Entity Object]]></field-label>
  <field-label lang="de_DE"><![CDATA[Legal Entity Object]]></field-label>
  <field-description><![CDATA[Legal Entity Object]]></field-description>
  <field-criteria sourceFieldName="cust_location.externalCode"
destinationFieldValue="location_obj"/>
</field-definition>
```

There are two tags available in **field-criteria**. They are:

- **sourceFieldName**

| Parent field type                                                    | Child field type                                                     | sourceFieldName value<br>(format)                             | Example                                                                                                                                                                                |

| Standard Generic Object                                                                                                                                                                                                                                                                                                                                                                  | Standard Foundation Object                      | <Name of the Parent field<br>Generic Object>    | Parent field type:<br>Department<br><br>Parent field ID:<br>department_obj<br><br>Child field type: Location<br><br>Child field ID: location_obj                                                        |

| Parent field type | Child field type | sourceFieldName value (format) | Example                        |
|-------------------|------------------|--------------------------------|--------------------------------|
|                   |                  |                                | sourceFieldName:<br>Department |

- **destinationFieldValue**  
This is the field ID of the parent field as defined in the Job Requisition template.

#### Note

If the option, *Allow users to select only those instances that are active as of the date in the Job Start Date field in the Job Requisition and Offer Detail pages* is enabled in ► [Admin Center](#) ► [Manage Recruiting Settings](#) ► [Generic Object / Foundation Object \(GO/FO\) field types](#) , the field criteria validation happens as of the *jobStartDate*.

Consider a use-case where field criteria is defined such that **Division** is the parent and **Department** is the child.

In this example, if the *jobStartDate* has a value before 1<sup>st</sup> March, the correct parent for Dept1 will be Div1. However, for a jobStartDate on or after 1<sup>st</sup> March the correct parent value for Dept1 would be Div2.

## 18.7.5 Permissions for Requisition

In Job Requisition, there are three types of permissions. They are, Template role permissions, Object level permissions, and Target Population. These permissions are executed in a specific sequence. At any point in time, if one of these permissions fail, the next set of permissions are not executed.

## 18.7.6 Labels Derivation for Foundation Object and Generic Object Field Types

For Foundation Object and Generic Object fields in Job Requisition, the labels are derived in a particular sequence. Learn how these labels are used based on where they're defined.

The labels for the 4 standard Job Requisition fields *businessUnit\_obj*, *costCenter\_obj*, *legalEntity\_obj*, and *std\_position\_obj* must be configured in the [Manage Job Requisition System Field Labels](#) page in Admin Center.

#### Note

If you update the labels in Recruiting, maintain the labels manually in the following pages to ensure consistency of these labels across the SAP SuccessFactors system:

- [Manage Job Requisition System Field Labels](#) and on Succession Data Model for users who have enabled Employee Central.
- [Manage Job Requisition System Field Labels](#) and in [Custom language pack](#) for users who haven't enabled Employee Central.

This applies to labels that are displayed on Job Requisition Details page and Job Requisition Summary page.

#### Note

Labels for tokens on e-mail templates and offer letter templates are picked from the language pack and tokens for job description (listing layout) are picked similar to Job Requisition Details page.

The labels for the fields [department\\_obj](#), [division\\_obj](#), and [location\\_obj](#) are derived in the following method. This applies to labels that are displayed on Job Requisition Details page and Job Requisition Summary page and tokens for these objects.

\*SDM: Succession Data Model

## 18.7.7 Tokens for Foundation Object and Generic Object Fields

You can use the fields of type Foundation Object and Generic Object defined on the Job Requisition template and Offer Detail template as tokens.

The following standard Foundation Object and Generic Object fields are readily available to be used as tokens:

- Legal Entity

- Business Unit
- Division
- Department
- Cost Center
- Location
- Position

To use the custom fields of type Foundation Object and Generic Object as tokens, configure them in ► [Provisioning](#) ► [Managing Recruiting](#) ► [Configure Custom Tokens](#) ►.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

When tokens get resolved, the system checks the option *Allow users to select only those instances that are active as of the date in the Job Start Date field in the Job Requisition and Offer Detail pages* to identify the correct **externalName**.

In this example, if,

- Option = ON, externalName = "HR Regional"
- Option = OFF, externalName = "HR"

### 📌 Note

- Permissions aren't considered for token resolution. For example, if you want to send out an E-mail, permissions aren't required for the tokens to be resolved.
- When the *Location* or *Position* field is multiselectable and is used as a token, the values are shown as a comma-separated value.

## 18.7.8 UI Changes to Requisition

Changes in the Recruiting Management UI with the introduction of Foundation Object and Generic Object field types in **Requisition**.

[Visibility Setting of Foundation Object and Generic Object Fields in Job Requisition Summary \[page 235\]](#)

Now you can use the options available in Admin Center to enable or disable the seven standard Foundation Object and Generic Object fields in the *Job Requisition Summary* page.

[Job Requisition Summary Page and Details Page \[page 236\]](#)

Changes to Job Requisition Summary page and Job Requisition Details page with the introduction of Foundation Object and Generic Object field types in requisition.

[Internal and External Career Search Settings \[page 239\]](#)

The standard Foundation Object and Generic Object fields are also exposed in the career search settings to appear as search fields.

[OData Operations for Job Requisitions \[page 240\]](#)

The Foundation Object/Generic Object fields that are defined in the Job Requisition template are available for OData API operations. Learn under what conditions these fields are available for OData API operations.

## 18.7.8.1 Visibility Setting of Foundation Object and Generic Object Fields in Job Requisition Summary

Now you can use the options available in Admin Center to enable or disable the seven standard Foundation Object and Generic Object fields in the [Job Requisition Summary](#) page.

The *Generic Object / Foundation Object (GO/FO) field types* section lists the options:

- Enable Generic Object / Foundation Object (GO/FO) field types
  - [Enable Business Unit Object](#)
  - [Enable Legal Entity Object](#)
  - [Enable Department Object](#)
  - [Enable Division Object](#)
  - [Enable Cost Center Object](#)
  - [Enable Location Object](#)
  - [Enable Position Object](#)

The options control the visibility of the fields in the following scenarios:

- Display options
- Filter options
- Manage recruiting e-mail template
- Manage offer letter template tokens

### Note

You can disable the existing non-Foundation Object and non-Generic Object fields such as [Department](#), [Division](#), and [Location](#) in Admin Center for the following:

- [Filter Info](#) in [Job Requisition Summary](#) page
- [Search fields](#) in the [Copy Existing Job Requisition](#) page

**Parent topic:** [UI Changes to Requisition \[page 234\]](#)

## 18.7.8.2 Job Requisition Summary Page and Details Page

Changes to Job Requisition Summary page and Job Requisition Details page with the introduction of Foundation Object and Generic Object filed types in requisition.

### Summary Page

After the Admin settings are done in [Manage Recruiting Settings](#), the [Summary](#) page displays **Filter** and **Display** options accordingly (provided you have the required Object level permissions). Display options decide what columns appear on the page and Filter options allows you to filter the data on the UI.

The values for [Filter](#) options and [Display](#) options in [Summary](#) page depend on the settings that you've done in Admin Center.

Display format shows exactly how the data is shown on the UI. The data for a Foundation Object and Generic Object field is shown in the format, **<externalName(externalCode)>**. If any job requisition on the instance has more than one position, it's displayed as a **<number(number of positions selected)>**. On clicking the number, a popup displays the positions itself.

The **externalName** displayed depends on the option *Allow users to select only those instances that are active as of the date in the Job Start Date field in the Job Requisition and Offer Detail pages* available in [Admin Center](#) [Manage Recruiting Settings](#) [Generic Object / Foundation Object \(GO/FO\) field types](#).

In this example, the externalName displayed is as follows:

For Job Requisition Summary Page Including Filter Option

| Option Status | externalName | Description                               |
|---------------|--------------|-------------------------------------------|
| OFF           | HR           | The name is as of the current system date |

| Option Status | externalName | Description                                                                                                     |
|---------------|--------------|-----------------------------------------------------------------------------------------------------------------|
| ON            | HR Retired   | The value displayed will always be from the most future version (active or inactive), that is, as of 31-12-9999 |

For Job Requisition Details Page Including Quickcard

| Option Status | externalName | Description                                 |
|---------------|--------------|---------------------------------------------|
| OFF           | HR           | The name is as of the current system date   |
| ON            | HR Regional  | The value shown is as of the Job Start Date |

### Note

- Currently, it isn't possible to sort on the standard *Location FO* and *Position GO* columns.
- If for the logged in user, there is at least one Job Requisition (that the user is an operator on) with more than one location or position values, the Location, and Position columns show the number rather than the name of the location or position.

## Details Page

The screenshot displays the SAP SuccessFactors Job Requisition Details page. On the left, a sidebar contains several filter sections: 'Division GO' (with a search bar containing 'ASIA1 Divi1 (ASIA1-DIV1)'), 'location group wrapper' (with a 'No Selection' button), 'location wrapper' (with a 'No Selection' button), 'Legal entity GO' (with a 'No Selection' button), and 'Business Unit GO' (highlighted with a red box and labeled 'No Permission'). Red arrows indicate the flow from the 'Division GO' and 'Business Unit GO' filters to the main content area. The main content area is divided into two sections: 'Division: ASIA1 Divi1 (ASIA1-DIV1)' and 'Legal Entity:'. The 'Division' section shows fields for Start Date (01/01/2012), Code (ASIA1-DIV1), Name (ASIA1 Divi1), Description, Status (Active), Head of Division, and Parent Division. The 'Legal Entity' section shows fields for Start Date (03/30/2017), Legal Entity ID, Legal Entity Name, Description, Status (Active), Default Pay Group (No Selection), and Default Location (No Selection). A red arrow points from the 'Business Unit GO' filter to the 'Legal Entity' section.

- View Current permission allows you to view the quickcard.

- Create permission allows you to create new instances.
- Edit permission allows you to edit the Business Card.
- When you don't have these permissions, only the field label is displayed without the input field.

Field Criteria Behavior for Parent and Child Field Permission

| Parent Field Permission | Child Field Permission | Field Criteria Behavior                                                                                                                                                           |
|-------------------------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| READ                    | WRITE                  | Field criteria is applied as specified.                                                                                                                                           |
| READ                    | READ                   | Since parent and child have Read only permissions, changes aren't allowed and the field criteria is ignored.                                                                      |
| No READ and WRITE       | READ                   | As the child value can't be changed, the field criteria isn't applied.                                                                                                            |
| No READ and WRITE       | WRITE                  | Even though the child field has Write permission, you don't see any values in the child field dropdown as the parent doesn't have Read and Write permissions.                     |
| WRITE                   | READ                   | It's possible to save the requisition on changing the parent value, even if the child value is incorrect. It's recommended that you don't configure the Job Requisition this way. |
| WRITE                   | WRITE                  | As both parent and child fields have Write permissions, the field criteria is applied as defined in the Job Requisition template.                                                 |

**Parent topic:** [UI Changes to Requisition \[page 234\]](#)

## Related Information

[Visibility Setting of Foundation Object and Generic Object Fields in Job Requisition Summary \[page 235\]](#)

[Internal and External Career Search Settings \[page 239\]](#)

[OData Operations for Job Requisitions \[page 240\]](#)

## 18.7.8.3 Internal and External Career Search Settings

The standard Foundation Object and Generic Object fields are also exposed in the career search settings to appear as search fields.

As of the Q2 2017 release, the search settings for Internal and External Career Site are done through Admin Center. These settings can be configured through ► [Admin Center](#) ► [Internal and External Career Search Settings](#) ►.

### Note

- It's not possible to configure custom fields of type Foundation Object and Generic Object in the search settings.
- You can't define field criteria for the Foundation Object and Generic Object field types on the career site in the search settings.
- Permissions are ignored on both the Internal and External Career Sites.
- The Position object isn't supported on Internal and External Career Search Settings.

If configured, the six standard Foundation Object and Generic Object fields are visible on the internal or external career site.

The sample display format on [Career Opportunities](#) page, which is the **externalName** is as shown. In this example, it's **ASIA1 Divi1**.

### Career Opportunities

The screenshot shows the 'Career Opportunities' page. On the left, there are search filters including 'Keywords', 'Exact Match', 'in job title', 'in job title or description', 'Job Language' (English US), 'Legal entity GO' (Any), 'Division GO' (Any), and a 'Select all' dropdown menu. The dropdown menu is open, showing options like 'ASIA1 Divi1' (highlighted with a red box), 'aus\_Div', 'Congineering10', 'Congineering100', 'Congineering1000', 'Congineering1001', and 'Congineering1002'. On the right, there is a list of 587 jobs matching the search. The list includes job titles like 'GO-GO for offer approval 1', 'FO FO offer approval (PayGroup-Location) 1', 'GO FO fields without external name second', 'GO FO fields without external name', 'odata offer all custom fields', and 'odata offer GO-GO'. Each job entry shows the 'Req ID', 'Posted date', 'Carla Grant', 'SAP United States', 'CCentre1', and 'externalName'. The 'externalName' for the third job is 'ASIA1 Divi1', which is highlighted with a red box. Each job entry also has a 'Select Action' button.

The **externalName** displayed depends on the option *Allow users to select only those instances that are active as of the date in the Job Start Date field in the Job Requisition and Offer Detail pages* available in ► [Admin Center](#) ► [Manage Recruiting Settings](#) ► [Generic Object / Foundation Object \(GO/FO\) field types](#) ►.

In this example, the externalName displayed is as follows:

For Search Dropdown, Search Results, and Alerts

| Option Status | externalName | Description                                                                                                                                         |
|---------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| OFF           | HR           | Only those instances that are active as of the current system date are displayed in the dropdown.<br><br>The name is as of the current system date. |
| ON            | HR Retired   | The value displayed will always be from the most future version (active or inactive), that is, as of 31-12-9999.                                    |

#### Note

- It isn't possible to sort the search results (using the [Sort by](#) option) on Foundation Object and Generic Object field types.
- On the Internal or External career site, you can only view the **externalName** of Foundation Object and Generic Object field. The **externalCode** isn't visible.
- If a Job Requisition has more than one location value, it's possible to search for the job based on any of the Location values. In the results page, the location is shown as a number. When you click the number, all the locations associated with that Job Requisition are displayed in a pop-up.

## 18.7.8.4 OData Operations for Job Requisitions

The Foundation Object/Generic Object fields that are defined in the Job Requisition template are available for OData API operations. Learn under what conditions these fields are available for OData API operations.

### Generic Object Fields

- The Object definition (MDF Entity) should have the API Visibility set appropriately (Editable or Read-only).

## Object Definition: Department (Department)

\* Code

\* Effective Dating

API Visibility

\* Status

MDF Version History

Default Screen

Label

- Under Object definition, if the Generic Object field isn't marked as Secured, no permissions are considered while accessing data for the Generic Object. If *Secured* is set to *Yes*, you have to enable *View Current* option for *Visibility*.

**Security**

\* Secured

Permission Category

RBP Subject User Field

CREATE Respects Target Criteria

### Note

Permission validation is performed on data retrieval and modification.

### Foundation Object Fields

- If the API user has *Employee Central API* permissions, no RBP permissions are considered. The user can access all Foundation Object data on the Requisition.
- If the API user doesn't have the permission, RBP Permissions (Under *Manage Foundation object types*) on the entity is considered.

### Note

#### API validations for Foundation Object fields

Permission validation is performed on data retrieval and modification.

Data validation such as externalCode and field criteria validations are performed only on data modification (INSERT/UPSERT/UPDATE).

When *Allow users to select only those instances that are active as of the date in the Job Start Date field in the Job Requisition and Offer Detail pages* option is ON, the ODATA API works similar to that of *Job Requisition Detail* page.

| Option Status | Description                                       |
|---------------|---------------------------------------------------|
| OFF           | The name is as of the current system date.        |
| ON            | The value displayed is always as of jobStartDate. |

#### Note

- Position Generic object is not supported in SFAPI.
- Multiple values for the Location field is not supported in SFAPI.

## 18.7.9 Foundation Object and Generic Object Fields in Ad Hoc Reports for Job Requisitions

While generating Ad Hoc reports, it's now possible to include Foundation Object and Generic Object fields defined in the Job Requisition template.

For custom Foundation Object and Generic Object fields types on the Job Requisition to be available in Ad Hoc Reports, it should be configured in [Provisioning > Managing Recruiting > Configure Reportable Custom Fields](#). These fields would then also be available for filtering and can be used to filter records in a report.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Note

For the Foundation Object and Generic Object fields, the Role-Based Permissions and Target Population permissions are not considered while viewing, generating, sharing, or downloading a report.

In Ad Hoc reports, the *Allow users to select only those instances that are active as of the date in the Job Start Date field in the Job Requisition and Offer Detail pages* option controls the display of the externalName Foundation Object and Generic Object version value as follows:

- Enabling the *Allow users to select only those instances that are active as of the date in the Job Start Date field in the Job Requisition and Offer Detail pages* option displays the value of the externalName Foundation Object and Generic Object from the latest future version (active or inactive), that is, as of 31-12-9999. You can enable the *Allow users to select only those instances that are active as of the date in the Job Start Date field in the Job Requisition and Offer Detail pages* option in ► **Admin Center** ► -> **Manage Recruiting Settings** ► **Enable Generic Object / Foundation Object (GO/FO) field types** ►.
- Disabling the *Allow users to select only those instances that are active as of the date in the Job Start Date field in the Job Requisition and Offer Detail pages* option displays the value of the externalName Foundation Object and Generic Object as the current system date.

### Note

If a Job Requisition has more than one Primary Location or more than one Position value, the Job Requisition is displayed in Ad Hoc Reports as multiple lines, with one line per Location or Position respectively. Similar to Location, there's a new column called *Primary Position*, that indicates which among the various Position values are the Primary one.

### → Remember

If you have an existing Ad Hoc Report with the Location or Position field configured and if you toggle the multiselect option for location or position field, you have to reconfigure the Ad Hoc reports. If this isn't done, the existing reports break.

## 18.7.10 Integrations with Job Requisition for HR Master Data

Learn how various modules such as Recruiting Marketing, Employee Central, and Position Management integrate with Job Requisition (HR Master Data).

- **Career Site Builder Integration**
  - The field mapping page, *Set Up Recruiting Marketing Job Field Mapping* supports the mapping of fields of type Foundation Object and Generic Object. The Foundation Object and Generic Object field types can only be mapped to **STRING** type fields from Career Site Builder.
  - Only the resolved externalName of the Foundation Object and Generic Object instance would be sent to Career Site Builder in the required locale. The external code **won't** be sent to Career Site Builder.
  - The fields such as **City**, **State**, **Country/Region**, and **Zip code** don't reside directly on the standard Location object (FO). The fields reside in another object called **CorporateAddress**, which is associated to standard Location object.

- If you've enabled the standard Location Foundation Object, all the Career Site Builder fields **City**, **State**, **Country/Region**, and **Zip code** have to be mapped to the standard Recruiting Management Location FO field. The application takes care of extracting the corresponding values and sending them to Career Site Builder during the Job Sync.
- Position Generic Object isn't supported for Career Site Builder integration.
- **Employee Central Integration**
  - The Employee Central Integration supports the mapping for fields of type Foundation Object and Generic Object.  
On the [Manage Pending Hires](#) page, if a Foundation Object or Generic Object instance is inactive, it is displayed as blank.
- **Position Management Integration**
  - While creating a Requisition from the Position Org Chart, it's now possible to map fields of type Foundation Object and Generic Object on the Position Object to the fields in Requisition.

Sample Mapping for Position Object

It's possible to create a Requisition from the [Position Org Chart](#) even if the **Position** is currently inactive. However, it isn't possible to create a Requisition from the [Position Org Chart](#), if one of the attributes of the

**Position** is currently inactive. For example, if **Location** is one of the attributes of the **Position** and it has a value that is currently inactive, it isn't possible to create a Requisition for the **Position** from the [Position Org Chart](#).

Select [Employee Central API](#) under [Administrator Permissions](#) and select [Employee Central Foundation OData API \(read-only\)](#) option for the integration to work.

#### Note

For Onboarding integration, it's required to use Business Rules. To do this, proceed as follows:

1. Create a custom text field for the Generic Object field that you want to be available in Onboarding.
2. Define a Rule, which would populate the text field with the externalCode of the Generic Object field.
3. Modify the Recruiting Management-Onboarding mapping to pass-over the new text field.

If

This rule is always true  
To add an expression please uncheck the Always True checkbox.

Then

|     |                                       |                |                                       |  |
|-----|---------------------------------------|----------------|---------------------------------------|--|
| Set | Job Requisition (All).Company Code    | to be equal to | Job Requisition (All).Company.Code    |  |
| Set | Job Requisition (All).Division Code   | to be equal to | Job Requisition (All).Division.Code   |  |
| Set | Job Requisition (All).Department Code | to be equal to | Job Requisition (All).Department.Code |  |
| Set | Job Requisition (All).Location Code   | to be equal to | Job Requisition (All).Location.Code   |  |

Sample Rule - Onboarding

## 18.7.11 Requisition Import with Foundation Object and Generic Object Fields

Requisitions with Foundation Object and Generic Object fields can be imported in bulk through the Job Requisition import job in Provisioning.

This job doesn't consider any user permissions while importing. The import, however validates if the **externalCode** entered for the fields is valid and if the values entered for the fields are conforming to the field criteria set up in the template.

#### Note

Job Imports for Job Requisition templates can be used, if the standard location Foundation Object or standard Position Generic Object field on the Job Requisition is configured to have multiple values (attribute **mutliselect="true"**) in the Job Requisition template. However, only one location value can be imported for the location field and only one position value can be imported for the position field.

## 18.7.12 Duplicate Position Check for Job Requisition

It's possible to save a Position (values of the field **std\_position\_obj**) on a job requisition, only if it isn't already saved on another open job requisition in the system. To ensure that same position isn't saved on more than one open job requisition, a check is in place and the operator is notified of the same through an error message. Duplicate position check is also applicable for Job Requisition OData Insert and Update operations and Job Requisition imports.

- When you copy a job requisition with a position, the Position Generic Object value doesn't get copied over to the new job requisition.
- When Position Generic Object is configured on the source job requisition and you try to duplicate the job requisition, the Position values aren't copied from the original job requisition. The position field on the duplicated job requisition is displayed as empty.
- When you try to restore a deleted job requisition that has one or more Position Generic Objects saved and if these positions are saved on another open requisition, restoration of the job requisition fails.

## 18.7.13 Warning for Number of Openings Field When Multiple Positions Are Chosen on the Requisition

Learn how *Number of Openings* option behaves with multiple positions (values of the field **std\_position\_obj**) when you perform certain actions on requisitions.

Usually, in a multi position scenario, number of openings on the job requisition is more than one. If the number of openings isn't updated accordingly, it's possible that the requisition could be closed even before candidates are hired for all positions, if the option *When number of remaining openings becomes less than one Automatically close requisitions with status* is enabled.

When trying to save multiple positions on a requisition, a warning is thrown on the UI to validate *Number of Openings* field. The warning isn't shown, if a single position is selected, or when the user doesn't have access to the field on the requisition.

### 📌 Note

Warning for *Number of Openings* field isn't available for OData, Imports, and SFAPL.

Following is the list of buttons where the warning is displayed:

- *Send to Next Step*
- *Save Changes*
- *Save and Close*
- *Save*

## 18.8 The *Job Requisitions* List Page

The *Job Requisitions* list page displays all the job requisitions to which the recruiting user has access, and navigational elements to interact with the requisitions.

- When a recruiting user navigates to *Recruiting*, the *Job Requisitions* tab is the default landing page. This may vary if the recruiting user does not have permissions for this tab, but the tab is not configurable.
- Expanding the *Requisition Statistics* menu displays various requisition details, such as number of candidates forwarded and new candidates.
- You can see the current number of active applications on the *Job Requisitions* list page under the Active Candidates column.
- The *Open and Pending Job Requisitions* option on the *Requisition State* dropdown allows the user to view the full list of open requisitions and those requisitions pending approval.
- The *Job Postings* tab page displays the external and internal job postings along with their statuses.

## 18.9 Adding Instructional Text on Job Requisition List Page

You may wish to provide instructional text on the job requisition list page to help orient users or provide links to training and other helpful tips.

### Procedure

1. Go to ► *Admin Center* ► *Manage Recruiting Settings* ► and scroll down to *Instructions* section.
2. Enter the instructional text.
3. Save your changes.

The instructional text shows up when you click the "?" mark next to the *Job Requisitions* label on the job requisitions list page.

## 18.10 Filter by Requisition State

Recruiting users can filter their requisition list based on the current state of the requisitions.

The options in the requisition state drop down are not configurable.

| <i>Option</i>        | <i>Displays</i>                                                   |
|----------------------|-------------------------------------------------------------------|
| All job requisitions | All requisitions the recruiting user has access to for any reason |

|                                   |                                                                    |
|-----------------------------------|--------------------------------------------------------------------|
| Job requisitions pending approval | Pre-approved requisitions the recruiting user can access           |
| Open Job Requisitions             | Approved requisitions the recruiting user can access               |
| Closed Job Requisitions           | Closed requisitions the recruiting user can access.                |
| Open and Pending Requisitions     | Both open and pending requisitions the recruiting user can access. |

It is not possible to multi-select requisition states in the filter drop down.

There are clear user interface differences between requisitions in different states.

1. Approved requisitions do not have a checkbox next to them.
2. Closed requisitions are highlighted in pink.
3. Pre-approved requisitions have a checkbox displayed at the left.

## 18.11 Requisition Filter Options and Display Options

The requisition list can be adjusted by recruiting users to change which requisitions appear in the list and what columns of data appear in the table.

The fields available in both *Filter Options* and *Display Options* are nonconfigurable. However, **Department**, **Division**, and **Location** fields for *Filter Options* can be disabled. There's no way to add or remove fields from these screens. If the recruiting user selects a display option that isn't configured as a field in the Requisition XML, the resulting column in the requisitions table appears blank.

### Note

Job Requisition filter keyword doesn't return any requisitions when you filter with letter such as A, I, and D as these letters are in the stoplist for Oracle Text. Any other letter that isn't on the stoplist for Oracle Text works fine. For more information on the stoplist, see **Oracle Text Supplied Stoplists**, which describes the default stoplists for all the different languages supported and lists the stopwords in each.

## Age Column

The Age column displays the age of the requisition in number of days. For open requisitions, it's calculated by subtracting the Date Approved from the current date. For closed requisitions, it's calculated by subtracting the Date Closed from the current date.

## Related Information

[Oracle Text Supplied Stoplists \(Oracle.com\)](#) ➞

## 18.12 Creating and Accessing a Requisition

Recruiting users with appropriate permissions can create new job requisitions so that they are available for the candidates to apply.

### Prerequisites

You have the ► [User Permissions](#) ► [General User Permission](#) ► [Permission to Create Forms](#) ► permission.

### Procedure

1. In ► [Admin Center](#) ► [Recruiting](#) ►, click [Create New](#) on the requisition Summary Page.
2. If the recruiting user has permissions to more than one requisition template, a template selection page appears. If the recruiting user has permissions to only one requisition template, that template is automatically selected and the page is bypassed.
3. The recruiting user is then prompted to pick a requisition creation method.
  1. There are three requisition creation methods. At present all these options always appear to all users; they cannot be disabled or permissioned
    - Copy Existing Job Requisition
    - Browse "Families & Roles"

#### Note

The job role description does not support the HTML code.

- Create New Job Requisition From Blank Template
4. Enter the **Internal Job Title** and select the **Due Date**. Click [Next](#)
  5. Enter the requested details and click [Send to Next Step](#)
  6. Confirm your choice by again clicking [Send to Next Step](#)

### Results

The new Job Requisition appears in the [Job Requisition Summary Page](#)

## 18.13 Evergreen Requisitions

An Evergreen Requisition is created to build a pool of candidates for critical positions within the organization. Typically these are posted for a longer period and not linked to a specific position within the organization.

Evergreen requisition lets you pool potential candidates for positions that are critical and are hard to fill, or when many positions are available and require a permanent list of potential candidates. The requirements are more generic and not linked to a specific office location as an example. As a Recruiter or a Hiring Manager, you can forward the candidate from Evergreen requisition to standard job requisitions when it's available for a regular hiring process.

Multiple hiring managers have access to view candidate profiles. When a specific position becomes available, they can forward the candidates to the open vacancy and start the normal recruitment process. Recruiters or Hiring Managers can create the new evergreen requisition and associate child requisitions to it. The evergreen requisitions are reportable on adhoc reports and Embedded Analytics reports. Evergreen and Child requisitions are created and approved in the normal way.

Evergreen requisitions are helpful in industries like call centers, retail management, hospitals, and health care management. For example, consider the positions for qualified nurses. Multiple hospitals in a city constantly need qualified nurses. While applying for a job, the candidate isn't selecting a specific hospital but applying to a pool of candidates for consideration.

Another example where an organization is hiring a hundred software engineers. The organization can create an evergreen requisition with a generic job description and a job title. The job location isn't mentioned in the evergreen requisition. Then add child requisitions such as software engineers - Java developer, location: Houston, Software engineers as DevOps Intern, location: USA, Software Engineers for .Net platform, location: Mexico.

### 18.13.1 Configure the Evergreen Job Requisition Template

Configure the job requisition XML template to make job requisition as an evergreen job requisition.

- Configure the field `evergreen` of type Boolean in a job requisition template and upload the job requisition. You can configure the evergreen field in an existing or a new job requisition XML template.

#### Sample Code

```
<field-definition id="evergreen" type="bool" required="false" custom="false">
  <field-label><![CDATA[Evergreen]]></field-label>
  <field-description><![CDATA[Evergreen Field]]></field-description>
</field-definition>
```

- Grant read and write permission to the operators (Recruiters or Hiring Managers) to view and edit the evergreen field on the [Job Requisition Details](#) page.
- The [Parent Job Requisition ID](#) is system field. You can't configure the [Parent Job Requisition ID](#) system field in the job requisition template. The [Parent job requisition ID](#) has dependency on [Job Requisition Type](#) for placement and permission. If the [Job Requisition Type](#) field is configured and the operator has permission, then the [Parent Job Requisition ID](#) is displayed on a job requisition. The [Parent Job Requisition ID](#) is shown on a requisition only if it's a child of an evergreen requisition.
- The [Job Requisition Type](#) is a template field. You can configure the [Job Requisition Type](#) field as read-only in the job requisition template, and configure the label from [Manage Job Requisition System Field Labels](#) in [Admin](#)

*Center*. The *Job Requisition Type* field is displayed on a job requisition only if the field is configured in a job requisition template. In the field definition, the *Job Requisition Type* ID is `sfstd_jobReqType`. Since it's a template field, you can configure an appropriate permission for the *Job Requisition Type* to view it on a job requisition. You can configure the *Job Requisition Type* field anywhere on the template. The display order in the UI follows the order of definition in the template, regardless of whether the evergreen field is configured in the template or not.

### Sample Code

Make sure to set the **required**, **custom**, and **multiselect** attribute values to **false**.

```
<field-definition id="sfstd_jobReqType" type="derived" required="false"
custom="false">
  <field-label><![CDATA[Job Requisition Type]]></field-label>
  <field-description><![CDATA[Job Requisition Type Field]]></field-
description>
</field-definition>
```

- Configure the button "LinkChildRequisitions" on the job requisition template to allow the operators to create child requisitions of an evergreen requisition. The LinkChildRequisitions button is based on the evergreen field configured on the template, and the operator has the required permission to view and add a child of an evergreen requisition. A button permission for the LinkChildRequisition allows the operators to link the child requisitions. The permission that is configured for the "LinkChildRequisitions" are considered for *Add Child*, *Link*, and *Unlink* buttons on the *Job Requisition Details* page and the *Add Child Requisitions* button on the *Job Requisition Summary* page.

### Sample Code

```
<button-permission>
  <description><![CDATA[Button Permission]]></description>
  <role-name><![CDATA[O]]></role-name>
  <role-name><![CDATA[G]]></role-name>
  <role-name><![CDATA[R]]></role-name>
  <role-name><![CDATA[W]]></role-name>
  <role-name><![CDATA[T]]></role-name>
  <role-name><![CDATA[S]]></role-name>
  <role-name><![CDATA[GM+]]></role-name>
  <button-id><![CDATA[LinkChildRequisitions]]></button-id>
</button-permission>
```

### Note

You can also configure the evergreen and *Job Requisition Type* field, LinkChildRequisitions, from [Admin Center](#) > [Manage Templates](#).

## 18.13.2 Creating Evergreen Job Requisitions

Create a new evergreen requisition or use an existing requisition where the evergreen field id is configured.

### Prerequisites

- Enable the evergreen field as a standard field of type Boolean in the Job Requisition template.
- Grant read and write permission to the operators (Recruiters or hiring managers) to view or edit the evergreen field on the job requisition Details page.
- Configure the Evergreen label in the Job Requisition System Field Labels.

### Context

The evergreen field appears on all the job requisitions that are created from the template that is configured with the evergreen field. Recruiting Users can create a new evergreen requisition or use an existing requisition where the evergreen field id is configured.

When an evergreen requisition is copied, if the source template chosen doesn't have the evergreen field defined, the resulting requisition is Standard requisition. Similarly, copying a child requisition copies it as a standard requisition without its *Parent Requisition ID*.

While duplicating an evergreen requisition, its child requisitions aren't copied. Similarly, while duplicating a child requisition, it's copied as a Standard requisition without the Parent Job Requisition ID.

### Procedure

1. Go to *Recruiting, Job Requisition*, select a job requisition to open the *Job Requisition Details* page.
2. Turn on the toggle and save it to make the requisition as an *Evergreen Job Requisition* toggle button to make it an evergreen requisition and click *Save Changes*.

A new column *Requisition Type* in the *Job Summary* page displays the job requisition as Evergreen. If the job requisition isn't configured as evergreen, then the *Requisition Type* displays a job requisition as *Standard*. The *Requisition Type* field is displayed on the *Job Requisition Summary* page for any job requisition, irrespective of whether the evergreen option is turned on or not. The *Requisition Type* field audits the change when a standard requisition is made an evergreen requisition or vice versa. The *Requisition Type* and *Parent Job Requisition ID* fields are available in filter and display options irrespective of whether they're defined or permissioned in a template or not. The *Requisition Type* and the *Parent Job Requisition ID* are reportable as columns in Adhoc reports and Embedded Analytics reports. You can filter the reports based on the *Requisition Type* and *Parent Job Requisition ID* fields.

#### Note

You can't create an evergreen requisition using an SAP SuccessFactors API, and job requisition import.

*Evergreen* and *Requisition Type* fields aren't available in the business rules. Evergreen field that was available in business rules in the previous release, is now removed completely from Business rules. If you have configured and saved business rules involving the evergreen field, those rules may not work. We request to revisit the rules to modify them.

## 18.13.3 Adding Child Requisitions from User Interface

Add child requisitions to an Evergreen Requisition from User Interface.

### Prerequisites

On the *Job Requisition Details* page, turn on the toggle and save the requisition to make it an Evergreen requisition.

The *Add Child Requisition* button is displayed on the *Job Requisition Details* page only when the permission to LinkChildRequisitions button and the evergreen toggle button is set as Evergreen. If the evergreen field is configured on a job requisition template, and you don't have permission to the LinkChildRequisitions button, then you don't see the *Add Child Requisition* button on the *Job Requisition Details* page.

The *Link* and *Unlink* buttons are displayed on the *Job Requisition Details* page based on the permission on the "LinkChildrequisition" button.

### Context

Operators can associate single or multiple requisitions as a child of an evergreen requisition. A child requisition can be associated with only one evergreen requisition. In turn, an evergreen requisition can have multiple child requisitions.

#### Note

It isn't recommended to remove the Evergreen field from the template, without converting the Evergreen requisitions into a standard requisition. To set a job requisition as standard, unlink all the child requisitions if any, on the evergreen requisition, toggle the switch and save the requisition and then remove the field safely.

### Procedure

1. Add child requisitions to an evergreen requisition using one of the following ways:
  - Add child requisitions from the *Job Requisition Summary* page.  
Go to ► *Recruiting* ► *Job Requisition Summary* ► page and select a requisition of type evergreen, click *Action* menu. Select *Add Child Requisition*.
  - Add child requisitions from the *Job Requisition Details* page.

Go to ► [Recruiting](#) ► [Job Requisitions](#) ►, click to open a requisition of type evergreen, [Job Requisition Details](#) page opens. Click the [Add Child Requisition](#) button.

[Search to Add Child Requisitions](#) pop up window opens.

2. Provide search criteria and click [Search](#).
3. [Search Result](#) pop window opens. Select the requisitions to add as child requisitions and click [Add Child](#) button. Click [Refine Search](#) to provide different search criteria. You can't add a pre-approved, deleted, closed, an evergreen, or a requisition that is a child to another evergreen requisition as child requisitions. After adding the child requisitions, ensure to save the evergreen requisitions. If you're adding a child requisition from the [Job Requisition Summary](#) page, save action isn't required.

The [Job Requisition Details](#) page shows the child requisitions. Once you are on the [Job Requisition Details](#) page, you can add more child requisitions by clicking the [Add Child Requisition](#) button to search for more requisitions and add them to an evergreen requisition. The [Child Requisitions](#) section shows the child of an evergreen requisition. Only four child requisitions are displayed on the [Job Requisition Details](#).

4. Click the [View All](#) link to view all the child requisitions. The [Child Requisitions](#) pop up window displays all the child requisitions associated with the evergreen requisitions.

The [Child Requisition](#) window displays the [Requisition ID](#), [Job Title](#), [Status](#), and [Action](#).

#### ⓘ Note

The Requisition ID is a hyperlink. The Operators must have permission to view details of the job requisition.

The [Action](#) column on the [Job Requisition Details](#) page displays [Unlink](#) link to remove the association between the child requisitions and evergreen requisition.

5. Click the [Unlink](#) button on the [Job Requisition Details](#) page to disassociate the displayed child requisitions from the parent requisition. The unlink action is also available on the "View all child requisitions" popup window. To unlink multiple child requisitions, click [View All Child Requisitions](#), [Child Requisitions](#) pop-up window, and click the [Unlink](#) link in the action column. The [Link](#) and [Unlink](#) links are toggled based on the linking and unlinking of a requisition.
6. Click [Save Changes](#) after you finalized the child requisitions of an evergreen. After adding child requisitions to an evergreen requisition, you can't change it to a standard requisition until you unlink all the child requisitions associated with the evergreen requisition. Turn off the toggle button to make it as a [Standard](#) requisition.

Child requisitions are added to an evergreen requisition. After a requisition is made a child of an evergreen requisition, the [Job Requisition Details](#) page of the child requisition displays [Parent Job Requisition ID](#) and the [Job Requisition Type](#) is set to as a child of evergreen. The [Job Requisition Type](#) field audits the change when a child requisition is added to an evergreen requisition. Note that the auditing isn't done for pre-approved requisitions.

#### ⓘ Note

A job requisition, created from a template that has Evergreen configured on it, is added as a child of an Evergreen Requisition. Then the Evergreen field is disabled on the [Job Requisition Details](#) page of the child requisition

## 18.13.4 Deleting Evergreen Requisitions and Child Requisitions

Delete evergreen requisitions and child requisitions linked to an evergreen requisition.

To delete an Evergreen requisition linked to child requisitions, first unlink the child requisitions and then proceed with the deletion. Similarly, to delete the child requisitions, unlink the child requisitions from the evergreen requisitions.

## 18.13.5 Viewing Parent-Child Relationships in Job Requisitions

View parent-child relationships in job requisitions on the [Job Requisition Summary Page](#) and [Job Requisition Details](#) pages.

The [Job Requisition Summary Page](#) and the [Job Requisition Details](#) pages display the parent child relationship. The following table lists what is updated on the [Job Requisition Summary](#) and the [Job Requisition Details](#) pages:

| UI Pages                                     | Update                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Job Requisition Summary Page</a> | <ul style="list-style-type: none"><li>The <a href="#">Requisition Type</a> column now displays the requisition types as evergreen, and, child of evergreen, and standard.</li><li>A new field <a href="#">Parent Job Requisition ID</a> is introduced on the <a href="#">Job Requisition Summary</a> page to view the parent job requisition Id associated with a child requisition. To view the <a href="#">Parent Job Requisition ID</a> column on the <a href="#">Job Summary</a> page, click the <a href="#">Display Options</a> and select the <a href="#">Parent Job Requisition ID</a>, click <a href="#">Update Screen</a>. | <a href="#">Job Requisition Details</a>      | <ul style="list-style-type: none"><li>The <a href="#">Job Requisition Details</a> page of an evergreen requisition now displays <a href="#">Requisition Type</a> as evergreen and displays its child requisitions.</li><li>The <a href="#">Job Requisition Details</a> page of the child requisition displays <a href="#">Parent Job Requisition ID</a> and the <a href="#">Type</a> is set to as child of evergreen.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 18.13.6 OData API Support for Evergreen Requisitions

Use the JobRequisition OData API to create evergreen requisitions, link child requisition to an evergreen requisition, or unlink a child requisition from an evergreen requisition.

Consider the following before you perform the OData operations on an evergreen field using the JobRequisition OData API:

- Configure the evergreen field in the job requisition template.
- Enable the permissions on the JobRequisition OData API.

- Grant read and write permission to the Operator on the Evergreen field.

Use the JobRequisition OData API to support the following operations:

- Get operation to fetch an evergreen requisition.
- Upsert operation to update the *Evergreen* field on an existing requisition using single or batch operations. You can set evergreen=yes on standard and evergreen requisition. Note that only standard and evergreen requisitions are eligible for upsert operation. The upsert operation can't be performed on the job requisition that is a child or a deleted requisition. The update operation audits the *Job Requisition Type* and *Evergreen* fields for a job requisition in OData API.
- Upsert operation to add a child requisition to an evergreen requisition. You can't link a preapproved, evergreen, child, closed, or deleted job requisition to an evergreen requisition.
- Upsert operation to unlink the child requisition from Evergreen.

## Related Information

[SAP SuccessFactors API Reference Guide \(OData V2\)](#)

### 18.13.6.1 Get Operation on Evergreen Requisitions

Expose evergreen field in JobRequisition OData API GET.

The evergreen field is exposed in the JobRequisition OData API and the *Job Requisition type* field follows template level permissions. The *Parent Job Requisition ID* doesn't follow template level permissions.

The *Job Requisition Type* and *Parent Job Requisition ID* fields are exposed in OData API, and *Job Requisition Type* field follows template level permissions. *Parent Job Requisition ID* doesn't follow template level permissions. The *Job Requisition Type* values resolve to evergreen, standard, or child of evergreen strings and are sortable and filterable.

The *Parent Job Requisition ID* field is always fetched in the GET query for an *Evergreen*, *Standard*, or *Child of Evergreen* requisition. The *Parent Job Requisition ID* is fetched as Null for Evergreen and Standard job requisitions. The *Parent Job Requisition ID* is filterable and sortable. Note that the *Parent Job Requisition ID* isn't a navigation entity.

A sample GET query is as follows:

#### Sample Code

```
https://<hostname>/odata/v2/JobRequisition(8689L)?$select=evergreen&$format=json
```

A sample payload is as follows:

#### Sample Code

```
{
  "d": {
    "__metadata": {
      "uri": "https://https://<hostname>/odata/v2/JobRequisition(8689L)",

```

```

        "type": "SF0Data.JobRequisition"
      },
      "evergreen": true
    }
  }
}

```

## 18.13.6.2 Upsert Operation on Evergreen Requisitions

Supports upsert on Evergreen field on job requisitions.

You can perform single or batch upsert on job requisitions to set evergreen field as yes or no. Upsert operation sets the *Job Requisition Type* field value as evergreen.

To upsert an evergreen field value to "yes", ensure that the evergreen field is configured in template with appropriate permissions. Also ensure that the job requisition is a standard or an evergreen requisition. The upsert operation fails if the job requisition is a child requisition.

To upsert an evergreen field value to "no", ensure that the evergreen field is configured in template. Also ensure that the job requisition is a standard or an evergreen that isn't link to child requisitions. If the evergreen requisition is linked to child requisitions, ensure to unlink the child requisitions and then perform the upsert operation.

### Sample Code

A sample Upsert payload is as follows:

```

{
  "__metadata": {
    "uri": "JobRequisition",
    "type": "SF0Data.JobRequisition"
  },
  "templateId": "4362",
  "internalStatus": "1",
  "appTemplateId": "6502",
  "division": "Div123",
  "evergreen": true,
  "jobReqLocale": {
    "__metadata": {
      "uri": "JobRequisitionLocale",
      "type": "SF0Data.JobRequisitionLocale"
    },
    "jobTitle": "Senior Software Engineer",
    "externalTitle": "Senior Soft ware Engineer"
  }
}

```

The update operation audits the *Job Requisition Type* and *Evergreen* fields for job requisitions.

### Note

You can't upsert on *Job Requisition Type* fields.

### 18.13.6.3 Link Child Requisitions to an Evergreen Requisition

Upsert operation on a job requisition to link it to an Evergreen requisition.

Perform single or batch upserts to link a child requisition to a [Parent Job Requisition ID](#). Upsert a valid value of [Parent Job Requisition ID](#) on a child requisition to link it to the parent requisition.

Consider the following:

- The parent requisition must be an evergreen requisition and not a child or standard requisition. The parent job requisition must not be a deleted from the system.
- The child requisitions can't be preapproved, evergreen, child, closed or deleted requisition.
- Link or unlink operation doesn't consider permissions on the 'LinkChildRequisitions' button.
- On successful linking of the child requisition to the parent, the [Job Requisition Type](#) of the child is updated to Child of Evergreen.

#### Sample Code

A sample payload to link a standard job requisition (5678) to an evergreen requisition 123 is as follows:

```
{
  "__metadata": {
    "uri": "JobRequisition(5678)",
    "type": "SFODData.JobRequisition"
  },
  "parentJobReqId": "1234"
}
```

The [Job RequisitionType](#) field is audited for both Evergreen and Child requisitions. During a batch upsert of linking child to parent, if the same child requisition is linked to different Evergreen requisitions, the value of the [Parent Job Requisition ID](#) from the last payload is saved. Note that the intermediate changes while linking from evergreen requisitions aren't audited on the parent or the child.

### 18.13.6.4 Unlink Child Requisition from Evergreen Requisitions

OData API support to unlink child requisition from evergreen requisition.

Provide '-1' as value in API query to unlink the child from parent. If [Parent Job Requisition ID](#) is null, or not passed in the payload, the child isn't unlinked and the [Parent Job Requisition ID](#) isn't updated for the child. The [Parent Job Requisition ID](#) doesn't follow any permissions in OData API.

#### Sample Code

A sample payload to unlink the child job requisition (5678):

```
{
  "__metadata": {
    "uri": "JobRequisition(5678)",
    "type": "SFODData.JobRequisition"
  },
  "parentJobReqId": "-1"
}
```

#### Note

Deleting an evergreen requisition linked to child requisitions through ODATA API unlinks the child requisitions from the evergreen requisition. Similarly, deleting a child requisition through ODATA API unlinks the child requisition from the evergreen requisition and converts the child requisition to a standard requisition.

### 18.13.6.5 Deleting Evergreen Requisitions and Child Requisitions Using OData API

Using OData API delete evergreen requisitions and child requisitions.

Deleting an evergreen requisition linked to child requisitions through ODATA API unlinks the child requisitions from the evergreen requisition. Similarly, deleting a child requisition through ODATA API unlinks the child requisition from the evergreen requisition and converts the child requisition to a standard requisition.

### 18.13.7 Reporting on Evergreen Requisitions

Support for evergreen fields in reports.

The *Evergreen*, *Job Requisition Type*, and *Parent Job Requisition ID* fields are reportable in Ad hoc and People Analytics Embedded Reports. To fetch the values of the *Parent Job Requisition ID* and *Job Requisition Type* fields in reports, configure the *Job Requisition Type* field in the Job Requisition template.

### 18.13.8 Forwarding a Candidate from Evergreen to Child Requisition

Forwarding a candidate from an evergreen requisition to child requisitions from Agency or via Employee referral then the child requisition carries forward the ownership and Candidate source values in Forward and Forward As applicant scenarios.

When a candidate is forwarded to an evergreen requisition from an Agency or via Employee referral, and then the candidate is forwarded to one of the child requisitions, the child requisition carries forward the ownership and Candidate source values in Forward and Forward As applicant scenarios. As a result, the candidates will appear as forwarded to Child requisitions as well, on the Agency and employee referral page, even though the Agency or Employee Referral did not refer the candidate to the Child job requisition.

## 18.14 Copy Existing Job Requisition

Recruiting users are prompted with a requisition filter page to search for requisitions that they want to copy.

The fields on this page are nonconfigurable. There's no way to add or remove fields from this screen.

Options

1. [Copy Existing Job Requisition](#)

Find an existing job requisition to copy for your new job requisition.

| <input type="radio"/> | <a href="#">New Jobreg</a>             | 1341     | 0          |        | 1                  | Select ▼ |

Items per page: 100 ▼ Showing 1–100 of 102 | <<First <Prev 1 2 Next> Last>>|

The recruiting user can select a radio button and choose [Copy Selected](#) or select the menu under the [Actions](#) column and select [Copy](#).

### Note

When creating more than one copy of a requisition, the requisition number increases by multiple values instead of a value of 1. When there's a time lapse in duplicating a requisition, the system creates its requisition ID numbers with incremental of 1 and cache of 20.

## 18.15 Duplicating an Existing Job Requisition

Duplicate an existing job requisition.

### Prerequisites

The *Enable Mass Copy Job Requisitions* feature setting is enabled in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Procedure

1. Go to ► [Admin Center](#) ► [Recruiting](#) ►.  
By default, Job Requisition page is displayed.
2. Hover on the requisition you want to copy and select [Duplicate Job Requisition](#).
3. Specify the number of copies you want to make and enter the due date for the new job requisitions.

### Results

New requisitions are created and routed for approval.

### 18.15.1 Copied Requisition Behavior

Result of copying a requisition.

When a requisition is copied, data from all the fields get copied.

There's no way to configure or select which fields copy. The copied data includes the requisition operator field data. The operator user on the source requisition can access the copied requisition. If the originator changes the operators before sending the requisition to the next step, the operator users on the source requisition can't access to the copied requisition.

The applicant list on the requisition won't copy.

The audit trail on the requisition won't copy.

It's possible to copy a requisition even if it was created using a different template. This can result in a copied requisition having some blank fields, if those fields didn't exist on the source requisition.

## Browse "Families & Roles"

The recruiting user creating a new requisition may choose to create using Families and Roles option. This allows the user to browse through the Families and Roles library configured by the administrator in [Admin Center](#), select a role, and have data from that role auto-populate to the requisition. For example, Account Management, Application Management, Business Development, and so on.

All families and roles from the library are displayed. There's no way to permission families or roles that the user can see (that is, there's no way to only allow a hiring manager to see roles in their organization, or to prevent them from seeing executive or HR families and roles.)

The recruiting user expands the desired families and can select from and/or expand the desired roles. For example, Application Management family expands to Application Engineer role.

When the role is selected the system populates the data from the Role Name, Job Description and Competencies areas of the Families and Roles library onto the title, extTitle, listingLayout, extListingLayout, and competencies field IDs on the requisition.

## 18.16 Configuring Job Code in Browse Families and Roles

In case you want the recruiting users to select the job code instead of the role, it can be configured.

### Prerequisites

Ensure that you have enabled job code in Provisioning.

You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Procedure

1. Go to ► [Admin Center](#) ► [Families and Roles](#) ►.
2. Select [Configure job codes on the roles](#).

When the job code is selected, the system populates the data from the Job Code in Families and Roles into the jobCode field ID on the requisition. This is in addition to the normal data auto-population that occurs from Browse Families and Roles on the role level.

It's possible to view and auto-populate the requisition with additional data about the job code.

## Related Information

[Auto-Populating Data on a New Requisition \(Job Code Entity\) \[page 266\]](#)

## 18.17 Creating and Selecting Job Role Tags in Browse Families and Roles

You may find that viewing the entire list of families and roles is too much for your users. In this case, you can use the Job Role Tags functionality to filter the Families and Roles list.

### Prerequisites

Ensure that you have enabled job role tags.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

Job Role Tags allows the admin to “tag” each role with a picklist value, and then present that picklist to the recruiting user. The recruiting user picks a value and only sees Families that contain Roles tagged with the matching value. It is possible to set up one layer of tagging or two layers of tagging with a parent-child relationship between the two picklists.

You can upload CSV files for importing Job Role Tags with file size up to 5 MB or less. If the CSV file size limits are exceeded, then appropriate error messages are displayed to guide you in resolving the errors. Validations make sure that the files to be uploaded have the right format (CSV) and are within the limit of the permitted file size. If not, then you are shown appropriate messages that will help you rectify any errors.

## Procedure

1. Go to ► [Admin Center](#) ► [Picklists](#) ► and create the picklist(s) for the job role tags.
2. Click ► [Admin Center](#) ► [Picklists Mappings Set Up](#) ►.
  - a. Select the tags picklist in the Picklist 1 field using the drop down and provide a Picklist Label to display on the Browse Families and Roles page.
  - b. If needed, select the child tags picklist in the Picklist 2 field using the drop down and provide a Picklist Label to display on the Browse Families and Roles page.

**Picklists Mappings Set Up**

Use this page to set up picklist mappings to other entities.

Select Language: [English US \(English US\)](#), [English UK \(English UK\)](#), [Español \(Spanish\)](#), [Français \(French\)](#), [English Debug](#), [ภาษาไทย \(SF Thai\)](#)

Job Role Mappings: Picklist 1: jobFamily, jobFunction, jobReqStatus, **jobRoleTags**, language, languageSkillLevel, legalEntity

Picklist 2: None

Picklist Label:

If used, Picklist 2 must have a child picklist relationship to Picklist 1.

[Save Changes](#)

3. Create a job role tags mapping file to associate the families and roles to tags.

|   | A                  | B                         | C                  | D                     | E           | F          |
|---|--------------------|---------------------------|--------------------|-----------------------|-------------|------------|
| 1 | JOBFAMILY          | JOBROLE                   | PARENT_PICKLIST_ID | PARENT_PICKLIST_LABEL | PICKLIST_ID | LABEL      |
| 2 | Marketing General  | Marketing Intern          |                    |                       | jobRoleTags | Marketing  |
| 3 | Distribution       | Material Handler I        |                    |                       | jobRoleTags | Operations |
| 4 | Distribution       | Distribution Intern       |                    |                       | jobRoleTags | Operations |
| 5 | Sales General      | Sales Intern              |                    |                       | jobRoleTags | Sales      |
| 6 | Company Store      | Company Store Associate I |                    |                       | jobRoleTags | Facilities |
| 7 | Facilities General | Facilities Coordinator I  |                    |                       | jobRoleTags | Facilities |

The mapping file consists of the following:

| Column                | Expected Content                                                                                                                                                                                                   |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JOBFAMILY             | Valid job family already configured in the Families and Roles library. Family name value must match exactly.                                                                                                       |
| JOBROLE               | Valid job role already configured in the Families and Roles library. Role name value must match exactly and must be associated with a valid role to which it is also associated in the Families and Roles library. |
| PARENT_PICKLIST_ID    | Valid picklist ID. Populate if both parent and child picklists are used in tagging.                                                                                                                                |
| PARENT_PICKLIST_LABEL | Valid picklist value in the default language of the instance. Populate if both parent and child picklists are used in tagging.                                                                                     |

|             |                                                                                                                                                                                                                                                                                                                      |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PICKLIST_ID | <p>Valid picklist ID.</p> <p>If parent-child picklists are not used in tagging, use this as the primary picklist.</p> <p>If parent-child picklists are used in tagging, this picklist ID must be a valid child of the specified parent picklist id.</p>                                                              |
| LABEL       | <p>Valid picklist value in the default language of the instance.</p> <p>If parent-child picklists are not being used in tagging, use this as the primary picklist.</p> <p>If parent-child picklists are being used in tagging, this picklist value must be a valid child of the specified parent picklist value.</p> |

#### 4. [Admin Tools](#) [Import Job Role Tags](#) [Select the tags mapping file and upload](#)

You can leave some roles untagged — this will effectively hide the role (and family, if all the roles in that family are untagged) from the recruiting user creating a requisition via Browse Families and Roles.

There is no way to delete a role tag mapping after it has been uploaded, but it can be replaced. If you need to remove a role tag mapping, it is recommended to create a “Retired” picklist value, upload a role tagging map to the picklist value, and then change the picklist value status to OBSOLETE. This will hide the picklist value from the tags picklist on the Browse Families and Roles page and prevent the role (and family, if all the roles in that family are tagged to an OBSOLETE value) from the recruiting user creating a requisition via Browse Families and Roles.

## 18.18 Complete the Short Requisition Create Page

Before the requisition is created, the recruiting user is presented with a short requisition create page to collect some essential details.

These details are collected upfront because they must be fed directly into the requisition because the record can't exist without them. The [Job Title](#) is used as a navigational element, the [Due Date](#) is calculated into scheduled reminders, and some operators are involved in the route map.

This page is automatically assembled — it isn't possible to add or remove fields from the page, or to reorder the content. Only operators who are part of the route map are displayed on this page. All fields on this page are displayed as editable, regardless of the field permissions in the Job Requisition template. Field permissions only take effect once the requisition record is created and saved to the database.

After the recruiting user clicks [Next](#), the Requisition Details page appears. This is when a requisition number is issued. At this point, the requisition is in the preapproved state. Depending on the method used to create the requisition, some data might prepopulate onto the requisition.

The recruiting user will be required to complete all required fields before taking the next steps to route the requisition along the recruiting route map for approval.

## 18.19 Auto-Populating Data on a New Requisition (Job Code Entity)

The main method to auto-populate data on a requisition (other than the few fields that auto-populate from Families and Roles) is through a feature commonly called Job Code Entity.

Configuration of the Job Code Entity feature enables some additional job attributes to pre-populate on the requisition when the recruiter selects a given job code.

The Families and Roles library stores the role information and associates it to a job code. A separate Job Classification foundation objects library stores the job codes and associated data. The Families and Roles library is a Platform feature and the Job Classification foundation object is an Employee Central feature, but they can be set up and used for non-EC clients.

Only selected fields can be pre-populated from the Job Classification foundation object library, so the Job Code Entity feature is useable but limited.

You cannot view Job Code Entity fields on job requisition approvals from a mobile device.

### 18.19.1 Configuring Auto-Populating Data

Set up families and roles, set Employee Central Foundation Objects, and configure corporate data model XML to set up auto-populating data.

#### Prerequisites

You have enabled the following:

- [Provisioning](#) > [Company Settings](#) > [Enable Job Code](#) >

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- [Admin Tools](#) > [Families and Roles set up](#) >
- [Admin Tools](#) > [Picklists set up](#) >

#### Procedure

1. Set up Families and Roles. The families and roles configuration should be one of the first things you complete. The foundation objects library relies on the corporate data model XML to be configured before it functions.

2. Go to [Provisioning](#) [Company Settings](#) [Employee Central Foundation Objects](#).
3. Configure the XML: [Provisioning](#) [Succession Management](#) [Import/Export Corporate Data Model XML](#).

## Related Information

[Setting Up the Basic Job Data Model \[page 219\]](#)

### 18.19.1.1 The Corporate Data Model for Requisitions

Additional information about configuring the requisition data model.

- Ensure that the following declaration is available at the top of every Corporate Data Model document:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE corporate-data-model PUBLIC "-//SuccessFactors, Inc.//DTD
Corporate Data Model//EN" "http://svn/viewvc/svn/V4/trunk/src/com/sf/dtd/
corporate-datamodel.dtd">
<corporate-data-model>
  <description>Success Factors HRIS Data Model</description>
```

- Add `hris-element` element and `id` attribute. The Job Classification foundation object is the only foundation object used in Recruiting, but other HRIS objects are supported for EC in addition to Job Classification. The HRIS element with `id="jobCode"` must exist and contain the recruiting-related fields, as shown. The presence of the `jobCode` `hris-element` produces the Job Code option on the Import Foundation Data page.

```
<hris-element id="jobCode">
```

- The `hris-element` can contain multiple `hris-field` elements. The field elements define the fields in the foundation object import file:

```
<hris-field id="custom-string1" visibility="both">
  <label>Compensation Title</label>
</hris-field>
<hris-field id="custom-string2" visibility="both">
  <label>Grade Level</label>
  <picklist id="gradeLevel"/>
</hris-field>
```

You may configure the following `hris-field` `id` values. These field names must be used exactly as listed below:

| <i>hris-field id</i> | <i>Acts as Field Type</i>              |
|----------------------|----------------------------------------|
| description          | Text (100 character limit)             |
| custom-string1-15    | Text or Picklist (100 character limit) |
| custom-long1-5       | Integer (no decimals)                  |
| custom-date1-5       | Date                                   |

## hris-field Element and id Attribute

Other hris-field id values may be supported for use in Employee Central but there's a mapping process that links the hris-field ids from the Job Classification foundation object to the jobCode fields in the Requisition form, and only these hris-field ids are supported in this mapping process. Additional fields can't be used for Recruiting.

### → Tip

The Job Code Entity file can also be set up via a scheduled recurring process in Provisioning. Clients should either extract the data from the current system of record or they can manually create the file if some of the data is to come from the system of record and some comes from other systems. If the JCE process is via a scheduled job from your HRIS, it is possible to do a Full Purge which replaces all existing records, or an Incremental load, which inserts new records where a match is found, updates records where it does find a match and leaves existing records alone if they aren't mentioned in the import file.

The visibility attribute doesn't affect Recruiting; unless it has been adjusted for EC reasons, set it to "both".

## label Element

```
<label>Grade Level</label>
```

The label element controls the appearance of the field name in the user interface for both importing the foundation data and for the field as it appears in the requisition page, regardless of the field-definition label in the Requisition data model.

The hris-field element must contain at least one field-label element.

## picklist Element and id Attribute

```
<picklist id="gradeLevel"/>
```

The custom string hris-field ids can be configured to validate against a picklist upon foundation data import, and render as picklists on the requisition page. The picklist must be defined in the hris-field in the Corporate Data Model.

## Example

This example is for reference purposes, and is not a recommended configuration:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE corporate-data-model PUBLIC "-//SuccessFactors, Inc.//DTD Corporate Data
Model//EN" "http://svn/viewvc/svn/V4/trunk/src/com/sf/dtd/corporate-datamodel.dtd">
<corporate-data-model>
  <description>Success Factors HRIS Data Model</description>
```

```

<hris-element id="jobCode">
  <hris-field id="name" visibility="both" required="true">
    <label>Name</label>
  </hris-field>
  <hris-field max-length="100" id="description" visibility="both">
    <label>Job Description</label>
  </hris-field>
</hris-element>
</corporate-data-model>

```

## Configure jobCode Fields in Requisition Template

For each Recruiting-related hris-field configured in the Corporate Data Model, configure a corresponding field-definition in the Requisition data model.

### Note

The field IDs change between the Corporate Data Model and the Requisition data model. Where the Corporate Data Model states custom-string1, the requisition states customString1 — if you reference these fields in the Offer Details data model, the field IDs change yet again. To reference this field in the Offer Details data model, you would configure jce\_customString1.

Be sure to configure the standard jobCode field-definition id in the Requisition data model.

```

<field-definition id="jobCode" type="text" required="true" custom="false">
  <field-label mime-type="text-plain"><![CDATA[Job Code]]></field-label>
</field-definition>
<field-definition id="customString1" type="jobCode" required="true"
custom="false">
  <field-label mime-type="text-plain"><![CDATA[Compensation Title]]></field-label>
</field-definition>
<field-definition id="customString2" type="jobCode" required="true"
custom="false">
  <field-label mime-type="text-plain"><![CDATA[Grade Level]]></field-label>
</field-definition>

```

| <i>field-definition ID</i> | <i>Acts as Field Type</i>              |
|----------------------------|----------------------------------------|
| description                | Text (100 character limit)             |
| customString1-15           | Text or Picklist (100 character limit) |
| customLong1-5              | Integer (no decimals)                  |
| customDate1-5              | Date                                   |

This data is auto-populated from the foundation data library at the point of requisition creation. There's no dynamic link that causes this data to be automatically updated on the requisition if the data in the foundation data library is changed at a later date.

It's possible to set the permission of the jobCode fields as editable to users if desired. Ensure that the client gives careful consideration to whether these fields should be made editable or not.

## Import Job Code Foundation Data

You manage the data that populates into these requisition fields by uploading it via the job code CSV template in

► [Admin Tools](#) ► [Import Foundation Data](#) ►.

To upload foundation data:

- Download the Excel template by selecting Type: Job Code and clicking the “Download a blank CSV template”
- Populate the Excel file with data
- Select an import type. Full Purge replaces all existing records, and Incremental Load inserts new records where a match is not found, updates records where it does find a match and leaves existing records alone if they aren’t mentioned in the import file
- Choose file by browsing your computer
- Click Validate Import File Data to check the file for any possible data errors without importing it, if desired.
- Click Import to import the data

## Set Up Job Code Field Preview in Browse Families and Roles

Clients may wish to provide the user more job code related information while they’re selecting from families and roles during the requisition creation process. Up to five fields can be displayed on the Browse Families and Roles page under the Job Code.

## Related Information

[Data Retention Management in Recruiting \[page 1509\]](#)

## 18.19.2 Process for Manually Migrating Job Classification Objects to MDF Generic Objects

If you do not have Employee Central enabled and you have turned on Role-Based Permissions, then migrate Job Classification manually. Migrate Job Code entities from the Job Classification Foundation Object to the Metadata Framework (MDF) Job Classification in five major parts, in the order given below.

## Prerequisites

- Ensure that the three following feature settings are enabled in Provisioning:
  - Role Based Permission
  - Enable Generic Objects

- Employee Central Foundation Objects

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- All new customers should be implemented with Role-Based Permissions and the MDF Job Classification Object.
- All existing customers upgrading to Role-Based Permissions after Q4 2015 must manually upgrade Job Classification to MDF.

## Context

### 📘 Note

- During manual migration of Job Classification to MDF, only jobcode custom fields that are present in the HRIS corporate data model are migrated.
- During manual migration of Job Classification to MDF, only jobcode fields that have visibility = **both** in the corporate-data-model are migrated.
- During the manual migration, all the picklists tied to Job Classification fields are also migrated to MDF automatically. Only the picklists related to the Job Classification fields are migrated. All other picklists remain on the regular picklist framework.

The Job Classification object was developed as a Foundation Object configured in the Corporate Data Model XML. The Job Classification object has been upgraded to an MDF Generic Object. In Q3 2015 all Role-Based-Permission-enabled customers were upgraded to the new Generic Object Job Classification. If you do not have Employee Central enabled and you have turned on Role-Based Permissions, then migrate Job Classification manually.

When the manual migration of Job Classification is done, a Job Classification object exists. Jobcode fields in the Corporate Data Model that meet the configuration requirements are added the new Generic Object. The data in the Job Classification Foundation Object library exists in the Job Classification Generic Object library, and the Corporate Data Model no longer contains the Job Code hrisc element.

The migration of Job Code entities is performed in five major parts, and must be performed in the following order:

1. Migrate Picklists.
2. Migrate Data Models.
3. Set Up Mapping.
4. Migrate Data.
5. Clean the Corporate Data Model.

## 18.19.3 Migrating Job Code-Related Picklists to MDF

Migrate Job Code-related picklists to MDF, as part of the process to set up the auto-populating of data in a new requisition.

### Prerequisites

You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

This migration copies picklists that the Corporate Data Model references in the Job Code entity to MDF picklists.

### Procedure

1. Log into Provisioning.
2. Create a backup of the Corporate Data Model XML.
3. Go to ► [Managing Recruiting](#) ► [Migrate Job Code related Picklist](#) ►.

The [Migrate Job Code related Picklist in Corporate Data Model to MDF Picklist](#) page opens.

4. Click [Migrate Job Code related Picklist](#).

#### 📘 Note

This migration only migrates picklists that are configured against the respective Job Code fields and their parent picklists.

## 18.19.4 Migrating Data Models

Migrate a data model by setting up the Job Classification Generic Object so that the fields in the Corporate Data Model are added to that object definition.

### Prerequisites

Before you perform Model Migration, ensure that Picklist Migration is completed. Contact SAP support to perform Picklist Migration

### Procedure

1. In the Admin Center's [<Tools Search>](#) field, search for and open the [Configure Object Definitions](#) page.
  2. In the first picklist, select **Object Definition**. In the second picklist, select **Job Classification**.
  3. Make the newly opened "Object Definition: Job Classification (JobClassification)" page editable by clicking the [Take Action](#) picklist on the top-right corner of the new page and selecting [Make Correction](#).
  4. Add the custom fields that are present in the Corporate Data Model to match the Corporate Data Model job code setup, using the following specifications:
    - Set the maximum field length to what is specified in the Corporate Data Model. If the length is not specified, set it to 255.
    - If the data type of the field in the Corporate Data Model is:
      - Picklist – set "Picklist" as the data type in the Object Definition. Click [Details](#) and specify the Picklist ID of your source picklist by entering the Picklist ID of the desired picklist in the "Valid Values Source" field, then click [Done](#).
- Note**
- Make sure this picklist ID matches the picklist ID used in the job code HRIS element field in the Corporate Data Model.
- String – set the Object Definition data type to "Translatable."
  - Long – set the Object Definition data type to "Number."
5. Save the object definition once all the fields from the Corporate Data Model have been defined in the Job Classification object.

## 18.19.5 Setting Up Mapping Between Job Classification and Job Code

Set up mapping between the Job Classification GO fields and the Job Code XML fields, as part of the process to set up the auto-populating of data in a new requisition.

### Prerequisites

You have the following permissions:

- You have the ► [Administrator Permissions](#) ► [Metadata Framework](#) ► [Manage Data](#) ► permission.
- You have view/edit/import/export permissions for ► [User Permissions](#) ► [Miscellaneous Permissions](#) ► [Element Type Map for EC Migration](#) ►.

### Context

Once the picklists and the object models are all migrated and configured, the Job Classification GO fields must be mapped to the Job Code XML fields.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Data](#) ►.
2. Configure the map object:
  - a. In the [Create New](#) picklist, select the "EC2MDFElementType Map for EC Migration" object.
  - b. To the EC2MDFElementType Map for EC Migration record, add [HrisElementId](#) as the JobCode and [GO Object type](#) as the JobClassification.
  - c. Add all the custom fields in the Corporate Data Model as the GO Field name into the map.
  - d. Save.
3. Go to ► [Admin Center](#) ► [Set Up Job Requisition Job Code Mapping](#) ►.
4. Add mapping between the custom-fields of GO type and Job Req Job Code type fields.
5. Save.

## 18.19.6 Migrating Data in the Job Classification Library to MDF

Migrate data in the Job Classification library, as part of the process to set up the auto-populating of data in a new requisition. .

### Context

Once the picklists and the object models are migrated and configured, and the mappings are set up, then the Job Classification library data must be migrated and synchronized.

### Procedure

1. Export the Job Code Data from Recruiting Management and import it using the Import Export Data option. To do so, navigate to [Admin Center](#).
2. In the Tools Search field, search for and open the [Job code Export](#) page.
3. Click [Export JobCode Foundation Object Data](#). This generates a .zip file that contains the exported data in the form of a CSV file.
4. Now import the generated CSV file. To do so, navigate to [Admin Center](#).
5. In the Tools Search field, search for and open the [Import and Export Data](#) page.
6. In the [Select action to perform](#) picklist, select [Import Data](#).
7. In the [Import Data](#) region, perform the following actions:
  1. Select the CSV File radio button to specify the file type.
  2. In the [Select Generic Object](#) picklist, select Job Classification.
  3. In the [File](#) field, click [Browse](#), navigate to the location of the generated CSV file and select it.
  4. In the [Purge Type](#) picklist, select [Incremental Load](#).
  5. Then click [Import](#).
8. You can check the status of this import activity. To do so:
  1. Navigate to [Admin Center](#).
  2. Search for and open the [Monitor Job](#) page.
  3. The job type [MDF Data Import](#) can be used to identify the import job and the status of this job will be displayed in the same row.

## 18.19.7 Purging the HRIS Element Job Code from the Corporate Data Model

Once your data has been migrated, purge the HRIS element job code from the Corporate Data Model.

### Prerequisites

You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Procedure

1. Generate a Corporate Data Model XML file by navigating to ► [Provisioning](#) ► [Succession Management](#) ► [Import/Export Corporate Data Model XML](#) ► and clicking [Export](#), then [Submit](#).
2. Save this generated XML file.
3. Edit your Corporate Data Model XML file by removing all the contents within the HRIS element tag, including the element tags themselves:

```
<hris-element id="jobCode">
...
</hris-element>
```

4. Save the updated Corporate Data Model XML file.
5. Navigate to ► [Provisioning](#) ► [Import/Export Corporate Data Model](#) ► and click [Import](#), then [Browse](#).
6. In the Search field, find and select your updated Corporate Data Model XML file, then click [Submit](#).

## 18.20 Job Descriptions

The internal job description shows the public all the information about the job opening.

Type what you want job seekers to know about the open job position in the [Internal Job Description](#) field. Everything in the box will be visible to job seekers. When Real Time Job Sync is published, everything in SAP SuccessFactors Recruiting displays automatically on the Career Site Builder career site.

You must keep the job description up to date and fix any formatting issues. The SAP SuccessFactors Recruiting system can't update anything in the [Internal Job Description](#) field.

### Note

Don't copy images or CSS into the *Internal Job Description* field. The program automatically converts the content to CSS with the appropriate tags. Copying and pasting material from Word without using the appropriate icons will result in errors on the Career Site Builder website.

By choosing *Internal Posting Preview* or *External Posting Preview* Recruiting users can preview the header, footer and job description content as the candidate will see it.

## 18.20.1 Adding a Job Description

Enter the job description on a job requisition.

### Context

Choose a method to enter the content for the job description. If you copy content from a spreadsheet, then formatting on the internal career site appears differently than on the external career site.

### Note

Inline images, CSS, and HTML code aren't supported the *Internal Job Description* field. The program automatically converts the content to CSS with the appropriate tags. Copying and pasting material from Word without using the appropriate icons will result in errors on the Career Site Builder website.

### Procedure

- Type job descriptions directly in Recruiting.
  - a. Use the inline rich-text editor in the blank box next to *Internal Job Description* to type the job description.
  - b. Click *Save*.
- Copy the job description from a plain-text editor.

Use this option if content was taken from another web page. Plain-text editors, like Notepad, strip formatting and HTML tags from content. Unwanted formatting and HTML tags may exist if content was copied from another web page.

- a. Copy the job description content from your plain-text editor.
- b. Use the *Paste as Plain Text* icon to paste content into Recruiting.
- c. Click *Save*.

## 18.20.1.1 Errors While Copying Description from Microsoft Word

If you copy and paste directly from Microsoft Word without using the [Paste from Word](#) option, you encounter an error. There's a risk of including browser-unsupported formatting from Word, and the program prompts you to clean the content.

Choose [OK](#) for the prompt to copy from Word using a browser-supported format. Choosing [Cancel](#) will still copy from Word, but it will use the unsupported format, which causes visible errors in the job description post and hampers future editing changes.

## 18.20.1.2 Errors While Creating Tables in Description

Don't use the RCM text editor [Table Creation](#) option when building job descriptions.

HTML tables aren't supported when transferring job descriptions from Recruiting Management to Recruiting Marketing. The Recruiting Marketing job description field can't be used to format data in rows and columns.

After job data is imported into Recruiting Marketing, it can be sent using structured XML to third-party job boards around the world. It's a standard practice for job boards to not support data formatted in a table.

## 18.20.2 Viewing a Job Description

After saving changes to job descriptions on a job requisition, check that it appears correctly on the career site.

### Context

It may take up to 20 minutes for the newly published material to appear.

### Procedure

1. Navigate to the Career Site Builder career site.
2. Read over the job description to check for errors.
3. If the job format needs adjusting, then go back to the SAP SuccessFactors Recruiting text editor to update it.

## 18.20.3 Enhancing Job Description with AI

Recruiters (hiring managers) can enhance and generate job descriptions using generative AI capabilities.

### Prerequisites

- You've purchased the **AI units** license. For more information about **AI units** license, please contact your Account Executive.
- As an Administrator, to enable configuration of job requisition fields required for generating job descriptions, ensure these permissions are enabled:
  - Under ► *Administration Permissions* ► *Manage MDF Recruiting Objects* ► *Recruiting AI Enhanced Job Description* ►, you've selected *View*, *Edit* and *Import/Export* options.
  - Under ► *Administration Permissions* ► *Manage MDF Recruiting Objects* ► *Recruiting AI Enhanced Job Description.fields (Recruiting Fields for AI Enhanced Job Description)* ►, you've selected *View*, *Correct*, *Create*, *Adjust Order*, *Delete* and *Import/Export* options.
- Ensure that you've configured the specific job requisition fields that are used as reference source for AI to generate an enhanced job description in *Recruiting Fields for AI Enhanced Job Description* Metadata Framework object in the *Manage Data* page.
- You've enabled the *Assisted Job Descriptions* setting under ► *Admin Center* ► *AI Services Administration* ► *Feature Settings* ► *Recruiting* ►.
- You've enabled the *Assisted Job Descriptions* permission under ► *Admin Center* ► *Manage Permission Roles* ► *User Permissions* ► *AI Access* ►.
- Ensure that you've saved the *Job Requisition Details* page before you enhance the job description. Save the *Job Requisition Details* page after each update for the changes to be reflected in the AI-generated version.

### Context

You can enhance and generate job descriptions based on the job requisition fields configured in the Metadata Framework object. The field types textArea, rte, text, date, percent, bool, number, currency, picklist, competencies, object, and the skill attribute are supported for the fields configured in the Metadata Framework object. However, the field types enum, derived, attachment, instruction, jobcode, questions, operator, and operator team aren't supported.

#### Note

- Tokens in the job description aren't supported when you enhance the job description using AI.
- The internal job description and job title are always considered as a source for enhancing the job description. They are configured by default in the *Recruiting Fields for AI Enhanced Job Description* Metadata Framework object and will always be mandatory.
- The interview question, header, and footer sections on the job description template aren't considered for enhancing the job description irrespective of their selection status.

## Procedure

1. Go to [Recruiting](#) > [Job Requisitions](#) page.
  - If *Job Profile Builder* isn't enabled, the *Enhance Job Description* option is available in the *Job Requisition Details* page.
  - If *Job Profile Builder* is enabled, the *Enhance Job Description* option is available in the *Job Profile* tab under *Job Requisitions*.
2. Choose *Enhance Job Description*.  
The *AI Usage Acknowledgment* dialog is displayed
3. Choose *Continue* to enhance your job description using generative AI capabilities.
  - **Continue:** Confirms that you're aware of the possible limitations of the AI-generated content. After choosing this option, you can use AI-assisted capabilities in the SAP SuccessFactors application.
  - *Decline:* Confirms that you don't prefer to use AI-assisted capabilities The acknowledgment message appears every time you sign in to any SAP SuccessFactors application and choose an option that triggers an AI-assisted workflow.

If you choose

The *Enhance Job Description* screen opens, displaying current and generated descriptions alongside each other.

4. You can select either the *Current* or *Generated* job description in the *Enhance Job Description* screen.

### Note

When *Job Profile Builder* is enabled, you can choose whether to retain the *Current* or *Generated* content in each section of the job description.

5. You can choose to *Accept* or *Discard* the refined job description and try again after editing the job description fields manually.

## 18.20.4 Extracting Skills from Job Descriptions with AI

Use AI to extract skills from job descriptions, so that we can better match candidates to job postings on your career site.

### Prerequisites

- You've purchased the **AI units** license. For more information about **AI units** license, please contact your Account Executive.
- You have the ► [Administrator](#) ► [Manage AI Capabilities](#) ► [AI Services Administration](#) ► permission.
- You have the following permissions:
  - ► [Administrator](#) ► [Admin Center Permissions](#) ► [Monitor Scheduled Jobs](#) ►
  - ► [Administrator](#) ► [Admin Center Permissions](#) ► [Manage Scheduled Jobs](#) ►

### Context

By itself, this procedure doesn't enable any visible functionality. It's a prerequisite task that enables you to use **other** AI-assisted features in Career Site Builder. First, set up the system so that it uses AI to analyze job descriptions and identify the skills required for your posted jobs. Then you can enable other features in Career Site Builder that match job skills to candidate skills.

We only extract job skills when a job is posted to your career site. To be analyzed, the job requisition must be **active** and the posting must be one of the following types: Internal Posting, External Posting, Internal Private Posting, External Private Posting.

### Procedure

1. Go to ► [Admin Center](#) ► [AI Services Administration](#) ►.
2. Turn on [Assisted Job Skills for Career Site Builder](#).

Going forward, **new** job postings are analyzed with AI to identify job skills. Recruiters can validate the identified skills in the job requisition.

3. Go to ► [Admin Center](#) ► [Scheduled Job Manager](#) ► [Job Scheduler](#) ►.
4. Create and run a scheduled job of type [Extract Skills from Job Description Using AI](#).

The scheduled job analyzes and extracts skills from **existing** job postings.

#### → Tip

If you have a large number of active job postings, we recommend scheduling the job to run outside of business hours, to minimize potential performance impacts.

5. Go to ► [Admin Center](#) ► [Scheduled Job Manager](#) ► [Job Monitor](#) ►.
6. Confirm that the job has completed successfully. If not, run it again.

Running the job can take some time. If you don't see results quickly, you don't have to wait. You receive an email notification when the job is completed (or in case of errors).

## Results

Now that all active job requisitions have been analyzed and we've identified the job skills, you can start using other AI-assisted features based on job skills.

Recruiters can also view and validate the identified skills in the job requisition.

## Next Steps

Consider:

- Enabling [AI-Assisted Skills Matching for Resumes](#) in the layout of the search results page.
- Adding the [Skills Cloud](#) component to the layout of the job details page.
- Validating the identified skills in the job requisition.

## Related Information

[Validating Skills in a Job Description \[page 339\]](#)

## 18.21 Requisition Pre-Screen Questions

Recruiting users can define pre-screen questions presented to applicants at the point of application. These pre-screen questions can be used to gather information, score the applicants and automatically disqualify applicants who meet certain criteria.

Pre-screening questions can't be auto-populated on a requisition; they must be set up individually on each requisition. If a requisition is copied, the pre-screening questions will be part of the data copied onto the resulting record. Note neither pre-screening questions nor pre-screening question responses are reportable in ad-hoc reporting. However, the data can be extracted using the Integration Center to export the questions and responses into a file.

It is a best practice to configure the questions field ID on the requisition as read only once the requisition reaches approval. If this field is left with write permissions it would be possible for question wording or answer options to

be changed after applicants have already applied, causing a mismatch between the question and answer. This also opens the client up for possible accusation of unfair hiring practices. For instance, if they require a question, get several applicants that respond to that question, and then the question is made unrequired, the client could be accused of treating subsequent applicants with more leniency than the initial applicants.

If this best practice is not followed and a recruiting user changes the scoring/disqualifier settings on the pre-screen questions after some applicants have already applied, they will be prompted upon save to allow the existing applicants to be re-evaluated and possibly un-disqualified based on the new scoring criteria. This helps to protect clients from accusations of unfair hiring practices.

In order to receive the prompt, the recruiting user saving the changes must have appropriate permissions to status the applicants. (If the recruiting user who changes the scoring criteria doesn't have permissions to status the applicants, the next recruiting user who has permissions to status the applicants and performs a requisition save will receive the prompt instead.)

## 18.22 Adding Questions to Requisitions

Recruiting users can define pre-screen questions presented to applicants at the point of application. These pre-screen questions can be used to gather information, score the applicants and automatically disqualify applicants who meet certain criteria.

### Procedure

1. Go to [Add more questions](#) section on the job requisition.
2. Search or Browse the Questions library.

Any user with write permissions to the questions field ID can access all three tabs. There's no way to restrict a user to only using questions from the library and bar them from creating their own questions.

Recruiting users can access all questions libraries set up in the instance. You cannot restrict access to only certain libraries for certain users. Users can save questions to their own personal libraries accessible only to them.

3. Check the boxes next to questions and select [Add](#).

### Results

Questions appear in the library in alphabetical order. They'll appear on the requisition (and in the application when viewed by a candidate) in the order in which the checkboxes were clicked while adding questions to the requisition.

## 18.23 Creating New Questions on Requisitions

You can create your own pre-req questions and add them to the requisitions.

### Procedure

1. Go to [Add more questions](#) section on the job requisition and navigate to the [Create](#) tab.
2. Add the question name in the text box.
3. To specify question details, select [Edit Answer](#).
4. Choose an answer format from the following:

| Answer Format   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Multiple Choice | <p>Define multiple answers from which the user can pick. The answers appear as radio buttons; applicants can select one answer. The recruiting user can define a single correct answer. There's no way to select multiple correct answers.</p> <p>When creating the question in the Library, you can only have a maximum of 10 answers. You can add more than 10 answers, however, in the user interface.</p> <div><b>Note</b><ul style="list-style-type: none"><li>• We don't support more than one correct answers for multiple choice questions.</li><li>• The score can be put on question only. Individual answers can't be scored.</li></ul></div>                                                                                                        |
| Rating Scales   | <p>Select from a rating scale defined in <a href="#">Admin Center</a> <a href="#">Rating Scales</a>. Correct answers can be specified as anything higher or lower than the selected value. This doesn't provide true multi-select functionality but does allow multiple correct answers to be specified.</p> <div><b>Note</b><p>You can also create rating scales from the <a href="#">Preferences</a>, <a href="#">My Saved Rating Scales</a> tab to use them on job requisition pre-screening questions as answer options. A rating scale created from the <a href="#">My Saved Rating Scales</a> tab is available only to the user who created it. Other users or operators on the requisition can't view or edit this rating scale answer option.</p></div> |

| Answer Format | Description                                                                                                                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Numeric       | Specify any number five digits or fewer, decimals included. Correct answers can be specified as anything higher or lower than the specified value. No formatting constraints can be applied to this answer range (for example, there's no way to restrict the applicant to only entering a four-digit year). |
| Free Text     | Allow applicants to write any answer they wish. No correct answer can be specified.                                                                                                                                                                                                                          |

→ Tip  
The free text response is a plain text field. It can't be changed to support HTML, which would honor line-breaks and other formatting.

5. Select [Create](#).

## Results

The pre-req question is created. You can edit and adjust the questions selected on the requisition if needed.

## 18.24 Configuring Questions on Requisitions

You can manage the prescreening question on the requisitions by defining them as [Required](#) or [Disqualifier](#) questions. You can also apply score and weight needed for an applicant to pass the overall questions.

### Procedure

1. Go to [Questions](#) section on the job requisition.
2. Select from the following:

| Option       | Description                                                                                                                                                                                                                                                                                            |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Required     | Select which questions are required when candidates apply to the requisition.                                                                                                                                                                                                                          |
| Disqualifier | Select which questions are disqualifiers. If a question is selected as a disqualifier, applicants who don't provide a correct answer are automatically disqualified. Free text questions can't be selected as disqualifier questions since there's no way for the system to identify a correct answer. |

3. Determine the Required Score needed for an applicant to pass the overall questions.

The threshold for the required score is a percentage value.

Rating Calculation per question = [Points per question/Total points] \* 100

Example: There are five prescreening questions and the required score threshold for an applicant is 40%. The points per question are set to 10 and the rating for each question is calculated as 20%. If the applicant answers three questions correctly, then the score is 60% as per the calculation. The applicant isn't automatically disqualified, as the acquired score is higher than the threshold value.

If the applicant's total score falls below the Required Score threshold, the applicant is automatically disqualified.

#### → Recommendation

Avoid deleting questions from the library, as it can cause issues on existing requisitions, especially the ones with cascading questions.

## 18.25 Adding Competencies to Requisitions

As a Recruiting user, you can define or add competencies to job requisitions presented to interviewers. These interview competencies are used to gather information and rate the applicants to help arrive at a hiring decision.

### Context

Competencies can be auto-populated on a requisition from Families and Roles. They can then be added to or removed individually on each requisition. If a requisition is copied, the competency will be part of the data copied onto the resulting record.

The Expected Rating and Weight % columns do not presently have any affect in Interview Central; these columns can be left blank. No change will occur based on data entered in these columns.

#### 📘 Note

- For a scenario where the *Job Profile* switch has been disabled:
  - If you add a new competency to the list in the job requisition, this competency will be added to the end of the list.
  - If you do not save after deleting a competency, and then re-add the competency to the list, the order of competencies will not change. The competency will be displayed in its original order. If you want to maintain the new order for a re-added competency, please save changes after deleting and before re-adding the competency to the job requisition.
- Neither competencies nor Interview Central results are reportable

## Procedure

1. Go to [Add more Competencies](#) section on the job requisition.
2. Search or Browse the Competencies library.

Any user with write permissions to the competencies field ID can access both. There is no way to allow a Recruiting user to create their own competencies; they must select from a library.

Recruiting users can access all competency libraries set up in the instance. It is not presently possible to restrict access to only certain libraries for certain users.

3. Check the boxes next to competencies and select [Add](#).

## Results

The competencies appear on the requisition in alphabetical order.

## 18.26 Performing Tasks Associated with Operators

You can perform a number of tasks that are associated with operators.

### Procedure

Perform an operator-related task:

| Option                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select operators on the short requisition create page</b> | On the short requisition create page, you can use <a href="#">Type-Ahead User Lookup</a> to select an operator. It is not possible to configure this type-ahead lookup on the Requisition Details page.                                                                                                                                                                                                                                                                                                                                                          |
| <b>Auto-populate operators from Admin Tools settings</b>     | It's possible to prepopulate users in the short operator fields on the short requisition create page. Refer to <a href="#">Adding Default Primary User</a> .                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Auto-populate OperatMors from Personal Preferences</b>    | <p>A recruiting user can set up Personal Preferences to auto-populate users into the operator fields by navigating to ► <a href="#">Recruiting</a> ► <a href="#">Preferences</a> ► <a href="#">My Recruiting Team Preferences</a> ► and selecting a requisition template:</p> <ol style="list-style-type: none"><li>1. In <a href="#">Selecting a Requisition to Adjust Personal Preferences</a>, select "Hiring Manager" (or whatever label has been given to the hiringManagerName field in the instance) from the "When I am the..." dropdown menu.</li></ol> |

| Option                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                          | <div> <div>  <b>Note</b> </div> <div> <p>To prevent conflicts where multiple users on a requisition might specify different default operators, you can only specify default operators for requisitions on which you are the hiring manager. Personal preference lookups occur automatically only at the point where the requisition details page is saved. This means personal preferences will not auto-populate onto a new requisition, and additions/removals from personal preferences resulting from changes to the primary operators will not take effect until the recruiting user saves the requisition details page.</p> </div> </div> <div> <p>2. Specify the desired user as a Default Operator for each field.</p> <p>Your name appears as the Default Operator value for the hiring manager field, since you are setting this up for conditions where you are the hiring manager.</p> </div> <div> <div>  <b>Tip</b> </div> <div> <p>Personal preference lookups occur automatically only at the point where the requisition details page is saved. This If there is a conflict between the operators already manually selected on a requisition and the personal preferences for that operator field, the operators already selected on the requisition will be retained and the personal preferences will not be honored.</p> <p>If there is a conflict between the default operator user set up in Personal Preferences and the default operator user set up in <a href="#">Admin Tools &gt; Manage Recruiting Team Settings</a>, the value in Personal Preferences takes precedence.</p> </div> </div> |
| <b>Managing operators on the Requisition Detail page</b> | <p>On both the short requisition create page and the Requisition Details page there is a Find User link that opens a user search pop-up. The recruiting user can enter search criteria and select the user they wish to place in the operator field.</p> <p>Both in the type-ahead and in the Find User lookups, results will be constrained if the field has a recruiting-group attribute specified on it in the XML.</p> <p>Unrequired operator fields also have a Clear link available so that the selected user can be removed, if desired. Required operator fields will not have this link — to remove a user from the field you have to select a replacement user.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## 18.27 Team Recruiting

Fields defining teams of users are supported on the requisition in addition to the recruiting operators that contain a single user. A team can be made up of users who are selected individually or set up as a Recruiting Group.

- It is not possible to route for approval to a team role
- You can include both an individual role and the same team role on a single requisition template. For instance, it is possible to enable a Recruiter and a Recruiter Team role on a single requisition. This has a number of advantages. For example:
  - Flexibility to assign to a single role (as opposed to team)
  - Sorting by single name
  - Allowing a single role to be included in a route map
- Team Recruiting is not available via SFAPI – the only way to get Team Recruiting preferences is if the user clicks [Restore Admin Defaults](#) once the req has been created. If the requisition is created via API; personal settings will not populate.

### 📌 Note

Team Recruiting settings are essential for the auto-populate feature to work. When you create a job requisition, the auto-populate feature facilitates defining the recruiting operators for that requisition.

You cannot add additional groups to the [Team](#) fields of the job requisition through OData and UI.

### 18.27.1 Configuring Team Recruiting

Configure team recruiting.

## Prerequisites

You have access to Provisioning.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Procedure

1. To enable the Recruiting Team functionality, navigate to ► [Provisioning](#) ► [Company Setting](#) ► [Recruiting](#) ► [Enable Recruiting Team Functionality](#) ►
2. Configure the Job Requisition XML
  - a. Template level default team recruiting settings can be set by first adding the corresponding job requisition templates with team recruiting fields and then configuring for these fields. Note that only team recruiting fields present in the template can be configured. If a job requisition template does not have any team recruiting fields then no configuration is possible. The following are the job requisition template fields for team recruiting:
    - hiringManagerTeam
    - coordinatorTeam
    - recruiterTeam
    - sourcerTeam
    - secondRecruiterTeam
    - vpOfStaffingTeam
    - vTeam
3. To enable team recruiting fields, fields need to be configured in the XML. Not all fields are required. The admin can select one team field per existing operator, but the recommended configuration is for all fields. Each field should be assigned the appropriate permissions to define who has read or write access to that field. These fields can be labeled however the client wants. Permissions granted to users in these fields are the same as the primary operators.

### ❖ Example

```
<field-definition id="hiringManagerTeam" type="operatorTeam" required="true"
custom="false">
  <field-label><![CDATA[Hiring Manager Operator Team]]></field-label>
  <field-description><![CDATA[]]></field-description>
</field-definition>
<field-definition id="recruiterTeam" type="operatorTeam" required="false"
custom="false">
  <field-label><![CDATA[Recruiter Operator Team]]></field-label>
  <field-description><![CDATA[]]></field-description>
</field-definition>
<field-definition id="sourcerTeam" type="operatorTeam" required="true"
custom="false">
  <field-label><![CDATA[Sourcer Operator Team]]></field-label>
  <field-description><![CDATA[]]></field-description>
</field-definition>
<field-definition id="coordinatorTeam" type="operatorTeam" required="false"
custom="false" group-name="ACE Head Quarters">
  <field-label><![CDATA[Coordinator Operator Team]]></field-label>
  <field-description><![CDATA[]]></field-description>
</field-definition>
<field-definition id="vpOfStaffingTeam" type="operatorTeam"
required="false" custom="false">
  <field-label><![CDATA[VP of Staffing Operator Team]]></field-label>
  <field-description><![CDATA[]]></field-description>
</field-definition>
<field-definition id="secondRecruiterTeam" type="operatorTeam"
required="false" custom="false">
  <field-label><![CDATA[Second Recruiter Operator Team]]></field-label>
  <field-description><![CDATA[]]></field-description>
</field-definition>
```

```
<field-definition id="vTeam" type="operatorTeam" required="false"
custom="false">
  <field-label><![CDATA[Approver Team]]></field-label>
  <field-description><![CDATA[]]></field-description>
</field-definition>
```

## 18.27.2 Adding and Removing Users from Recruiting Teams on the Requisition Detail Page

You can add and remove users from recruiting teams on the requisition detail page.

### Procedure

- To add a user in a recruiting team field, type the user's first or last name, or username and select from the type-ahead lookup prompt.  
Results are constrained if the field has a recruiting-group attribute specified in the XML.
- To select an additional user, begin typing another name after selecting your first user. Recruiting team fields may contain multiple users, separated by commas — the comma is added automatically.
- To update the operatorTeam field, you have to first add the recruiter name in the operator field and change the recruiter. Then, add the new user directly to operatorTeam field and save the page again.
- To remove a user from an operatorTeam field, hover your mouse over the user — a strikethrough line appears. Selecting the strikethrough user removes that user.

## 18.27.3 Managing Admin-Defaulted Users and Groups on a Requisition

Recruiting users with write access to the operatorTeam field can remove the users and groups the admin settings defaulted onto the requisition.

|                       |                                                                                                                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Recruiter Team</b> | <b>Admin-selected Groups:</b> <span>College Recruiter Team</span> ⓘ<br><b>Manage Additional Users</b><br><div style="border: 1px solid #ccc; height: 20px; margin-top: 5px;"></div> |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

If the recruiting user removes admin settings and then changes their mind, they can choose to Restore Admin Defaults, which pulls the current set of admin settings back onto their requisition. This will also work to look up and apply admin settings on requisitions that pre-date the admin settings.

Alternatively, the admin can choose to prevent a recruiting user from altering the admin-defaulted settings, even if that recruiting user has write access to the operatorTeam field.

- [Admin Tools](#) > [Manage Recruiting Team Settings](#) >
  - Select a requisition template
  - Prevent end-users from changing an admin's default settings

#### Note

Any admin settings or personal preferences changes that would require a new user or group name to appear on a requisition are not retroactively applied to existing requisitions. Any changes that alter the content of a group name already appearing on a requisition are retroactively applied to existing requisitions.

## 18.27.4 Auto-Populating operatorTeams from Personal Preferences

It's possible for a recruiting user to set up Personal Preferences that will auto-populate personal groups of users into the operatorTeam fields.

### Procedure

1. Go to [Recruiting](#) > [Preferences](#) > [My Recruiting Team Preferences](#) >.
2. Select a Requisition template.
3. Select a value from the [When I am the...](#) menu. It's possible to set up different sets of personal preferences that will apply depending on one or more roles you're playing on a given requisition. For instance, when you're the recruiter on a requisition you may want a particular team of sourcers to appear, but when you're the hiring manager on a requisition and someone else is the approver then you may not want that team to appear.

## Note

If a user has multiple employments, you can set up Personal Preferences individually for each employment associated to the user. The following table shows the behavior of a user with multiple employments on the job requisition, if the personal preferences are configured:

Example

| User   | Employment | Personal preferences configured                                                                                          | Behavior on the Job Requisition                                                                                                                                                                                                                                                                                               |
|--------|------------|--------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User A | Emp1       | <i>When I am the "Hiring Manager"</i> , then the additional users configured for Sourcer team are Sourcer1 and Sourcer2. | <p>If you select <b>User A-Emp1</b> as the Hiring Manager for a job requisition, then corresponding personal preferences are applied for the requisition.</p> <p>In this case, Sourcer Team field of the job requisition is populated with personal preferences of <b>User A-Emp1</b> having users Sourcer1 and Sourcer2.</p> |
| User A | Emp2       | <i>When I am the "Hiring Manager"</i> , then the additional users configured for Sourcer team are Sourcer3 and Sourcer4. | <p>If you select <b>User A-Emp2</b> as the Hiring Manager for a job requisition, then corresponding personal preferences are applied for the requisition.</p> <p>In this case, Sourcer Team field of the job requisition is populated with personal preferences of <b>User A-Emp2</b> having users Sourcer3 and Sourcer4.</p> |

#### 4. Specify the desired additional users, for each team.

Note that personal preference lookups occur automatically only upon the point that the requisition details page is saved. This means personal preferences won't auto-populate onto a new requisition, and additions/removals from personal preferences resulting from changes to the primary operators will not take effect, until the recruiting user saves the requisition details page.

The personal preferences saved by a user create a personal Recruiting Group behind the scenes. This Recruiting Group is used on requisitions. This ensures that if a user later changes their personal preferences the group is dynamically updated and those changes are automatically reflected on a requisition that references that group.

If the recruiting users remove personal preferences and then changes their mind, they can choose to reapply personal preferences, which pulls the current set of all users' personal preferences back onto their requisition. This will also look up and apply personal preferences on requisitions that predated the personal preferences setup.

## → Tip

If a recruiting user's personal preferences are already applied to a requisition as a personal group, and the user alters the personal preferences, those alterations apply to the requisition that contains their group. However, if a user creates new personal preferences, that new personal preferences group won't be retroactively applied to existing requisitions.

Any admin settings or personal preferences changes that require a new user or group name to appear on a requisition aren't retroactively applied to existing requisitions. Any changes that alter the content of a group name already appearing on a requisition are retroactively applied to existing requisitions.

## 18.28 Requisition Detail Button Toolbar

Pre-approved requisitions display a toolbar related to the Performance Management form toolbar.

Some of the icons on the toolbar can be enabled or disabled in ► [Admin Center](#) ► [Form Templates](#) ►. Not all buttons that can be enabled can function on the Requisition form.

If it's incorrectly configured in ► [Provisioning](#) ► [Company Settings](#) ►, this toolbar might appear multiple times in the user interface. If this occurs, review your baseline company settings, particularly making sure that all the UI version settings are correctly enabled.

## 18.29 Enabling and Updating Header and Footer Fields

Header and footer fields store rich text content appended to the top and bottom of a job description when the job is posted.

### Prerequisites

Enabling these fields and configuring the Requisition XML requires that you have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

Header and footer templates cannot automatically populate onto a requisition; they must be selected by a recruiting user. The recruiting user must have write permissions to select a template. There is no way to give the user permission to select a template while restricting them from updating the text afterwards.

#### 📘 Note

If duplicate options appear when selecting a configured header or footer, you have configured the header or footer in both all languages and a specified language. To fix this, save the header or footer on a language-by-language basis, rather than using all languages.

The header and footer templates contain filter field values. These filter field values are compared to the values stored in the filter fields on the requisition. The best possible match will appear at the top of the list flagged as **[Recommended]**.

A [Recommended] value always appears; if several templates equally match the requisition filter field values, the first item in the matching list will appear as [Recommended]. You cannot disable this feature.

The external header and footer display “Same as Internal Header” and “Same as Internal Footer” buttons so a recruiting user can easily copy content from the internal values to the external fields if desired.

## Procedure

1. Go to ► [Provisioning](#) ► [Company Settings](#) ► and select [Enable Job Description Header and Footer](#).
2. Configure the Requisition XML with intJobDescHeader, extJobDescHeader, intJobDescFooter and extJobDescFooter field IDs.
3. Recruiting users can choose Update and write their own header and footer, or choose Add Header and Footer Content and select from a list of predefined header and footer templates.
4. After selecting a header and footer template, recruiting users can select update and make further changes to the header and footer text, if desired.

## 18.30 Routing a Requisition for Approval

When Recruiting users are done filling out requisition data, they can send the requisition to the next step in the approval process.

## Prerequisites

- Some steps require access to Provisioning.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- Requisition XML is configured with mobile fields (using the mobile-fields element).

- Role-based permissions for Mobile have been granted by enabling ► [User Permissions](#) ► [General User Permissions](#) ► [Mobile Access](#) ►.
- Select [Enable SAP Jam Integration for Job Requisition \(requires Candidate Workbench, SAP Jam Integration\)](#) under ► [Provisioning](#) ► [Company Settings](#) ►.
- Select [Recruiting](#) under ► [Admin Center](#) ► [Enable Mobile Features](#) ► [Modules](#) ►.

## Context

The system sends a Document Routing Notification email. This asks the next user in the approval process to approve the requisition. The requisition approval also appears on the user To-Do list, under the route-map step name.

Only the user listed as [Currently With](#) can send the requisition back one step in the route map. This applies to all route map step types and users. If a [Currently With](#) user sends back a requisition, the action is captured in the audit trail, including any comments. There's no other way to reject or send a requisition back to a previous route map step. You can, however, configure an iterative or collaborative step to allow recruiting users to pass a requisition form back and forth to other users within a step.

Recruiting users can't see the requisition record on the requisition list page until it reaches them in the approval route map. If a Recruiting user is not part of the route map, that user can't see the requisition record until it's approved. You can change this behavior in ► [Admin Tools](#) ► [Recruiting Settings](#) ►. You can allow users to view pre-approved requisitions without regard to route map status.

### Note

If you've created a requisition through [Position Org Chart](#), then disable [Document Routing Step Exit Notification](#) before sending it to the next approver.

## Procedure

The user can approve a requisition in one of three ways:

- Open the requisition and click the [Approval/Send](#) button.

### Note

The button name varies depending on the route map

configuration.

- Open the requisition list page, check the boxes next to the requisitions, and approve several requisitions at once.

- Approve through the SAP SuccessFactors mobile app.

## 18.31 Requisition State and Status

Know more about requisition state and status, how to indicate pre-approved requisition as inactive, and calculate Recruiting metrics.

Configure a picklist item in the status field to indicate that a pre-approved requisition is no longer active because you can't close or put a pre-approved requisition on hold.

A status of **99999** indicates a closed requisition, while a status of **88888** indicates a requisition that is on hold. Users who can access that pre-approved requisition continues to access the record. It isn't possible to remove a pre-approved requisition from a recruiting user's view. An originator can delete the pre-approved requisition if deletion capabilities are enabled.

Dates Used to Calculate Time to Hire, Time to Fill, and Age of Requisition

| Date                        | Definition                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Candidate Review Date | Date the application was first opened by a recruiting operator.                                                                                                                                                                                                                                                                                                                                                                     |
| Date of Availability  | Editable field on the job application.                                                                                                                                                                                                                                                                                                                                                                                              |
| Start Date            | Editable field on the job application.                                                                                                                                                                                                                                                                                                                                                                                              |
| Hired on Date         | Generated when a candidate is moved into a step with a Hired status. If they're moved into a Hired status more than once, it's the most recent move. The most recent Hired on Date is maintained even if the candidate is moved out of the Hired status and into another in progress status, such as Onboard. The only time that the Hired on Date are removed if the candidate is moved to a Withdrawn or Disqualification status. |

#### Note

Recruiting Operators can't reopen the closed job requisition by changing the status to Open from the legacy Candidate Workbench.

You can enable three Recruiting settings to automatically calculate Recruiting metrics in ► [Admin Center](#) ► [Recruiting Settings](#) ► [Time to Hire](#), [Time to Fill](#), and [Age of Requisition](#).

## Time to Hire and Time to Fill

The [Time to Hire](#) and [Time to Fill](#) are automatically calculated based on the [Start Date](#) and [End Date](#) selected in ► [Admin Center](#) ► [Recruiting Settings](#) ► [Time to Hire](#), [Time to Fill](#). The [Job Start Date](#) and [Actual Start Date](#) are standard fields on the requisition. To use them, configure them in the job requisition XML template and must populate them with data from the calendar widget. Selecting the [exclude time spent in hold statuses](#) option excludes hold status time from the calculation.

#### Note

The hold status time that is in between the start and end date is considered for the Time to Fill calculation. The hold status time outside the start and end date timeline isn't considered for Time to Hire and Time to Fill calculation.

## Age of Requisition

The Age of Requisition populates a nondefault value for the [Age of Requisition](#) field in reportable requisition fields. [Age of Requisition](#) is based on the [Start Date](#) selected in [Recruiting Settings](#). Once the requisition is closed, the [Age of Requisition](#) becomes [Time to Fill](#). The [Age of Requisition](#) is calculated in whole days only. If an admin user doesn't configure the [Age of Requisition](#), the default age calculation of the current date minus approved date (closed dated minus approved date if the requisition is closed) persists.

#### Note

If a requisition is placed in an **88888** status before approval, each day spent on hold counts as -1 for the age of the requisition. Use a different preapproval hold status to support this process, or the calculated age of the requisition could be a large negative number, which wouldn't produce the desired behavior.

## Pre-approved Requisition

Pre-approved requisitions can be closed and then reopened while still in the preapproved state. This behavior honors the existing button permissions. When the requisition reopens in the preapproved state, it is in the same route map step it was in before being closed.

### → Tip

You can't grant permission to requisition open and requisition closed buttons based on the requisition state. For example, you can't grant permission to a hiring manager to close a requisition when it's preapproved, but not when the requisition is in the approved state.

When a requisition completes all steps in the route map, it automatically switches from the Preapproved state to the Approved state.

This switch triggers the Document Completed Notification from ► [Admin Center](#) ► [E-mail Notification Templates Settings](#) ►.

### ⓘ Note

The carbon copy feature on the route map that Performance Management uses to copy users on the Document Completed Notification doesn't apply to Recruiting.

Once a requisition is in the Approved state, there's no way to again send it back into the Preapproved state for further route map approvals. The only supported requisition state change is to close the requisition.

There's no way to automatically close requisitions upon the final hire. Requisitions must be manually closed once the position is filled.

Requisitions can be closed by choosing the [Close Job Requisition](#) button as long as the Recruiting user has permission to view the button. You can specify a custom label for this button.

### ⚠ Caution

A Recruiting user could close a requisition regardless of the status field value, resulting in a [Closed](#) status requisition that has a mismatched status, such as [Open](#). To avoid this mismatch, configure the optional requisition status field to be validated against the requisition Approved or Closed state so that the requisition state and status match.

## 18.31.1 Configuring Requisition Hold Status and Closed Status Using MDF Picklists

When migrating to MDF picklist, by default, the [Picklist Center](#) displays only the most commonly used fields. To make the hidden MDF picklist fields visible, you have to edit the Picklist Value MDF Object. With this, you can configure the closed requisition or hold requisition status picklist.

### Procedure

1. Go to ► [Admin Center](#) ► [Configure Object Definition](#) ► and select [Object Definition](#) in the first search menu.
2. Type the picklist value in the second search menu and select this object.
3. Choose [Make Correction](#) from the [Take Action](#) menu.
4. Locate the [OptValue](#) field from the [Fields](#) section.
5. Choose [Details](#) to see all properties of this field.
6. Set the [Visibility](#) property to [Editable](#).
7. Choose [Done](#) to close the [Details](#) dialog and save your changes.
8. Go to ► [Admin Center](#) ► [OData Metadata Refresh and Export](#) ► and choose [Refresh](#) to refresh the metadata.

### Results

You can now view and edit [OptValue](#) field in Picklist Center to set the picklist value of **99999** to a closed requisition status or **88888** to a hold requisition status.

If the status isn't 99999 status, an attempt to close the requisition fails and the recruiting user gets an error message on the Job Requisition Details page.

Once the requisition is closed, recruiting users with appropriate button permissions can click the Reopen button and change the requisition state back to Approved.

If the status is a 99999 status, an attempt to reopen the requisition fails and the recruiting user gets an error message on the Job Requisition Details page. The Recruiting user can change the status to an appropriate non-99999 status and click the Reopen button.

## 18.32 The Creation and Updating of Job Requisitions with Requisition Triggers

When a vacancy is created at the position level in SAP org management, the requisition is not automatically created, but is queried. The requisitions template ID retained in the query is attached to the position and all attributes of the positions are extracted and extend to the requisition template using the field mapping.

The INFOTYPE 1107 (vacancy) is created and the requisition is created in SAP SuccessFactors via WebService API in the pre-approved Route Map state. When position attributes change in SAP HCM suite the INFOTYPE 1107

(vacancy) is marked for an update. A report runs and all positions with an INFOTYPE 1107 are selected and the corresponding requisition is updated.

Not all fields updated will be changed in SAP SuccessFactors with every update. See field update exceptions below.

- The title and extTitle will not be updated after the creation so the recruiter can advertise the jobs in with an externally facing title
  - sapPositionName will contain the HRIS job title and will be created and updated
- The listingLayout and extListingLayout will not be created or updated
  - sapJobDesc can be created and updated. Recruiters can use this information, if it's available, to update the advertised job description
- The originator is transferred during the initial transfer for job requisition data, but not updated. The SF USERID of the manager of the position can be defined as the originator, which means the customer can begin the approval process with the manager of the role. If this cannot be specified via OM, the API user may be defined as the originator, but all requisitions will be sent to a dummy user first in this case.
  - If a dummy user is required the customer can choose to have recruiting users login and assign the job requisition to the next person(s) in the workflow.
- The jobReqStatus is not defined explicitly on the job requisition XML, but is applied in SAP SuccessFactors Recruiting Management (Pre-Approved=0, Approved=1, Closed=2). This status cannot be customized. State is a required field when closing or reopening the job requisition. E.g `<urn:jobReqStatus>1</urn:jobReqStatus>`
- The status will only be considered when closing and reopening the job requisition. The statuses defined in the SAP Integration Scenario must be configured in the job requisition status picklist (SAPClosed, SAPReopened, SAPDeleted). For more information on updating job requisition status refer to below
- The dateCreated is only sent for the initial transfer. Contains the system date on which the requisition is created
- The dateClosed is only send when the job requisition is closed. Contains the system date on which the requisition is closed
- All other standard fields mentioned in the XML will be updated and created

#### → Tip

It is not possible to make an update in SAP that changes the Job Requisition Template. If you need to use a different requisition template, you need to close the vacancy in SAP first, and create a new one.

## 18.33 The Opening and Closing of Job Requisitions with Requisition Triggers

Information on opening and closing job requisitions.

If the Infotype 1107 Status changes (the SAP Target Status is different from the Current Status), the SAP SuccessFactors jobRequisitionStatus will also be changed. It is always necessary for the API query to define the

status to change a requisition to. Reopening a job requisition does not automatically open the job requisition in the state it was closed in.

#### ⚠ Caution

Closing and reopening requisitions the integration **requires** the latest update available on the SAP Portal. Do not attempt to reopen job requisitions if the update has not been installed.

If there is an attempt to reopen a job requisition which has not previously been approved, SAP SuccessFactors will send an error "Can't update the internal status to 1. Please change it to 0 to reopen the req." The integration cannot respond to this error. The update will fail. If clients report this error they should be prompted to install the update from the SAP portal to continue using the SAP Requisition Triggers.

## When Job Requisitions are Closed

- In SAP, if the Infotype 1107 State changes from Open to Closed, the API should send `<urn:jobReqStatus>2</urn:jobReqStatus>`.
- The job requisition becomes changed to a state of closed in SAP SuccessFactors.
- The following message is passed back to SAP: `Internal status changed from <old status> to <new status>`. For example:  
`Internal status changed from 0 to 2.`
- SAP stores the state the requisition was before it was closed.
- *Job Requisition Status*, a configurable field on the job requisition XML, becomes updated to a value of `SAPClosed`.

## When Job Requisitions are Reopened

- If the Infotype 1107 State changes back to Open, SAP will update `jobRequisitionStatus` with the value that was stored when the requisition was closed.
- *Job Requisition Status* becomes updated to a value of `SAPReopened`.
- The position will be reopened again in the pre-approved or approved state, as determined by the stored former state. In the case of a pre-approved requisition, this will be the route map step the requisition was closed in.

## 18.34 Posting a Requisition

You can post job requisitions to several locations.

With SAP SuccessFactors Recruiting, you can post requisitions to the following locations:

- Internal career site
- External career sites

- Private Postings
- Job boards
- Agencies

### 📘 Note

While posting a job, if any job requisition fields are empty or not appropriately mapped to [Recruiting Marketing](#) fields on the [Set Up Recruiting Marketing Job Field Mapping](#) page, validation messages suggest providing the required data to prevent job posting failures on the external or internal career sites.

To be posted successfully, the requisition can be a maximum of 500 KB. If a requisition exceeds this limit, it's usually due to media content like photos or videos. Try removing some of the content to make the requisition smaller in total size.

Recruiting Management doesn't support passing job tracking codes to third-party job boards, including Monster and eQuest.

### → Recommendation

Don't add additional required questions to existing requisitions. Any updates to the requisition also update the posting. Adding other questions to a job requisition prompts you with a message that they're modifying an existing posting. In addition, making a field added to an existing requisition required can cause conflicts when using multistage applications.

### 📘 Note

Whenever a candidate view or applies for jobs of different companies using the same instance of integrated SAP SuccessFactors Recruiting with Recruiting Marketing by opening multiple tabs within the same browser, the candidate has to sign in to the newly opened instance. As a result, all the other sessions get signed out, and only one company's instance remains open and signed in. This stops the candidate from incorrectly applying for other companies.

Hovering over the job requisition shows the [Job Postings](#) option that opens the [Job Postings](#) page and displays the number of posted jobs.

### View Job Posting Details

## Posting Type

The Internal and External postings types appear in all instances. In addition, the internal and external private posting types may be present depending on the instance configuration.

### Note

- On the Internal career site, the *Posted on* date on the *Jobtop Listing* page, and the *Posted* date fields on the job listing detail page are shown in the logged in user's timezone.
- On the External career site, the *Posted on* date on the *Job Listing* page, and the *Posted* date fields on the job listing detail page are shown in the browser timezone.

The *Posting Type* column shows the following job posting types:

- Intranet Posting
- External Career Site
- Internal Private Posting

- External Private Posting

The internal, external, and agency posting types labels are configurable in ► [Provisioning](#) ► [Managing Recruiting](#) ► [Job Requisition System Field Labels](#) ►. Configure the field labels for private postings in the Requisition XML.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

When a job is currently posted, there's a hyperlink icon. When clicked, this icon displays the direct link to the posting that the recruiting user can copy and distribute in e-mail or by other means.

There may also be a Copy URL link that automatically copies the direct link to the clipboard. This isn't supported in all browsers — for example, Firefox default browser security settings don't allow a Web application to access the clipboard, and so in that browser the Copy URL link isn't available.

| Job postings                                                                                           |                |                                                                                            |

| External Private Posting                                                                               | Not Posted     | MM/DD/Y                                                                                    |

Hyperlink Icon for Posted Job

## Posting Status

The posting status displays the present state of the job posting. The values are maintained automatically and display Expired, Posted, or Not Posted.

## Posting Start Date

The recruiting user can select a start date when the posting appears in the [Posting Start Date](#) field on any posting type.

Only requisitions in the approved state can be posted. It isn't possible to set up posting information on a preapproved requisition even for future-dated posting. It isn't possible to have a requisition immediately post automatically upon approval.

Posted requisitions must be indexed before they become searchable or available on the career site. The indexer runs three times an hour, so it can take anywhere from 1 to 30 minutes for the posting to appear. This isn't configurable.

If a candidate attempts to access the job posting before the posting being indexed (which could occur if the recruiting user sent them a direct link, for example), a warning message appears, stating: **This job cannot**

be viewed at this time. It has either been deleted or is no longer available for application. For more job opportunities, please click [here](#).

Recruiting users should post the job at least an hour before distributing it to candidates or third-party job boards. Posting the requisition to a third-party job board immediately after posting the job externally could mean that the link won't work during the highest-traffic period of exposure for that fresh posting.

## Posting End Date

On any posting type, recruiting users can select an end date when the posting ceases to appear in the [Posting End Date](#) field.

The posting dates don't display a timestamp but time is factored in. Postings begin at 12 a.m. on the posting start date, and end at 12 a.m., at the beginning of the selected expiration date. There's no way to configure a time to be visible or editable.

### Note

The corporate posting end date always takes precedence over the private posting end date.

## Posting Start and End Date

Posting start and end dates are displayed based on the user's time zone, as designated in ► [Admin Tools](#) ► [Manage Users](#) ►. You can't hide these columns from the job postings page.

## Last Modified Date and Last Modified By

The Last Modified information displays the details of the last change to the posting information. The values are maintained automatically.

You can track and report all posting activity in the JobReq Posting Audit History folder in Ad hoc Reports. The posting history isn't available in the job postings page user interface.

## Action

Once you specify the posting dates, select [Post Job](#) in the Action column. Once the posting dates have been saved, the button changes to [Remove Post](#). The [Remove Post](#) button is present even if the posting start date hasn't yet occurred or the posting end date has already passed.

There's no option to extend, repost, or renew the posting. The recruiting user must select [Remove Posting](#), adjust the dates, and select [Post Job](#) again to change posting dates.

### ⓘ Note

While reposting the jobs, if there's an error because incorrect values for country/region or state/province fields, refer to *Actions to Consider When ISO Code Changes for Country/Region or State/Province* for more details.

For more information on posting jobs using the agency portal, refer to *Recruiting Agencies*.

## Related Information

[Actions to Consider When ISO Code or Label Changes for Country/Region or State/Province \[page 1628\]](#)

## 18.34.1 Internal Posting

A recruiting user can post the requisition to the internal career site. There is a single internal career site, accessible to candidates via the Careers tab.

The internal career site posting option is available in all instances. No special XML configuration, or Admin Tools or Provisioning setup is needed other than proper baseline and Requisition XML configuration.

Jobs posted to the internal career site are only accessible to active SAP SuccessFactors users. If you have employees who you've chosen **not** to give SAP SuccessFactors user accounts, they can't access the internal career site.

For clients using SSO, where employees can only access the SuccessFactors system from within the client's network, it is not possible for employees to go home and access internally posted jobs from their home computer unless they have VPN.

Recruiting Marketing functionality such as site branding is not supported on internally posted jobs.

## 18.34.2 External Posting

A recruiting user can post the requisition to the external career sites.

The external career site posting option is available in all instances. No special XML configuration, or Admin Tools or Provisioning setup is needed other than proper baseline and Requisition XML configuration.

There can be multiple external career sites. When the requisition is posted externally, it posts to the Default site and to all microsites where the microsite filter criteria matches the requisition data. There is no way to pick and choose the microsites to which the requisition posts, or to post a job to a microsite while excluding it from the Default site or other microsites with filter criteria that match the requisition data.

## 18.34.3 Creating External Job Postings with SAP SuccessFactors Recruiting Posting

Post jobs to external jobs boards using Recruiting Posting.

### Prerequisites

- The [Enable Recruiting Posting](#) feature setting is enabled in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- The [Recruiting Posting Permission](#) permission enable you to see the [Job Board Posting – Recruiting Posting](#) section in the Job Postings area of a Job Requisition.
- [OData API Job Requisition Export](#) permission

### Context

The job requisition has to be posted externally on the career site before being posted to job boards. As a permissioned recruiting user, identify a Job Requisition that is ready for posting. Access SAP SuccessFactors Recruiting Posting functionality from within Recruiting Management as follows:

### Procedure

1. Go to ► [Admin Center](#) ► [Recruiting](#) ► [Job Requisition](#) ►.
2. Open [Job Postings](#).
  - Open the [Actions](#) menu for a job and select [Job Postings](#).
  - Open the Job Requisition detail view and select [Job Postings](#).
3. Click [Post Job](#) from within the [Job Board Posting – Recruiting Posting](#) section.
4. Select the [View Posting Details](#) option in the [Actions](#) drop-down to view the complete posting details associated with the corresponding job requisition. The [Language](#) drop-down lets you select your preferred languages.
5. After you click the [Post Job](#), you can either post the new job or manage the existing postings.
  - If the particular requisition hasn't already been posted to job boards with Recruiting Posting, you're redirected to a page where you can post the requisition using SAP SuccessFactors Recruiting Posting. This doesn't ask for you to switch context and sign in. Most of the information about the Job Requisition is prepopulated for you.

- If you used [Recruiting Posting](#) to post the particular job requisition to job boards, you're taken to a page for managing existing postings. This doesn't ask you to switch context and sign in. The job board details page shows the [Job Board Posting- Recruiting Posting](#) section that lists all the job boards the job is posted to.
6. Once you're done with the work within SAP SuccessFactors Recruiting Posting, you can navigate back to the Job Postings section of the particular Job Requisition within SAP SuccessFactors Recruiting Management without losing the context and without the need to sign in again.

## 18.34.4 Enabling Private Postings of Jobs

Enable private postings functionality to distribute a job to selected candidates in situations where the posting doesn't display in job search results. This functionality allows the requisition to have a candidate-accessible job posting page, but be omitted from search results.

### Prerequisites

You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Procedure

1. Configure the following fields in the Job Requisition template for internal and external private job postings:

```
<field-definition id="intranetPrivatePosting" type="bool" required="false"
custom="false">
  <field-label mime-type="text-plain"><![CDATA[Private Internal Posting]]></
field-label>
</field-definition>
<field-definition id="externalPrivatePosting" type="bool" required="false"
custom="false">
  <field-label mime-type="text-plain"><![CDATA[Private External Posting]]></
field-label>
</field-definition>
```

2. Configure read and write permissions for required user roles:

```
<field-permission type="read">
  <description><![CDATA[read access to 0 Role]]></description>
  <role-name><![CDATA[0]]></role-name>
  <status><![CDATA[pre-approved]]></status>
  <field refid="intranetPrivatePosting"/>
  <field refid="externalPrivatePosting"/>
  ...
  ...
```

```
</field-permission>
```

```
<field-permission type="write">
  <description><![CDATA[Write access to Recruiter]]></description>
  <role-name><![CDATA[R]]></role-name>
  <role-name><![CDATA[0]]></role-name>
  ...
  ...
  <status><![CDATA[approved]]></status>
  <field refid="agencyPosting"/>
  <field refid="intranetPrivatePosting"/>
  <field refid="externalPrivatePosting"/>
  <field refid="status"/>
  ...
  ...
</field-permission>
```

3. Go to [Admin Tools](#) [Manage Recruiting Settings](#) and select *Enable private postings of jobs*.

## 18.34.5 Post Externally Posted Private Jobs to the Job Boards

Recruiters can now post externally posted private jobs to job boards even though the job is not public to external corporate sites.

To post the externally posted private jobs to job boards, enable the *Allow recruiters to post the externally posted private jobs to the job boards* option in [Admin Center](#) [Manage Recruiting Posting](#) [Settings](#).

As a Recruiter, you can post jobs to job boards in one of the following ways:

- After posting the jobs to the external career sites, post the jobs to job boards.
- After enabling the *Allow recruiters to post the externally posted private jobs to the job boards* option, post the jobs directly on the job boards without posting them publicly on external career sites.

## Related Information

[Posting a Requisition \[page 302\]](#)

## 18.34.6 Configuring Job Requisition Template to Post Multilocation Job

The Multilocation Job Posting feature allows you to post a Job Requisition with multiple location values.

### Prerequisites

To use multilocation job posting feature, ensure that the following prerequisites are met:

- Access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- Multilocation posting only works with the standard Location Foundation Object field.

### Context

Following are the steps to configure multilocation values on the Job Requisition in Recruiting Management.

### Procedure

1. Go to [Provisioning](#) > [Edit Company Settings](#) > [Company Settings](#).
2. Select [Employee Central Foundation Objects](#).  
Foundation Objects are now ready to be used.
3. Verify that different Foundation Objects have been configured correctly by downloading the [Corporate Data Model](#). To do this, select [Succession Management Import/Export Corporate Data Model XML](#).
4. In the Job Requisition template, define the standard Location Foundation Object field with the attribute `multiselect="true"` as shown in the example snippet.

#### Sample Code

```
<field-definition id="location_obj" type="object" required="true"
custom="false" object-type="location" multiselect="true">
  <field-label><![CDATA[Location ]]></field-label>
  <field-description><![CDATA[Location]]></field-description>
</field-definition>
```

#### Note

Currently only the *Location* and *Position* fields support the attribute `multiselect="true"`.

You can now define a Job Requisition in Recruiting Management with multiple location values with this procedure.

### 18.34.6.1 Impacted Areas and Their Expected Behavior

The multi-location job posting has impacted several areas. This section allows you to understand the details on the expected behavior of these impacted areas.

| Feature                                                | Expected Behavior                                                                                                                                                                                                  |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Job Requisition Detail page                            | A Job Requisition can be defined with multiple location values.<br><br>One of the location values must be selected as a Primary Value.<br>By default, the first selected value is marked as the Primary Value.     |
| Job Requisition Summary Page - Location column         | If the logged in user is an operator in at least one Job Requisition with more than one Location value, the <i>Location</i> column shows the number of Locations rather than the name of the Location in all rows. |
| Job Requisition Summary Page - Filter options          | While filtering on Locations, currently, it is only possible to filter for Job Requisitions on the Primary Location value.                                                                                         |
| Recruiting Management-Recruiting Marketing Integration | Sends multiple location values across to the Recruiting Marketing.                                                                                                                                                 |
| Internal or External Site                              | These Recruiting Management pages currently support only the Primary Location value of the Job Requisition.                                                                                                        |
| OData                                                  | Supports multiple location values.                                                                                                                                                                                 |
| SFAPI                                                  | Does not support multiple location values.                                                                                                                                                                         |

| Feature                         | Expected Behavior                                                                                                                    |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Offer Detail                    | If the Offer Approval Location field has the source defined as Job Requisition, the Primary Value gets copied in the Offer Approval. |
| Position Management Integration | No change. It continues to work as-is for a single location field.                                                                   |

## 18.34.7 Automated Posting of Jobs on Job Boards (MVP)

Jobs posted to the external career site no longer need to be manually published to the job boards.

In Recruiting, you can automate posting of jobs across job boards through Recruiting Posting. Once posted on the external career site, the jobs are automatically posted to job boards based on the job board preselection, posting profile preselection, and field completion rules already set up in [Job Posting Rules](#).

Recruiting leverages the [Intelligent Services Center](#) (ISC) framework to trigger the automated posting of jobs. Using ISC, you can publish events from any SAP SuccessFactors application, and subscribe to these events. An event is a change that occurs in the SAP SuccessFactors HCM suite, such as posting the jobs on an external career site. Subscriber is aware of the change that happens within another application and automatically responds with a configured activity.

### Here's How the Automated Posting Works

When a job requisition is posted to an external career site, an event is published in SAP SuccessFactors. A subscriber available in Recruiting receives the event email notifications and acts on it based on the activity that you've configured for the event in Intelligent Services Center. The activities are referred to as flows in Intelligent Services Center. Configure a flow to set your business rules and time when to automatically post jobs on job boards. Note that if the start date is set to future-dated posting in Recruiting, then trigger automatically posts the job based on the delay set in days or weeks from the future date.

#### Note

The Automated Posting of jobs is released as a Minimum Viable Product (MVP). That is, it presents a certain number of limitations.

Consider the following MVP limitations:

- Automated posting works only on the first external posting of the job requisition. If the job is removed from the career site and posted again on the career site, then the job isn't automatically posted.
- Automated job posting isn't automatically reposted on job boards even though the job requisition is still open. For example, if a job requisition is open for 60 days and the duration of the posting on a job board is 30 days, then Recruiter have to manually repost the job on the job board. Use the Repost option in the [Job Posting Status](#) table of the job requisition to repost the jobs to job boards.

#### Note

If the start date of the job posting on the external career site is changed, automated posting considers this change. Other modifications on the job requisition, such as a change in the description isn't considered.

## 18.34.8 Automated Job Posting Removal from Job Boards

Job postings are automatically removed from the job boards when the job postings are withdrawn from the external career site, or when job requisition is closed or deleted.

Regardless of the recruiter's permission to Recruiting Posting, the job postings are removed from job boards when a Recruiter removes the job posting or closes the job requisition.

In Recruiting the status related to Recruiting Posting is updated in the Job Posting table when:

- Job Posting is removed from the external career site.
- Job Requisition is deleted or closed.
- Job Requisition is closed due to automatic disposition.
- Job Requisition is closed based on the configured business rules.
- Job Requisition is closed through the OData API.
- Job Posting is removed from the external career site through the OData API.
- Job Postings are removed in bulk from the external career site for different job requisitions.
- Multiple job requisitions are deleted or closed.

## 18.35 Schedule an Automatic Closure of Requisition

Conditions to trigger automatic closure of job requisition on final hire

### Procedure

1. Trigger the check to calculate remaining number of openings for job requisition whenever an applicant is moved to a status of prestart, hired, onboard, or employee.
2. If the remaining number of openings is found to be 0, trigger the automatic job requisition closure.
3. On job requisition closure, move all candidates from *New Application* and *In-Progress* statuses to *Requisition Closed* status. Do not move any application which belongs to the previously mentioned 4 status categories.

## 18.36 Deleting Requisitions

You can delete job requisitions.

### Prerequisites

- [Hide Delete Icon Inside Form](#) has been disabled in ► [Provisioning](#) ► [Company Settings](#) ►.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- [Disable delete button](#) is **not** selected in ► [Admin Center](#) ► [Form Template Administration](#) ► [Form Templates](#) ►.
- You have the ► [User Permissions](#) ► [Recruiting Permissions](#) ► [Delete Job Requisitions](#) ► permission.

#### ⓘ Note

If no permissions are granted for [Delete Job Requisition](#), the Originator can still delete pre-approved requisitions. However, any requisitions deleted after 1402 can be restored.

### Context

Administrators with mass delete job requisition permission can search for and delete Pre-Approved and Approved Job Requisitions in batches of 10, 25, 100, 500, and 1000.

### Procedure

1. Go to [Job Requisitions](#) page and select the requisition you want to delete.
2. In the [Job Requisition Detail](#) tab, click the  ([Delete Job Requisition](#)) icon.

The [Delete Job Requisition](#) confirmation dialog appears.

3. Choose your desired action in the [Delete Job Requisition](#) dialog, which displays different options depending on whether the requisition has candidates associated with it:

| Option                                | Description                                                                                                                                                                                                                                              |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>The requisition has candidates</b> | Choose one of these options, then click <a href="#">OK</a> : <ul style="list-style-type: none"><li>• Delete the job requisition and email applicants.</li><li>• Delete the job requisition without sending a system email alert to applicants.</li></ul> |

| Option                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| associated with it.                                   | <p>Alternatively, click <a href="#">Cancel</a> to cancel the delete request and return to the requisition's detail page.</p> <div> <p><b>Note</b></p> <p>If you choose to email applicants, the email will only go to actual applicants, and not to forwarded candidates.</p> <p>You can choose to configure a generic e-mail and send it to all candidates, including those who have been dispositioned from the job requisition, or you can choose not to email candidates automatically and use the multi-select status set feature to select the candidates you'd like to notify.</p> </div> |
| The requisition has no candidates associated with it. | Click <a href="#">OK</a> to confirm the deletion, or <a href="#">Cancel</a> to cancel the delete request and return to the requisition's detail page.                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Next Steps

You can restore deleted job requisitions in ► [Admin Center](#) ► [Restore Deleted Job Requisitions](#) ►. Refer to *Restoring Deleted Requisitions*.

## 18.37 Restoring Deleted Requisitions

Restore deleted requisitions and set up triggers to send email alerts when a deleted requisition is restored.

### Prerequisites

- You have the ► [Administrator Permissions](#) ► [Manage Recruiting](#) ► [Restore Deleted Job Requisitions](#) ► permission.
- If you want the option to send an email notification when a deleted job requisition is restored, first go to ► [Admin Center](#) ► [Recruiting Email Triggers](#) ► and configure the [Approved job requisition restored](#) trigger.

### Context

Restoring deleted job requisitions reinstates all active To Dos, including form routing approvals, offer approvals, and overdue interview assessments. The email from ► [Admin Tools](#) ► [System Email Notifications or Recruiting Email Notifications](#) ► that has already been sent for these tasks will be triggered again to alert the user.

If the interview is in the past, the Outstanding Interview Assessment email is triggered at a particular time depending on where the server is located. This gives you the chance to go and update the interview date to the present and send the current notification if you'd like.

There is no restore email alert for candidates. To alert candidates of a restored requisition, send an email manually.

## Procedure

1. Go to ► [Admin Center](#) ► [Restore Deleted Job Requisitions](#) ►.

The [Restore Deleted Job Requisitions](#) page appears.

2. Use the search fields to find the deleted job requisition.

You can search by user (by hiring manager or recruiter), or by requisition details, including requisition ID, job title, the person who deleted the requisition, or by deletion date range.

3. Select the deleted job requisitions you want to restore from the results, then select [Restore](#) in the upper-left of the search results.

The [Restore Jobs](#) dialog appears.

4. **Optional:** Choose [Send email notifications](#) in the [Restore Jobs](#) dialog to send a restoration alert email.
5. Select [Restore](#) to restore the deleted requisition, or [Cancel](#).

## 18.38 Use Job Profile Builder with Job Requisitions

While creating a requisition using [Browse Families & Roles](#), when the Recruiting user selects the appropriate family from the dropdown, the available job roles for that family are listed down. By selecting each role, user can preview the complete job profile information. This helps the Recruiting user to go through the job profile of each role before selecting the appropriate role and job code.

The job description will no longer appear under [Requisition Details](#) but under a new [Job Profile](#) subtab. This tab is available for Approved, Pre-Approved, and Closed requisitions. This subtab also includes the internal description, external description, competencies, and skills. If [Talent Intelligence Hub](#) is enabled, these four fields will be displayed on the [Job Requisition Details](#) page instead of the subtab.

The screenshot displays two views of the 'Job Requisition: Network Specialist' page. The left view shows a sidebar with 'Job Requisition' and 'Signature' tabs, and a main area with 'Job Requisition Detail' and 'Job Profile' tabs. The 'Job Profile' tab is highlighted with a red box. The right view shows the 'Job Profile' subtab selected, displaying fields for 'Internal Job Title' and 'External Job Title', both set to 'Network Specialist'. A 'Same as Internal' button is visible below these fields. The 'Job Profile' tab is also highlighted with a red box in the top navigation bar.

Users with **write** permissions to the `listingLayout` field can edit the sections of the job profile. For more details on permissions for `listingLayout` field, refer to *Configuring Job Requisition Template to Use Job Profile Builder* from **Related Information** section on this page.

You can edit the title and format of the overall section by clicking on the section heading. For library sections, you can also edit the library by clicking the section header. For text sections, edit the content by clicking directly on the section's text. Each individual section can be limited to the internal posting, the external posting, or both. It's possible to display sections to Recruiting users and not candidates.

#### Note

- For the job requisitions that use job profiles and are created after the 2H 2021 release, the H2 to H6 heading levels come from the job profile template. For existing job requisitions created before the 2H 2021 release and were using a job profile, the section titles have H2 heading levels by default. However, you can override the options based on your requirements, and the heading levels will be applicable for job postings.
- Changing the heading level won't change the content's appearance on the job requisition details or job posting but will only be beneficial for users who use screen readers to access the content.

The Recruiting user can also edit the library-based sections individually, such as Competencies or skills. When editing these sections, the corresponding library is displayed and the user can add additional items from the library. The user can also add additional sections, but the ability to edit or add sections isn't configurable by user permission. It isn't possible to allow only recruiters to add sections, but not hiring managers, for example.

#### Note

Enable the *Use Job Profiles in Requisitions* setting if you have permission to access all the competencies. Else, the competencies that you do not have access are not migrated.

#### Note

Changes made to library sections of the job profile don't affect the job profile library in Admin.

## Edit Roles on Job Requisitions

If the `jobRole` field is configured and permissioned in the job requisition template, users can select the *Update* option that is available to the right of the job role displayed at the top of the requisition. This action redirects them back to *Browse Families and Roles*, where they can select a new Family & Role. The new Family and Role values overwrite any existing job profile customization on the requisition. User sees a warning, asking them to confirm their selection of the Family/Role for the requisition.

For more details on permission for `jobRole` field, refer to *Configuring Job Requisition Templates to Use Job Profile Builder* from **Related Information** section on this page.

## Handle Existing Requisitions

For existing requisitions with a job description defined, the job description will move to the *Job Profile* tab and remain as is, once the Job Profile Builder Integration is enabled. Existing competencies will also move to the *Job Profile* tab.

In order to select roles for existing requisitions, the `layoutListing` and `jobRole` fields must be enabled and permissioned. When these fields are turned on, the user can select a job role for requisitions that don't have a role,

or select a new role for jobs with existing roles. These role selections will overwrite the existing job descriptions and competencies.

For more details on permissions for `layoutListing` and `jobRole` fields, refer to *Configuring Job Requisition Template for JPB* from **Related Information** section on this page.

## Manage Job Profile Templates

You can add new job profile templates or edit existing templates from ► [Admin Center](#) ► [Manage Job Profile Templates](#) ▾. You can also configure individual templates to show/hide sections on job requisitions.

To know more details about managing job profile templates, refer to *Job Profile Templates* from the **Related Information** section on this page.

## Data Migration and the Job Profile Builder Integration

- Importing requisitions through legacy data migration with a completed Role field and blank Job Description field causes the system to look up the job profile associated with that role and populate the Job Profile data onto the imported requisition.
- To import the jobRole during data migration, use the format “Family|Role” in the field (without quotation marks, without spaces next to the pipe).
- Importing requisitions with a single block of job description text in listingLayout is supported, even if the Job Profile Builder integration is enabled. The job description will appear in a single field on the Job Profile tab on the imported requisition.
- Requisitions created via the Succession Org Chart will populate the appropriate job role and associated job profile for the To-Be-Hired position used to initiate the requisition.

## 18.38.1 Additional Information on Using Job Profile Builder

Consider and understand the following information while using Job Profile Builder for your job requisitions.

### Additional Information

- The following functionality is not supported
  - SFAPI access to individual job profile sections (education, skills, competencies, etc.) on a requisition
  - Importing content into each Job Profile section separately on a requisition during requisition data migration
  - Creating a job requisition via the SFAPI or importing job requisitions through legacy data migration with a completed Role field and blank Job Description field is not supported.
  - Separate permissions for job profile template editing (layout/formatting) and job profile content
  - Ability to define how many levels of library information the recruiting users and candidates will see in the library sections of the job profile. Only one level (the name of the library item) of information is supported on the candidate facing posting.
  - Search functionality in Browse Families and Roles
- We recommended using the integration center to import job requisition data with a job role to create job requisitions with a relevant job profile.
- To use Competencies for job profiles, ensure to include the [Competencies](#) section in the job profile template, and include the [Competencies](#) field in the job requisition template. We recommend not having the competencies field on the job requisition as a required field. The [Competencies](#) field does not display on the job requisition details page but is only displayed on the job profile section.
- Job Role Tags can be used in combination with the Job Profile Builder
- Job Code Entity functionality can be used with the Job Profile Builder integration. The user browses Families and Roles and selects the desired job code. The Job Code Entity fields and job profile content populate onto the Requisition.

## 18.39 Configuring Recruiting YouCalc Widget

Configure the Recruiting YouCalc widget.

### Prerequisites

In Provisioning:

- [Enable YouCalc for Analytics](#) is enabled.
- [Enable YouCalc Model for Job Requisition](#) is enabled.
- Requisition XML is configured, loaded, and tested.

## → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

In system configuration:

- Users have *Manage Reports and Dashboards* permission.
- You've gone to ► *Admin Center* ► *Manage Dashboards* ► *Manage Standard Dashboards and YouCalc Files* ► *Add From SuccessStore* ► and added *Recruiting Model*.

## Context

The top of the requisition list page displays a graphical representation of requisition data.

## Procedure

1. ► *Admin Center* ► *Manage YouCalc Dashboards* ► *Upload New Dashboard* ►
2. Populate the following information:

| <i>Field</i>   | <i>Content</i>                                         |
|----------------|--------------------------------------------------------|
| Dashboard Name | Recruiting Metrics Bar                                 |
| Description    | Optional – enter anything                              |
| Dashboard Type | Recruiting                                             |
| Choose File    | Upload the latest version of the YouCalc Library file. |

## 18.39.1 Working with the Recruiting YouCalc Widget

The YouCalc widget is interactive, acting as a method to filter the requisition list to view only requisitions that meet certain criteria.

| <i>Metric</i>        | <i>Functionality</i>                                                                                                                                                                 |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Candidates Forwarded | Displays the number of candidates in the Forwarded or Invited to Apply statuses. Clicking filters the requisition list to only requisitions containing applicable candidates         |
| New Candidates       | Displays the number of applicants the viewing recruiting user has never clicked on. Clicking this filters the requisition list to only requisitions containing applicable candidates |

|                               |                                                                                                                                                                 |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Current External Requisitions | Displays the number of requisitions presently posted to the external career site. Clicking filters the requisition list to only applicable requisitions.        |
| Current Internal Requisitions | Displays the number of requisitions presently posted to the internal career site. Clicking filters the requisition list to only applicable requisitions.        |
| Average Days Open             | Averages the age of all Approved requisitions and shows the average on a scale of 0 – oldest. Users do not interact with this metric as a navigational element. |

Use the [Clear all filters](#) link to return to a non-filtered view of the requisition list.

The contents of the YouCalc widget are not configurable; the same metrics display for all clients. The widget is not permissionable. If enabled, it appears for all users with access to the requisitions tab.

## 18.40 Viewing the Change History of Job Requisitions

View changes made to job requisitions in audit trails.

### Context

#### ⓘ Note

This page describes functionality for the legacy Candidate Workbench.

### Procedure

1. From the Admin Center, go to ► [Recruiting](#) ► [Job Requisitions](#) ►.
2. Select the job requisition.
3. From the top-right corner of the page, choose ⓘ [Info about this form](#).

A separate, smaller window opens, with the change history information about the job requisition.

Change history displays the old and new value for the field labels, user information, and timestamp. The Source column lets you view whether the Job Requisition is updated using the user interface or OData API. The Source column also identifies and records the data created or updated through a business rule.

Source Column Description

| Source Value                                    | Description                                                                                      |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------|
| Job Requisition Details                         | Updates in standard or custom fields on the <a href="#">Job Requisition Details</a> page.        |
| OData                                           | Updates through OData API                                                                        |
| Job Requisition update from Job Profile Builder | Updates on the <a href="#">Job Profile</a> page.                                                 |
| Job Requisition Reassignment                    | Any Operator updates in the Reassign Job Requisition.                                            |
| Job Requisition update from Candidate Workbench | Status updates from candidate workbench                                                          |
| Auto close Job Requisition                      | Auto closure of a Job Requisition                                                                |
| OData Rule                                      | Updates through OData Rule.                                                                      |
| Delete Restored Job Requisition                 | When a job requisition is deleted and restored from <a href="#">Restore Job Requisition</a> page |
| SAP SuccessFactors Application                  | Updates to attachment                                                                            |

4. Close the separate window when you're done.

## 18.41 Tips for Troubleshooting the Default Language of a Job Requisition Template

defaultLanguage determines the default posting language of the job requisition template.

To know the default locale in the job requisition template, here's the hierarchy of steps to follow:

1. First, check the Job Requisition XML default locale definition.

```
<field-definition id="defaultLanguage" type="text" required="true" custom="false">
  <field-label><![CDATA[Default Language]]></field-label>
  <field-description><![CDATA[Default Language]]></field-description>
  <default-value>en_US</default-value> </field-definition>
```

2. If the expected default locale does not appear, then check the default language in ► [Admin Center](#) ► [Recruiting](#) ► [Manage Recruiting Languages](#) .
3. If the expected default locale still does not appear, then check the default company language in ► [Provisioning](#) ► [Company Settings](#) ► [Default Language](#) .

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### 📌 Note

The supported data Types for the default language are [Text](#) and [Text Area](#). Note that [Picklist](#) is not a supported data type for the default language.

## 18.42 Enabling Detailed Requisition Reporting Privileges

Enable the [Detailed Requisition Reporting Privileges](#) option, after which you can select fields for special filters and grant permissions on them.

### Prerequisites

You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

Use this feature in combination with Recruiting V2 Secured reports. V2 Secured reports usually allow people to report on data they have a specific relationship to, based on their recruiting role, such as recruiter or hiring manager. You can use [Detailed Requisition Reporting Privileges](#) to enable them to report on more data. For example, you can allow an HR Generalist supporting the Finance division to report on recruiting data for jobs they aren't directly involved in but only for the Finance division.

#### ⓘ Note

You can only display a maximum of 50 users at a time.

### Procedure

1. Go to ► [Provisioning](#) ► [Company Settings](#) ► and select [Recruiting V2 Secured](#).
2. Go to ► [Provisioning](#) ► [Recruiting Security Field Setup](#) ► and select the fields you want to be available as special filters.
3. Grant [Manage Detailed Requisition Reporting Privileges](#) permission to the appropriate permission roles.

## 18.42.1 Choosing Special Filters for Detailed Requisition Reporting Privileges

Define the values that selected users have access to in each special filter when running Recruiting V2 Secured reports.

### Procedure

1. Go to ► [Admin Center](#) ► [Recruiting](#) ► [Detailed Requisition Reporting Privileges](#) ►.
2. Look up a user or group of users.
3. Select the values in the [Permission](#) section to which the users should have access in each special filter when running Recruiting V2 Secured reports.

#### ⓘ Note

The RBP permission and Target Population permissions are not considered for the Generic Objects and Foundation Objects in the special filters section.

## 18.43 Reassigning a Job Requisition

Reassign job requisitions to other Recruiting users, if there's a change in assignment or a user becomes inactive. Requisitions pending approval are routed to the new [Currently With](#) approver upon reassignment.

### Prerequisites

You have ► [Manage Recruiting](#) ► [Reassign Job Requisitions](#) ► permission.

### Procedure

1. Go to ► [Admin Center](#) ► [Recruiting](#) ► [Reassign Job Requisitions](#) ►.
2. Select a requisition template or search for a job requisition by entering the requisition ID number.
3. Select the checkboxes for the requisitions you'd like to reassign, then choose [Continue](#).
4. Select the operator (or operators) to whom you want to reassign the requisitions, then choose [Reassign](#).

The operators and admin then receive an email notification of the reassignment.

If the Hiring Manager is changed in cases where Recruiting Teams are configured, and that Hiring Manager has preferences set for a Recruiting Team, those preferences populate into the operate fields on the reassignment

screen. You can keep or edit the Hiring Manager's team preferences after they've been applied. Team preferences for any operator applies by default. You can reassign multiple operators (for example, the Hiring Manager, Recruiter, and Sourcer) in one action.

## Next Steps

### ⓘ Note

Before you purge an originator of a pre-approved, approved, or closed job requisition as a part of the Master data purge, you should reassign the job requisitions to another originator. Go to ► [Admin Center](#) ► [Recruiting](#) ► [Reassign Job Requisitions](#) ► to reassign the job requisitions to an active originator.

When the requisition is assigned to a new user and is sent back to previous steps in a route map, you see the name of the old operator instead of the new one.

## 18.44 Recruiting Team Settings

In the Job Requisition XML, define **operatorTeam** fields that contain recruiting groups and multiple users to allow users to access a requisition record and the applicants on that record.

### Prerequisites

- Ensure that you have selected [Enable Recruiting Team Functionality](#) and [Configure and permission the operatorTeam fields](#) options in Provisioning.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- Ensure that you have [Manage Recruiting Team Settings permission](#).

Admin uses the Recruiting Team Settings to default values and settings on operator and operatorTeam fields.

### → Tip

The enhanced people search feature enables you to assign users along with their associated employments to default primary user and additional users fields of operatorTeams. The search prepopulates the Job Requisition (operator and operatorTeams fields) with the configured users along with their employment details.

The Team Recruiting functionality requires a thorough understanding of many different aspects of the Recruiting Management configuration. Be sure that you also understand Recruiting operators, Recruiting groups, field definitions in Job Requisition templates, and permissions in both Job Requisition and Job Application templates.

### ⚠ Caution

Candidate saved searches and job alerts that rely on that field configuration might cease to function, if the configuration is changed. Be cautious when removing or changing the picklists associated with a filter or field.

## Related Information

[Using Role-Based Permissions](#)

### 18.44.1 Job Requisition Element: Required

Some fields you configure as not required and available in most statuses can become required at a certain point in the status workflow. For such fields, add the `required` attribute to the `field application-field-id` element to specify that the ordinarily nonrequired field is required in that status.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

```
<field application-field-id="baseSalary" required="true"/>
```

## Related Information

[Job Requisition Element: Field Permission \[page 171\]](#)

### 18.44.2 Allow Upline Managers to Access Job Requisitions

Allow managers to access job requisitions that are associated with hiring managers downstream from them in the reporting hierarchy so that they can review them.

## Context

Generally, people only have access to requisitions they're directly associated with.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Team Settings](#) ► and select *Allow managers above Hiring Manager to have access*.

All users upline in the reporting hierarchy from the user listed in the **hiringManagerName (G)** field can access the requisition.

2. Add **GM+** to field permissions in the Job Requisition template and Application template.

If this permission isn't specified, the upline manager receives baseline permissions only (V operator).

### ❖ Example

```
<field-permission type="read">
  <description>
    <![CDATA[Hiring Manager and Upline Manager Access]]>
  </description>
  <role-name><![CDATA[G]]></role-name>
  <role-name><![CDATA[GM+]]></role-name>
  <status><![CDATA[pre-approved]]></status>
  <field refid="instrReqDetails"/>
  <field refid="id"/>
  <field refid="status"/>
</field-permission>
```

## 18.44.3 Adding Default Primary User

It's possible to prepopulate users in the short operator fields on the short requisition create page.

## Context

It's currently not possible to conditionally select the user that populates into the operator field, so this functionality is limited in usefulness. This functionality is useful in circumstances where all requisitions created from a particular template involve the same user. For example, you might have a **New Headcount** requisition template and you wish to have the CFO receive every requisition for approval. Otherwise, the hiring manager might not know who their recruiter is, so you could set the recruiter field up to populate to a recruiting coordinator, who then assigns the correct recruiter, removing the burden on the hiring manager.

## Procedure

1. Go to ► [Admin Center](#) ► [Recruiting](#) ► [Manage Recruiting Team Settings](#) ► and select a requisition template from the dropdown.
2. Select the operatorTeam field. For example, VP of Staffing.

3. Provide a value in the [Add Default Primary User](#) field.
4. Click [Save](#).

## 18.44.4 Adding Users to Recruiting Team

You can prepopulate users in the `operatorTeam` fields from the Admin Center.

### Context

The group-name constraint configured on the `operatorTeam` field doesn't apply during this setup. The admin can select any groups containing any active users, regardless of whether or not those users are included in the group-name constraint on the Requisition XML `operatorTeam` field.

Admin setup changes only apply to new requisitions created after the changes are saved. The existing requisitions aren't affected.

### Procedure

1. Go to ► [Admin Center](#) ► [Recruiting](#) ► [Manage Recruiting Team Settings](#) ► and select a requisition template.
2. Select the `operatorTeam` field.
3. Provide a value in the [Add Users to Team](#) field.
4. Select [Save](#).

### Related Information

[Group Name Attribute in Field Definition for Job Requisition \[page 169\]](#)

## 18.44.5 Adding Groups to Recruiting Team

You can prepopulate groups in the `operatorTeam` fields from the Admin Center.

### Context

The group-name constraint configured on the `operatorTeam` field doesn't apply during this setup. The admin can select any groups containing any active users, regardless of whether or not those users are included in the group-name constraint on the Requisition XML `operatorTeam` field.

Admin setup changes only apply to new requisitions created after the changes are saved. The existing requisitions aren't affected. Changes to the Recruiting Group definition, however, take effect on any requisitions that list that group as part of the `operatorTeam` field.

### Procedure

1. Go to ► [Admin Center](#) ► [Recruiting](#) ► [Manage Recruiting Team Settings](#) ► and select a requisition template.
2. Select the `operatorTeam` field.
3. Provide a value in the [Add Groups to Team](#) field.
4. Select [Save](#).

### Related Information

[Group Name Attribute in Field Definition for Job Requisition \[page 169\]](#)

## 18.44.6 Preventing End-Users from Changing the Default Recruiting Team Settings

Preventing the end-users from changing the default Recruiting Team settings. Permission the `operatorTeam` fields so that some recruiting users can edit the contents of the field to add or remove additional users. At the same time, it's possible to protect the admin-specified users and groups so that they remain unchanged.

### Context

Use the following configuration to lock down the admin-specified contents of `operatorTeam` fields.

## Procedure

1. Go to ► [Admin Center](#) ► [Recruiting](#) ► [Manage Recruiting Team Settings](#) ► and select a requisition template.
2. Select [Prevent end-users from changing admin's default settings](#) option.
3. Click [Save](#).

## 18.45 Editing and Importing a Question Library

Import a question library so that recruiting users can use it to select pre-screen questions on a job requisition.

### Prerequisites

[Question Object Management](#) is enabled in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Procedure

1. Prepare a Question Library import file in CSV format as shown in the table.

#### 📘 Note

Don't include a header row. Row 1 should be an actual question you wish to import.

Information to Include in a Question Library Import

| <i>Column</i> | <i>Content Type</i> | <i>Details</i>                                                                                                                                                                                         |
|---------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A             | Question Type       | Only four question types are presently supported: <ul style="list-style-type: none"><li>• QUESTION_MULTI_CHOICE</li><li>• QUESTION_NUMERIC</li><li>• QUESTION_TEXT</li><li>• QUESTION_RATING</li></ul> |

|   |                         |                                                                                                                                                                                                                                                                              |
|---|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| B | Category                | All questions must be placed in a category. Either a new or existing category can be used. The category value can be any alphanumeric string, preferably short.                                                                                                              |
| C | Parent Question         | <p>This is optional; only use when you intend to set up this row as a child question in a set of cascading questions.</p> <p>If used, specify the exact name of a question that already exists in the instance or is defined as a new question earlier in the file.</p>      |
| D | Name of Question        | Any alphanumeric string.                                                                                                                                                                                                                                                     |
| E | Description of Question | <p>Any alphanumeric string.</p> <p>Descriptions added for a question are visible to candidates only when RMK is not in use. This means the description text is visible for most of the <b>internal candidates</b> unless the internal Career Site Builder is configured.</p> |
| F | Valid Rating Scale ID   | <p>The exact name of a rating scale set up in the instance.</p> <p>Example:</p> <ul style="list-style-type: none"> <li>• Pre-Screen Rating Options</li> </ul>                                                                                                                |
| G | Answer Options          | <p>Use only for multiple choice questions. Specify a comma-separated list of values from which the applicant can pick.</p> <p>Example:</p> <ul style="list-style-type: none"> <li>• Yes,No,Maybe So,Probably</li> </ul>                                                      |

|   |                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| H | Expected Right Answer             | <p>Use for questions that have a right answer. Questions can only have a single right answer specified.</p> <p>Specify the right answer's place in the answer option list. The answer option list counts up from zero.</p> <p>If you have the question as a Multiple Choice type, define the expected answer in a numeric format. For example, if the answer options are Yes, No, and Maybe, then if the expected answer is No, the value added to the column should be 1. (0 for Yes, 1 for No, and 3 for Maybe).</p> <p>Multiple Choice Example - If the answer "Maybe" in the prior list is the right answer, then the expected right answer would be:</p> <ul style="list-style-type: none"> <li>• 2</li> </ul> <p>Numeric Example:</p> <ul style="list-style-type: none"> <li>• 150</li> </ul> <p>Rating Scale Example: - specify the rating scale number that is the right answer:</p> <ul style="list-style-type: none"> <li>• 4</li> </ul> |
| I | Expected Correct Answer Direction | <p>For numeric and rating scale questions, it's possible to specify that the right answer is "x or higher" or "x or lower". Allowable values, therefore, are:</p> <ul style="list-style-type: none"> <li>• higher</li> <li>• lower</li> </ul> <p>These should be lower-case when included in the import file.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| J | GUID for the Question             | Any alphanumeric value. Spaces and special characters should be avoided.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

K

Locale in which this copy of the question is translated

Any locale enabled in the instance in ► [Provisioning](#) ► [Company Settings and Admin Center](#) ► [Recruiting Languages](#) ►.

Example: en\_US

If translated questions are desired, define the question multiple times in the import file, using the same GUID each time but specifying a different locale value on each import row.

---

L

Parent Response

This is optional; only use when you intend to set up this row as a child question in a set of cascading questions.

If used, specify the answer the applicant needs to give to the parent question in order to reveal this row as a child question.

A child question can only be tied to a single right parent answer. This means if multiple parent answers need to reveal the child question, the child question actually needs to be set up multiple times in the library, once per right parent answer.

The Parent Response value must match exactly the Answer Option value (Column G).

Example: If Yes, No, Maybe, So, and Probably are the parent options, and if the expected correct response is Yes, then the value imported to the Parent Response (Column L) is Yes and not 0 as it would be for the Expected Right Answer (Column H).

You cannot modify the parent response, question description, and the name of the child question after importing the question library.

To modify the parent response, question description, and the name of the child question, delete the parent question from the [Admin Center, Question Libraries](#), and reimport it with modified data.

If the parent question is linked to a job requisition, first unlink it from the job requisition and then remove it from the [Admin Center, Question Libraries](#) to avoid data corruption.

---

Here's an example of a question library sample file.

|                       |                 |                                                                                                        |  |  |                                                                    |          |       |
|-----------------------|-----------------|--------------------------------------------------------------------------------------------------------|--|--|--------------------------------------------------------------------|----------|-------|
| QUESTION_NUMERIC      | Basic Screening | On a scale of 1-10, with 10 being the highest, how comfortable is your understanding of this position? |  |  |                                                                    | 8 higher | en_US |
| QUESTION_MULTI_CHOICE | Basic Screening | What percentage are you willing to travel?                                                             |  |  | Less than 25%,25-50%,50-75%,75%+                                   | 0        | en_US |
| QUESTION_NUMERIC      | Basic Screening | On a scale of 1-5, with 5 being the highest, rate your technical skills?                               |  |  |                                                                    | 0        | en_US |
| QUESTION_NUMERIC      | Basic Screening | On a scale of 1-10, with 10 being the highest, how competitive are you?                                |  |  |                                                                    | 0        | en_US |
| QUESTION_MULTI_CHOICE | Basic Screening | What is the highest level of education you have completed?                                             |  |  | High School,Some College,Associate's,Bachelor's,Master's,Doctorate | 0        | en_US |
| QUESTION_NUMERIC      | Basic Screening | On a scale of 1-5, with 5 being the highest, rate your presentation skills?                            |  |  |                                                                    | 0        | en_US |
| QUESTION_MULTI_CHOICE | Basic Screening | Are you able to perform the essential duties of the position for which you are applying?               |  |  | Yes,No                                                             | 0        | en_US |

2. Go to [Admin Center](#) [Import Question Library](#).
3. Select and import the CSV file you prepared, containing the questions you want to import.
4. To edit questions, go to [Admin Center](#) [Question Libraries](#).
5. Select [library](#) [optionally filter by Category](#) [select Question Name](#)
  - a. Edit Description to access the Rename feature.
  - b. Update Answer Format and answer details.

### Note

It isn't possible to manage cascading question parent-child relationships directly in the user interface. Parent-child setup may only be managed via question library imports.

When creating a multilanguage question library you have to assign a value (this value can be whatever you chose) for the GUID, then load all desired languages into the same import into a new library.

## Results

### ❖ Example

If you don't follow this configuration, you'll see an error similar to the following:

QUESTION:

System error encountered:

Line: [2], Import type: [QUESTION], Info: [LBI NL Library | Basic Screening | Heeft u een eigen bedrijf? | QUESTION\_MULTI\_CHOICE]

Line: [1], Import type: [QUESTION], Info: [LBI NL Library | Basic Screening | Heeft u op dit moment een concurrentiebeding? | QUESTION\_MULTI\_CHOICE]

Line: [3], Import type: [QUESTION], Info: [LBI NL Library | Basic Screening | Is er nog andere informatie over u waardoor u wellicht niet bij ons zou kunnen komen werken? | QUESTION\_MULTI\_CHOICE]

## 18.46 Creating and Editing Job Posting Header and Footer Templates

Create and edit Job Posting Header and Footer templates so they can be used to populate data onto a requisition that is visible to candidates viewing the job posting.

### Prerequisites

- You have selected recruiting languages in Admin Center.
- The [Enable Job Description Header and Footer](#) feature setting is enabled in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- You have [Manage Job Posting Header and Footer](#) permission.
- Additional configuration is required to allow end users to use the header and footer templates.

### Context

Generally, these templates are standardized and recruiting users want to pick from a pre-defined list rather than create a new set of header and footer text from scratch. The Job Posting Header and Footer section of Admin Tools allows the admin to set up templates with various sets of standardized text.

### Procedure

1. Go to ► [Admin Center](#) ► [Recruiting](#) ► [Manage Job Posting Header and Footer](#) ►.
2. Select ► [Take Action](#) ► [Edit or Create New Content](#) ► to open a template for editing.
3. In each template, the admin can specify the following:

| Option         | Description                                                                                                                                                                  |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>    | Name appears in several places in the user interface. This value may include spaces. Special characters should be avoided.<br><br>Once this is created it cannot be changed. |
| <b>Locale</b>  | Used to switch between languages so the admin can provide translated contents for text.                                                                                      |
| <b>Filters</b> | These fields populate from ► <a href="#">Provisioning</a> ► <a href="#">Internal and External Applicant Search Settings</a> ►.                                               |

| Option                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                  | <p>Values set in these filters on the template are compared to the values set in the filter fields on the requisition when a recruiting user selects a template. The template that has the most matching values appears as the [Recommended] template.</p> <p>If some templates are equal in the number of matching values, or if all templates are equally mismatched, the top alphabetized template appears as the [Recommended] template. There is no way to disable the [Recommended] functionality.</p> |
| <b>Internal Header</b>           | This is the text the internal candidates will see at the top of posted jobs.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>External Header</b>           | This is the text the internal candidates will see at the bottom of posted jobs.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>(Header) Same as Internal</b> | Check this box to cause the text from the internal field to populate into the external field. This functions the same way as the "Same as Internal" button on the requisition.                                                                                                                                                                                                                                                                                                                               |
| <b>Internal Footer</b>           | This is the text the external candidates will see at the top of posted jobs.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>External Footer</b>           | This is the text the internal candidates will see at the bottom of posted jobs.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>(Footer) Same as Internal</b> | Check this box to cause the text from the internal field to populate into the external field. This functions the same way as the "Same as Internal" button on the requisition.                                                                                                                                                                                                                                                                                                                               |

## 18.47 Using Set Up Job Board Options

The allowable values for the industry, country/region and state/province fields on the requisition are set up using [Set Up Job Board Options](#).

### Prerequisites

You have the [Set Up Job Board Options](#) role-based permission.

### Procedure

1. Go to ► [Admin Center](#) ► [Recruiting](#) ► [Set Up Job Board Options](#) ►.  
You have options to configure [Industry Values Set up](#) or [Country/Region and State/Province Values Set up](#).
2. Choose [Industry Value Set up](#).

The options configured here map to the `industry` field in the Requisition XML. As an admin user, you can configure the industries applicable to the customer's business. The selected fields appear in the dropdown list when the `industry` field is shown or edited on the Job Requisition XML.

3. Choose [Country/Region and State/Province Values Set up](#) to configure the list of countries/regions and states/provinces.

The option [All](#) displays the complete list of countries/regions and states/provinces on the Job Requisition Details page. Choose [Custom Select](#) if you want to restrict the list. Search for countries/regions by name or two-digit code and add them to the list.

When a country/region is selected, all states/provinces in that country/region are available by default. If you don't need all states, take the additional step of selecting only the desired states/provinces within a selected country/region.

4. Select [Finish](#) and save your changes.

## 18.48 AI-Assisted Skills Validation for Job Requisition

Validate skills that the AI-assisted skills validation feature extracted from a job description and include them as a job requirement. Recruiters can categorize a job's critical skills and hire applicants who are the best fit for the job based on their skills match.

Recruiters can modify and adjust the skills in a job description to increase the accuracy and overall quality of the skills and help recruiters or hiring managers find candidates with the required skills. Recruiters can:

- Identify primary and secondary skills in a job description to find candidates who are the best fit for the job according to their skills matching the required skills for the job.
- Add, remove and save skills in job to control the visibility of the skills listed in the job posting on the career site. In the [Application Management](#), the skills validated in the job requisition are listed as [Primary](#) and [Secondary](#) skills in the [Skills Compatibility](#) section to show how many applicants' skills match those identified in the job requisition.

### 18.48.1 Validating Skills in a Job Description

Recruiters can categorize a job's critical skills and hire candidates who best fit the job based on skill match.

#### Prerequisites

- Enable either or both of the following settings in [Admin Center](#):
  - [Assisted Applicant Screening](#) in [AI Services Administration](#) > [Feature Settings](#) > [Recruiting](#)
  - [Assisted Job Skills for Career Site Builder](#) in [AI Services Administration](#) > [Feature Settings](#) > [Recruiting](#)
- Ensure you have the following permissions:
  - If you are using Job Profile Builder, set the read and write permission to true for the `listingLayout` field permission.

- If you're using Job Description Manager, set the read or write permission to true for the `listingLayout` or `extListingLayout` field permission or both.

### Note

Job Profile Skills and Competencies are not required to use this functionality. Skills in [Manage Skills](#) are not pulled from custom libraries (Job Profile Builder skills and competencies) but are AI-extracted using a universal taxonomy. For instance, "Self Motivation" might appear in extracted skills even if not in the Job Profile Role or your custom skills library. The AI analyzes all the externally or internally posted fields and sections of the job profile using Natural Language Processing to identify skills. If the "Skills" section is configured, the system will attempt to extract skills from its content. For example, even if your custom library lists "Initiative & commitment," the AI might extract "Self Motivation" instead.

## Context

Recruiter can:

- Review the AI-extracted skills from the job description and include them as required job skills.
- Search for skills based on the relatedness of the skills from the job description.
- Add up to 100 skills that are relevant to a job.

After you validate the skills, you can view the number of skills from the job requisition that matched an applicant's skills in the [Skills Compatibility](#) tab on the [Applicant Management](#) workbench.

## Procedure

1. Choose the [Manage Skills](#) option on the [Job Profile](#) to view AI-extracted skills listed as [Primary](#) and [Secondary](#) skills on the [Manage Skills](#) page. When Job Profile Builder is not enabled, you can access the [Manage Skills](#) option from the [Job Requisition Details](#) page.

### Note

You can manage skills if you have edit permissions for the job description. If you have read permissions for the job description, you can only view skills using the [View Skills](#) option.

2. Accept the acknowledgment message before viewing the AI-extracted skills.
3. Review the listed skills and, if necessary, make changes to the already marked primary and secondary skills using the [Mark as Primary](#) option.
  - Primary skills - Skills required for a job.
  - Secondary skills - Complementary skills that enhance job performance but are not required for a job.
4. Add more skills in addition to the AI-extracted skills to the job description using the following options:

### Note

Until you save the skill set, any change to the job description content updates the AI-extracted skills listed on the [Manage Skills](#) page.

- Search Skills - Lets you search skills from the universal skills taxonomy to make it a skill required for a job.
- Suggest Skills - Lists the skills extracted from the job description using the Natural Language Processing technique or based on the relatedness of the skills added on the [Manage Skills](#) page as per the universal skills ontology.

### Note

By default, the skill is added as a primary skill when you add a skill either from [Search Skills](#) or the [Suggest Skills](#) option. You can change skills to secondary based on the job requirement.

Hovering over a resume icon in the [Source](#) column for a skill displays the phrase and where the skill is extracted from. The source can be either suggested by the universal taxonomy or extracted from a job description. If a skill is extracted from a job description, the source is displayed as [Extracted from job description](#).

If the job description is updated, the skills extracted from the new job description are displayed in addition to the suggested skills. Note that the AI-extracted skills you removed on the [Manage Skills](#) page while validating the skills are also listed.

### Note

Until you save the skill set, any change to the job description content updates the AI-extracted skills listed on the [Manage Skills](#) page.

## Next Steps

The validated skills can now be used to recommend jobs to candidates on your career site. To enable that in Career Site Builder, go to ► [Layouts](#) ► [Search Results](#) and select the [Enable AI-Assisted Skills Matching for Resumes](#) option.

# 19 Advertising Jobs with SAP SuccessFactors

There are many ways to advertise a job requisition, once it's been approved. With SAP SuccessFactors Recruiting you can build a career site, distribute job postings to external job boards, leverage an employee referral program, and work with recruiting agencies.

## Know Before You Start

- Most organizations use Career Site Builder to create and manage career sites. Some use the Careers Portal tab instead, especially for private postings that aren't possible in Career Site Builder.
- To make a career site (powered by Career Site Builder) available to internal candidates, first set up your SAP SuccessFactors system to use the SAP Cloud Platform Identity Authentication Service. Otherwise, it's only available to external candidates.
- Many customers use Recruiting Posting to distribute job postings to external job boards.
- When you set up integration with a new Recruiting Posting instance, be sure to disable any existing Web Service integration configured for the Job Marketing feature.
- To use the Employee Referral feature, jobs must be posted on the internal career site or career portal, as well as externally.
- You can create a separate portal for recruiting agencies so external recruiters can view and manage candidates for job requisitions open for agency access.

## Leading Practices

- Use XML feeds to distribute jobs in mass to job boards or compliance networks so that recruiters don't need to remember to do it during the recruiting process.
- You can test and validate most of the recruiting processes in your staging instance, including career sites and job posting. There are only a few things you can't test until after going live in production, such as pushing a job to external job boards.
- You can use a mixture of advertising channels to distribute jobs, like Recruiting Posting, XML feeds, social media feeds, and direct postings.
- Use Campaign URL Builder when possible, to track your sources and/or campaigns when posting outside of normal channels.

## 19.1 Career Sites for SAP SuccessFactors Recruiting

Information about setting up and maintaining career sites with SAP SuccessFactors Recruiting.

A **career site** is a website where organizations post open jobs. External and internal candidates can use the career site to find and apply for jobs, create a profile, and subscribe to job alert notifications.

With SAP SuccessFactors Recruiting there are two ways to create a career site:

- Career Site Builder (recommended)
- Career Portal

### Related Information

[Career Site Builder \[page 343\]](#)

[Career Portals \[page 688\]](#)

## 19.2 Career Site Builder

Career Site Builder is the recommended method for managing career sites with SAP SuccessFactors Recruiting.

With Career Site Builder, you can build a career site that matches your brand, with a responsive display that's optimized for different devices. You can adjust the colors, images, headers, footers, content, and layout.

Use Career Site Builder to:

- Manage sourcing and candidate engagement in one platform.
- Make multichannel job postings.
- Integrate with social networks.
- Set up a career site that's adapted specifically for mobile devices.
- Set up an internal career site for your employees.
- Capture dynamic source data for performance analytics.
- Search for jobs using keyword search, map-based search, and featured job search.

## 19.3 Implementing Career Site Builder

Here's an overview of the implementation process for Career Site Builder.

| Task                                                                                                                                                                                                                                                                                                                                                                                                                                            | Description                                                                                                                                                                                                                                                                                                                             |

#### [Setting Up a Career Site Builder Project \[page 346\]](#)

Implementation partners typically perform this initial setup after the handoff from Sales, and request access to the SAP SuccessFactors Recruiting system and tools related to Career Site Builder.

#### [Using the Recruiting Command Center \[page 347\]](#)

Use the back-end Command Center system to control customer instances and to configure site-wide settings for career sites.

#### [Integrating Career Site Builder with SAP SuccessFactors Recruiting \[page 360\]](#)

Career Site Builder is a standalone application must be integrated with the rest of SAP SuccessFactors Recruiting.

#### [Configuring Social Apply \[page 396\]](#)

The Social Apply functionality in Career Site Builder enables the displaying of links so that candidates can apply for jobs through their social networking profiles.

#### [Configuring Multiple Applicant Tracking Systems \[page 401\]](#)

The Multiple Applicant Tracking System capability allows customers to use other Applicant Tracking System (ATS) tools in addition to SAP SuccessFactors Recruiting with Career Site Builder. This capability allows the organization to combine their jobs from other ATS on the same Career Site Builder career site.

#### [Adding Initial SSL Certificate for New Public Career Site \[page 403\]](#)

Implementation partners should use *SSL Certificates* in Career Site Builder to get and install the initial SSL certificate as part of setting up a career site for a new organization.

#### [Candidate Workflow from SAP SuccessFactors Recruiting to Career Site \[page 405\]](#)

There are several areas to redirect from SAP SuccessFactors Recruiting pages to the Career Site Builder home page.

#### [Removing Partner and Consultant Access from Provisioning and Command Center \[page 406\]](#)

You can choose to remove access by an implementation partner or consultant to both Provisioning and Command Center at any time.

## 19.3.1 Setting Up a Career Site Builder Project

Implementation partners typically perform this initial setup after the handoff from Sales, and request access to the SAP SuccessFactors Recruiting system and tools related to Career Site Builder.

### Prerequisites

You have access to the following:

- SAP SuccessFactors HCM BTP Operations Portal
- SAP Partner Edge

### Procedure

#### 1. Perform in the HCM BTP Operations Portal:

- a. Log in to the SAP SuccessFactors HCM BTP Operations Portal.

The Welcome to the SAP SuccessFactors HCM BTP Operations Portal page appears.

- b. Go to ► [OPERATIONS REQUESTS](#) ► [REQUEST FORMS](#) ► from the portal's Welcome page, and select [RMK Site Manager Assignment](#).

The RMK Site Manager Assignment Request form appears. If you don't have both C\_THR83 and C\_THR84 Recruiting certifications, the Certification Required dialog appears, with information on certifications.

- c. Complete and submit the RMK Site Manager Assignment Request form for the Stage/Preview instance.
- d. Complete and submit the RMK Site Manager Assignment Request form a second time, for the Production instance.

#### 2. Perform in SAP Partner Edge:

- a. Log in to Partner Edge.
- b. From the top menu, select ► [Products](#) ► [HR and People Engagement](#) ► [SAP SuccessFactors Recruiting](#) ►.

The Explore SAP SuccessFactors Recruiting page appears.

- c. Select [Implementation Assets for Recruiting Marketing/Career Site Builder](#).
- d. Send the job delivery intake documents listed in the *Job Distribution for SAP SuccessFactors Recruiting Marketing – Send to Customer* section of the page to your customers.

Make sure that your customer completes the Job Distribution Sources tab in the *SAP SuccessFactors Recruiting Candidate Experience Career Site Builder Configuration Workbook*. The workbook maps out all of the current sources that they're using as part of their job distribution and online sourcing strategy.

## 19.3.2 Using the Recruiting Command Center

Use the back-end Command Center system to control customer instances and to configure site-wide settings for career sites.

### Prerequisites

You have the following information for the organization:

- Credentials for the Stage Command Center
- Credentials for the Production Command Center

#### Note

As a customer, you don't have access to Command Center. To complete tasks in Command Center, contact your implementation partner or your Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

Command Center allows you to see all the sites you have permission to view.

This topic outlines things you can do in Command Center. For detailed information on how to log into Command Center and use its functionality, refer to *The Backend Recruiting Command Center*.

### Procedure

- Use the Site Management section to view and configure site information:

| Option                   | Description                                                                                                                                                                                                                                                                                                                            |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Site List page</b>    | The Site List page lets you filter on a number of fields to locate your customer's site. It includes direct links to Career Site Builder, the career site, as well as Advanced Analytics.                                                                                                                                              |
| <b>Site Details page</b> | The Site Details page, which appears when you select a site, lets you enable the career site, Career Site Builder, and Multiple ATS options. You can view logs related to jobs and processes, and deactivate all jobs to perform a "hard reset" after you add or change job field mapping, or a field on the job requisition template. |

- Use the Feed Management section to view and configure all the settings for a job feed:

| Option                   | Description                                                                                                                                                                         |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Feed List page</b>    | The Feed List page displays all feeds for all the sites you have permission to view. This view allows you to create a new feed, run a feed test (preview), delete a feed, and edit. |
| <b>Feed Details page</b> | The Feed Details page allows you to view and configure all the settings for a feed. This page displays when you create or edit a feed.                                              |

## Related Information

[The Backend Recruiting Command Center \[page 348\]](#)

[Recruiting Advanced Analytics \[page 1474\]](#)

[Accessing the Command Center \[page 349\]](#)

### 19.3.2.1 The Backend Recruiting Command Center

Recruiting Command Center is a back-end system, similar to Provisioning, that implementation partners and Technical Support can use to control customer instances and configure site-wide settings for career sites.

#### Note

As a customer, you don't have access to Command Center. To complete tasks in Command Center, contact your implementation partner or your Account Executive. For any non-implementation tasks, contact Technical Support.

Functions of the Recruiting Command Center include:

- A link to Career Site Builder – if a legacy career site doesn't have Career Site Builder enabled, you access an admin-only subset of pages to perform some functional configurations.
- A link to Recruiting Advanced Analytics.
- A link to Recruiting Advanced Analytics Admin.
- A link to the public career site.
- Manage sites.
- The ability to activate and deactivate a Career Site Builder site.
- The ability to enable or disable Career Site Builder for a site.
- The ability to enable or disable Multiple ATS.
- View and update folder names.
- Export automated process logs – the functionality of the site maintenance viewer in the legacy Command Center.
- Export all jobs in a CSV-format file.

Recruiting Command Center has two environments: Stage/Preview and Production. Stage/Preview is used for building a career site before it goes live in the Production environment. The URLs to access these environments vary depending on which data center houses the site, but all use the following format:

- **Stage/Preview** – `https://bizx<Data Center>.stage.jobs2web.com/commandcenter`

For example, the Stage/Preview URL for Data Center 12 would be `https://bizx12.stage.jobs2web.com/commandcenter`.

- **Production** – `https://bizx<Data Center>.jobs2web.com/commandcenter`

For example, the Production URL for Data Center 12 would be `https://bizx12.jobs2web.com/commandcenter`.

## 19.3.2.2 Accessing the Command Center

Sign into the Command Center.

### Prerequisites

- Know your Command Center URL.

#### 📘 Note

The Command Center URL is composed of the Recruiting Marketing data center URL plus the path `/commandcenter`.

For example:

- Stage: `https://bizx23.stage.jobs2web.com/commandcenter`
- Production: `https://bizx23.jobs2web.com/commandcenter`

[Recruiting Marketing Data Center URLs \[page 363\]](#)

- **SAP employees** – if you're an SAP employee with an I or D number, you're prompted to perform two-factor authentication when you try to log in to Command Center. For this reason, install the SAP Authenticator mobile application from the Apple App Store or Google Play before you try to log in.
- **Implementation partners** – if you're an implementation partner with an S number, you need to obtain permission through the SAP SuccessFactors HCM BTP Operations Portal to be able to access Command Center. In the portal, go to ► [OPERATIONS REQUEST](#) ► [REQUEST FORMS](#) ►. Under *RMK Requests*, select *RMK Site Manager Assignment* to fill out and submit the form.

### Context

Logins are restricted to persons with an I, D, or S SAP number, and who have permission to access Command Center.

#### 📘 Note

As a customer, you don't have access to Command Center. To complete tasks in Command Center, contact your implementation partner or your Account Executive. For any non-implementation tasks, contact Technical Support.

## Procedure

- **Command Center:**

Go to the appropriate Command Center URL and enter your login credentials when you see the Recruiting Command Center Log On page:

| Option                                                                                                                                                                                                                                                                                                                                                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## 19.3.2.3 Command Center Navigation

The SAP SuccessFactors Recruiting Command Center provides a standardized interface to monitor and manage career sites, job feeds, and sources.

The Command Center includes the following major sections, which you navigate to from the dropdown list at the top of the page:

- Site Management
- Feed Management

The top right identifies the name of the person logged in to Command Center in the following format: *Welcome, <First Name> <Last Name>*.

Choose the  (log) icon on the top-right corner of the page to log out of Command Center.

## 19.3.2.4 Command Center Site Management

The Site Management section of Command Center lets you see and configure sites.

To navigate to the Site Management section of Command Center from other areas, select *Site Management* from the dropdown list at the top of the page.

### 19.3.2.4.1 Command Center Site List Page

Logging in to the Recruiting Command Center takes you its main Site List page, which displays all the sites you have permission to manage.

Use the Site List page to navigate through the Command Center for site-related actions. The top portion displays several fields you can specify to filter the list of sites you see on the page.

Site List Columns

| Column                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Site ID</i>             | The ID number assigned to the site.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <i>Site Name</i>           | The name of the site. Selecting the name takes you to its Site Details page.                                                                                                                                                                                                                                                                                                                                                                                    |
| <i>Site Status</i>         | Indicates whether the career site is active or not. This setting is set in the Site Details page's <i>Active</i> field.                                                                                                                                                                                                                                                                                                                                         |
| <i>Career Site Builder</i> | Selecting the  icon opens the site's Career Site Builder, regardless of whether Career Site Builder is enabled for the site.<br><br>If Career Site Builder isn't enabled for a site, you're given access to a subset of Career Site Builder pages that are designed to allow you to configure site settings. Refer to <i>Career Site Builder Admin-Only</i> for information. |

| Column                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### 19.3.2.4.2 Command Center Site Details Page

When you select a site from the Command Center's main Site list page, Command Center takes you to the Site Details page, where you can configure some settings.

#### Note

As a customer, you don't have access to Command Center. To complete tasks in Command Center, contact your implementation partner or your Account Executive. For any non-implementation tasks, contact Technical Support.

Use the Site Details page to set some configurations as well as export files for a site.

Any changes you make to the settings on this page require you to choose [Save](#) at the bottom right of the page.

You can log out of Command Center from this page by choosing  [log](#) on the top right of the page.

The Site Details page includes the following links:

#### Site Details Links

## Related Information

[Career Site Admin Settings in Career Site Builder \[page 683\]](#)

[Restoring All Jobs After a Hard Reset \[page 354\]](#)

### 19.3.2.4.3 Restoring All Jobs After a Hard Reset

When you run the [Inactivate All Jobs](#) option to perform a "hard reset" after you add or change job field mapping, or a field on the job requisition template, restore all the jobs so that they appear on the career site.

## Context

You perform these steps in both Provisioning, as well as in Command Center.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Procedure

1. Log in to Provisioning and go to [Manage Scheduled Jobs](#).
2. Find and submit [RMK Job Sync](#).
3. Select ► [Actions](#) ► [Run It Now](#) ►.
4. Return to Command Center.
5. Go to the site's [Site Details](#) page and select [Export Automated Process Logs](#).

The log lets you verify that the jobs have been reactivated.

6. Select Export Jobs to CSV from the same Site Details page to verify that the field changes appear in the jobs.

Additionally, you can check the career site to see whether the reactivated jobs are available.

### 19.3.2.5 Command Center Feed Management

The Feed Management section of Command Center lets you view, manage, and run job feeds for different sites, as well as maintain the sources you feed your jobs to. Feed Management creates and publishes the XML document lists of jobs that are syndicated to various job aggregators and job boards. Feeds are generated on demand and reflect job content at the time of generation.

Users can schedule the delivery of XML feeds, rather than manually sending them out through Command Center. Feeds are constructed from source templates. A source template defines the XML format that a specific aggregator requires to syndicate jobs. The source template contains tokens, which are variables replaced when the feed is generated.

To navigate to the Feed Management section of Command Center from other areas, select [Feed Management](#) from the dropdown list at the top left of the page.

## 19.3.2.5.1 Command Center Feed List Page

The Feed List page displays all feeds belonging to all the sites that a user has permission to view.

For example, if you can access five sites, the Feed List page displays the feeds belonging to all five sites in one view. This view allows you to create a new feed, run a feed test (preview), delete a feed, and edit.

### Command Center Navigation Path to Feed List

► [Recruiting Command Center](#) ► [Feed Management](#) ► [Feeds](#) ► [Feed List](#) ►

### Feed List Details

The row of search filters at the top of the page allow you to narrow the list of feeds you see on the page using the following fields: [ID](#), [Feed Name](#), [Feed Status](#) (dropdown menu), [Site Name](#), and [Source](#) (dropdown menu).

Selecting [+ Add Feed](#) on the far right of the search filters opens a blank Feed Details page for you to add a new feed.

Feed List Columns

| Column                                                                              | Description                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ID</a>                                                                  | The ID number assigned to the feed.                                                                                                                                                                                                                                                                  |
| <a href="#">Feed Name</a>                                                           | The name of the feed. Selecting the feed name takes you to its <a href="#">Feed Details</a> page. When longer feed names are truncated in this column, you can see its full name by hovering over it.                                                                                                |
| <a href="#">Feed Status</a>                                                         | Indicates whether the feed is active or inactive. Turn on this setting in the <a href="#">Activate Feed</a> field in the feed's <a href="#">Feed Details</a> page.                                                                                                                                   |
| <a href="#">Site Name</a>                                                           | The name of the site that you want the feed to be associated with.                                                                                                                                                                                                                                   |
| <a href="#">Source</a>                                                              | The source used for the feed.                                                                                                                                                                                                                                                                        |
| ►► <a href="#">Run Feed</a>                                                         | Prompts the Run Feed dialog, where you can specify an option for running a feed. The options are: <ul style="list-style-type: none"><li>• <a href="#">Debug Feed</a></li><li>• <a href="#">Debug Rules</a></li><li>• <a href="#">Run Full Feed</a></li><li>• <a href="#">FTP Full Feed</a></li></ul> |
|  | Prompts a delete confirmation dialog.                                                                                                                                                                                                                                                                |

## 19.3.2.5.2 Command Center Feed Details Page

The Feed Details page allows you to view and configure all the settings for a feed.

### Command Center Navigation Path to Feed Details

In the Command Center, go to ► [Feed Management](#) ► [Feeds](#) ► [Feed List](#) ►, then select a feed, or select + [Add Feed](#) from the top of the page.

### Feed Details Settings

The top section of the Feed Details page shows the basic settings for the feed.

| Field         | Description                                                                                                                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name          | The name of the feed. When you save a new feed page, the feed's title changes from <a href="#">Feed Title</a> to the name you enter here.                                                                                                                                                             |
| Source        | The dropdown list you use to select a source to associate with the feed. After you select a source, the <a href="#">TOKENS</a> section on the page becomes populated with the tokens associated with the source.                                                                                      |
| Feed ID       | A read-only system-generated ID, assigned after you save a new feed. While you're initially creating a feed, this field shows a value of 0.                                                                                                                                                           |
| Site          | The dropdown list of all the sites that the user has permission to access.                                                                                                                                                                                                                            |
| Activate Feed | A slider that activates or disables the field. This field is set to <a href="#">NO</a> by default when you first create the feed. Set it to <a href="#">YES</a> to activate the feed.                                                                                                                 |
| Internal Feed | This field is only visible if a site is configured as an internal career site powered by Career Site Builder. A slider lets you specify whether you want the feed to only be populated with internal job postings. This field is set to <a href="#">NO</a> by default when you first create the feed. |

### Tokens

The [TOKENS](#) section is empty until you select a feed source in the [Source](#) field, where the source has been configured to include header or feed tokens as part of its feed. The section continues to remain empty if there are no header or feed tokens associated with the source you choose.

Tokens are the base data unit of a feed. A source defines the format of the feed, but the tokens define the content of the feed. There are four types of tokens that can be associated with a source:

| Token Type | Description                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Job        | Data is taken directly from the job model; job tokens aren't user-definable, and aren't visible in the Feed Details page. An example is <code>{job.location}</code> ; at feed-generation time, this token would be replaced with the value in the jobs table of the location column. Job tokens can't be used in the header of a source template.                                                   |
| Site       | Data is taken directly from the site model, site tokens aren't user-definable, and aren't visible in the Feed Details page. An example is <code>{site.portalurl}</code> ; at feed-generation time, this token would be replaced with the value in the sites table of the <code>portalurl</code> column. Site tokens can be used in both the header of a source template and the repeated job nodes. |
| Header     | The replacement value for head tokens is defined in the feed detail screen. Head tokens can only be used in the header of a source template.                                                                                                                                                                                                                                                        |
| Feed       | The replacement value for feed tokens is defined in the feed detail screen. Feed tokens can't be used in the header of a source template.                                                                                                                                                                                                                                                           |

## Rules List

The Rules List section allows you to set up multiple rules for the feed; individual rules can be inactive or inactive. You need to activate at least one rule for the feed. Select **+ Add Rule** to add additional rules.

Rules use the same search syntax used for category rules, and are limited to 4,000 characters. Note, however, that some languages and special characters can take up more than a single character's worth of space. The rule field expands to show a longer rule.

### → Recommendation

A longer rule is better than multiple rules.

| Rules Settings | Description                                   |
|----------------|-----------------------------------------------|
| Rule           | Use this field to write your query.           |
| Activate Rule  | A slider that activates or disables the rule. |
| Tokens         | Specify tokens for the rule.                  |

### 📘 Note

**Exclusion rules** can use the following format:

```
NOT {field_name}:{"string to exclude"}
```

Consider the following:

- The uppercase **NOT** is applied only to the field immediately following it:

```
NOT title:"RN" AND NOT title:"LPN" AND title:"Nurse"
```

- Applying **NOT** to grouped clauses causes it to fail. For example:

```
title:"Nurse" AND NOT (title:"RN" AND title:"LPN")
```

Use the following format instead:

```
title:"Nurse" AND (NOT title:"RN" AND NOT title:"LPN")
```

Use the [Debug Rules](#) option in the [Run Feed](#) command to test your rules.

In addition to setting the configurations for rules, you can perform the following in the Rules List section:

- [Validate Rule](#) – allows you to inspect the query to make sure that its syntax is valid.
- ^ (up) and v (down) arrows – allow you to change the order of the rules. The arrows indicate the order the rules run.
-  (delete) – allows you to delete a rule.

## FTP Settings

General Settings

| Fields       | Description                                                                                                                                                                                                                                                                                                |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Activate FTP | Activates/Deactivate all FTP scheduled items for the feed. A feed can have any number of scheduled distributions. For example you could create two scheduled items, to distribute a feed daily at 8AM and again at 8PM.                                                                                    |
| Host         | The URL of the FTP site, without the protocol prepended. For example: <b>alpha.jobs2web.com</b> .                                                                                                                                                                                                          |
| Port         | The FTP port. The default values are 21 for FTP, and 22 for SFTP.                                                                                                                                                                                                                                          |
| Directory    | A feed can have any number of scheduled distributions. For example, the directory path on the remote FTP server where you save the generated feed file, such as <b>jobs2web/feeds/&lt;client_career_site&gt;/</b> . The directory is optional; the root of the FTP account is used if this field is blank. |

| Fields       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File Name    | <p>The name of the generated feed XML file that's saved on the remote FTP server. The file name can contain these tokens:</p> <ul style="list-style-type: none"> <li>yy – two-digit year</li> <li>yyyy – four-digit year</li> <li>mm – two-digit month</li> <li>dd – two-digit date</li> <li>hh – two-digit hour (24-hour clock)</li> <li>nn – two-digit minute</li> </ul> <p>For example:</p> <ul style="list-style-type: none"> <li>SampleAggregatorJobs-<b>&lt;yyyy&gt;</b> <b>&lt;mm&gt;&lt;dd&gt;</b>.txt:<br/>SampleAggregatorJobs-20111112.txt</li> <li>Jobs <b>&lt;hh&gt;</b>:<b>&lt;mm&gt;</b>.xml: Jobs 15:45.xml</li> </ul> |
| Protocol     | The FTP protocol, generally FTP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Passive Mode | Use passive FTP transfer. This setting usually isn't enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Anonymous    | Select the checkbox to use anonymous account validation without any credentials.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| User Name    | User Name for FTP account. Unavailable if you select <a href="#">Anonymous</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Password     | Password for FTP account. Unavailable if you select <a href="#">Anonymous</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

#### FTP Schedules

| Fields    |                                                                  |
|-----------|------------------------------------------------------------------|
| Frequency | Use the dropdown list to specify the frequency of the FTP.       |
| Time      | Specify the hour and minutes when the FTP is scheduled to occur. |

The FTP Schedules section also allows you to perform the following:

- + [Add Schedule](#) to add additional FTP schedules.
-  (delete) – allows you to delete an FTP schedule.

## 19.3.3 Integrating Career Site Builder with SAP SuccessFactors Recruiting

Career Site Builder is a standalone application must be integrated with the rest of SAP SuccessFactors Recruiting.

### Before You Start

This section describes integration tasks that are typically performed by an implementation consultant, using tools that aren't available to customers.

To configure the integration, you need access to Command Center, Provisioning, and Admin Center.

#### Note

As a customer, you don't have access to Command Center or Provisioning. To complete tasks in Command Center or Provisioning, contact your implementation partner or your Account Executive. For any non-implementation tasks, contact Technical Support.

### Overview

Here's an overview of the process:

1. Configure the integration in Provisioning.
2. Configure Recruiter Sync to sync user information.
3. Configure Real Time Job Sync so that jobs posted externally in SAP SuccessFactors Recruiting are sent to the career site.
4. Enable Candidate Account Simplification so that candidates can use their SAP SuccessFactors user account and single sign-on to navigate between all parts of SAP SuccessFactors Recruiting.
5. Configure Mobile Apply to optimize the career site experience on different devices.

#### [Enabling Career Site Builder in Provisioning \[page 361\]](#)

Enable settings in Provisioning for a new Career Site Builder implementation.

#### [Configuring the Data Center URLs for Career Site Builder \[page 362\]](#)

Enter data center URLs in Provisioning to connect Recruiting Marketing with the SAP SuccessFactors platform. Recruiting Marketing is the platform on which Career Site Builder is built.

#### [Configuring Recruiter Sync \[page 368\]](#)

Configuring Recruiter Sync is a multistep process that gives Recruiting users the ability to use both Career Site Builder and Recruiting Advanced Analytics, as well as synchronizing recruiter information.

#### [Configuring Real Time Job Sync \[page 370\]](#)

Configure Real Time Job Sync (sometimes referred to as Job ATS Integration or JATS) so that jobs posted externally in SAP SuccessFactors Recruiting are sent to the career site in near-real time.

#### [Enabling Candidate Account Simplification \[page 386\]](#)

Candidate Account Simplification (CAS) allows candidates to use their SAP SuccessFactors user account and single sign-on to navigate between all parts of SAP SuccessFactors Recruiting, including career sites.

[Integration Troubleshooting Tips \[page 387\]](#)

Suggestions for how to troubleshoot issues when creating a Recruiting integration for Career Site Builder.

[Configuring Mobile Apply \[page 390\]](#)

Configure Mobile Apply so that you can search for jobs, create and manage a profile, and navigate and complete the job application using mobile devices such as a smartphone or a tablet computer. Mobile Apply must be enabled for Career Site Builder career sites to work.

## 19.3.3.1 Enabling Career Site Builder in Provisioning

Enable settings in Provisioning for a new Career Site Builder implementation.

### Prerequisites

You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Procedure

1. In Provisioning, go to *Company Settings*.
2. Select the following settings:
  - *Recruiting Marketing*
  - *Enable Job Marketing*
  - *Enable Career Site Builder*
  - *Enable Candidate Account Simplification*
3. Save.

### Results

Career Site Builder is enabled.

### Next Steps

You can now use Career Site Builder to set up your career site.

## 19.3.3.2 Configuring the Data Center URLs for Career Site Builder

Enter data center URLs in Provisioning to connect Recruiting Marketing with the SAP SuccessFactors platform. Recruiting Marketing is the platform on which Career Site Builder is built.

### Prerequisites

You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

Use the [Configure Recruiting Marketing Datacenter URL](#) screen to specify the URLs for your Recruiting Marketing instance.

The following fields tell the SAP SuccessFactors platform which Recruiting Marketing environment to connect to:

- [Recruiting Marketing Base SSO URL](#) – the base address of the Recruiting Marketing services like Career Site Builder, job marketing and other various tools that are part of the Recruiting Marketing landscape but integrated with the SAP SuccessFactors platform for Session Management.
- [Recruiting Marketing job post sync production URL](#) – the base address for Job Synchronization. This field is also used for a variety of other back-end calls that synchronize data between Recruiting Management and Recruiting Marketing.
- [Recruiting Marketing REST production URL](#) – used to synchronize candidate data between Recruiting Management and Recruiting Marketing.

The following two fields are specific to your organization's career site URL and control features related to the candidate experience:

- [RMK Portal URL](#) – the base URL for the Recruiting Marketing site that matches the Recruiting Marketing Site URL as defined in the Recruiting Marketing Command Center, prefaced with `https://`. Depending on configuration options, this URL is used in a number of candidate redirects.
- [RMK Job Search URL](#) – where Recruiting users are redirected when they attempt to search for jobs. The redirect could be back to the Recruiting Marketing site's home page or to a default brand or content page, based on the needs of the customer.

## Procedure

1. Sign into Provisioning and go to ► [Manage Recruiting](#) ► [Configure Recruiting Marketing Datacenter URL](#) ►.
2. Enter the appropriate URLs for for the Recruiting Marketing Base SSO URL, job post sync URL, and REST URL fields, as listed in *Recruiting Marketing Data Center URLs*.
3. Enter the RMK Portal URL, beginning with `https://`.

You can find the URL in Career Site Builder at ► [Settings](#) ► [Site Configuration](#) ► [Site URL](#) ►. If both standard and custom URLs are defined, use the one selected as "primary".

4. Enter the RMK Job Search URL, beginning with `https://`.

The RMK Job Search URL is identical to the RMK Portal URL, with the addition of `/search` at the end.

### 19.3.3.2.1 Recruiting Marketing Data Center URLs

Recruiting Marketing URLs for preview and production environments in each data center.

All Recruiting Marketing URLs follow a consistent pattern and reflect the base URL for the service in Recruiting Marketing.

All URLs:

- Begin with `https://`
- Don't include a final character. For example, there's no closing slash (/).
- Include `.stage` for Preview environments, but are otherwise are the same in Preview and Production. For example, for DC22, the production URL is `https://bizx22.jobs2web.com` and the preview URL is `https://bizx22.stage.jobs2web.com`.

The following table lists DC 22 URLs:

DC 22 URLs

| Environment | Recruiting Marketing Base SSO URL              | Recruiting Marketing job post sync URL              | Recruiting Marketing REST URL                 |
|-------------|------------------------------------------------|-----------------------------------------------------|-----------------------------------------------|
| Preview     | <code>https://bizx22.stage.jobs2web.com</code> | <code>https://javamaint22.stage.jobs2web.com</code> | <code>https://api22.stage.jobs2web.com</code> |
| Production  | <code>https://bizx22.jobs2web.com</code>       | <code>https://javamaint22.jobs2web.com</code>       | <code>https://api22.jobs2web.com</code>       |

The following table lists DC 30 URLs:

DC 30 URLs

| Environment | Recruiting Marketing Base SSO URL                                                           | Recruiting Marketing job post sync URL                                                                  | Recruiting Marketing REST URL                                                               |
|-------------|---------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|

## 19.3.3.3 Configuring Recruiter Sync

Configuring Recruiter Sync is a multistep process that gives Recruiting users the ability to use both Career Site Builder and Recruiting Advanced Analytics, as well as synchronizing recruiter information.

### Prerequisites

- Recruiter SSO is required for any user who needs to access Advanced Analytics.
- Two additional permissions are required to access Advanced Analytics:
  - [Manage Recruiting](#) > [Recruiting Marketing Advanced Analytics Permission](#) >
  - [Manage Recruiting](#) > [Access Advanced Analytics with Details](#) >
- You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

Recruiter Sync synchronizes admin user information between Career Site Builder and SAP SuccessFactors Recruiting:

You can configure the Recruiter Sync in both stage and production environments.

### Procedure

1. Verify these settings in Provisioning, in [Company Settings](#) > [Recruiting](#) >:
  - [Use email as external applicant user ID](#)
  - [Enable Separate Password Policy for External Candidates](#)
2. Complete these fields in Career Site Builder, at [Career Site Builder](#) > [Settings](#) > [Site Configuration](#) > [Site Integrations](#) >:

| Option                      | Description                                                           |
|-----------------------------|-----------------------------------------------------------------------|
| Company ID                  | Copy this information from Provisioning.                              |
| Deployment Data Center      | Select the data center that hosts SAP SuccessFactors HCM Core.        |
| Single Sign-On Security Key | Use the secure password generator. This field requires the following: |

| Option | Description                                                                                                                                                                                                                                 |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|        | <ul style="list-style-type: none"> <li>• 20–28 characters.</li> <li>• At least one uppercase and one lowercase letter.</li> <li>• At least one numeric character.</li> <li>• At least one special character or punctuation mark.</li> </ul> |
|        | <p><b>Note</b></p> <p>The security key must be unique across all Career Site Builder sites.</p>                                                                                                                                             |

### Note

Refer to *SAP Knowledge Base Article 3008375 – How to Display Site Integrations tab in Career Site Builder – Recruiting Marketing* if the Site Integration tab is missing, and contact Technical Support for assistance.

3. Enable Recruiter Sync in Career Site Builder at [Settings > Site Configuration > Site Integrations](#).

- a. Go to the Site Integrations page.
- b. Move the slider for the *Recruiter Sync* field to *YES*.
- c. Enter a time for the sync to perform each day.

Choose a time that's outside of the organization's normal business hours. The default is 12:00 midnight.

- d. Select *Save* to save the Recruiter Sync settings.
- e. Test the sync by selecting *Execute Now*.
- f. Verify that the sync worked by viewing the process log.

You generate the process log using *Export Automated Process Logs* from the Recruiting Command Center, selecting a date range up to 2 days.

The bulk of the log data generates during nightly maintenance runs, but could also be from manual maintenance requests performed from someone using Command Center.

The log includes details for both Recruiter Sync and Real Time Job Sync. Check for errors related to the Recruiter Sync job.

You can also check that the correct administrators have synced from Career Site Builder, in [Users > Roles > Admin Users](#).

## 19.3.3.4 Configuring Real Time Job Sync

Configure Real Time Job Sync (sometimes referred to as Job ATS Integration or JATS) so that jobs posted externally in SAP SuccessFactors Recruiting are sent to the career site in near-real time.

### Prerequisites

You have access to both Command Center and Provisioning.

#### Note

As a customer, you don't have access to Command Center or Provisioning. To complete tasks in Command Center or Provisioning, contact your implementation partner or your Account Executive. For any non-implementation tasks, contact Technical Support.

Career Site Builder is enabled in Provisioning.

Understand how SAP SuccessFactors Recruiting fields maps to Career Site Builder. Refer to *SAP Note 2557601 – RCM-RMK Fields for Job Data Mapping – Recruiting* for a detailed explanation.

### Context

A job is available in a career site once it has posted in SAP SuccessFactors Recruiting and usually happens quickly. It can, however, take a while because of delays inherent in transferring the job into the career site. SAP SuccessFactors Recruiting also sends job detail updates and jobs deletes to career sites.

When setting up job data mapping between SAP SuccessFactors Recruiting and a career site, consider downstream impacts like how the data appears in Recruiting Advanced Analytics.

If you're using SAP SuccessFactors Recruiting multilocation fields, ensure that you map these multilocation fields to Real Time Job Sync. Set up mapping in SAP SuccessFactors Recruiting, through ► [Admin Center](#) ► [Manage Recruiting](#) ► [Set Up Recruiting Marketing Job Field Mapping](#) ►.

#### Note

You can't disable the *YES* setting for *Use Real Time Job Sync*, located in Career Site Builder at ► [Settings](#) ► [Site Configuration](#) ► [Site Information](#) ►.

### Procedure

1. Go to ► [Tools](#) ► [Manage API Credentials](#) ► in Career Site Builder.
2. Select + [Add New Provider](#).

The Add New Provider dialog appears.

- Complete the following fields in the Add New Provider dialog:

| Option                                                     | Description                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Provider ID</a>                                | A read-only, system-generated ID number for the provider. Choosing <a href="#">Regenerate</a> replaces the ID with another system-generated ID.                                                                                                                                                                                               |
| <a href="#">Provider Name</a>                              | The name of the provider that you're providing API credentials for. Enter the folder name from the Command Center Site Details page, then a dash, then the site ID using this format: <b>Folder Name-Site ID</b> . The site ID is located in Career Site Builder, at <a href="#">Settings &gt; Site Configuration &gt; Site Information</a> . |
| <a href="#">Username</a>                                   | Use the Provider Name ( <b>Folder Name-Site ID</b> ) as the username used to gain access to the Career Site Builder system.                                                                                                                                                                                                                   |
| <a href="#">Password</a>                                   | A password for the user. Choosing <a href="#">Regenerate</a> replaces the password with a system-generated password. Select the  (hide) icon to mask the password.                                                                                           |
| <a href="#">Recruiting Management (Real Time Job Sync)</a> | Selecting this field allows you to specify that the API credential is being used for Career Site Builder to use Real Time Job Sync with SAP SuccessFactors Recruiting.                                                                                                                                                                        |

In most cases, you only need a single credential on this page. Some organizations that manage many systems using multiple Applicant Tracking System (ATS) tools could have additional entries on this page.

#### Note

If you later need to connect an existing Career Site Builder instance to a different SAP SuccessFactors HCM suite instance, you may need to replace the API credentials.

To prevent the overwriting of API credentials, they aren't imported when you perform an [Import](#) command in the Career Site Builder Import & Export page.

- In **Provisioning**, go to [Service Provider Settings > Recruiting Marketing Settings](#) and complete the following fields by using information from Career Site Builder.

| Option                               | Description                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Security Key</a>         | <p>Enter the value from <a href="#">Single Sign-On Security Key</a> in <a href="#">Career Site Builder &gt; Settings &gt; Site Configuration &gt; Site Integrations</a>.</p> <p>If you don't see the <a href="#">Site Integrations</a> tab, refer to <a href="#">SAP Note 3008375 - How to Display Site Integrations tab in Career Site Builder - Recruiting Marketing</a> for more information.</p> |
| <a href="#">Expires in (seconds)</a> | Set this value at 360, the field's default.                                                                                                                                                                                                                                                                                                                                                          |

#### Note

After you save these settings, the system stores this key, but it disappears from the UI. Re-enter the security key if you need to revise additional fields here later.

- Save your settings.
- In **Admin Center**, log in as admin and go to [Set Up Recruiting Marketing Job Field Mapping > Job Requisition Template >](#) to map the fields for every Job Requisition XML template, and save when complete.

The following is an example; you can specify your own mapping based on the details described in [SAP Knowledge Base Article 2557601 – RCM-RMK Fields for Job Data Mapping – Recruiting](#).

| Recruiting Marketing Field                          | Recruiting Management Field/Menu                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>External Job Title (required)</i>                | <i>External Job Title</i>                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>External Job Description (required)</i>          | <i>Full External Job Description (Header, Description, and Footer)</i>                                                                                                                                                                                                                                                                                                                                                                        |
| <i>Internal Job Title (required)</i>                | <i>Internal Job Title</i>                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>City (required)</i>                              | <p><i>Location</i>, as long as you enable Location Foundation Object in the organization's environment, which is the leading practice. Once this mapping is complete, the four fields (City, State, Country/Region, Postal/Zip Code) are concatenated as the <b>location</b> field in Career Site Builder.</p> <p>Otherwise, map to <i>City</i>.</p>                                                                                          |
| <i>State (required for U.S.-based jobs)</i>         | <p><i>Location</i>, as long as you enable Location Foundation Object in the organization's environment, which is the leading practice. Once this mapping is complete, the four fields (City, State, Country/Region, Postal/Zip Code) are concatenated as the <b>location</b> field in Career Site Builder.</p> <p>Otherwise, map to <i>State</i>.</p>                                                                                         |
| <i>Country/Region (required)</i>                    | <p><i>Location</i>, as long as you enable Location Foundation Object in the organization's environment, which is the leading practice. Once this mapping is complete, the four fields (City, State, Country/Region, Postal/Zip Code) are concatenated as the <b>location</b> field in Career Site Builder.</p> <p>Otherwise, map to <i>Country/Region</i>.</p>                                                                                |
| <i>Postal/Zip Code (required for radius search)</i> | <p><i>Location</i>, as long as you enable Location Foundation Object in the organization's environment, which is the leading practice). Otherwise, map to <i>Postal/Zip Code</i>.</p> <p>Once this mapping is complete, the four fields (City, State, Country/Region, Postal/Zip Code) are concatenated as the <b>location</b> field in Career Site Builder.</p> <p>Also useful for creating a Google Job Map or determining job markets.</p> |
| <i>Department</i>                                   | <i>Function</i>                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <i>Category</i>                                     | <i>Department</i>                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                                                     | <div>  <b>Note</b> <p>This field is an outlier; the <i>Department</i> field on job requisitions is always mapped to the <i>Category</i> field in Career Site Builder.</p> </div>                                                                                                                                                                           |
| <i>Shift</i>                                        | If the organization has <i>Shift</i> on the job requisition, map it here.                                                                                                                                                                                                                                                                                                                                                                     |
| <i>Job Type</i>                                     | If the organization has <i>Job Type</i> on the job requisition, map it here.                                                                                                                                                                                                                                                                                                                                                                  |
| <i>Facility</i>                                     | <i>Facility</i>                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <i>Product Service</i>                              |                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <i>Business Unit/Division</i>                       | The leading practice is to map the <i>Division</i> field from the job requisition to <i>Business Unit/Division</i> .                                                                                                                                                                                                                                                                                                                          |
| <i>Compensation/Salary</i>                          | <i>Base Salary</i>                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <i>Required Travel</i>                              | <i>Travel Required</i>                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <i>Adcode</i>                                       | No longer used.                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Recruiting Marketing Field      | Recruiting Management Field/Menu                                                                                                                                |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Employee Referral Amount</i> |                                                                                                                                                                 |
| <i>Custom Field 1</i>           | <i>Legal Entity</i> , if used on the job requisition.                                                                                                           |
| <i>Custom Field 2</i>           | <i>Business Unit</i> , if used on the job requisition.                                                                                                          |
| <i>Custom Field 3</i>           | Map other fields from the job requisition to the custom fields for various uses in Career Site Builder, Advanced Analytics reporting, or to generate XML feeds. |
| <i>Custom Field 4</i>           |                                                                                                                                                                 |
| <i>Custom Field 5</i>           |                                                                                                                                                                 |

7. In **Provisioning**, go to **Managing Job Scheduler** > **Manage Scheduled Jobs** and select *Create New Job* to set up the job scheduler to sync your existing posted jobs to the career site.

| Field                    | Setting                                                                                                        |
|--------------------------|----------------------------------------------------------------------------------------------------------------|
| <i>Job Name</i>          | Sync job postings                                                                                              |
| <i>Job Owner</i>         | Select <i>Find User</i> and search for and select the admin user (such as <b>HR Coordinator</b> ).             |
| <i>Job Type</i>          | Sync all external job postings                                                                                 |
| <i>Occurrence</i>        | Recurring.                                                                                                     |
| <i>Recurring Pattern</i> | Select <b>Daily</b> and <b>0 - (12AM)</b> .                                                                    |
| <i>Start Date</i>        | Enter today's date (using this format: MM/DD/YYYY), and 10 minutes after the current server time that's shown. |
| <i>End Date</i>          | Leave blank.                                                                                                   |

- a. Select *Create Job*.
  - b. From the *Select* dropdown list, select *Submit*.
  - c. From the same dropdown list, select *Run It Now*.
8. In **Command Center**, check that the jobs were synced by selecting **Site Details** > **Export Jobs to CSV**:
  - a. With *Job Type* set to **External** and *Job Status* set to **Active**, select the *Export*.
  - b. Open the CSV file, and confirm that the fields that you mapped display correctly, for example, the location fields plus Department.

#### Note

There can be a delay in the appearance of your results.

9. In **Command Center**, you can troubleshoot site setup by selecting *Export Automated Process Logs* for the site to verify the success of real time job sync and recruiter sync.
10. Troubleshoot further by selecting *Export Jobs to CSV* to export all jobs in a CSV-format file, specifying what types of jobs to export, such as internal or external jobs, active or inactive, and so on.

### 19.3.3.4.1 Real Time Job Sync Considerations

Consideration when setting up Real Time Job Sync.

- You can't connect more than one career site instance to the SAP SuccessFactors platform.
- Map the standard Country/Region field to the career site location field in Admin Center in order for location parsing to function.
- You can't scale Career Site Builder to manage find-and-replace functions to adjust location formatting.
- Jobs can't be larger than 100,000 bytes (100 KB), or the import generates an error such as the following:

#### Sample Code

```
<id>Job Location : 1 : clientJobId : 184-en_GB Exception:  
size of job data (703970) exceeds configured maximum 100000</id>
```

The typical job size is 5,000 bytes to 15,000 bytes, and only exceeds the 100,000-byte limit if you embed a graphic in the job description.

To avoid exceeding this limit, don't embed images directly in the job description; use a Content Delivery Network (CDN) instead.

To verify whether jobs are processed correctly for the site, you can export automated process logs from the Command Center.

- To ensure that description content only contains formatting that appears correctly to candidates viewing the posting, recruiters should only use the **Ctrl** + **V** in the Job Description Editor, rather than job scraping services such as Kapow that strip job postings of formatting. If job information isn't displaying properly or recruiters need to make changes, they can update their job descriptions in real time. For more information about the Job Description Editor, refer to [SAP Note 2807628](#).
- Full feed job sync scheduled jobs can't run more frequently than once every 24 hours. For sync containing a large amount of data, schedule the job to run at an off-peak time, like overnight.

## Mapping Considerations

- Mapping must be completed for every job requisition template.
- If you configure the Location Foundation Object for the organization, map Location to all Career Site Builder location fields (city, state, country/region, postal code).
- If you enable internal career site, be sure to map the Internal Job Title and Description, as well as the External Job Title and Description.
- A field that's been mapped can be used in Advanced Analytics, as long as that field maps all the way to Advanced Analytics.
- Custom fields on the job requisition can be mapped, as long as they have a data type of text or picklist on the job requisition. After the data is in Career Site Builder, its data type doesn't matter.
- It's possible for data to originally be coming from the HRIS, such as Employee Central.
- If a job doesn't contain a job description, it doesn't sync.

- When mapping Job Description, always choose “Full External Job Description” (Header, Description, and Footer), so that the complete contents of the headers and footers are transmitted to Career Site Builder. Doing so is especially important for organizations using Job Profile Builder, since the job description becomes the header file in the Applicant Tracking System.
- Is the organization using Job Profile Builder (JPB)? All JPB fields are mapped into the Job Description field. When you map the External Job Description field to Career Site Builder, all of the information from JPB is transferred to the customer’s Career Site Builder career site. Note that you can’t parse out fields from JPB anywhere in the instances, so those fields aren’t available for other purposes within Career Site Builder, such as customizing the job page layout or search results.

For more information on field specifications, refer to *Data Recommendations for Recruiting Management*.

For more information on technical specifications for Recruiting Marketing fields, refer to *Career Site Builder Job Data Fields*.

### 19.3.3.4.2 Career Site Builder Job Data Fields

Look up the UI and internal field names, functions, and field specifications for Career Site Builder fields.

Technical Specifications for Career Site Builder Fields

| UI Field Name                              | Internal Field Name | Function                                                                                                                                                                                                                                                                                  | Field Specifications                             |
|--------------------------------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------|
| <a href="#">[External] Job Title</a>       | title               | When possible, single out this field on its own line, pulled from the page of search results, or tagged with a unique ID.                                                                                                                                                                 | Required. Alphanumeric, limited to 95 characters |
| <a href="#">[External] Job Description</a> | description         | Don't use special characters, nonstandard HTML formatting, or other unusual formatting so you can avoid undesired display results, poor formatting, or exclusion from external vendors/sources. Limit formatting to bold tags and line breaks. Any other HTML formatting is stripped out. | Required. Alphanumeric, no length limitation.    |
| <a href="#">Internal Job Title</a>         | title               | Visible only when you select <a href="#">Enable Internal Career Site powered by Career Site Builder</a> in Admin Center.                                                                                                                                                                  | Required. Alphanumeric, limited to 95 characters |
| <a href="#">Internal Job Description</a>   | description         | Visible only when you select <a href="#">Enable Internal Career Site powered by Career Site Builder</a> in Admin Center.                                                                                                                                                                  | Required. Alphanumeric, no length limitation.    |

| UI Field Name                 | Internal Field Name | Function                                                                                                                                                                                                                                                                                                    | Field Specifications                     |
|-------------------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------|
| <i>City</i>                   | city                | Don't use Virtual, Multiple, and so on. <i>City</i> isn't a specific enough location to provide location details; the job doesn't display properly for mapping and SEO markets.                                                                                                                             | Alphanumeric, limited to 30 characters.  |
| <i>State</i>                  | state               | Don't use Virtual, Multiple, and so on. <i>State</i> isn't a specific enough location to provide location details; the job doesn't display properly for mapping and SEO markets. If available, use the two-letter abbreviation to help ensure accurate capture of data.                                     | Limited to four characters.              |
| <i>Country/Region</i>         | country             | Use the standard two-character ISO country/region code.                                                                                                                                                                                                                                                     | Two characters.                          |
| <i>Zip/Postal Code</i>        | postal code         | Zip or postal code of the position.                                                                                                                                                                                                                                                                         | Alphanumeric, limited to 10 characters.  |
| <i>Department</i>             | department          | Department or work area that describes the job. <i>Department</i> is a division of the <i>Category</i> ; for example, <b>Clinical Staff</b> or <b>Web Development</b> .                                                                                                                                     | Alphanumeric, limited to 50 characters.  |
| <i>Category</i>               | category            | Category or industry of the job posting. For example, <b>Information Technology</b> , or <b>Healthcare</b> . Use <i>Category</i> to categorize and target the jobs to the appropriate business sectors. Improper use or a blank category field can result in display errors or inaccurate job distribution. | Alphanumeric, limited to 50 characters.  |
| <i>Shift</i>                  | shift               | Designates the job hours.                                                                                                                                                                                                                                                                                   | Alphanumeric, limited to 50 characters.  |
| <i>Job Type</i>               | shifttype           | Designates the type of position, for example <b>Full-Time</b> or <b>Part Time</b> .                                                                                                                                                                                                                         | Alphanumeric, limited to 100 characters. |
| <i>Facility</i>               | facility            | Physical location of the position that you can use to distinguish between different branches or office locations.                                                                                                                                                                                           | Alphanumeric, limited to 75 characters.  |
| <i>Product Service</i>        | productservice      | A more detailed description of the job's focus or work area.                                                                                                                                                                                                                                                | Alphanumeric, limited to 50 characters.  |
| <i>Business Unit/Division</i> | businessunit        | Describes the target area of the posting, for example <b>Educational Software</b> or <b>Mobile Devices</b> . Using this field provides improved analytics results.                                                                                                                                          | Alphanumeric, limited to 40 characters.  |
| <i>Compensation/Salary</i>    | compensation        | Compensation for the job. This field can be either a text value, but including a numerical value improves analytics tracking. You can include an hourly rate, or a salary range.                                                                                                                            | Alphanumeric, limited to 50 characters.  |
| <i>Required Travel</i>        | travel              | The amount of travel required for the position, as a percentage.                                                                                                                                                                                                                                            | Alphanumeric, limited to 50 characters.  |
| <i>Adcode</i>                 | adcode              | A code that directs the routing of the job, or provides additional tracking.                                                                                                                                                                                                                                | Alphanumeric, limited to 50 characters.  |

| UI Field Name         | Internal Field Name | Function      | Field Specifications                    |
|-----------------------|---------------------|---------------|-----------------------------------------|
| <i>Brand</i>          | brand               | The brand ID. | Alphanumeric, limited to 25 characters. |
| <i>Custom Field 1</i> | customfield1        |               | Alphanumeric, limited to 50 characters. |
| <i>Custom Field 2</i> | customfield2        |               | Alphanumeric, limited to 50 characters. |
| <i>Custom Field 3</i> | customfield3        |               | Alphanumeric, limited to 50 characters. |
| <i>Custom Field 4</i> | customfield4        |               | Alphanumeric, limited to 50 characters. |
| <i>Custom Field 5</i> | customfield5        |               | Alphanumeric, limited to 50 characters. |

Refer to *SAP Note 2557601 - RCM-RMK Fields for Job Data Mapping - Recruiting Marketing* for more mapping information.

### 19.3.3.4.3 Setting Up Mapping of Recruiting Management Job Fields to Career Site Builder Job Postings

Map the job fields between Recruiting Management and Career Site Builder so that you can sync job postings between the two.

## Prerequisites

The initial configuration steps are performed by implementation partners and are identified with "(Requires Provisioning)."

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Procedure

1. (Requires Provisioning) Navigate to [Provisioning](#) > [<Company>](#) > [Service Provider Settings](#) > [Recruiting Marketing Settings](#) , and add the following to the Job Post Sync:

- API Key
- Username
- Password

These credentials come from Professional Services or a consultant with access to Provisioning and Command Center, who configure API credentials in the RMK system, Command Center. An implementation partner can do this while setting up the integration.

2. After you've updated the API key, username, and password in Provisioning, grant admin user permissions for the RMK Mapping page.
3. Once permission has been granted, the admin user maps their RCM custom and/or standard Job Requisition fields to the RMK hard-coded fields. Mapping must be completed for every Job Requisition XML template.

### Note

You can't send multiple values from RCM to RMK. If you map `mfield` picklists, RMK receives only the primary value. Don't use `mfields` on location fields when using Real Time Job Sync with RMK. If an `mfield` is mapped to an RMK field, the values in the `mfield` are concatenated when the field is sent to RMK. Because RMK requires a single value for the location to work with the map functionality, this doesn't work when integrating with RMK.

The Adcode multiselect picklist field was previously used to send multiple values to Recruiting Marketing. In the Q2 2017 Release, a change was made whereby for `mfields` only the primary value of the `mfield` was sent from Recruiting Management to Recruiting Marketing. For this reason, the integration between Recruiting Management to Recruiting Marketing was breaking for some customers sending multiple Adcode values. The work-around to resolve this issue is as follows:

1. Define a new Adcode field as a text field (custom field).
2. Enter the multiple Adcode values into the text field using the following format:  
`<value>, <SPACE><value>, <SPACE><value> . . .` For example, `ADCODE1, ADCODE2, ADCODE3 . . .`
3. An instructional or help text can be added next to the text field, which helps the user to enter the values in a format.
4. Update the Recruiting Management to Recruiting Marketing mapping to include the new text field.
5. You can run the RTJS once the change is done just to ensure that the latest information is available in Recruiting Marketing.
6. If the data entered in the text box needs to be validated, a Business Rule could be defined using the **onChange** event.

Mapping RMK Fields to RCM Fields for Real Time Job Sync

| RMK Field       | Required? | Supported RCM Field Types/Field |
|-----------------|-----------|---------------------------------|
| Job Title       | Yes*      | text, picklist                  |
| Job Description | Yes*      | richtext, textarea, text        |

| RMK Field                                                                                                                                                                                                            | Required? | Supported RCM Field Types/Field                              |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|--------------------------------------------------------------|
| City                                                                                                                                                                                                                 | Yes*      | derived, text, picklist, location_obj, sfstd_jobLocation_obj |
| State                                                                                                                                                                                                                | Yes*      | derived, text, picklist, location_obj, sfstd_jobLocation_obj |
| Country/Region                                                                                                                                                                                                       | Yes*      | derived, text, picklist, location_obj, sfstd_jobLocation_obj |

| Custom Field 5                                                                                                                                                                                                       | No        | text, picklist                                               |

### → Recommendation

For external career sites, map the following the Recruiting Management fields to post a job:

- *Job Title*
- *Description*
- All the *Location* fields: *City*, *State*, *Country/Region*, and *Postal/Zip Code*

For the internal career site, map the following Recruiting Management fields:

- [Internal Title](#)
- All the [Location](#) fields: [City](#), [State](#), [Country/Region](#), and [Postal/Zip Code](#)

#### Note

Partial mapping isn't allowed, and validations are shown if you don't meet the specified conditions.

Not mapping all the location fields or not providing the field values for the mapped location fields might affect job publishing to job boards and features such as the Google Job Map component and radius search in Career Site Builder.

For more details on job data mapping, refer to *SAP Note 2557601 – RCM-RMK Fields for Job Data Mapping – Recruiting*.

### 19.3.3.4.3.1 Validations to Prevent Job Posting Failures

We've introduced validations to help you identify and fill in the missing field values in job requisitions before you publish jobs on the external and internal career sites.

On the Career Site Builder enabled instances, the validations occur in the following scenarios:

- An error is displayed while posting a job from the [Job Posting](#) page or using OData API when the job requisition XML template used in the job requisitions has no mapping for any fields on the [Set Up Recruiting Marketing Job Field Mapping](#) page in *Admin Center*.

#### Note

This error message is not displayed while posting a job using a business rule. We recommend you maintain the required mapping if you are using business rules to post jobs.

- A warning occurs on the [Set Up Recruiting Marketing Job Field Mapping](#) page if all the location (City, Country/Region, State, and Pincode/Zip Code) fields aren't mapped to the Recruiting Marketing fields.
- A warning occurs on the [Job Posting](#) page when all the mapped location (City, Country/Region, State, and Pincode/Zip Code) fields don't have values.

#### Note

Not mapping all the location fields or not providing the field values for the mapped location fields might affect job publishing to job boards and features such as the Google Job Map component and radius search in Career Site Builder.

- Validations also occur while posting a job if the job requisition fields that are mapped to the following Recruiting Marketing fields on the [Set Up Recruiting Marketing Job Field Mapping](#) page have missing field values:

- [Internal Job Title](#), [City](#), [State](#), [Country/Region](#), and [Postal/Zip Code](#) fields for the internal career site.
- [Job Title](#), [Job Description](#), [City](#), [State](#), [Country/Region](#), and [Postal/Zip Code](#) fields on the external career site. When the Full External Job Description (Header, Description, and Footer) or Full Internal Job Description (Header, Description, and Footer) option is mapped to a job description field, but if the description isn't provided in the job requisition, then the posting fails. Provide the value for the description to proceed with a job posting.

#### Note

The validations occur only for the newly posted or reposted jobs and don't affect the already posted jobs.

The validations aren't triggered in the following scenarios:

- Scheduling a background job to run a business rule to post jobs.
- When a new job posting language is added to a job requisition after the job requisition is posted on external or internal career sites.

## 19.3.3.4.4 Data Recommendations for Recruiting Management

The recommended JRDM and Recruitment Management field types for Recruiting Marketing career site fields.

#### Note

The Real Time Job Sync integration supports the mapping of `mfield` data types. If an `mfield` is mapped from Recruiting Management to Recruiting Marketing, and multiple values are selected in the field, only the value specified as the primary value is sent to Recruiting Marketing.

Field Specifications

|-----------------------------------------|------------------------------------------|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Facility                                | <b>facility</b>                          | Picklist                               | This field is used to provide additional information about the job's location, typically used for designations like Corporate Headquarters or West Office. This isn't a replacement for geographical location data.                    |
| Product Services                        | Varies based on Recruiting configuration | Picklist                               | This field is most valuable for customers with multiple products or services lines, where indicating the type of product or service is important.                                                                                      |
| Business Unit/Division                  | Varies based on Recruiting configuration | Picklist                               | This field is similar to Category and Department, and often used to further break down the Department information, or as a way to track other ways a customer categorizes their job data.                                              |
| Compensation/Salary                     | <b>salaryBase</b>                        | Currency                               | You can also map the Recruiting fields salaryMin, salaryMid, or salaryMax to this field. Some job boards require salary information for posting jobs. The value for this field should be a single value in numerical format.           |
| Required Travel                         | <b>requiredTravel</b>                    | Picklist                               |                                                                                                                                                                                                                                        |
| Adcode                                  | <b>adCode</b>                            | Multi-Select Picklist                  | You can use this field to direct jobs to specific job boards based on media XML feeds. Work with the media team to find out if this solution makes sense for your customer.                                                            |
| Recruiter Name                          | <b>recruiterName</b>                     | Operator                               |                                                                                                                                                                                                                                        |
| Brand                                   | <b>brand</b>                             | Picklist                               | Use this field only if your customer has a multibranded career site. This field determines which brand attributes are displayed on a job page. This field only supports alphanumeric characters, and not spaces or special characters. |
| Employee Referral Amount                | Varies based on Recruiting configuration | Currency                               | Don't use this field. It was originally created for Employee Referral and isn't currently in use.                                                                                                                                      |
| Custom Field 1                          | Varies based on Recruiting configuration | Picklist                               | You can map over fields from Recruiting Management as needed for additional data or rules. If possible, leave custom fields blank for Advanced Analytics to use.                                                                       |
| Custom Field 2                          | Varies based on Recruiting configuration | Picklist                               |                                                                                                                                                                                                                                        |
| Custom Field 3                          | Varies based on Recruiting configuration | Picklist                               |                                                                                                                                                                                                                                        |
| Custom Field 4                          | Varies based on Recruiting configuration | Picklist                               |                                                                                                                                                                                                                                        |
| Custom Field 5                          | Varies based on Recruiting configuration | Picklist                               |                                                                                                                                                                                                                                        |

An error occurs while posting a job from the [Job Posting](#) page or using OData API when the job requisition XML template used in the job requisitions has no mapping for any fields on the [Set Up Recruiting Marketing Job Field Mapping](#) page in [Admin Center](#).

#### ⓘ Note

This error message isn't displayed while posting a job using a business rule. We recommend you maintain the required mapping if you're using business rules to post jobs.

Ensure the mapping of the job requisition fields to the following Recruiting Marketing fields on the [Set Up Recruiting Marketing Job Field Mapping](#) page before posting a job to avoid inconsistencies:

- [Internal Job Title](#), [City](#), [State](#), [Country/Region](#), and [Postal/Zip Code](#) fields for the internal career site.
- [Job Title](#), [Job Description](#), [City](#), [State](#), [Country/Region](#), and [Postal/Zip Code](#) fields on the external career site.
- A warning occurs on the [Set Up Recruiting Marketing Job Field Mapping](#) page if all the location((City, Country/Region, State, and Pincode/Zip Code) fields aren't mapped to the Recruiting Marketing fields.
- A warning occurs on the [Job Posting](#) page when all the mapped location (City, Country/Region, State, and Pincode/Zip Code) fields don't have values.

#### ⓘ Note

Not mapping all the location fields or not providing the field values for the mapped location fields might affect job publishing to job boards and features such as the Google Job Map component and radius search in Career Site Builder.

#### ⓘ Note

The validations occur only for the newly posted or reposted jobs and don't affect the already posted jobs.

## 19.3.3.4.5 Locations in Recruiting Integrations

Location formatting affects how jobs and other features behave in Recruiting integrations.

When jobs pass from Recruiting Management to career sites, the Recruiting Marketing system runs a job maintenance process that includes location scrubbing.

The location scrubbing process optimizes job location data, associates with known cities, and maps them for use on the career site. It also maps fields from Recruiting Management to the city, state, country/region, and ZIP code field in Recruiting Marketing. Recruiting concatenates these individual location files and stores the concatenated values in the career site `Location` field.

Locations scrubbing compares the location data of a job to an existing database of global city locations. It only uses state data for U.S.-based locations. When a match is found in the database, the job gets a geocode, which updates fields on the job for the map location's latitude and longitude. This data places jobs on the job map and provides the location for location-based searches. Missing fields on the job are also populated with data from the matched cities. The process doesn't overwrite populated fields.

## 19.3.3.4.6 Location Formatting for Career Site Builder and Recruiting

Learn about the location elements to configure the job requisition.

### Required Career Site Builder Formatting for Location Field Data

Career Site Builder locations use the following format: **City, State, Country/Region, Postal Code**. For example, **San Francisco, CA, US, 94103** for U.S.-based jobs. For non-U.S. jobs, omit the fields that aren't relevant, for example, **Berlin, DE**. Postal code data can be U.S.-based Zip codes or other country/region-specific postal codes. The data consists of these elements:

#### Location Field Data Elements

| Region            | Function                                     |
|-------------------|----------------------------------------------|
| City              | Required for all jobs.                       |
| State             | Required for U.S. jobs; otherwise optional.  |
| State or Province | 2-character ISO abbreviation.                |
| Country/Region    | Required for all jobs; 2-character ISO code. |

#### Career Site Builder Database Location Fields

| Region         | Function                                                                                                                                                                                                                                                                                                                                   |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Location       | Displayed on Job page.                                                                                                                                                                                                                                                                                                                     |
| Alt Location   | Not displayed on Job page and not used for existing functionality.                                                                                                                                                                                                                                                                         |
| City           | Not displayed on Job page. You can use it for filters and fields in XML feeds.                                                                                                                                                                                                                                                             |
| State          | Not displayed on Job page. You can use it for filters and fields in XML feeds. U.S. locations only.                                                                                                                                                                                                                                        |
| Country/Region | Not displayed on Job page. You can use it for filters and fields in XML feeds.                                                                                                                                                                                                                                                             |
| Zip            | Not displayed on Job page. You can use this Zip/postal code field for filters and fields in XML feeds. This field is used for and required by the Career Site Builder <a href="#">Search by Radius</a> field. Refer to <i>Search Tab in Career Site Builder Global Settings</i> for details on the <a href="#">Search by Radius</a> field. |
| Map Location   | Not displayed on Job page. Used to plot jobs on the interactive job map.                                                                                                                                                                                                                                                                   |

### Career Site Builder Location Fields

Location fields stored in the index are used for Keyword Search, Location Search, Zip Code Search, and the Job Map. These features make calls to the search index, and not the Career Site Builder job location database.

## Recruiting Management Best Practices for Location

- The Recruiting Management system concatenates the Job Requisition Template field mappings for City, State, Country/Region, and Zip Code (when used) to populate the Career Site Builder Location Field.
- All job requisitions use the standard field for country/region (field name=country). This field is used for other Recruiting features and is critical to the correct operation of those related features.
- When you use the location field in a job requisition, make sure you maintain an external name for the location object in all the relevant locales to avoid issues on the career pages, or else the location may not show any label.
- Regional job locations aren't supported. Regional jobs aren't located in a specific city, like **Europe** or **Minnesota, US**. You can't include descriptions such as **remote** or **multiple** in the location fields. These values display in the location field, but the jobs don't appear on the job map and causes problems with job distribution.
- Consult with Technical Support or SAP SuccessFactors Professional Services to determine the best strategy for developing and using Job Requisition templates. Defining different templates for different geographies can facilitate location-handling.

### 19.3.3.5 Enabling Candidate Account Simplification

Candidate Account Simplification (CAS) allows candidates to use their SAP SuccessFactors user account and single sign-on to navigate between all parts of SAP SuccessFactors Recruiting, including career sites.

## Prerequisites

You have access to Provisioning.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Context

When a candidate registers in the Sign In page then proceeds to the Create an Account page, Candidate Account Simplification creates an account in Recruiting, with the candidate's information automatically sent to

the Recruiting Marketing (career site) database. This means that candidates need only interact with their SAP SuccessFactors user account or profile even when in the career site.

Considerations:

- You can't connect more than one Recruiting Marketing instance to the SAP SuccessFactors platform.
- You can't connect more one SAP SuccessFactors platform instance to a Recruiting Marketing instance.
- You can't connect an SAP SuccessFactors instance and multiple ATS instances to a single Recruiting Marketing instance.
- Don't change the Company ID or System Name after configuring a site for Candidate Account Simplification. However, if the customer instance moves to a new data center, change the settings to reflect the new data center at the time of the move.

## Procedure

In Provisioning, enable Candidate Account Simplification in Recruiting Management by selecting ► [Company Name](#) ► [Company Settings](#) ► [Recruiting Marketing](#) ► [Enable Candidate Account Simplification](#) ►.

### 19.3.3.6 Integration Troubleshooting Tips

Suggestions for how to troubleshoot issues when creating a Recruiting integration for Career Site Builder.

For general troubleshooting, check the following settings:

| Where to Configure | Issue                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Command Center     | If you get an HTTP Status 500 error, confirm that you have enabled ► <a href="#">Recruiting Command Center</a> ► <a href="#">Site Details</a> ► <a href="#">Enable Career Site Builder</a> ►, and that the user is set up for Recruiter SSO.                                                                                                                                                                                                                                            |

| Admin Center       | Make sure you've set role-based permissions.                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Where to Configure         | Issue                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Manage Career Site Builder | When you select Manage Career Site Builder, are you sent back to the SAP SuccessFactors home page? This action can happen during the "blackout period," between the Preview and Production releases. The career site instance is on a stage environment, therefore on the latest version, while the SAP SuccessFactors instance is on a productive environment, thus still on the previous version. |

## Security Keys

### Note

For security reasons, the security key is cleared after saving each time.

|                                                                                                |                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| If the Security Key isn't set correctly, several types of errors can occur:                    | <ul style="list-style-type: none"> <li>• Recruiter SSO</li> <li>• Real-time Job Sync</li> <li>• When attempting to open Career Site Builder, you're redirected back to the instance home page.</li> </ul>                                                                                                    |
| Ensure that the Security Key is unique (not used in another instance) and follows these rules: | <ul style="list-style-type: none"> <li>• Is 20–28 characters long</li> <li>• Includes at least one uppercase and one lowercase letter</li> <li>• Includes at least one numeric character</li> <li>• Includes at least one special character or punctuation mark</li> </ul>                                   |
| Ensure that the Security Key is the same in both locations:                                    | <ul style="list-style-type: none"> <li>• In Career Site Builder: <a href="#">Settings</a> &gt; <a href="#">Site Configuration</a> &gt; <a href="#">Site Integrations</a></li> <li>• In Provisioning: <a href="#">Service Provider Settings</a> &gt; <a href="#">Recruiting Marketing Settings</a></li> </ul> |

## Recruiter Sync

- There may be a delay for your results to appear.
- Ensure that your staffing group is populated in Admin Center.
- To find out the status of your job, choose [Command Center](#) > [Site Details](#) > [Export Automated Process Logs](#), select the job, and read the log at the bottom. If the log shows a 403 Error, check the **System Name** field on the SSO page and make sure that you've selected the datacenter where your instance is installed.
- Check the settings in Career Site Builder, from [Settings](#) > [Site Configuration](#) > [Site Integrations](#) and re-run Recruiter Sync by choosing [Execute Now](#).
- If when you select [Manage Career Site Builder](#) and you get the error "The requested operation is not available," check that your admin user (HR Admin) is included in the Recruiter Sync.

## Real Time Job Sync

- There may be a delay for your results to appear. Even if a scheduled job in Provisioning is displayed as Complete, the job may not be finished running on the career site side. The request is sent to a queue called Maintenance and the time to execute maintenance jobs varies greatly based on the time of day and number of jobs in the queue.

- To find out if the job ran, choose [Command Center](#) > [Site Details](#) > [Export Automated Process Logs](#) , and review the downloaded CSV file.
- Make sure that every job contains a job description.
- Confirm that the jobs are posted to the external career site created for Recruiting.
- Unpost and repost the job in Recruiting. Also, change a field on the requisition and save the change.
- Ensure that you haven't included a large image in the job requisition that exceeds the size limit.
- Check your field mapping.
- Rerun the career site "Sync all external job postings" job in Provisioning.
- Check your settings in Provisioning for the career site Service Provider Settings (including the Security Key) and the RMK data center URLs.
- If used, ensure that a Job Profile exists for that particular requisition. One customer's job wouldn't sync because of invisible characters in empty lines in the job profile, External job description.

### Site Settings Export XML File

There are some configuration settings that aren't available in the current Command Center tool, which are also unavailable in Career Site Builder. The only way to integrate these settings for a career site is to manually add them to a career site's export file directly. Refer to *SAP Note 3062549 – XML Overview for Site Settings in Career Site Builder – Recruiting Marketing* for details.

#### Caution

Manually editing the exported XML file can unintentionally introduce code that can cause the career site to break.

## 19.3.3.7 Configuring Mobile Apply

Configure Mobile Apply so that you can search for jobs, create and manage a profile, and navigate and complete the job application using mobile devices such as a smartphone or a tablet computer. Mobile Apply must be enabled for Career Site Builder career sites to work.

### Prerequisites

- You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- You have a Career Site Builder implementation.
- You have a working, integrated Recruiting Management-Recruiting Marketing system. Customers can also use the supported API job collection process.
- The candidate workflow between Career Site Builder and SAP SuccessFactors Recruiting is configured and functional.
- A responsive site is enabled. You enable this through a Web Development site rebuild or a Career Site Builder implementation.
- If using the Candidate Account Simplification method for candidate integration, the Recruiting Marketing profile allows candidates access to both their profiles from the user interface of the career site without going through the apply process. Ensure to enable the Recruiting Marketing Profile for all screen sizes for the best candidate experience and workflows.
- If using a Candidate Account Simplification site, ensure that the [View Profile](#) link is visible on the career site. This is how candidates directly navigate to Recruiting Management to access their profile.
- An SSL certificate is installed for the career site.

#### 📘 Note

Use Career Site Builder if you need to get and install an SSL certificate.

- Configured [RMK Portal URL](#) redirect.

### Context

There are three main parts to Mobile Apply:

- **Responsive Apply Process and Profile** – the Recruiting Management Apply Process, as well as the Candidate Profile, are built on a responsive framework. The display of these pages can be used on mobile devices.
- **Consolidated Profile and Application** – when Mobile Apply is enabled, the profile creation and application process are consolidated into a single page. Fields that are common between the Candidate Profile and

job-specific information (application) only display once if they're properly mapped. This way, the candidate doesn't have to enter the same data more than once.

- **Career Site Wrapper** – when Mobile Apply is enabled, the career site wrapper, which is a page generated from the Recruiting Marketing career site, wraps (contains) the Recruiting Management Application and Profile screens. This wrapper lets you experience a consistent look, feel, and branding across multiple pages.

#### 📘 Note

For security purposes, all SAP SuccessFactors Recruiting career sites require an SSL certificate to be registered and installed on their domain. If the site isn't currently SSL, you must complete this process before the career site wrapper gets generated. For stage/preview instances, an SSL certificate has been provided. If the stage/preview site isn't SSL, this can be done by updating the site URL in both Command Center and Provisioning.

Mobile Apply consolidates the candidate profile and application on the same page. As a result, there will be some differences. Remember that Mobile Apply as a feature isn't designed to be the same for the instance without Mobile Apply. For example, the *Candidate ID* field isn't displayed on the page when Mobile Apply is enabled, but is displayed on the page when Mobile Apply is disabled.

#### 📘 Note

- Candidates using the Mobile Apply process can opt-in to text message notifications for instances where the feature is configured.
- When Mobile Apply is used with Resume Parsing, there is a logic that resume parsing populates the data into a field only if it does not have a data already and does not override the existing values. However, for all the other screens, resume parsing overrides the data.

## Procedure

1. In Provisioning, go to ► [Company Settings](#) ► and select [Enable External Career Site Home Page](#).
2. From Admin Center, go to ► [Recruiting](#) ► [Manage Recruiting Sites](#) ► and select [Enable Mobile Apply](#).
3. Choose the location candidates can upload files from:
  - [Enable Upload of documents from Dropbox](#)
  - [Enable Upload of documents from Google Drive](#)
4. **Optional:** Go to ► [Admin Center](#) ► [Recruiting](#) ► [Manage Recruiting Sites](#) ► [Enable Mobile Apply](#) ► and select [Show Only Required Fields In Mobile Application](#).

#### 📘 Note

Enabling [Show Only Required Fields in the Mobile Application](#) allows only those fields listed as required to display for users who apply on a handheld phone. All optional fields are hidden from their experience. This only applies to the handheld devices.

### 19.3.3.7.1 Configuring Career Site Themes for Mobile Apply

Follow the steps to configure the external career site theme manager career portal.

## Prerequisites

- You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- Enable Recruiting Management External Career Site themes.

## Context

When using Mobile Apply, the Application and Candidate Profile pages are a hybrid with branding elements from both Recruiting Management and Recruiting Marketing. The header, footer and page background are powered by the Recruiting Marketing Responsive Wrapper. The content area is powered by Recruiting Management. The header and footer in the Responsive Wrapper receive its styling and branding from the Career Site. The colors of the individual application sections and the buttons are controlled by the Recruiting Management Career Site theme manager. These two styling elements are designed to work together when Recruiting Management microsites and Recruiting Marketing brands are properly configured together.

## Procedure

- Navigate to [Admin Center](#) > [Manage Recruiting Sites](#) > [Manage Recruiting Site Themes](#).
- Select the desired theme for the text color, background color of the accordion boxes, and hover color by navigating to [Fine Tune](#) > [Career Navigation](#).

| Career Navigation Checkbox Option | What Option Controls                                    |
|-----------------------------------|---------------------------------------------------------|
| <i>Navigation menu Text color</i> | Controls the text color                                 |
| <i>Navigation selected color</i>  | Controls the background colors of the accordion headers |
| <i>Navigation hover color</i>     | Controls the color of the hover text                    |

#### Note

None of the other values apply for Mobile Apply.

3. Select the desired theme for the *Options* dropdown on the right side of the header by navigating to ► *Fine Tune* ► *Language Drop-Down* ►.

| Language Drop-Down Checkbox Option          | What Option Controls                                  |
|---------------------------------------------|-------------------------------------------------------|
| <i>Text color – default</i>                 | Controls the text within the <i>Options</i> box       |
| <i>Text color – hover</i>                   | Controls the hover text color in the header box       |
| <i>Menu item background color – default</i> | Changes the background color of the header box        |
| <i>Menu item background color – hover</i>   | Changes the color of the header box when hovered over |

#### Note

None of the other values apply for Mobile Apply.

4. Select *Save*.

## 19.3.3.7.2 Mobile Apply Field Behavior

When you enable Mobile Apply, data from both the Profile and Application are consolidated into a single page to the candidate, and fields are split into Personal Information and Job Specific Information sections.

### Field Behavior

- The 13 predetermined standard fields always display under *Profile Configuration*, even if they're configured on Profile and Application.
- Fields configured on the profile XML display under *Profile Information*, along with the 13 system standard fields.
- Fields configured on the application XML display under the Job Specific Information.
- In order to have the parent-child relationship working for picklists, define both parent and child picklists in both the application XML template and candidate profile XML template. When you do, the child picklist appears in *Profile Information*.
- Fields configured on both the application XML template and the candidate profile XML template appear in *Personal Information*, along with the 13 predetermined standard fields.
- The Mobile Apply text area field has a character limit of 1024.

## Sample Scenarios

| Scenario                                                                                                                                          | Behavior                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The 13 fields that are common to both the Application and Candidate Profile templates.                                                            | All 13 fields are visible in <a href="#">Profile Information</a> .                                                                                                                                                                                                                                             |
| When a standard field that's present in both application template and candidate profile template, is removed from the candidate profile template. | <a href="#">Profile Information</a> no longer shows the field.<br><br>For example, the standard field <b>ethnic</b> is in both the application and candidate profile templates. When you remove it from the candidate profile template, <a href="#">Profile Information</a> no longer displays <b>ethnic</b> . |
| When a custom field is present in both Application and Candidate Profile templates.                                                               | The custom field is displayed in <a href="#">Profile Information</a> .                                                                                                                                                                                                                                         |
| When a standard field is available only in the application template.                                                                              | The field is displayed in the respective Job-related information section.                                                                                                                                                                                                                                      |

## Predetermined Standard Fields for Personal Information

The personal information section contains 13 predetermined fields. These fields don't change, and always appear in the same order.

| Number | Field Definition ID | Type             |
|--------|---------------------|------------------|
| 1      | firstName           | text             |
| 2      | middleName          | text             |
| 3      | lastName            | text             |
| 4      | address             | text             |
| 5      | city                | text or picklist |
| 6      | state               | text or picklist |
| 7      | country/region      | picklist         |
| 8      | zip                 | text or picklist |
| 9      | cellPhone           | text             |
| 10     | homePhone           | text             |
| 11     | contactEmail        | text             |
| 12     | currentTitlee       | text             |
| 13     | currentCompany      | text             |

## Job Specific Information

Fields that are configured in the application XML but aren't listed in the Personal Information section appear under Job Specific Information. The fields appear in the order they were configured.

Fields that are configured on both the application and candidate profile XML are considered common standard fields.

Common Standard Fields: Required Status

| Is Candidate Profile Required? | Is Job Application Required? | Result       |
|--------------------------------|------------------------------|--------------|
| True                           | True                         | Required     |
| False                          | True                         | Required     |
| True                           | False                        | Required     |
| False                          | False                        | Not required |

Common Standard Fields: Miscellaneous Conditions

|                                                                                                     | How it Appears in Candidate Profile | How it Appears on Combined Candidate Profile and Job Application |
|-----------------------------------------------------------------------------------------------------|-------------------------------------|------------------------------------------------------------------|
| Label                                                                                               | Candidate Profile Label             | Candidate Profile Label                                          |
| Permissions-Single Stage                                                                            | Candidate Profile Permissions       | Candidate Profile Permissions                                    |
| Permissions-Multi Stage                                                                             | Candidate Profile Permissions       | Candidate Profile permissions                                    |
| <div><div> ⓘ Note</div><div>These permissions are configured in the job requisition XML</div></div> |                                     |                                                                  |
| Save as draft/Apply                                                                                 | Candidate Profile Values            | Both Candidate Profile and Application values are updated        |

### ⓘ Note

When you apply for a job, resume and cover letter attached to an application takes precedence over the attachments in the candidate profile. If resume and cover letter aren't available at the time of applying, then they're taken from the profile. However, once you apply for the job without these attachments, any changes to resume or cover letter in the candidate profile don't impact the application.

## 19.3.3.7.3 The Responsive Wrapper

A responsive wrapper represents a modified version of the head, header, and footer from a job detail page of a career site within which other content can be displayed.

The responsive wrapper is an XML document that presents the format and styling (color, tab names, and so on) of a client site in the header and footer of a page that is not hosted on the career site, making it appear to be part of the client site. This provides the user a seamless experience by retaining the branding elements as a user moves from a client site into the apply process pages within Recruiting. The application and other information from Recruiting is displayed within the responsive wrapper.

## 19.3.4 Configuring Social Apply

The Social Apply functionality in Career Site Builder enables the displaying of links so that candidates can apply for jobs through their social networking profiles.

### Prerequisites

- [LinkedIn](#) – even if you enable LinkedIn here, it won't show up on your public career site until you establish a contract with LinkedIn, and provide LinkedIn credentials in your SAP SuccessFactors system.

#### Note

For this functionality to be visible to visitors in your career site, make sure to include its related cookie provider in the cookie consent manager at ► [Appearance](#) ► [Global](#) ► [Cookie Manager](#) ►. If the cookie banner is enabled without including the corresponding cookie provider in the cookie consent manager, this functionality is removed and unavailable to your site's visitors completely.

- [Seek](#) – Career Site Builder doesn't support adding the Apply with Seek option for new career site implementations, so this option is visible only if you have an existing Seek configuration for your system.
- [Xing](#) – available only if you already have an existing Xing configuration in your system. If you don't, you won't see this option.

### Context

When configured for social apply, a site displays on job detail pages; in place of the standard [Apply Now](#), a button instead opens social network-based application options. After you configure **social apply**, [Apply Now](#) with a dropdown list indicator on it displays instead of the standard [Apply Now](#) text. When candidates choose [Social Apply](#), the configured options appear underneath the button, floating over other content on the page.

When candidates select a social network [Start Apply](#) link, a button appears that candidates can select to get into a new form. When the candidates choose [Start](#), a new window appears and displays the login form for the social network selected.

#### Note

You can change how these labels appear in the career site by editing them in the translation editor in Career Site Builder, at ► [Tools](#) ► [Translations](#) ►. Enter **social** in the Group field filter to view all the button labels you can edit.

### Procedure

1. In Career Site Builder, go to ► [Tools](#) ► [Social Apply](#) ►.

A list of locales display on the left column, and you see the list of options on the page.

2. Enable or disable the various social networking options.

[Apply Now](#) is enabled by default, and can't be disabled. You can, however, change where it appears on the list.

3. Configure a locale for each social-media profile.

You can configure a locale for each social-media profile, and the options shown in Social Apply are specific to the social-media profile configured for that site. For example, options configured in the en\_US social-media profile are shown on en\_US locale jobs, and those configured in the ru\_RU social-media profile are shown on ru\_RU locale jobs.

4. Select [Save](#) to save your settings.

## Related Information

[Social Apply Settings in Career Site Builder Tools \[page 632\]](#)

[Configuring the Career Site Cookie Banner and Cookie Consent Manager \[page 471\]](#)

### 19.3.4.1 Configuring Apply with LinkedIn

The Apply with LinkedIn feature allows candidates to start the application process using their LinkedIn credentials. Applying with LinkedIn credentials allows Career Site Builder to populate the business card with candidate LinkedIn profile information.

## Prerequisites

SAP SuccessFactors system requirements:

- You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- You've set up SAP SuccessFactors Recruiting.
- You have a career site using Career Site Builder with the following:
  - The career site is configured to use Candidate Account Simplification.
  - The career site has at least one social profile configured to use Apply with LinkedIn for applications.
  - You've configured the cookie consent manager and enabled the Advertising Cookies section in [Appearance](#) > [Global](#) > [Cookie Manager](#), and included the LinkedIn option there.
- Third-party cookies are allowed in the browser (for LinkedIn cookie).
- Pop-ups are allowed in the browser (for authorizing LinkedIn with username and password).

- The administrator has the following role-based permissions:
  - ► [Manage Recruiting](#) ► [Configure Standardization Mapping](#) ►
  - ► [Metadata Framework](#) ► [Access to non-secured objects](#) ►
  - ► [Manage Integration Tools](#) ► [Manage LinkedIn Account Setup](#) ►
  - ► [MDF Recruiting Permissions](#) ► [LinkedInIntegrationConfiguration](#) ►
  - ► [MDF Recruiting Permissions](#) ► [LinkedInDeveloperApplication](#) ►
- Generic objects
- Role-based permissions

LinkedIn requirements:

- Your organization has an established contract with LinkedIn. Refer to LinkedIn documentation for more information.
- You've reviewed and accepted the LinkedIn cookie policy.
- The administrator user who sets up the LinkedIn account has an account with recruiter permissions or a recruiter license for at least one of these LinkedIn products:
  - LinkedIn Recruiter
  - LinkedIn Job Slots

## Context

When candidates apply with LinkedIn, they're directed to a standard LinkedIn authentication dialog to log in. Once the candidates authenticate with LinkedIn, they're logged into the application and exit it separately. Candidates don't have to log in again on subsequent visits, unless they log out or delete their login cookie.

### ⚠ Restriction

Apply with LinkedIn 2.0 isn't available in the internal career site.

The typical configuration workflow for [Apply with LinkedIn](#) follows these steps:

1. Configure SAP SuccessFactors Recruiting for [Apply with LinkedIn](#).
2. Configure Career Site Builder for [Apply with LinkedIn](#).
3. Select [Save](#) from [Site Settings](#) in Career Site Builder to trigger a site reload.

## Procedure

1. As an **Administrator**, ensure that the organization has a LinkedIn account and has set up the LinkedIn account by obtaining credentials and the API key for [Apply with LinkedIn](#):
  - a. Go to ► [Admin Center](#) ► [Security Center](#) ► [LinkedIn Account Setup](#) ►.
  - b. Select [Enable Client LinkedIn Account](#) option.

[Create Customer LI Account](#) appears.

  - c. Select [Create Customer LI Account](#).

If the [Sign in or join LinkedIn to configure ATS integrations](#) dialog opens, select [Sign in](#), and sign into LinkedIn.

- d. Choose [Request](#) for the type of integration requested, and select [Apply with LinkedIn](#).

A message confirming the integration displays.

- e. To verify the integration, choose [Go back](#).

[Enabled](#) appears next to [Apply with LinkedIn](#). If it doesn't display immediately, check later. Occasionally the setting of this status is delayed.

#### ⚠ Caution

When [Apply with LinkedIn](#) is enabled, MDF objects are created in the background. In most cases, you should never change or delete these objects manually. However, if you have multiple brands and you've configured brand-specific site URLs in [Brand Settings](#), you need to manually add brand-specific URLs to a configuration object. For details, refer to [Enabling the Apply with LinkedIn Feature on a Brand-Specific Career Site \[page 503\]](#).

- f. To map standard fields from candidate profile XML of the customer to LinkedIn fields, select ► [Admin Center](#) ► [Recruiting](#) ► [Configure Standardization Mapping](#) ►.
2. In Career Site Builder, go to ► [Tools](#) ► [Social Apply](#) ► and enable the [LinkedIn](#) option.

## 19.3.4.2 Restoring an Apply with LinkedIn Error

There are a few reasons why you experience an error with the [Apply with LinkedIn](#) button.

## Prerequisites

You have access to Provisioning and Command Center.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Context

The following are some reasons why the [Apply with LinkedIn](#) button doesn't display correctly:

- If the career site's portal and search URLs have a trailing slash.
- The SAP SuccessFactors API isn't in LinkedIn's allowlist because a related URL is updated in Provisioning and the LinkedIn object in [Manage Data](#) isn't updated, but this information is transferred to LinkedIn.
- You haven't configured the cookie consent manager and enabled the Advertising Cookies section in [Appearance > Global > Cookie Manager](#), and included the LinkedIn option there.

Perform both steps to troubleshoot the issue.

## Procedure

1. In Provisioning, remove any trailing slash in the career site portal URL and search URL.
2. Update the LinkedIn integration:
  - a. Make sure that you aren't logged in to any LinkedIn account on your current browser.
  - b. Go to [Admin Center > Manage Data](#) and search for **LinkedInDeveloperApplication**.  
  
You see a single entry for **LinkedInDeveloperApplication**.
  - c. Go to [Admin Center > Security Center > LinkedIn Account Setup](#).
  - d. Select [Enable Customer LinkedIn Account](#) and sign in with the account that has the required rights on the LinkedIn side.  
  
Signing in adds your career site domain as a permitted site in LinkedIn.
  - e. Select [Save](#) from [Site Settings](#) in Career Site Builder to trigger a site reload.

The [Apply with LinkedIn](#) button should now display and allow candidates to log in to LinkedIn.

## 19.3.5 Configuring Multiple Applicant Tracking Systems

The Multiple Applicant Tracking System capability allows customers to use other Applicant Tracking System (ATS) tools in addition to SAP SuccessFactors Recruiting with Career Site Builder. This capability allows the organization to combine their jobs from other ATS on the same Career Site Builder career site.

### Prerequisites

- Candidate Account Simplification (CAS) is properly configured and enabled; the *Use Multiple ATS* setting is dependent on this setting.
- Job Applicant Tracking System (JATS) process for importing jobs from external Applicant Tracking Systems is properly configured. This process could require the use of middleware to ensure that data adheres to JATS standards.
- Each external ATS has a unique set of provider user credentials generated from Command Center. Share the credentials with the external ATS or middleware provider.

### Context

Organizations using multiple Applicant Tracking Systems can pull jobs from Applicant Tracking Systems other than SAP SuccessFactors Recruiting and display them on the Career Site Builder career site.

To use the multiple ATS feature, organizations need a working SAP SuccessFactors Recruiting and career site integration with CAS enabled. Multiple ATS relies on Candidate Account Simplification ; you can't configure the multiple ATS capability without it. Also, Career Site Builder can only connect to one SAP SuccessFactors Recruiting instance.

#### ⓘ Note

Candidate and other data from external Applicant Tracking Systems aren't available in Recruiting Advanced Analytics or other Recruiting Management and Career Site Builder integrated systems. Only data from the SAP SuccessFactors Recruiting system is available for tracking in Career Site Builder.

This configuration is a two-part process that involves enabling multiple ATS in Command Center and providing user credentials in Career Site Builder. Consider the following when generating credentials:

- Within Recruiting, the Requisition ID is used as the unique identifier for jobs.
- A third-party ATS could assign a Requisition ID that's the same as the RequisitionReq ID from SAP SuccessFactors Recruiting or another ATS, so we append the Requisition Id with an integration code.
- For each external ATS, you must create a unique set of provider user credentials in Command Center.
- Present the credentials to gain access to the Career Site Builder system for JATS integration, and Talent Community Member API.
- The API credentials define the username and password associated with a provider, as well as the site ID and the allowed integration requests.

## Procedure

1. Log in to Command Center, and select the site's [Site Name](#) link from [Site List](#).

The site's [Site Details](#) page appears.

2. Set the [Use Multiple ATS](#) slider to [YES](#), then choose [Save](#).

You're done with your work in Command Center.

3. Log in to Career Site Builder, and go to [Tools > Manage API Credentials](#).

You see the Manage API Credentials list page.

4. Select [+ Add New Provider](#).

The Add New Provider dialog appears.

5. Complete the following fields in the Add New Provider dialog:

| Option                                                     | Description                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Provider ID</a>                                | A read-only, system-generated ID number for the provider. Choosing <a href="#">Regenerate</a> replaces the ID with another system-generated ID.                                                                                                                                                                                                 |
| <a href="#">Provider Name</a>                              | The name of the provider that you're providing API credentials for. Enter the folder name from the Command Center Site Details page, then a dash, then the site ID using this format: <b>Folder Name - Site ID</b> . The site ID is located in Career Site Builder, at <a href="#">Settings &gt; Site Configuration &gt; Site Information</a> . |
| <a href="#">Username</a>                                   | Use the Provider Name ( <b>Folder Name - Site ID</b> ) as the username used to gain access to the Career Site Builder system.                                                                                                                                                                                                                   |
| <a href="#">Password</a>                                   | A password for the user. Choosing <a href="#">Regenerate</a> replaces the password with a system-generated password. Select the  (hide) icon to mask the password.                                                                                           |
| <a href="#">Recruiting Management (Real Time Job Sync)</a> | Selecting this field allows you to specify that the API credential is being used for Career Site Builder to use Real Time Job Sync with SAP SuccessFactors Recruiting.                                                                                                                                                                          |

6. Select [Save](#) to save the provider settings, or choose [Close](#) to cancel and close the dialog.

If you saved a new provider, you see its ID and provider name listed in the Manage API Credentials list page, as well as [Yes](#) in the [Recruiting Management](#) column, to indicate that Real Time Job Sync is enabled.

7. **Optional:** Add any additional providers in Career Site Builder.

## Results

After you enable the support for multiple ATS, the new workflow takes effect. In this workflow, jobs from SAP SuccessFactors Recruiting come into the Career Site Builder system through the real-time job sync process. Jobs from external Applicant Tracking Systems come into Recruiting Marketing through JATS. These jobs are then displayed on the Career Site Builder career site.

Once candidates apply to a job, they're taken through the Candidate Account Simplification workflow, where they either log in as an existing user, or a new user account is created. Candidates are then directed to either SAP SuccessFactors Recruiting or the external ATS, based on the original source of the job.

## 19.3.6 Adding Initial SSL Certificate for New Public Career Site

Implementation partners should use [SSL Certificates](#) in Career Site Builder to get and install the initial SSL certificate as part of setting up a career site for a new organization.

### Context

[SSL Certificates](#) is a self-service tool that automates much of the process, and allows administrators to get and install a certificate in as little as a day.

Perform the following steps once, as part of setting up a new public career site for a new customer. Once organizations have their initial SSL certificates for their new career site, they can then use the [SSL Certificates](#) tool to install additional certificates on their own.

#### 📘 Note

SSL certificates are only applied to production environments, not stage environments.

The [SSL Certificates](#) tool doesn't allow you to upload more than one intermediate certificate. If you've more than one to upload, contact Technical Support. Refer to *SAP Note 3111993 - How to Upload Two Intermediate Certificates in CSB - Recruiting Marketing* for details.

### Procedure

1. Implement Career Site Builder for the organization first (but before you've done the hand-off of the career site), so that you can access ► [Tools](#) ► [SSL Certificates](#) ►.
2. Follow all the steps described in *Creating a Certificate Signing Request and Adding a New SSL Certificate*, starting with getting a certificate signing request (CSR), all the way to installing the SSL certificate in ► [Tools](#) ► [SSL Certificates](#) ►.

When a CSR is created in the [SSL Certificates](#) tab in Career Site Builder for an **initial** installation, this triggers an internal request for SAP SuccessFactors to add a DNS entry for the new career site that using the `<Site_ID>.jobs2web.com` format.

`<Site_ID>` refers to Site ID value at ►► [Settings](#) ► [Site Configuration](#) ► [Site Information](#) ►.

This DNS entry process takes an additional business day.

3. Contact SAP SuccessFactors Cloud Operations and provide them with domain name to map the career site URL to.

The domain name you provide is added as a CNAME record in the system.

#### Note

Don't submit a specific IP address for the public career site to map to. Refer to *CNAME Record for New Public Career Site* for more information.

[SAP Note 3111993](#)

### 19.3.6.1 CNAME Record for New Public Career Site

The final step in setting up the URL for a new public career site is to map to it in a CNAME record.

Part of the process of implementing Career Site Builder includes creating a public Web site where the Career Site Builder-enabled career site appears.

The Domain Name System (DNS) entry that's added for the new career site uses the `<Site_ID>.jobs2web.com` format, where `jobs2web` is the SAP domain.

#### Note

The DNS entry creation by SAP is automatically triggered when a certificate signing request (CSR) is generated or when an SSL certificate is installed using Option 2 in Career Site Builder ([Tools](#) > [SSL Certificates](#) > [Option 2: To obtain and install an SSL without generating a CSR](#)). The entry should be created within 24 hours of either action.

The location information that implementation partners provide should be in the form of a canonical name (CNAME) instead of an "A" record. The CNAME record is used in the DNS to create an alias from one domain name to another domain name, while the "A" record points to an IP address.

Associating a CNAME to the career site allows SAP SuccessFactors to handle any IP changes in the data center without customer involvement or impact.

When SAP SuccessFactors finishes setting up the record for the career site, the public career site shows up as a subdomain of the corporate URL, such as in the following example:

- Corporate site: `www.example.com`
- Career site: `https://jobs.example.com`

#### ⚠ Restriction

We don't support IP addresses in URLs as part of our reference architecture. Use domain names instead. If you think you have a special case that requires IP addresses instead of domain names, contact Technical Support.

## 19.3.7 Candidate Workflow from SAP SuccessFactors Recruiting to Career Site

There are several areas to redirect from SAP SuccessFactors Recruiting pages to the Career Site Builder home page.

The [RMK Portal URL](#) powers the following behaviors, including the Job Level Redirect, which occurs when the user arrives on the SAP SuccessFactors Recruiting job page.

RMK Portal URL Field

| Functionality Type | User Action                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Job Level Redirect | Select the URL of the job from the Invite to Apply email.                                                                                        |
| Job Level Redirect | Select the URL of the job from the Job Alert email.                                                                                              |
| Job Level Redirect | Select the URL of the job from the Agency email.                                                                                                 |
| Job Level Redirect | Select the URL of the job from the Employee Referral email.                                                                                      |
| Job Level Redirect | Select the URL of the job from the Tell a Friend email. The user goes to the corresponding Career Site Builder URL.                              |
| Job Level Redirect | Users land on an SAP SuccessFactors Recruiting job URL. They're redirected to the corresponding RMK job page.                                    |
| Redirect           | Select <a href="#">Sign Out</a> .                                                                                                                |
| Redirect           | Users decline the Data Privacy Consent Statement on the SAP SuccessFactors Recruiting site.                                                      |
| Redirect           | Users delete their profile on the SAP SuccessFactors Recruiting site.                                                                            |
| Redirect           | Select <a href="#">Options</a> , then <a href="#">Contact Preferences</a> . This option is only applicable in Mobile Apply/Responsive Framework. |
| Mobile Apply       | Generates and powers the Career Site Builder career site wrapper.                                                                                |

| Functionality Type                     | User Action                                                                  |
|----------------------------------------|------------------------------------------------------------------------------|
| Candidate Account Simplification (CAS) | ▶ <a href="#">Manage Job Alerts</a> ▶ <a href="#">Preview Job Alerts</a> ↗   |
| Candidate Account Simplification (CAS) | ▶ <a href="#">Manage Job Alerts</a> ▶ <a href="#">Create New Job Alert</a> ↗ |

The [RMK Job Search URL](#) powers the following redirect behaviors.

#### → Recommendation

Unless otherwise requested, configure this URL to match the [RMK Portal URL](#).

RMK Job Search URL Field

| Functionality Type                     | User Actions                                                                                                         |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| Redirect                               | Select the <a href="#">Job Search</a> tab on the SAP SuccessFactors Recruiting external career site.                 |
| Redirect                               | Select <a href="#">Job Search</a> from the SAP SuccessFactors Recruiting external career site home page.             |
| Redirect                               | Select <a href="#">Start your Search Now!</a> from the SAP SuccessFactors Recruiting external career site home page. |
| Redirect                               | Select <a href="#">Return to Job Search</a> from the Application Thank You Page.                                     |
| Redirect                               | Select <a href="#">Find More Jobs</a> from the withdrawal application on the success page.                           |
| Redirect                               | Select <a href="#">Find More Jobs</a> from the SAP SuccessFactors Recruiting event portal.                           |
| Candidate Account Simplification (CAS) | ▶ <a href="#">Subscribe/Job Alert Create Thank You page</a> ▶ <a href="#">Return to Job Search Button</a> ↗          |

## 19.3.8 Removing Partner and Consultant Access from Provisioning and Command Center

You can choose to remove access by an implementation partner or consultant to both Provisioning and Command Center at any time.

### Context

At the end of a project, terminating access to Provisioning and Command Center by an implementation partner allows you to maintain control over your own configuration and settings.

## Procedure

- **Provisioning** – as an administrator, you can view and control who has Provisioning access to your instance by using the [Manage Provisioning Access](#) tool in the Admin Center. As an administrator, you can remove this access from anyone on the list.
- **Command Center** – there are two types of requests you can make with Technical Support:

| Option                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Requesting information on who has access to Command Center</b> | <p>You can request Technical Support to provide a list of individuals who have access to your account in Command Center. When you submit your Support ticket, provide the following information:</p> <ul style="list-style-type: none"><li>• Your organization's site name or site ID</li><li>• Your data center location and environments.</li></ul> <p>Your request will typically be processed within 5 business days.</p>                                                                                                                                                                                                                                                                                                                                                                |
| <b>Requesting access termination to Command Center</b>            | <p>You can request Technical Support to terminate access by an implementation partner or consultant to your account in Command Center. When you submit your Support ticket, provide the following information:</p> <ul style="list-style-type: none"><li>• Consultant organization (the partner's name or SAP)</li><li>• The consultant's first name</li><li>• The consultant's last name</li><li>• The consultant's email address</li><li>• The Career Site Manager username (if known)</li><li>• The date you wish to terminate access on. If you don't specify a date, the request is processed within five business days.</li><li>• Your (or your organization's) name</li><li>• Your organization's site name or site ID</li><li>• Your data center location and environments</li></ul> |

**Note**

Contact your SAP account manager if you have any questions or concerns about terminating the access of your implementation partner or consultant.

## 19.4 Embedding SmartRecruiters Winston on a Career Site in Career Site Builder

Embed SmartRecruiters Winston Chat on a career site that's managed in Career Site Builder.

### Prerequisites

- You have a license for SmartRecruiters Winston for SAP SuccessFactors.
- You've completed the initial setup steps for SmartRecruiters Winston for SAP SuccessFactors to connect the 2 systems.

- You've completed the field mapping and have successfully run the data sync.
- You've copied the Winston embed code snippet from SmartRecruiters so that you can paste it into Career Site Builder.

More information: [SmartRecruiters Winston for SAP SuccessFactors](#)

## Context

SmartRecruiters Winston for SAP SuccessFactors delivers conversational and AI-assisted experiences for SAP SuccessFactors Recruiting. You can embed Winston Chat on your career site.

### Note

- Winston Chat isn't available on internal career sites accessed within SAP SuccessFactors HCM. It's only available on the external career site.
- If your organization has multiple brands, Winston Chat may give responses that refer to any job on your career site, for any brand. It can't restrict its responses to a specific brand.
- Winston Chat configuration isn't included in the [Import & Export](#) tool in Career Site Builder. You have to configure in each of your systems (such as staging and production).

## Procedure

1. In Career Site Builder, go to ► [Settings](#) ► [Data Privacy & Security Settings](#) ► [Custom Allowed Domains](#) ► and check if the [Content Security Policy](#) setting is turned on. If so, add the following domains to the allowlist.
  - `embed.jochat.ai`
  - `*.winstonchat.smartrecruiters.com` (starting with an asterisk and dot)

For more information, see [Enabling the Content Security Policy for a Career Site \[page 540\]](#)

2. Go to ► [Settings](#) ► [Site Configuration](#) ► [SmartRecruiters](#) ►.
3. Set the [Enable SmartRecruiters Winston Chat](#) setting to [Yes](#).
4. Paste the Winston embed code snippet that you copied from SmartRecruiters into the text box.
5. Save.

## Results

Winston Chat is now embedded on all your external career sites, across all brands.

## 19.5 Adopting the Unified Data Model for Career Site Builder

If your Career Site Builder system was implemented **without** the Unified Data Model, adopting it in your system involves several steps. Here's an overview of the process.

For existing customers, with existing job postings on a live career site, adopting the Unified Data Model requires several steps. First, you need to prepare certain data in the system by migrating it to a common data structure (generic objects). Next, after you've migrated your data successfully, you can enable the Unified Data Model in Career Site Builder. Finally, after you've enabled it, you may need to make some changes to other settings in Career Site Builder to better leverage the new functionality.

### → Recommendation

All new implementations of Career Site Builder should be based on the Unified Data Model, if possible. We strongly encourage all customers who already use Career Site Builder to consider adopting it as well.

However, the Unified Data Model may not be available for all customers. To ensure optimal performance, it requires that your Recruiting and Career Site Builder servers are located geographically close together. If they aren't, the [Use Unified Data Model](#) switch is disabled and you can't turn it on. Discuss availability options with your account team.

To adopt the Unified Data Model, as an existing customer, complete the following tasks.

| Task                                                                                      | Description                                                                                                                                                                                                                                                                               |
|-------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Implementing Career Site Builder [page 344]</a>                               | <p>You only need to follow this adoption process if your Career Site Builder system was already implemented <b>without</b> the Unified Data Model.</p> <p>As of 2H 2025, all new implementations include the Unified Data Model by default, so this process isn't necessary.</p>          |
| <a href="#">Preparing Recruiting Data for the Unified Data Model [page 411]</a>           | <p>Before you enable the Unified Data Model, prepare some types of Recruiting data by migrating it to the standard data structure.</p> <p>Including:</p> <ul style="list-style-type: none"><li>• State/Province data</li><li>• Job Location data</li><li>• Marketing Brand data</li></ul> |
| <a href="#">Enabling the Unified Data Model in Career Site Builder [page 424]</a>         | <p>Enable the Unified Data Model in Career Site Builder.</p>                                                                                                                                                                                                                              |
| <a href="#">Enabling Search Filtered by Locale Setting for Google Job Maps [page 426]</a> | <p>After you enable the Unified Data Model, update settings of the Google Job Map component, if it's used on any page of your career site.</p>                                                                                                                                            |
| <a href="#">Creating a Custom Job Layout for the Unified Data Model [page 510]</a>        | <p>Existing job layouts aren't ported over when you enable the Unified Data Model.</p>                                                                                                                                                                                                    |

| Task                                                                                              | Description                                                                                                              |
|---------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Review Existing Category Pages After You Enable the Unified Data Model [page 426]</a> | After you enable the Unified Data Model, review the <i>Job List</i> filters on category pages and update them as needed. |
| <a href="#">Understanding Changes After the Unified Data Model Is Enabled [page 427]</a>          | Review the changes and consider using features that are only available with the Unified Data Model                       |

## 19.5.1 Unified Data Model for Career Site Builder

To provide a better experience for candidates and leverage the full capabilities of Career Site Builder, use the Unified Data Model.

The Unified Data Model creates a tighter integration between Career Site Builder and the rest of SAP SuccessFactors Recruiting. It provides a standard, common data structure so that information can be more easily shared between different parts of the application, like job location and marketing brand. Using this common data structure, it's able to provide more features on your career site, like a more robust search experience and AI-based skill matching.

### → Recommendation

All new implementations of Career Site Builder should be based on the Unified Data Model. We strongly encourage all customers who already use Career Site Builder to consider adopting it as well.

However, the Unified Data Model may not be available for all customers. To ensure optimal performance, it requires that your Recruiting and Career Site Builder servers are located geographically close together. If they aren't, the *Use Unified Data Model* switch is disabled and you can't turn it on. Discuss availability options with your account team.

The Unified Data Model provides the following functionality:

- Improved support for non-English languages.
- All job requisition properties become directly configurable within Career Site Builder.
- A new GUI-based, intuitive filter method replaces the rule editor in category pages, custom job layouts, and data capture forms in landing pages. This new method lets you refine what to display based on the values you select from fields in the job requisition.
- The search tiles and search grids are replaced with a list that displays job results in the form of cards, which you can customize.
- Job searches on career sites are not limited to just the job title field. A new search experience has the ability to search for jobs within a specific category, in addition to the overall career site.
- Use of the Job Location generic object to standardize location information between Recruiting and Career Site Builder
- An integrated map view of search results.

Functionality provided by the Unified Data Model applies to both external and internal career sites. There are no special configurations or additional settings specific to internal career sites.

## 19.5.2 Preparing Recruiting Data for the Unified Data Model

Before you enable the Unified Data Model, you need to complete a few tasks to prepare Recruiting data, such as job location and marketing brand, so that it can be shared between Career Site Builder and the rest of SAP SuccessFactors Recruiting.

All Recruiting systems are preconfigured with a set of **object definitions** that support the Unified Data Model. They include:

- State/Province
- Job Location
- Job Location Long Format
- Job Location Short Format
- Marketing Brand

Before introduction of the Unified Data Model, there was no standardized way to include information about job location or marketing brand in a job requisition. It could be done several different ways, using standard Recruiting fields, custom Recruiting fields, or Foundation Objects.

The Unified Data Model requires a standardized way of capturing this information. The preconfigured standard objects provide a common data structure that can be shared between different parts of the application.

To prepare Recruiting data in your system for the Unified Data Model, complete the following tasks.

| Task                                                                                | Description                                                                                                                                                                                                                                      |
|-------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Verifying Migration to the State/Province Generic Object [page 412]</a> | Verify that the scheduled job <i>State Province GO Migration Job</i> has completed successfully. It's run automatically in all systems, but we recommend verifying that it was successful.                                                       |
| <a href="#">Migrating Job Location Data for the Unified Data Model [page 413]</a>   | Migrate job location information in your existing job requisitions to the standard Job Location object. This is a multistep process, involving a mapping tool, a migration job, and business rules.                                              |
| <a href="#">Migrating Brand Data for the Unified Data Model [page 421]</a>          | If you're using multiple brands or any brand other than the default brand in Career Site Builder, migrate your brand information to the Marketing Brand generic object.<br><br>(If you're only using the default brand, you can skip this step.) |
| <a href="#">Rebuilding the Search Index with Migrated Data [page 424]</a>           | Run a scheduled job to rebuild the search index for posted jobs with migrated data.                                                                                                                                                              |

## 19.5.2.1 Verifying Migration to the State/Province Generic Object

Verify that the scheduled job *State Province GO Migration Job* has run successfully.

### Prerequisites

- To verify if the job ran successfully, you need ► *Manage MDF Recruiting Objects* ► *State/Province* ► permission.
- To troubleshoot errors, you need *Monitor Scheduled Jobs* and *Manage Scheduled Jobs* permissions.

### Context

#### → Tip

This task is optional. As of 1H 2025, this job is run automatically in all systems, so you don't need to set it up. But, to avoid data issues, we recommend verifying that it completed successfully.

The scheduled job *State Province GO Migration Job* migrates state/province information (ISO codes) from a location in our database to the standard State/Province object. The State/Province object is used to include state/province information in the Job Location object.

After state/province information has been migrated successfully, you can proceed to the migration of Job Location data, as required for the Unified Data Model.

### Procedure

1. To verify that the automatic job was successful, go to ► *Admin Center* ► *Manage Data* ► and search for the *State/Province* object (in the first dropdown). Then check if there's any existing state/province data (in the second dropdown). If there isn't, the migration hasn't been completed successfully.
2. If the migration hasn't been completed successfully:
  - a. Within 180 days of the 1H 2025 release, you can check the job status. Go to ► *Admin Center* ► *Scheduled Job Manager* ► *Job Monitor* ►, search for job type *State Province GO Migration Job*, and check the status.
  - b. To run the job again, go to ► *Admin Center* ► *Scheduled Job Manager* ► *Job Scheduler* ► and set up a *State Province GO Migration Job* job.

## Next Steps

[Migrating Job Location Data for the Unified Data Model \[page 413\]](#)

### 19.5.2.2 Migrating Job Location Data for the Unified Data Model

Before you enable the Unified Data Model, you need to migrate job location data in your existing job requisitions to the standard Job Location object and then add the standard Job Location field to your job requisition templates.

#### Context

Before the introduction of the Unified Data Model, there was no standardized way to represent job location information on a job requisition. It could be done several different ways, using standard job requisition fields, including location\_obj, or custom job requisition fields..

To support the Unified Data Model, we introduced a standard way to capture job location information. All systems provisioned with a Career Site Builder instance are preconfigured with an object definition for the standard Job Location object. You can add data for each job location in your organization to the object. Then you can use the standard Job Location field to display the job location data on job requisitions.

If you have any existing job requisitions on your career site that contain job location information, you need to migrate data to the Job Location object, before you enable the Unified Data Model.

The data migration process includes several steps:

1. Adding the Job Location field (sfstd\_jobLocation\_obj) to each job requisition template.
2. Adding each job location in your organization to the Job Location object.
3. Setting a value in the Job Location field on each job requisition, using data in the Job Location object.

You can complete these steps in several different ways, using different tools. Choose one of the following methods.

#### Migrating Data with a Scheduled Job

You can migrate job location data for all job requisitions at the same time using a **scheduled job**, using the [Initiate Migration](#) option on the [Set Up Job Location Mapping and Initiate Migration](#) page.

Complete the following tasks:

| Task                                                                               | Description                                                                                                       |
|------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <a href="#">Mapping Job Location Data for Job Requisition Templates [page 415]</a> | Set up a mapping between fields in the Job Location object and fields in your existing job requisition templates. |

| Task                                                                                               | Description                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Initiating Job Location Data Migration [page 416]</a>                                  | <p>Migrate data from existing fields to the Job Location object, using a scheduled job.</p> <p>The scheduled job <i>Migrate Job Location Data for Job Requisitions</i> sets the Job Location value on each job requisition, based on the field mapping and on existing data in other location-related fields.</p> |
| <a href="#">Setting the Job Location Field on Job Requisitions with a Business Rule [page 419]</a> | <p>Create business rules that <b>update</b> the value of the Job Location field whenever a specified trigger event occurs.</p> <p>For example, you might create a rule that updates the Job Location field any time a requisition is saved.</p>                                                                   |
| <a href="#">Rebuilding the Search Index with Migrated Data [page 424]</a>                          | Run a scheduled job to rebuild the search index for posted jobs with migrated data.                                                                                                                                                                                                                               |

## Migrating Data Manually

If your organization requires more fine-grained control of the process, you can also migrate job location data manually and then update each job requisition individually, using **business rules**.

Complete the following tasks:

| Task                                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 19.5.2.3 Mapping Job Location Data for Job Requisition Templates

Save a mapping between fields in the Job Location object and fields in your existing job requisition templates, so that job location data in existing requisitions can be migrated to the Job Location object.

### Prerequisites

- There are existing job postings on your career site. For new implementations, this task isn't necessary.
- You've identified which job requisition templates require mapping. Save a mapping for each template that includes job location data and has a requisition posted on your career site.
- The *State Province GO Migration Job* job has completed successfully. [Verifying Migration to the State/Province Generic Object \[page 412\]](#)
- You have the *Set Up Job Location Mapping and Initiate Migration* permission.

### Context

Before you enable the Unified Data Model, you need to migrate job location data to the Job Location object. And before you can do that, you first need to map fields in the object to the corresponding fields in each job requisition template.

Save a field mapping for each job requisition template that requires it, so that job location data can be migrated correctly.

### Procedure

1. Go to ► [Admin Center](#) ► [Set Up Job Location Mapping and Initiate Migration](#) ►.
2. Select a template from the *Job Requisition Template* menu.

You're shown the default mapping between "Job Location" fields in the standard object and "Recruiting Management" fields in the requisition template.

If a field mapping has already been configured on the [Set Up Recruiting Marketing Job Field Mapping](#) page, the existing mapping is shown by default. Otherwise, the Recruiting Management fields are blank by default.

3. For each Job Location field, select a corresponding Recruiting Management field to map it to.

#### → Tip

- Although a mapping is only **required** for the Country/Region field, it's **recommended** for all location-related fields.

4. Save the mapping.

5. Repeat these steps for each job requisition template that you want to migrate.

#### → Tip

Save a mapping for all Job Requisition templates that include job location information and have requisitions posted on your career site. Data from unmapped templates isn't migrated.

## Results

Now that you've created a field mapping, you can proceed to migrate job location data to the Job Location object. The mapping can be used to add job location data to the Job Location object and set a value in the Job Location field, based on existing data in each requisition.

## Next Steps

You can use the [Initiate Migration](#) option on the [Set Up Job Location Mapping and Initiate Migration](#) page to migrate data with a scheduled job.

Alternatively, you can also manually add job locations to the Job Location object and add the Job Location field (sfstd\_jobLocation\_obj) to requisition templates, then set a Job Location value on each requisition with a business rule.

## 19.5.2.4 Initiating Job Location Data Migration

Initiate the migration of job location data in each job requisition to the Job Location object.

## Prerequisites

- There are existing job postings on your career site. For new implementations, this task isn't necessary.
- You have the [Set Up Job Location Mapping and Initiate Migration](#) permission.
- You've saved a field mapping for each job requisition template that includes job location information and has a requisition posted on your career site. [Mapping Job Location Data for Job Requisition Templates \[page 415\]](#)
- No fields in the Job Location object, except Country, are configured as a "required" field.

## Context

Before you enable the Unified Data Model, you need to migrate job location data to the Job Location object. To do that, you first need to save a field mapping. After you've confirmed the mapping for each template, you can use the [Initiate Migration](#) option to initiate data migration with a scheduled job.

When you initiate migration, a scheduled job runs and makes the following changes for each mapped template:

- Adds the standard Job Location field and field permissions to each mapped template, if not present already.
- Adds a job location to the Job Location object for each requisition, if not present already, based on existing data in each requisition that was created from a mapped template.
- Sets a Job Location value on each requisition that was created from a mapped template, using the corresponding job location in the Job Location object.

By default, the migration includes all **preapproved** and **approved** requisitions, as well as all **closed** requisitions that have been created in the past 2 years. You can change the cutoff date for closed requisitions or choose to exclude them.

### → Tip

We recommend that you save a mapping for **all** templates first, then initiate migration **once** for all templates at the same time.

However, if you accidentally miss a template or need to update the field mapping, you can run the migration job again. Each time you initiate migration, the scheduled job only makes changes to templates and requisitions with field mappings that have changed since the previous run.

## Procedure

1. Go to ► [Admin Center](#) ► [Configure Object Definition](#) ► and verify that no fields in the Job Location object definition, except Country, are configured as a "required" field.

### → Tip

If your organization needs to make any field other than Country required, you can temporarily change the object definition for the purposes of migration. Before you initiate migration, go to [Configure Object Definition](#), edit the Job Location object, and verify that the [Required](#) attribute is set to [No](#) for every field except Country. After the migration job completes, you can make them required again.

This step prevents some potential errors. If the migration job encounters an error while saving data in the Job Location object, the job fails and the process stops. If these fields are configured as "required" and the migration job encounters a requisition that doesn't contain the required information and the corresponding job location isn't present in the Job Location yet, we attempt to add a new job location to the Job Location object. Since the required information isn't available in the requisition, it causes an error on save that causes the migration process to stop.

2. Go to ► [Admin Center](#) ► [Set Up Job Location Mapping and Initiate Migration](#) ►.
3. **Optional:** Go to [Migrate closed requisitions that were created on/after](#) and choose whether to include closed requisitions in the migration and the date from which to include them.

By default, the date is set to 2 years before the current date, so the migration includes all closed requisitions created in the past 2 years. If you want to exclude all closed requisitions, remove the date.

#### → Tip

For best results, include all requisitions that contain valid job location data that you want to use in the future, whether they're open or closed.

For example, you have an office in New York, but you haven't had any job requisitions in that location during the past 2 years. Your last job opening in New York was almost 3 years ago, but it's still a valid location and you want the New York location to be available for use on future requisitions. To ensure that the New York location is added to the Job Location object, you choose to include all closed requisitions created in the past **3 years** in the migration.

4. Select *Initiate Migration*.

#### ⚠ Caution

If any of the templates include location-related fields (City, State/Province, or Postal Code) that haven't been mapped, you're shown a warning. For best results, we recommend mapping **all** location-related fields before you initiate migration. Once a Job Location value has been set by the scheduled job, it can't be set again using the migration tool. You have to update it manually.

## Results

The migration job runs in the background. When it completes, job location data has been migrated to the Job Location object.

For each mapped template, the Job Location field (`sfstd_jobLocation_obj`) is added, if it wasn't present already. For each requisition created from a mapped template, a corresponding job location is added to the Job Location object, if it wasn't present already. Then, a Job Location value is set in each requisition.

## Next Steps

Consider creating business rules that update the Job Location value automatically whenever a specified trigger event occurs. If you have multiple fields in a job requisition template that contain location information (such as Job Location and Location), you can use business rules to ensure that all the location-related fields stay in sync and don't contain conflicting information.

## 19.5.2.5 Setting the Job Location Field on Job Requisitions with a Business Rule

Create a business rule that sets the value of the Job Location field in job requisitions. Then assign the rule to a specified job requisition template.

### Prerequisites

- You've configured a field mapping for each job requisition template on the [Set Up Job Location Mapping and Initiate Migration](#) page.
- Job location data is added to the Job Location object for each location in your organization and the Job Location field (sfstd\_jobLocation\_obj) is added to each template that you want to create a rule for.

#### → Tip

If you initiated data migration on the [Set Up Job Location Mapping and Initiate Migration](#) page, these steps are done automatically. Otherwise, you need to do them manually.

### Context

Use the [Job Location \(\)](#) rule function to create business rules that set the value of the Job Location field whenever a specified trigger event occurs. The function looks up the appropriate job location in the Job Location object, based on the field mapping and on existing data in the job requisition. You can use it to set the value of the Job Location field.

After you adopt the Job Location object, you may eventually want to remove other location-related fields from your templates and only use the Job Location field, which would make these business rules unnecessary. But it may take some time for you to manage this change in your organization and update all your templates, processes, and integrations accordingly. During this transition, you can use business rules to ensure that location-related fields stay in sync and don't contain conflicting information.

### Procedure

1. Go to  [Admin Center](#)  [Configure Business Rules](#) .
2. Create a rule for the [Configure Business Rules on Job Requisition](#) scenario.

Choose a template for which you've completed the field mapping. Don't select "Job Requisition (All)". You need to choose a specific template.

Choose [Field Change](#) or [Save](#) as the "purpose" or trigger event that executes the rule. An "initialize" rule doesn't work for this purpose.

3. If needed, configure an [If](#) statement. If you don't, the rule always executes when a trigger event occurs.

4. Configure the *Then* statement to set the value of the *Job Location* field using the *Get Job Location ()* function.

In the left expression, be sure to select the standard field Job Location (sfstd\_jobLocation\_obj) and not another location-related field (such as Location).

#### Note

A business rule can only set **one** value in the Job Location field, even if the field is configured as multiselect. If needed, you can add additional job location values manually.

If the Job Location field is configured as multiselect, it's displayed in the rule definition with the prefix "Primary" to indicate that it only sets a value for the "primary" job location.

In the right expression, select the function *Get Job Location ()* as the Value. Then select *Job Requisition Template* as the argument of the function. (No other selection is allowed.)

#### Example

In this example, the Job Location field has the label "Job Location Unified" and it's configured as multiselect, so it appears in the rule definition with the prefix "Primary".

The exact labels in your system may vary.

##### Then

Set *Job Requisition Template.Primary Job Location Unified* to be equal to *Get Job Location()*  
*Job Requisition: Job Requisition Template*

5. Repeat these steps for each job requisition template.
6. To activate the rules, go to ► *Admin Center* ► *Manage Rules in Recruiting* ► and assign each rule you created to its corresponding template.  
For Field Change rules, you can choose which fields trigger the rule.

## Results

Whenever the trigger event occurs, the rule executes. The Job Location field in each job requisition is populated with an appropriate value, based on existing data in each requisition.

## 19.5.2.6 Migrating Brand Data for the Unified Data Model

If you use multiple brands in Career Site Builder, migrate brand information to the Marketing Brand generic object before you enable the Unified Data Model.

### Prerequisites

- Career Site Builder is enabled.
- The Marketing Brand generic object is defined in the system.

### Context

If you use multiple brands, you may have included brand information, such as names and descriptions, in existing job requisitions. Before you enable the Unified Data Model, you can use a scheduled job to migrate brand information to the standard Marketing Brand generic object.

#### ⓘ Note

To avoid errors, don't run the *Migrate Brand to Marketing Brand on Job Requisition* job if:

- You only use the default brand, with no additional brands.
- You've already configured and started using the standard Marketing Brand generic object.

### Procedure

1. Go to ► [Admin Center](#) ► [Scheduled Job Manager](#) ►.
2. Create, schedule, and run the scheduled job *Migrate Brand to Marketing Brand on Job Requisition*.

### Results

The scheduled job migrates brand information to the Marketing Brand generic object by performing the following actions:

- Considers all job requisition templates that have a mapping set up at ► [Admin Center](#) ► [Set Up Recruiting Marketing Job Field Mapping](#) ►.
- Adds the standard field Marketing Brand (sfstd\_marketingBrand\_obj) and copies field attributes and permissions from the old brand field, as well as localized labels and descriptions.
- Copies the brand field data to the standard field Marketing Brand (sfstd\_marketingbrand\_obj).

- Sends the external name of the Marketing Brand Object to Recruiting Marketing for a job requisition template when the Marketing Brand Object (sfstd\_marketingbrand\_obj) field is mapped to any other field and not to the brand field on the [Set Up Recruiting Marketing Job Field Mapping](#) page. By default, the translation available for the external name of the Marketing Brand Object in the job posting language is sent to Recruiting Marketing. If the translation for the external name of the Marketing Brand Object isn't available, then the translation for the external Name in English US (EN\_US) of the brand object is sent to Recruiting Marketing. Otherwise, the default external name of the Marketing Brand Object is sent to Recruiting Marketing.

## Next Steps

You can monitor the status of the migration job in [Scheduled Job Manager](#). If the job doesn't complete successfully, here are some possible reasons:

- The default Marketing Brand Object is set as the value of the field to the job requisition template:
  - A matching Marketing Brand Object isn't found. The field value is set to the default "marketingBrandObject" object because no marketing Brand Object's brand URL matches the Brand value.
  - The Brand field has no value on the job requisition. The field value is set to the default "marketingBrandObject" object because the brand value isn't found on the job requisition.
  - The Brand field isn't present on the job requisition XML template. The field value is set to the default "marketingBrandObject" object because no brand field is found on the job requisition.
  - The standard Marketing Brand Object has no value on the job requisition, and then the internal ID of the object found is copied for migration.
- The value migration is skipped, and no changes are made to the job requisition:
  - The standard Marketing Brand Object on the job requisition has a value, the migration is skipped, and no changes are made to the job requisition.
  - The mapping is unavailable on the job requisition XML template against the brand field on the [Set Up Recruiting Marketing Job Field Mapping](#) page, then the migration is skipped, and no changes are made to the job requisition.
  - The standard Marketing Brand Object field definition isn't found on the job requisition XML template, and then the migration is skipped.
- The migration fails:
  - Data on the job requisition XML template is corrupt.
  - Data migration for the "sfstd\_marketingBrand\_obj" field has failed.
- Migration is interrupted when the Provisioning Administrator terminates the job or the number of the scheduled jobs has more records to process and it has crossed the two-hour limit in provisioning. Rerun the job to complete the data migration.

### 19.5.2.6.1 Supported Data Types for Brand Migration

The supported and unsupported data types for the migration of Brand Information to the Marketing Brand generic object.

#### Supported Data Types for the Migration of Brand information

## Note

During the migration of the job requisition templates with data types of Custom GO and the External Title used for the Brand field aren't migrated.

| Data Type                                          | If Single Translation is Available                                                                                                                                                                                                                      | If Multiple Translations are Available                                                                                                                                                         |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Picklist (standard/custom)                         | <ul style="list-style-type: none"><li>For a standard picklist, a unique label is matched to the brandURL for migration.</li><li>For a custom picklist, the value stored in the default locale of requisition is considered for the migration.</li></ul> | If no unique label is available, the value migration is skipped, and the Marketing Brand Object value remains null. To start the migration, correct the configuration and rerun the migration. |
| Mfields                                            | The unique label is matched to the brandURL for the migration.                                                                                                                                                                                          | If no unique label is available, the value migration is skipped, and the Marketing Brand Object value remains null. To start the migration, correct the configuration and rerun the migration. |
| Filter fields                                      | The unique label is matched to the brandURL for the migration.                                                                                                                                                                                          | If no unique label is available, the value migration is skipped, and the Marketing Brand Object value remains null. To start the migration, correct the configuration and rerun the migration. |
| Standard brand field/custom text field             | The standard brand field and custom text field value is matched to the brandURL for migration.                                                                                                                                                          | N/A                                                                                                                                                                                            |
| Custom text                                        | The value stored in defaultLocale of the job requisition is considered for migration.                                                                                                                                                                   | Use the value stored in defaultLocale of the job requisition.                                                                                                                                  |
| Legal Object/Department Object                     | The defaultExternalName for brandURL is considered for migration.                                                                                                                                                                                       | If no unique label is available, the value migration is skipped, and the Marketing Brand Object value remains null. For migration to start, correct the configuration and rerun the migration. |
| Custom field object of type Marketing Brand Object | The defaultExternalName for brandURL is considered for migration.                                                                                                                                                                                       | The defaultExternalName for brandURL is considered for the migration. Note that if multiple translations are present for external names, then the migration is skipped.                        |

## Related Information

[Managing Scheduled Jobs in Admin Center](#)

## 19.5.2.7 Rebuilding the Search Index with Migrated Data

Just before you enable the Unified Data Model for Career Site Builder, run a scheduled job to rebuild the search index for posted jobs on your career site.

### Prerequisites

- You've prepared all your Recruiting data, such as job location and brand information, and are ready to adopt the Unified Data Model.
- You've configured all of the default and translated values for field labels and picklist values, for each generic object and for all the locales in the system. With the Unified Data Model, if values aren't populated for each locale, it affects field and data availability.

### Procedure

1. Go to ► [Admin Center](#) ► [Scheduled Job Manager](#) ► [Job Scheduler](#) ►.
2. Set up and run the scheduled job [ReBuild Posted Job Requisition Search Index](#) to update the search index.

#### Note

If you've enabled Unified Data Model in the 2H 2023 release and are enabling Google Map in the 1H 2024 release, ensure you run the [ReBuild Posted Job Requisition Search Index](#) job with the "Rebuild the Complete Posted Job Requisition Search Index" parameter enabled to have all list and Google Map functionalities.

## 19.5.3 Enabling the Unified Data Model in Career Site Builder

Turn on the Unified Data Model in Career Site Builder

### Prerequisites

#### Caution

Before you enable the Unified Data Model, make sure you've prepared your Recruiting data first. [Preparing Recruiting Data for the Unified Data Model \[page 411\]](#)

## Context

This task is only necessary in Career Site Builder systems that were created before the 2H 2025 release. After that, the Unified Data Model is enabled automatically in all new systems where it's available and cannot be disabled.

### Note

The Unified Data Model requires that your Recruiting and Career Site Builder systems are hosted in data centers that are geographically close together, to ensure better performance and user experience. If your Recruiting and Career Site Builder systems **aren't** geographically close, the Unified Data Model isn't available to you yet and the [Use Unified Data Model](#) switch is grayed out. Discuss available options with your account team.

## Procedure

1. Go to ► [Settings](#) ► [Site Configuration](#) ► in Career Site Builder, then scroll down to [Unified Data Model](#).
2. In the [Use Unified Data Model](#) field, move the slider to [Yes](#).
3. Save your settings.

## Results

You have now enabled the Unified Data Model for your career site.

## Next Steps

You can now create custom job layouts, create search result cards, set up search filters, update category pages and email templates for job alerts.

Also consider:

- [Enabling Search Filtered by Locale Setting for Google Job Maps \[page 426\]](#)
- [Review Existing Category Pages After You Enable the Unified Data Model \[page 426\]](#)
- New features are available in Career Site Builder after the Unified Data Model is enabled. For example, you can now use AI-assisted features. [Premium AI Features for Recruiting \[page 93\]](#)

## 19.5.4 Enabling Search Filtered by Locale Setting for Google Job Maps

After you enable the Unified Data Model, you need to update configuration of the [Google Job Map](#) component.

### Context

When the Unified Data Model is enabled, the [Search Filtered by Locale](#) option for the [Google Job Map](#) component must be turned on for the component to render correctly.

This is a one-time task that's only required if you had career site pages with the [Google Job Map](#) component **before** the Unified Data Model was enabled. **After** the Unified Data Model is enabled, this option is always set to [Yes](#).

### Procedure

1. In Career Site Builder, go to the page that uses the [Google Job Map](#) component.
2. Select the component to open the [Details](#) tab.
3. Set the [Search Filtered by Locale](#) option to [Yes](#).
4. Repeat these steps for each page with the [Google Job Map](#) component.
5. Choose [Publish](#) to update your site.

## 19.5.5 Review Existing Category Pages After You Enable the Unified Data Model

Review your existing category pages to make sure the new Unified Data Model filters accurately reflect their legacy rules.

### Note

Due to the significant changes in underlying data services and data models, full deterministic migration of categories is not feasible.

Preparing Career Site Builder for the Unified Data Model involves a process that provides significant assistance in category migration, but categories still need to be reviewed for accuracy. A transition to the Unified Data Model is an opportunity to review category pages and clean house.

The original function of category pages was to provide search engine optimization (SEO) value and improve career site ranking in the major search engines. Category pages no longer serve this function, as SEO ranking algorithms and indexing processes have changed significantly since the introduction of the original category design in Career Site Builder.

As you review your existing category pages, focus on providing value to visitors and job seekers, highlighting the types of positions and aspects of organizations that are relevant to candidates. Category pages can also play a role in campaigns and other marketing efforts, as well.

Category pages continue to be listed at [Pages > Category](#) after you enable the Unified Data Model, with no special notations to indicate that they existed before the Unified Data Model was enabled.

When you enable the Unified Data Model, Career Site Builder automatically scans and processes all existing category pages. It then converts the rules into keyword-based filters and adds them in the *Job List* tab in [Pages > Category > <Category Page>](#).

At the same time, Career Site Builder moves the legacy category rules into a new tab called *Rule Archive*. This read-only tab allows you to see what the rule details were, including whether you used the simple rule editor, or the advanced version for complex rules created using Solr syntax.

#### → Tip

The existence of the *Rule Archive* tab is the easiest way to identify category pages that existed before the Unified Data Model was enabled.

As part of your career site's transition process when you enable the Unified Data Model, you should review the new *Job List* filters and see if they match the original rules to your satisfaction. Not all filters match legacy rules exactly, but the flexibility of the Unified Data Model allows you to combine many standard and custom fields (such as picklist, enum, and object types) to filter out jobs so that you're unlikely to need the complexity of the legacy advanced rules.

If a *Job List* filter doesn't match a legacy rule to your satisfaction, update the filter or consider deactivating the page.

For more information on re-creating rules, refer to *Creating New Category Pages in the Unified Data Model*. For more information on legacy category rules and the NOT operator, refer to *SAP Knowledge Base Article 3409791 Unified Data Model - Legacy Category Rules and the NOT Operator - Recruiting*.

#### ⓘ Note

The Unified Data Model does not support Solr syntax in category rules. Career Site Builder ignores any Solr syntax that was included before the rules were migrated to the Unified Data Model.

## 19.5.6 Understanding Changes After the Unified Data Model Is Enabled

Learn about the changes to career sites and Career Site Builder that take effect when the Unified Data Model is enabled.

### [Fields and Filters in the Unified Data Model \[page 428\]](#)

The Unified Data Model allows Career Site Builder to access all objects and fields defined in job requisition templates, and use them as fields ("facets") when refining a list through filters; site field mapping and job field mapping are not used.

### [Search Experience Settings for the Unified Data Model \[page 429\]](#)

When the Unified Data Model is enabled, more settings are available to configure the search experience on your career site.

#### [Job Alerts in the Unified Data Model \[page 430\]](#)

If the Unified Data Model is enabled, candidates can sign up for job alerts on the job details page, in addition to search results and category pages.

#### [Legacy Category Rules and the NOT Operator \[page 431\]](#)

When Career Site Builder creates new filters, it **ignores** the NOT Boolean operator in advanced category rules.

When the Unified Data Model is enabled, links to private postings navigate to your career site (powered by Career Site Builder).

#### [Keyword Stemming Support on Career Site Search \[page 434\]](#)

Support for different word forms in a search query on career site.

## 19.5.6.1 Fields and Filters in the Unified Data Model

The Unified Data Model allows Career Site Builder to access all objects and fields defined in job requisition templates, and use them as fields ("facets") when refining a list through filters; site field mapping and job field mapping are not used.

When fields are shown in a dropdown list in Career Site Builder, the field name is followed by the field ID, in parentheses. For example, the field named *Department* is shown as *Department (department\_obj)*.

The following Career Site Builder features take advantage of Unified Data Model functionality.

### Search Results

The *Search Results* page is located under *Layouts*, and includes the following tabs:

- *General* allows you to specify brand and enable location searches
- *Results Cards* lets you choose up to 10 fields from the job requisition template to show in the third line of text in individual search results cards. The first line always displays the job title, and the second line displays the short location (defined in ► *Manage Data* ► *Job Location Short Format* ►).
- *Search Filters* lets you display fields (picklists, enum objects, and generic objects) in the job requisition template that candidates can use to refine their search.

### Category Pages

The category page editor includes a new tab, *Job List*, which lets you define the scope for what displays on a category page by keyword and location. A GUI filter also lets you refine the list using all objects from the job requisition template.

Existing category pages have a new tab *Rule Archive*, which provides you with read-only access to the rules you had for the category page before.

When the Unified Data Model is not enabled, category pages require setting up category rules. These are done in the Rule Editor tab, where you specify simple rules for keyword, location, and a small set of fields available for the

site. Administrators who are familiar with SOLR syntax could also create more complex rules in the Advanced Rules Editor tab. Neither option, however, provides access to all objects in the job requisition.

## Custom Job Layouts

The Custom Layouts Editor includes a new tab, called [Layout Rules](#), where you can add multiple filters to limit the scope of what appears in that particular job layout. Because this filter uses all objects from the job requisition template, you are not limited to just a job category for the job layout.

In addition, the ability to add multiple filters means you can add a filter that specifies the brand, and another that specifies locale. This means that you don't need to organize your job layout by brand and locale, and this is no longer an option when you create a new job layout.

## Job Alerts in Data Capture Forms

The [Job Alerts](#) tab gives you the ability to add additional filters using all objects from the job requisitions template. Landing pages with existing job alerts in the data capture form display a new [Rule Archive](#) tab.

The [Job Alerts](#) tab allows you to create a filter rule based on keyword and location, and add additional filters based on the site field mapping you configured.

## 19.5.6.2 Search Experience Settings for the Unified Data Model

When the Unified Data Model is enabled, more settings are available to configure the search experience on your career site.

| Location                                                                                         | Description                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Configuring Style of the Search Form for the Unified Data Model [page 466]</a>       | To configure the overall look of the search form page itself, such as background color or background image, go to <a href="#">Appearance &gt; Styles &gt; Global Styles &gt; Search Form</a> .<br><br>(If you see a <a href="#">Search</a> tab instead of <a href="#">Search Form</a> , the Unified Data Model isn't enabled.) |
| <a href="#">Configuring Style of the Search Experience for the Unified Data Model [page 468]</a> | To configure the style of results cards on the job search page, go to <a href="#">Appearance &gt; Styles &gt; Global Styles &gt; Search Experience</a> .<br><br>(If you don't see a <a href="#">Search Experience</a> tab, the Unified Data Model isn't enabled.)                                                              |

| Location                                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Configuring Layout of Search Results for the Unified Data Model [page 514]</a> | <p>To configure the layout of the search experience, such as what information to show on each result card and which fields are available as search filters, go to ► <a href="#">Layouts</a> ► <a href="#">Search Results</a> ►.</p> <p>You can also enable the <a href="#">AI-Assisted Skills Matching for Resumes</a> feature, to help candidates can find jobs that match their skills.</p> <div> <p>📘 Note</p> <p>(If <a href="#">Search Results</a> isn't available under <a href="#">Layouts</a> and is located under <a href="#">Appearance</a> instead, the Unified Data Model isn't enabled.)</p> </div> |

### 19.5.6.3 Job Alerts in the Unified Data Model

If the Unified Data Model is enabled, candidates can sign up for job alerts on the job details page, in addition to search results and category pages.

You can add a job alert link in job details pages as a component, giving you the ability to choose where on the page you want the link text to appear.

The [Job Alerts Link](#) component is available only if the Unified Data Model setting is enabled in Career Site Builder. The job alert link appears in job detail pages without the ability to change its settings. The links appear in category pages and search results pages regardless of whether you have enabled the Unified Data Model or not.

If you don't already have job alerts turned on, enable [Use Job Alerts](#) at ► [Site Configuration](#) ► [Email Settings](#) ►, and include an email address for [Job Alert Sender Address](#) (using whatever username you want before the @ sign), then save your settings. Job alerts are automatically emailed to subscribers every seven days.

#### 📘 Note

If you don't already have job alerts turned on, learn more about them here: [Enabling Job Alerts \[page 533\]](#)

What happens in your job layout when you turn on the [Use Job Alerts](#) switch depends on whether the Unified Data Model setting is enabled:

- If Unified Data Model is already enabled, you can **add** the [Job Alerts Link](#) component to your layout. The job alert link **doesn't** automatically show up on the job detail page. The component becomes available at ► [Layouts](#) ► [Job](#) ► [Custom Layouts Editor](#) ► and you add it manually.
- If Unified Data Model isn't enabled, this component isn't available. When you do enable Unified Data Model, Career Site Builder then adds a job alert link to your default job layout. You can then change its positioning and alignment at ► [Layouts](#) ► [Job](#) ► [Custom Layouts](#) ►.

You can add the [Job Alerts Link](#) component in the layout wherever you're allowed to add a component.

The default link label is [Job Alerts Link](#). To change it, use the `<tcJobResultsCreateJobAlertsDetailsText>` key in the translation editor at ► [Tools](#) ► [Translations](#) ►.

You can change the way the text looks at [Appearance](#) > [Styles](#) > [Global Styles](#) > [<Brand>](#) > [Search Experience](#) > [Job Alerts](#):

- [Job Alert Link Style](#) sets the text settings for the text, including the font stack, font size, and font color.
- [Job Alert Link Hover Color](#) the default font color when you mouse over the text.

You can control the alignment of the link text in the component (left, center, and right).

## 19.5.6.4 Legacy Category Rules and the NOT Operator

When Career Site Builder creates new filters, it **ignores** the NOT Boolean operator in advanced category rules.

For example, if you have a legacy advanced rule for manager jobs but **not** in Chicago, the new filter ignores the NOT Chicago portion of the query syntax.

This means that you need to review **all** category rules that use the NOT operator, and decide what to do with them. Options include adjusting the [Job List](#) filter to make sure the category page lists the correct jobs, or deactivating them.

If you choose to revise those category pages that use the NOT operator, consider using division or department or various location properties to narrow down the jobs.

The flexibility of the Unified Data Model means you can combine many standard and custom fields (picklist, enum, object types) to filter out jobs.

### NOT Behavior Examples

How Career Site Builder interprets the use of NOT in category rules in Unified Data Model filters depends on where it appears in the SOLR syntax. These examples illustrate some differences.

#### Query: "Manager NOT Chicago"

When the Unified Data Model is enabled, Career Site Builder shows **Manager** in the keywords and ignores Chicago.

| Unified Data Model Status | Search Results                                                                                    |
|---------------------------|---------------------------------------------------------------------------------------------------|
| Enabled                   | The query changes to list <b>all</b> Manager jobs (including jobs with Chicago).                  |
| Not enabled               | This query lists <b>all</b> Manager jobs <b>excluding</b> those that have Chicago in job content. |

#### Query: "NOT Manager"

When the Unified Data Model is enabled, Career Site Builder displays nothing (blank) in keyword and location fields.

| Unified Data Model Status | Search Results                                                                   |
|---------------------------|----------------------------------------------------------------------------------|
| Enabled                   | The query simply changes to list ALL jobs.                                       |
| Not enabled               | This query will list ALL jobs EXCLUDING those that has "Manager" in job content. |

### Query: "NOT ("IT Security" AND "Industrial Security") AND (custom1:"Rocket Center" AND marketmajor:(Pittsburgh OR Cumberland))"

When the Unified Data Model is enabled, Career Site Builder displays "Rocket Center" in keyword field and "Pittsburgh Cumberland" in the location field.

| Unified Data Model Status | Search Results                                                                                                                                             |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enabled                   | The query will fetch all jobs that match "Rocket Center" in "Pittsburgh or Cumberland", EXCLUDING nothing.                                                 |
| Not enabled               | This query will list all jobs that match "Rocket Center" in "Pittsburgh or Cumberland" and EXCLUDING jobs that has "IT Security" or "Industrial Security". |

## 19.5.6.5 Changes to Tokens in the Job Alerts Email Template with the Unified Data Model

Learn about changes to token behavior in the job alerts email template when the Unified Data Model is enabled.

The `[[jobs]]` token no longer accepts token variables.

With the Unified Data Model, the `[[jobs]]` token stops accepting any token variables.

If an email template uses the `[[jobs]]` token with an additional variable, like `::location::`, the variable is ignored. The template behaves as if it just used the `[[jobs]]` token by itself.

#### → Recommendation

Although the ignored variables don't cause any errors, consider removing them from the email template, so that it's clear that the information isn't included in the email.

The `[[agent]]` token is no longer supported.

With the Unified Data Model, the `[[agent]]` token is **not supported**.

#### → Recommendation

Remove the `[[agent]]` token from your email templates. Consider using the `[[alertname]]` token instead.

The `[[alertname]]` token is available to replace the `[[agent]]` token.

The `[[alertname]]` token is supported **only** when the Unified Data Model is enabled. It doesn't accept any token variables.

It represents the name of the user-created alert. It will be one of the following: Category Name, Job Title, or search terms entered by the user.

#### → Recommendation

After you enable the Unified Data Model, you can use it to replace the unsupported `[[agent]]` token.

---

Job alert emails have a standard frequency of 7 days.

When the Unified Data Model is enabled, job alert emails always have a frequency of 7 days. You don't need to use tokens to include frequency information in the email template.

---

## Related Information

[Editing the Job Alerts Email Template in Career Site Builder \[page 522\]](#)

[Tokens Used in the Job Alerts Email Template \[page 524\]](#)

## 19.5.6.6 Enhanced Experience for Private Postings with the Unified Data Model

When the Unified Data Model is enabled, links to private postings navigate to your career site (powered by Career Site Builder).

If private postings are enabled in the system, recruiters can copy a link to a private posting on the [Job Postings](#) page, to share with applicants. Using the link, applicants can access the private posting with a branded career site application experience.

Recruiters can also generate a language-specific URL. There's a new [Languages](#) column on the [Job Postings](#) page for a given job requisition, showing the number of postings in different locales. You can choose the number in the [Languages](#) column to open a dialog where you can copy a URL for each language the job is posted in.

## Related Information

[Enabling Private Postings of Jobs \[page 309\]](#)

## 19.5.6.7 Keyword Stemming Support on Career Site Search

Support for different word forms in a search query on career site.

On the career site, the Search Results page lets candidates search for jobs with different combinations of the same keyword and apply for jobs accordingly. The Title, Description, Header, and Footer fields defined in a job requisition support the keyword-stemming capability.

All the Recruiting languages support keyword stemming except for the following languages:

- Montenegrin
- Hebrew
- Croatian
- Macedonian
- Slovak
- Slovene
- Serbian Cyrillic
- Serbian
- Tagalog
- Ukrainian
- Vietnamese

## 19.6 Creating a Career Site with Career Site Builder

Career Site Builder allows you to build a responsive corporate career site by adjusting colors, images, headers, footers, and site layout components so that you can have a custom look without engaging SAP SuccessFactors Professional Services.

Career Site Builder lets you configure the site as a whole using the [Global Styles](#), [Global Settings](#), and [Search Grid](#) menus. These settings control site-wide components like headers, footers, button color, and so on.

You can also change the layout and content of the site home page, content pages, and category pages using components. Components are prestyled blocks of content that you can add to pages. You can then edit the content of the components, update some settings of the component, and modify the colors and appearance of component-specific elements.

You can also configure brand and location-specific elements for the site. If your organization has multiple brands, you can set up a different career site for each brand in Career Site Builder, each with its own look and feel, including logos, colors, images, and fonts. You can also configure different headers and footers for any of the site brands, as well as creating localized headers and footers for any configured locales. For example, if you'd like to display different links in the footer depending on whether users are in the U.S. or Germany, you can configure those options in [Global Styles](#).

When adding components to the home page, content pages, or category pages, you can also configure different pages by brand and locale. Doing so lets you configure different home pages, for example, for both U.S. and Canadian versions of a site. You can also configure different pages for different brands.

## 19.6.1 Accessing Career Site Builder from the Admin Center

Access the Career Site Builder from the Admin Center so that you can use it to customize and configure your career site.

### Prerequisites

- An implementation consultant has enabled Career Site Builder in Provisioning.
- An implementation consultant has set up the integration between Career Site Builder and the rest of SAP SuccessFactors Recruiting.
- You have the following permissions:
  - ► [Administrator Permissions](#) ► [Manage Recruiting](#) ► [Manage Career Site Builder](#) ►
  - ► [User Permissions](#) ► [Recruiting Permissions](#) ► [Recruiter RMK SSO Permission](#) ►

### Procedure

Go to ► [Admin Center](#) ► [Manage Career Site Builder](#) ►.

### Results

Career Site Builder opens, within the Admin Center. You can start using it to set up your career site.

## 19.6.2 Search-Related Settings in Career Site Builder Without the Unified Data Model

The locations in Career Site Builder where you configure your settings for search depend on what you need to customize.

#### ❗ Note

This information only applies when the Unified Data Model is **not** enabled. When it's enabled, the settings described here change.

For information about search settings after the Unified Data Model is enabled, refer to [Search Experience Settings for the Unified Data Model \[page 429\]](#).

| What You Want To Do                                                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Specify the global settings for the type of search experience you want to offer, such as limiting a search by locale. | Configure the global settings that affect all your career site pages in the <a href="#">Search</a> tab in <a href="#">Appearance &gt; Global</a> . Refer to <a href="#">Search Settings in Career Site Builder Global Appearance Without the Unified Data Model</a> [page 594].                                                                                                                                                                                                                                                                                                                                                                                                             |
| Specify fonts and colors in the search bar, as well as a background image and how you want the image to appear.       | Configure the visual style settings at the brand level, in the <a href="#">Search</a> tab under <a href="#">Appearance &gt; Styles &gt; Global Styles &gt; &lt;Brand&gt;</a> . You can configure different settings for each of your brands. Refer to <a href="#">Search Settings in Career Site Builder Global Styles Without the Unified Data Model</a> [page 607].                                                                                                                                                                                                                                                                                                                       |
| Display your job listings on a search results page in a table grid format.                                            | Customize the settings in <a href="#">Appearance &gt; Search Results</a> , making sure to disable the <a href="#">Use Search Result Tiles</a> setting there. Refer to <a href="#">Search Results in Career Site Builder Appearance Menu Without the Unified Data Model</a> [page 617].                                                                                                                                                                                                                                                                                                                                                                                                      |
| Display your job listings on a search results page in individual tiles.                                               | <p>Enable the <a href="#">Use Search Result Tiles</a> field in <a href="#">Appearance &gt; Search Results</a>. Doing so reveals the <a href="#">Search Tiles</a> tab in <a href="#">Appearance &gt; Styles &gt; &lt;Brand&gt;</a>, where you configure the rest of your search tiles settings. Refer to <a href="#">Configuring Search Tiles Settings Without the Unified Data Model</a> [page 488].</p> <div> <p>→ Recommendation</p> <p>Use this tile search results style instead of the grid style to make your career site more accessible to a wider audience — including persons who use assistive technologies or who use the <b>Tab</b> key to navigate through a page.</p> </div> |

## 19.6.3 Special Characters in Career Site Searches

Keyword and location searches performed in Career Site Builder-enabled career sites return results regardless of whether candidates use special characters in their queries.

SAP SuccessFactors Recruiting users can choose to include special characters in their job postings or not; the result displays both regardless of whether candidates included special characters in their searches or not.

The following special characters are recognized for both keyword and location searches, and are treated as if they were unaccented so that search results are the same whether special characters are used or not:

- é – accent acute
- è – accent grave
- ë – umlaut
- ê – circumflex
- ç – cedilla
- ñ – tilde
- ø – streg
- ð – eth (capital form Ð)
- å – bolle
- æ – ligature
- œ – ligature
- ě – macron
- č – háček
- ů – crescent

### ❖ Example

The following example describes how search handles "Québec" with and without the é special character:

| Term the Recruiter Uses in a Job Posting | The Search Term a Candidate Enters | Search Result                                          |
|------------------------------------------|------------------------------------|--------------------------------------------------------|
| Québec                                   | Quebec                             | Returns job postings that list both Québec and Quebec. |
| Quebec                                   | Québec                             | Returns job postings that list both Québec and Quebec. |

## 19.6.4 Adding Images in Career Site Builder Using Image Selector

Use the Image Selector whenever you need to upload and specify an image to use in a Career Site Builder component.

### Prerequisites

You have the image you want to use in a career site page or component.

### Context

The Image Selector appears in the following locations:

- The *Meta Image* and *Content Background Image* fields in [Appearance](#) > [Styles](#) > [Global Styles](#) > [<Brand>](#) > [Main](#) .
- The *Search Form Background Image* field in [Appearance](#) > [Styles](#) > [Global Styles](#) > [<Brand>](#) > [Search](#) .
- The *Image* field in the *Logo* tab in the Header Editor in [Appearance](#) > [Styles](#) > [Headers](#) > [<Locale>](#) > [<Brand>](#) .
- The *Image* field in the *Logo* tab in the Footer Editor in [Appearance](#) > [Styles](#) > [Footers](#) > [<Locale>](#) > [<Brand>](#) .
- The *Slide <Number>* field in the Image and Text Carousel component.
- The *Image* field in the *Images* tab in the Image Carousel component.
- The *Image* field in the *Column <Number>* tab and *Background Image* field in the *Styles* tab in the Three Column Images with Caption component.
- The *Image* field in the *Details* tab in the Info and Subscribe component.
- The *Background Image* field in the Large Image component.
- The *Background Image* field in the *Styles* tab in the following page components:
  - Two Column
  - Text
  - Featured Jobs
  - Subscribe Form
  - Data Capture Form

The Image Selector isn't available in the Custom Plugin component. To upload an image to your Career Site Builder image library and link to it in your customized content, refer to *Uploading Images to Link to in Career Site Builder Custom Plugin Components*.

Career Site Builder supports the following media types:

- GIF
- ICO

- JPG, PJPEG
- PNG
- SVG – this format is specifically for logos

## Procedure

1. Select the shaded image box in the component to go to the Styles settings for the image.
2. Select  [Select Image](#).

The Image Selector dialog appears.

3. If you haven't uploaded an image you plan to use for your meta image, select  [Upload Image](#).
4. Select the [Select Image](#)  icon.

The Open dialog appears.

5. Select the image you want to upload, and confirm.

The Open dialog closes, and the image name appears in the Image Selector.

6. Select the green  [Add](#) icon to add the image, and accept the confirmation dialog.
7. Select  (left arrow) to return to the first page in the Image Selector.

Your uploaded image now appears in the list of available images with the following columns:

- [Preview](#) – a thumbnail of your image.
  - [Name](#) – your image's file name, including the file type extension.
  - [Size, Dimensions](#) – the file size of your image, as well as height and width dimensions.
  - [Created](#) – a timestamp of when your image was uploaded.
  - [Alt Text](#) – alternative text that is announced in a screen reader.
  - [Action](#) – allows you to select the image to use in your image field.
  - [Archived](#) – allows you to archive the image. When you select it, you need to accept the confirmation dialog.
8. Enter descriptive text in the [Edit Alt Text](#) field for your newly uploaded image.

Alt text is used by assistive technology such as screen readers, and is a requirement for accessibility.

9. Select the  [Select](#) field for your image.

The Image Selector closes as soon as you select your image, and your image now appears in the [Image](#) field.

10. **Optional:** To change the image, select  [Change Image](#).
11. **Optional:** To remove the image, select  [Remove Image](#).
12. Select [Save](#) on your page to save the changes.

## 19.6.5 Pages and Page Components

### 19.6.5.1 Types of Pages You Can Create in Career Site Builder

Career Site Builder allows you to select specific types of pages depending on your needs.

Career Site Builder allows you to create the following types of pages.

| Page Type      | Description                                                                                                                                                                                                                                                                                                                                     |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Home pages     | The home page editor allows you configure home pages for each active locale and brand.                                                                                                                                                                                                                                                          |
| Content pages  | The content page editor allows you to create web pages in your career site that contains different types of content based on the components you add.                                                                                                                                                                                            |
| Category pages | <p>The category page editor allows you to create career site pages based on different categories, which you specify using category rules.</p> <p>Category pages display jobs grouped together based on keyword, location, or other job data. Rules are written for some types of category pages in order to create specific types of pages.</p> |
| Landing pages  | <p>The landing page editor allows you to create a campaign-specific pages that you can use for a targeted audience.</p> <p>On systems enabled for Candidate Relationship Management features, you can brand the landing pages appropriately for specific types of candidates, and include data capture forms.</p>                               |

### 19.6.5.2 Configuring Home Pages in Career Site Builder

Add various components to the home page and adjust their style, appearance, and content.

#### Context

If you have a branded career site, selecting the [Home](#) link at the top of the page takes you to that specific brand's jobs home page, rather than the job's home page for the default brand.

#### Procedure

1. Log in to Career Site Builder and select [Home](#) at [Pages](#) > [Home](#) > [<Locale>](#) > [<Brand>](#) [X](#).

Every brand shows a [Home](#) listing, but they're empty by default, and don't include any components when you first select them.

2. Select [Add Component](#), then choose a component from the dropdown list to add a new component to a page.

If a page has existing components, you can also select the **+ plus** (*Add Component Below*) icon of a configured component to add a new component below it.

→ Tip

The *Add Component* dropdown list stays open. To close it, navigate off of the list and click anywhere within the home page editor.

Once you've added the desired type of component, you can control the component's location on the page by choosing **△ up arrow** or **▽ down arrow** for the section. Components display on the page in the same order they appear on the site's live content page.

3. Choose the devices you want the component to display in by selecting *Desktop*, *Tablet*, or *Mobile*. You can select any combination, or all of them for the component.

Choose individual components to adjust the style, appearance, or content of the component. You can't control the size of components, or the distance between them on the page. These are controlled by content and functionality of the components.

4. If you've set up an internal career site powered by Career Site Builder and you want the home page to be visible in it, choose *Internal*. Choose *External* for a home page for an external career site. You can also select both.
5. Select the gray box for the component to configure the settings for the component.
6. **Optional:** Add additional components to the home page:

| Option                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Add Component</i>       | Select <i>Add Component</i> to add a new component below the components you added, or the <b>+ plus</b> ( <i>Add Component Below</i> ) icon of a configured component to add a new component below it.                                                                                                                                                                                                                                                                                                                   |
| <i>Duplicate Component</i> | Choose  <i>Duplicate Component</i> to insert a copy of the component, with the same settings you used in the component you're duplicating.<br><br><i>Duplicate Component</i> is helpful if you want to create a variation of the page for different display types. For example, you can configure a component for Desktop display, duplicate the component for Mobile, then change just a few of the settings for the Mobile version. |

7. Add metadata about the page by choosing the  *gear icon* in the upper left corner, then choosing  *Tags*.

In the Tags dialog, complete the *Page & Meta Title*, *Meta Keywords*, and *Meta Description* fields. Select *Confirm* to save your changes.

8. Choose *Save Draft* to save the home page.

You see a confirmation dialog that your page was saved successfully.

9. Choose *Publish* to publish the page to the live career site.
10. **Optional:** To work with different versions of the home page, choose the  *gear icon*, then select one of the following:

| Option                                                                                                    | Description                                                                                                                                                    |
|-----------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  <i>Edit Draft</i>     | When you're viewing the published version of the page, you can select <i>Edit Draft</i> to switch to the most recent draft version of the page (if available). |
|  <i>Edit Published</i> | When you're viewing the most recent draft version of the page, you can select <i>Edit Published</i> to switch to the published version of the page.            |

11. **Optional:** To duplicate this home page for another locale and brand, choose the  *gear icon*, then choose  *Duplicate Page*.

The Duplicate Page dialog appears, where you can specify the *Locale* and *Brand* fields using the dropdown lists.

12. **Optional:** To view previous versions of the page, choose the  *gear icon*, then choose  *View Published Revisions*.

The Published Revisions dialog appears.

The dialog shows the previously published versions of the page, when they were published, and the user who published them. Choose *Edit* to revise a previous version of the page, or *Preview* to view how the page would appear on the customer site.

This option allows you to revert to earlier versions. If you'd like to go back to a previously published version, you can select it to edit, make any adjustments, then publish the page.

### 19.6.5.3 Creating and Configuring Content Pages in Career Site Builder

You can add components to a content page, add pages, duplicate pages, as well as control the appearance of pages for different devices.

#### Procedure

1. Log in to Career Site Builder and select *<Brand>* at  *Pages*  *Content Pages*  *<Locale>*.
2. Choose  *Add*.

A dialog opens with an empty field with the ghost text *Enter Page Name*.

3. Enter a unique name in the field, then choose *Add*.

This name also serves as the page title and is displayed on the career site.

A new screen appears with the words *No Components* for the content page you created, and the name of the page and its path appears in the top of the page in the format *<Locale> / <Brand> / <Content Page Name>*. The content page also appears in the left pane in the list of locales, brands, and content pages. You're now ready to add components to the page.

4. Choose *Add Component*, then choose a component from the dropdown list to add a new component to a page. If a page has existing components, you can also select the plus sign icon of a configured component to add a new component below the existing ones.

→ Tip

The [Add Component](#) dropdown list stays open. To close it, navigate off of the list and click anywhere within the content page editor.

Once you've added the desired type of component, you can control the component's location on the page by choosing [△ up arrow](#) or [▽ down arrow](#) for the section. Components display on the page in the same order they appear on the site's live content page.

5. Choose the devices you want the component to display in by selecting [Desktop](#), [Tablet](#), or [Mobile](#). You can select any combination, or all of them for the component.

Choose individual components to adjust the style, appearance, or content of the component. You can't control the size of components, or the distance between them on the page. These are controlled by content and functionality of the components.

6. Select the gray box for the component to configure the settings for the component.
7. **Optional:** Add additional components to the home page:

| Option                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Add Component</a>       | Select <a href="#">Add Component</a> to add a new component.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <a href="#">Duplicate Component</a> | Choose  <a href="#">Duplicate Component</a> to insert a copy of the component, with the same settings you used in the component you're duplicating.<br><br><a href="#">Duplicate Component</a> is helpful if you want to create a variation of the page for different display types. For example, you can configure a component for Desktop display, duplicate the component for Mobile, then change just a few of the settings for the Mobile version. |

8. Add metadata about the page by choosing  [gear](#) in the upper left corner, then choose  [Tags](#).

In the Tags dialog, complete the [Page & Meta Title](#), [Meta Keywords](#), and [Meta Description](#) fields. Select [Confirm](#) to save your changes.

9. Choose [Save Draft](#) to save the content page.

You see a confirmation dialog that your page was saved successfully.

10. Choose [Publish](#) to publish the page to the live career site.

11. **Optional:** To duplicate a content page, choose  [gear](#), then choose  [Duplicate Page](#).

The Duplicate Page dialog appears, where you can specify the new page's title, locale, and brand.

12. **Optional:** To delete a content page, choose  [gear](#), then choose  [Delete Page](#).

13. **Optional:** To view previous versions of an existing content page, choose  [gear](#), then choose  [View Published Revisions](#).

The Published Revisions dialog appears.

The dialog shows the previously published versions of the page, when they were published, and the user who published them. Choose [Edit](#) to revise a previous version of the page, or [Preview](#) to view how the page would appear on the customer site.

This option allows you to revert to earlier versions. If you'd like to go back to a previously published version, you can select it to edit, make any adjustments, then publish the page.

### 19.6.5.4 Creating New Category Pages in the Unified Data Model

Category pages allow you to create special pages in your career site that only display jobs grouped together based on keyword, location, or other information that help refine the list of jobs.

## Prerequisites

- Your job requisitions are configured with all the fields you want to use as filters for your category page.
- The Unified Data Model is enabled.

## Context

You can display job listings on a category page based on many filters, allowing you to offer a highly customized and relevant result set. For example, instead of displaying all available senior technician automotive jobs on a category page, you can restrict the listings to just those automotive jobs that are located in California or New York.

### → Tip

Plan how you want to filter the jobs for a category page. For example, avoid using so many filters that your page only displays a single job, excluding other relevant jobs.

If you have a category page that was created **before** the Unified Data Model was enabled, you should review them to make sure they're behaving correctly. [Review Existing Category Pages After You Enable the Unified Data Model \[page 426\]](#)

## Procedure

1. Go to  [Pages](#)  [Category](#) .
2. Select  [Add](#).

The [Create New Category](#) dialog appears.

3. Enter a unique name for the page, then select a locale and brand from the dropdown lists and save this setting.

### → Tip

For page titles, use whole words, without acronyms, and words that make sense to candidates outside the organization.

Career Site Builder creates a new category page, and takes you to its [Component Layout](#) tab, where the [Search Results](#) component is automatically added.

4. Select [Add Component](#) to add any of the following additional components you want to display on the page:

| Option                                  | Description                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Custom Plugin</b>                    | The <a href="#">Custom Plugin</a> component inserts custom code for a new component, such as JavaScript and third-party widgets.                                                                                                                                                                             |
| <b>Featured Jobs</b>                    | The <a href="#">Featured Jobs</a> component displays links to featured jobs. You can configure the style and destination of links.                                                                                                                                                                           |
| <b>Google Job Map</b>                   | The <a href="#">Google Job Map</a> component displays jobs on a map. You can control some aspects of the map's appearance.                                                                                                                                                                                   |
| <b>Image Carousel and Text</b>          | The <a href="#">Image Carousel and Text</a> component displays a rotating series of images and/or text, as a slide show. You can configure the content of each slide, as well as the appearance of the component as a whole.                                                                                 |
| <b>Image Carousel</b>                   | The <a href="#">Image Carousel</a> component displays a rotating series of images, as a slide show. You can configure the content of each slide, as well as the style and colors of the component as a whole.                                                                                                |
| <b>Info and Subscribe Form</b>          | The <a href="#">Info and Subscribe Form</a> component displays information about the company, side by side with the Talent Community Subscribe form.                                                                                                                                                         |
| <b>Large Image</b>                      | The <a href="#">Large Image</a> component displays a "hero" image that spans the width of the page. The component includes a large image with a customized dropdown navigation (height 250 px for mobile; 390 px for tablet; 590 px for desktop) (absolute minimum 200 px; maximum 9999 px; default 590 px). |
| <b>Search Bar</b>                       | The <a href="#">Search Bar</a> component displays the search bar that people can use to search for jobs. Settings are located in Global Styles.                                                                                                                                                              |
| <b>Subscribe Form</b>                   | The <a href="#">Subscribe Form</a> component displays an email sign-up form for the Talent Community.                                                                                                                                                                                                        |
| <b>Text</b>                             | The <a href="#">Text</a> component displays a single column of text. You can't change the size or orientation of the component.                                                                                                                                                                              |
| <b>Three Column Images with Caption</b> | The <a href="#">Three Column Images with Caption</a> component displays three columns of content in a set layout. The content can be images or text.                                                                                                                                                         |
| <b>Two Columns</b>                      | The <a href="#">Two Columns</a> component displays a banner that spans the width of the page. It can include an image, a background color, and text. The text is always on the right side. The image doesn't display on mobile devices.                                                                      |
| <b>Video</b>                            | The <a href="#">Video</a> component enables you to add (embed) videos on a career site page. It supports videos from YouTube, Vimeo, and Wistia.                                                                                                                                                             |

### Note

For this functionality to be visible to visitors in your career site, make sure to include its related cookie provider in the cookie consent manager at ► [Appearance](#) ► [Global](#) ► [Cookie Manager](#) . If the cookie banner is enabled without including the corresponding cookie provider in the cookie consent manager, this functionality is removed and unavailable to your site's visitors completely.

5. Select the newly inserted component's gray box to access its configuration settings.

6. Continue adding components and configuring them in the [Component Layout](#) to complete the layout for your category page.

#### → Tip

To save time, select the  ([Duplicate Component Below](#)) icon to create an identical copy of the component, including all of the settings you made for the original

When you change the image on a duplicated component, that new image can sometimes appear on the original component in the category page editor (or conversely, when you change an image on the original component and this changes the image you see on your duplicated component). If this happens, just refresh the cache by either refreshing the page or restarting Career Site Builder.

7. Go to the [Job List](#) tab and provide values to the following fields so that the category page only displays the jobs with these values:

| Option          | Description                             |
|-----------------|-----------------------------------------|
| <b>Keyword</b>  | Enter a keyword, such as <b>cashier</b> |
| <b>Location</b> | Enter a location.                       |

#### ⓘ Note

The Unified Data Model does not support Solr syntax in category rules. Career Site Builder ignores any Solr syntax included in rules.

8. Choose [Add Filter](#) on the page.

The [Add Filter](#) dialog appears.

9. Specify values in the [Add Filter](#) dialog to create a filter to refine the category page:

| Option            | Description                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Field Name</b> | Choose a field from the list. The list shows all the objects you have in your job requisition template.                                      |
| <b>Values</b>     | The options that appear in this field change dynamically based on which field you choose. You can choose multiple values for the same field. |

The dialog closes, and you see your new filter and its associated field and values listed on the page.

You can have multiple filters on the same page.

Select the  [pencil](#) icon to edit the filter, and  [delete](#) icon to remove it.

10. Select [Save](#) to save the page.

## 19.6.5.5 Creating Category Pages Using Career Site Builder Without the Unified Data Model

As a Career Site Builder administrator, you can create category pages and customize all the settings, including adding components, specifying colors and text, as well as creating rules.

### Context

#### Note

This information only applies when the Unified Data Model is **not** enabled. When it's enabled, the settings described here change.

For information about creating category pages after the Unified Data Model is enabled, refer to [Creating New Category Pages in the Unified Data Model \[page 444\]](#).

### Procedure

1. Log in to Career Site Builder and go to ► [Pages](#) ► [Category](#) ►.
2. Select + [Add](#).

The Create New Category dialog appears.

3. Enter a name for the page, then select a locale and brand from the available dropdown lists.

Career Site Builder creates a new category page, and takes you to its [Component Layout](#) tab.

4. Select [Add Component](#) and choose any available component from the dropdown list.
5. Select the newly inserted component's gray box to access its configuration settings.
6. Continue adding components and configuring them in the [Component Layout](#) to complete the layout for your category page.

#### → Tip

To save time, select the  ([Duplicate Component Below](#)) icon to create an identical copy of the component, including all of the settings you made for the original

When you change the image on a duplicated component, that new image can sometimes appear on the original component in the category page editor (or conversely, when you change an image on the original component and this changes the image you see on your duplicated component). If this happens, just refresh the cache by either refreshing the page or restarting Career Site Builder.

7. Select the [Rule Editor](#) tab and create a rule that pulls jobs to the page.

The most basic rules are based on [Keyword](#) and [Location](#), but other parameters are available. To access these parameters, choose the + [Select a Picklist Term](#) icon in the Rule Editor.

The category page editor includes the [Advanced Rules Editor](#) tab, which allows you to both create and edit advanced category rules using search syntax.

If you have an advanced rule that you want to verify as valid, choose [Test Rule](#) in the Edit Advanced Rule dialog. The results appear in a table in the dialog.

Refer to *Creating Advanced Rules Using Search Syntax in Category Pages* and *Search Syntax and Field Information for Rule Writing* for instructions on how to create advanced rules.

#### Caution

Use the Advanced Rules Editor only if you have a thorough understanding of search schema and syntax. Incorrect syntax can cause your rules to break.

8. Test your rule by selecting [Search](#).

#### Recommendation

Fine-tune your search terms to get the results you're looking for.

9. Add metadata about the page by choosing  [gear](#) in the upper left corner, then choose  [Meta Tags](#).

In the Meta Tags dialog, you can change the page's title, relevant SEO keywords, and description.

| Option                                       | Description                                                        |
|----------------------------------------------|--------------------------------------------------------------------|
| Category page and meta title character limit | 1,024 English characters; at least 256 characters in all languages |
| Category meta keyword limit                  | 1,024 English characters; at least 256 characters in all languages |
| Meta description limit                       | 250                                                                |

10. Choose [Confirm](#) to save your changes.
11. After you've created your rule for the page, navigate to the [Details](#) tab, and set the [Active](#) slider to [Yes](#).
12. Choose [Publish](#) to make the page available on the career site.

To save the page without publishing, select [Save Draft](#).

In addition to saving or publishing, you can create a backup of your category pages by performing an [Export](#) in Career Site Builder, at  [Tools](#)  [Import & Export](#) .

## Related Information

[Creating Advanced Rules Using Search Syntax in Category Pages \[page 449\]](#)

[Using Import and Export in Career Site Builder \[page 504\]](#)

[Import & Export Settings in Career Site Builder Tools \[page 624\]](#)

[Search Syntax and Field Information for Rule Writing \[page 450\]](#)

[Page Components \[page 563\]](#)

## 19.6.5.5.1 Creating Advanced Rules Using Search Syntax in Category Pages

The category page editor in Career Site Builder includes the [Advanced Rules Editor](#) tab, which lets you create and edit complex rules.

### Context

#### ⚠ Caution

Incorrect syntax can cause your advanced rule to break; use [Advanced Rules Editor](#) only if you have a thorough understanding of schema and syntax. Otherwise, use the regular rule editor instead. Refer to *Search Syntax and Field Information for Rule Writing* for information.

### Procedure

1. In Career Site Builder, go to ► [Pages](#) ► [Category](#) ► and select the category page in which you want to create an advanced rule.
2. Select the [Advanced Rules Editor](#) tab.
3. Choose + [Add](#).

You see [New Advanced Rule](#) in the Rule Name list on the page.

4. Choose [Edit Rule](#).

The Edit Advanced Rule dialog appears.

5. Rename [New Advanced Rule](#) to a rule name that describes the rule.
6. Enter the rule in the [Search Term](#) field for the category page.

For example, **Title:"Marketing" AND Location:"Pittsburgh"** to create a rule that would pull in jobs with **Marketing** in the title field and **Pittsburgh** in the location field.

7. Verify that the syntax is valid by choosing [validate](#) on the end of the [Search Term](#) field.

If the syntax is valid, you see a confirmation message similar to Rule is Valid.

8. Test your newly created rule by selecting [Test Rule](#).

The test returns the jobs that use the rule. Refine the rule as needed.

9. Choose [Confirm](#) to save the rule.

### Related Information

[Search Syntax and Field Information for Rule Writing \[page 450\]](#)

## 19.6.5.5.2 Search Syntax and Field Information for Rule Writing

Field information, including their field names in the Admin Center, rule field name, whether the fields are an exact or partial match, as well as example rules and notes.

A rule consists of queries and any query is broken up into terms and operators. There are two types of terms: Single Terms and Phrases. A single term is a single word, like "sales" or "manager". A phrase is a group of words, like "sales manager." Surround both single terms and phrases with quote marks.

Multiple terms can be combined together with Boolean operators to form a more complex query. The rule editor supports AND, +, OR, NOT, and - as Boolean operators. Boolean operators must be in uppercase. If search terms are on two lines, the OR operator is the default conjunction operator. For example, "**finance accounting**" assumes "**finance** OR **accounting**".

The rule editor supports fielded data. When performing a search, you can either specify a field or use the default field. The default field searches all available job data/fields. You can search any field by typing the field name followed by a colon and then enter in the term or data element.

Rule Editor Search Syntax

| Search Character | Meaning                                                                                                                                                                  |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OR               | Using OR operator searches on any of the listed criteria. If multiple search terms are provided but no Boolean operator is provided, searches have an "OR" relationship. |
| NOT              | Excludes the listed search criteria.                                                                                                                                     |
| AND              | Requires both the listed search criteria.                                                                                                                                |
| ( )              | Parentheses are used to group search expressions.                                                                                                                        |
| Fieldname        | Used to search within a specific indexed field for a term.                                                                                                               |
| " "              | Surrounding a term with double quotes searches for an exact match.                                                                                                       |

The rule field names are in parentheses.

Field Information

| Field          | Rule Field Name | Exact or Partial Match | Example Rule and Notes                 |
|----------------|-----------------|------------------------|----------------------------------------|
| Job Title      | title           | Partial                | title:("ecommerce"<br>OR "E-commerce") |
| Location       | location        | Partial                | location:"SG"                          |
| City           | city            | Partial                | city:("Paranaque" OR<br>"Tung Chung")  |
| State          | state           | Partial                | state:"CA"                             |
| Country/Region | country         |                        | country:"UK"                           |

| Field                  | Rule Field Name | Exact or Partial Match | Example Rule and Notes                                                                                                                                                                                                            |
|------------------------|-----------------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Job Description        | description     | Partial                | <p>body: ("Engineering"<br/>NOT ("Sales" OR<br/>"Mechanic"))</p> <p>When writing rules against the body, check the results thoroughly. Results may not reflect relevant jobs depending on the uniqueness of the search terms.</p> |
| Job Locale             | joblocale       |                        | <p>joblocale:"en_GB"</p> <p>joblocale often indicates the language of the job description and is frequently used in page rules for language packs.</p>                                                                            |
| Zip/Postal Code        | postal code     |                        | zip:"94101"                                                                                                                                                                                                                       |
| Department             | dept            | Exact                  | <p>dept:"IMT =<br/>Information<br/>Technology"</p> <p>Don't search on partial terms using this field. For example, dept:"Information Technology" returns different results.</p>                                                   |
| Category               | department      | Partial                | department:"Cargo"                                                                                                                                                                                                                |
| Shift                  | shift           | Partial                | shift:"SFO"                                                                                                                                                                                                                       |
| Job Type               | shifttype       | Partial                | shifttype:"Orchidair"                                                                                                                                                                                                             |
| Facility               | facility        | Partial                | facility:"Mumbai"                                                                                                                                                                                                                 |
| Product Service        | productservice  | Partial                | productservice:<br>("SFO" OR "LAX")                                                                                                                                                                                               |

## 19.6.5.6 Editing Existing Category Pages in Career Site Builder

Use the category page editor to update category page titles, add components to category pages, or edit their rules.

### Context

You can sort the category pages by using the filters at the top of each column, or by expanding the locale and brand list to the left. The *Modified/Unmodified* filter refers to pages that have been customized using Career Site Builder. As with other pages in Career Site Builder, you can configure different versions of the same page content by locale and brand.

Selecting the link icon allows you to view the page on the live client site.

You can also edit category pages that you saved in an import file, by exporting them back into Career Site Builder. Be aware, however, that the process of importing category pages overwrites your existing category pages.

## Procedure

1. In Career Site Builder, go to **Pages > Category > <Locale> > <Brand> >**.
2. Select the green  (pencil) icon to the right of the category page name.

The *Component Layout* tab of the page appears.

3. Add, edit, duplicate, or delete page components in the *Component Layout* menu.

| Option                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>To add a component</b>       | Select <i>Add Component</i> and choose any available component from the dropdown list.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>To edit a component</b>      | Select the gray box representing the component to access the component's settings.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>To duplicate a component</b> | <p>Select the  (<i>Duplicate Component Below</i>) icon. A copy of the component, including all of the settings you made for the original, appears below it.</p> <p>This option is helpful if you want to create a variation of the page for different display types. For example, you can configure a component for Desktop display and duplicate it for Mobile, then change just a few of the settings for the Mobile version.</p> |
| <b>To delete a component</b>    | Select the  (delete) icon.                                                                                                                                                                                                                                                                                                                                                                                                        |

### Note

When you change the image on a duplicated component, that new image can sometimes appear on the original component in the category page editor (or conversely, when you change an image on the original component and it changes the image you see on your duplicated component). If this issue happens, just refresh the cache by either refreshing the page or restarting Career Site Builder.

### Note

You can't edit the text in *Category Header Text*, but you can change its order of appearance on the page, or remove it from the page entirely.

4. **Optional:** Reorder the components on the page by using the arrows in each component block.
5. Modify category page rules by selecting the *Rule Editor* tab to view any rules associated with the page, and choose the pencil icon to the right of the category name.

This tab displays any rules created for the page. You can't add rules on this tab, but only modify existing ones unless you select the gear icon to open the Advanced Rule Editor.

If you have an advanced rule that you want to verify is valid, choose *Test Rule* in the Edit Advanced Rule dialog. The results appear in a table in the dialog.

### Caution

You need a thorough understanding of search schema and syntax to use Advanced Rules Editor. Incorrect syntax can cause your rules to break.

Refer to *Creating Advanced Rules Using Search Syntax in Category Pages* and *Search Syntax and Field Information for Rule Writing* for instructions on how to create advanced rules.

6. **Optional:** To deactivate the category, set the [Active](#) slider to **No** in the [Details](#) menu.  
This setting doesn't delete the category page, but keeps it from appearing on the career site.
7. **Optional:** You can change the name of the category in the [Name](#) field in the [Details](#) menu.
8. **Optional:** You can select the  (gear) icon to perform the following actions on category pages:

| Option                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Description                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Duplicate Page</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Takes all the configuration settings from one existing category page — including all its components, rules, branding, and styling — and uses them to overwrite the settings of another existing category page. In other words, <a href="#">Duplicate Page</a> copies category X to category Y, overwriting category Y with everything from X. |
| <div>  <b>Note</b> </div> <p>When you change the image on a duplicated page, that new image can sometimes appear on the original page in the category page editor (or conversely, when you change an image on the original page and it changes the image you see on your duplicated page). If this issue happens, just refresh the cache by either refreshing the page or restarting Career Site Builder.</p> |                                                                                                                                                                                                                                                                                                                                               |
| <a href="#">Meta Tags</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Updates meta information. Use it to change the title of the category page by updating the <a href="#">Title</a> field, or add additional metadata for SEO in the <a href="#">Keywords</a> or <a href="#">Description</a> fields.                                                                                                              |
| <a href="#">Category Title Style</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Changes the display of the category title. Use it if you can select a font, size, color, and alignment for the category page title.                                                                                                                                                                                                           |
| <a href="#">View Published Revisions</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Shows the changes made to the page, and who did it.                                                                                                                                                                                                                                                                                           |

9. Select [Save](#) to finalize your changes to the category page.

In addition to saving or publishing, you can create a backup of your category pages by performing an [Export](#) in Career Site Builder, at  [Tools](#)  [Import & Export](#) .

## 19.6.5.7 Copying Page Layout Settings Using the Duplicate Page Option

The [Duplicate Page](#) option lets you duplicate the look and feel of an existing home, content, or category page to a new one, by copying layout settings from one page to another. This option saves you time, because you don't have to configure the individual settings manually.

### Prerequisites

If you want to duplicate a category page, create and save a category page and configure all of its rules first.

### Procedure

1. In Career Site Builder, go to the page you want to duplicate:

| Page Type     | Navigation Path                                                                                                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Home page     | ► <a href="#">Pages</a> ► <a href="#">Home</a> ► <a href="#">&lt;Locale&gt;</a> ► <a href="#">&lt;Brand&gt;</a> ► <a href="#">Home</a> ►                                                                                                                                |
| Content page  | ► <a href="#">Pages</a> ► <a href="#">Content</a> ► <a href="#">&lt;Locale&gt;</a> ► <a href="#">&lt;Brand&gt;</a> ► <a href="#">&lt;Content Page&gt;</a> ►                                                                                                             |
| Category page | ► <a href="#">Pages</a> ► <a href="#">Category</a> ► <a href="#">&lt;Locale&gt;</a> ► <a href="#">&lt;Brand&gt;</a> ►, then select the green  (pencil) icon for the category page. |
| Landing page  | ► <a href="#">Pages</a> ► <a href="#">Landing</a> ► <a href="#">&lt;Locale&gt;</a> ► <a href="#">&lt;Brand&gt;</a> ►, then select the green  (pencil) icon for the landing page.   |

The page appears.

2. From the blue  ([Page Options](#)) icon on the top of the page, select  [Duplicate Page](#).

The Duplicate Page dialog appears.

3. In the Duplicate Page dialog, provide the following information:

| Option        | Description                                                                                                                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Home page     | Specify the locale and brand. If that combination already has a home page, a confirmation dialog appears for you to verify that you want to overwrite the home page.                                                                                 |
| Content page  | Specify a unique title that contains no spaces or special characters, then choose the locale and brand. If that combination already has a content page, a confirmation dialog appears for you to verify that you want to overwrite the content page. |
| Category page | Specify the locale and brand, then choose an <b>existing</b> category page from the <a href="#">Category</a> dropdown list.                                                                                                                          |

| Option              | Description                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     | <p><b>Note</b></p> <p>Duplicating a category page takes all the configuration settings from an existing category page — including all its components, rules, branding, and styling — and applies them to overwrite the settings of <b>another existing</b> category page.</p> <p>In other words, Duplicate Page copies category X to category Y, overwriting category Y with everything from X.</p>                     |
| <b>Landing page</b> | <p>Specify a name for the landing page, then choose the locale and brand.</p> <p><b>Note</b></p> <p>The <i>Name</i> field is required, but doesn't need to be unique because Career Site Builder automatically assigns a unique ID number to each landing page. This ID number displays as the last part of the landing page's URL, in the following format: <code>.../landingPages/&lt;landing_page_ID&gt;</code>.</p> |

You don't need to activate or publish the page before you can duplicate it.

The new page appears, and you can start modifying its settings.

#### → Tip

When you change the image on a duplicated page, that new image might appear on the original page in that page's editor. Conversely, changing an image on the original page could change the image that appears on your duplicated page. If this happens, just refresh the cache by either refreshing the page or restarting Career Site Builder.

- If your newly duplicated page replaced an existing page (such as for a home page for a specific locale and brand), save and publish the new page to make sure your updates are reflected in the career site.

## 19.6.5.8 Creating and Configuring Landing Pages in Career Site Builder

Create and edit landing pages for your career site using Career Site Builder.

### Context

The landing page editor allows you to create a campaign-specific page that you can use for a targeted audience.

In general, a landing page isn't part of the navigation on your career site. Instead, you create them for a specific audience or event, such as a university career fair or a strategic email campaign.

Use Career Site Builder to set up the following:

- Create and manage a library of landing pages for external career sites.

- Define multiple-column landing pages.
- Include all supported Career Site Builder components.

Landing pages support all configured brands and locales in the Career Site Builder.

Landing pages aren't indexed by search engines, and aren't available in the Career Site Builder link editor.

On systems enabled for Candidate Relationship Management features, you can do the following:

- Brand the landing pages appropriately for specific types of candidates.
- Connect to SAP SuccessFactors Candidate Relationship Management connect to features and data capture forms.

## Procedure

1. Log in to Career Site Builder and go to **Pages > Landing Pages**.
2. Select **+ Add** and enter these values, then select **Save**:

| Option        | Description                                                                                 |
|---------------|---------------------------------------------------------------------------------------------|
| <b>Name</b>   | The name for the page. For example, <b>Business Students</b> .                              |
| <b>Locale</b> | Choose your locale from the dropdown list, such as <b>(en_US) English (United States)</b> . |
| <b>Brand</b>  | Choose from brand from the dropdown list, such as <b>Default Brand</b> .                    |

### Note

This field is required, but doesn't need to be unique because Career Site Builder automatically assigns a unique ID number to each landing page. This ID number displays as the last part of the landing page's URL, in the following format: `.../landingPages/<landing_page_ID>`.

All locales and brands configured for the site are available in this menu.

3. Select the **Component Layout** tab to add and configure components as you would for other Career Site Builder pages.
4. Go to the **Details** menu and choose Yes for **Is Active**.
5. Choose **Publish** to publish the page to the live career site.
6. Select the new landing page, and choose the **Edit Landing Page** icon.
7. Select the **Details** tab and choose the desired options for making the landing page active and displaying two columns.
8. Move the **Column width** slider to adjust the column width.
9. Change the order of a section by selecting the **Δ** (up-arrow) icon or **▽** (down-arrow) icon for the section.
10. Add a component to a column by selecting the **Column 1** or the **Column 2** tab, and choosing a component from the list.

Career Site Builder displays the selected component in the gray design area.

11. Select **Add Component** and choose a component from the dropdown list to add a new component to a column. If a page has existing components, you can also select the plus sign icon of a configured component to add a new one following it. tab, selecting

### → Tip

The [Add Component](#) dropdown list stays open. To close it, navigate off of the list and click anywhere within the landing page editor.

Control the newly added component's location by selecting  [up arrow](#) or  [down arrow](#) for the section. Components display on the page in the same order they appear on the site's live landing page.

12. Choose the devices you want the component to display in by selecting [Desktop](#), [Tablet](#), or [Mobile](#). You can select any combination, or all of them for the component.

Choose individual components to adjust the style, appearance, or content of the component. You can't control the size of components or the distance between them on the page, since they're controlled by the content and functionality of the components.

13. **Optional:** Add additional components to the landing page by using the following options:

| Option                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Add Component</a>       | Select this option to add a new component.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <a href="#">Duplicate Component</a> | <p>Choose  <a href="#">Duplicate Component</a> to insert a copy of the component, with the same settings you used in the component you're duplicating</p> <p>This option is helpful if you want to create a variation of the page for different display types. For example:</p> <ol style="list-style-type: none"><li>1. Configure a component for Desktop display.</li><li>2. Duplicate the component for Mobile.</li><li>3. Change just a few of the settings for the Mobile version.</li></ol> |

14. Choose [Save Draft](#) to save the landing page.

You see a confirmation dialog that your page was saved successfully.

15. Publish the landing page by selecting [Publish](#).

16. **Optional:** To duplicate a landing page, select the blue  [gear](#) icon, then choose  [Duplicate Page](#).

The Duplicate Page dialog appears, where you can specify the new page's title, locale, and brand.

17. **Optional:** To view previous versions of an existing landing page, select the blue  [gear](#) icon, then choose  [View Published Revisions](#).

The Published Revisions dialog appears.

The dialog shows the previously published versions of the page, when they were published, and the user who published them. Choose [Edit](#) to revise a previous version of the page, or [Preview](#) to view how the page would appear on the career site.

To revert to a previously published version, select a version to edit, make any adjustments, then publish the page.

## 19.6.5.9 Adding Customized Content to a Career Site Page

Use the Career Site Builder Custom Plugin component to add customized content to your career site, such as a customer photo gallery, custom forms, or page components with different layouts than the standard Career Site Builder components.

### Prerequisites

Make sure you're assigned to a role that has appropriate permission to access the Custom Plugin component:

- The permission is specified in ► [Career Site Builder](#) ► [Users](#) ► [Roles](#) ► [Edit Role](#) ► [Permissions](#) ► [Appearance Settings](#) ►.
- With the appropriate permission, you can view, add, edit, and delete the component.
- If you don't have permission for this component, the [Add Components](#) dropdown list is unavailable to you. If it's already been added to a page or layout, a gray component box displays, but you can't delete or edit it. You can, however, change its position on the page or layout without permission.

#### Note

If the element or component uses cookies, make sure to include its related cookie provider in the cookie consent manager at ► [Appearance](#) ► [Global](#) ► [Cookie Manager](#) ►. If the cookie banner is enabled without including the corresponding cookie provider in the cookie consent manager, this element or component is removed and unavailable to your site's visitors completely.

### Context

#### Caution

Any custom JavaScript code that's added to your career site for purposes other than tracking, can cause pages to not display the configured content across the application process, and also affect the site theme and styling. The following could result in the breakdown of some or all career site functionality, possibly rendering the site unusable:

- Introducing other versions than the one provided for JQuery or Bootstrap.
- Introducing any third-party libraries.
- Changing the layout (such as CSS or JavaScript) of any components other than the Custom Plugin component.
- Manipulating of external resources that SAP doesn't support, and which SAP won't fix if they're found to be the cause of any issues.

Such customizations, if they're the cause of problems, are removed or deactivated.

Each Custom Plugin component is limited to 2 MB, regardless of what content you add. This limit is the equivalent of approximately 2,000,000 characters. If your custom content is too large, consider the following possible solutions:

- Minify the code for your custom plugin to reduce all unnecessary characters from your code.
- Split your custom plugin in half, or in smaller increments. You can have multiple Custom Plugin components on a single page, as long as each is no larger than 2 MB.
- Host the code externally and link to that script.

#### ⓘ Note

The Custom Plugin component doesn't support Base64 images. Link to them instead.

The Image Selector is not available for the Custom Plugin component. To upload an image to your Career Site Builder image library so that you can link to it in your customized content, refer to *Uploading Images to Link to in Career Site Builder Custom Plugin Components*.

## Procedure

1. Select ► [Pages](#) ► [Content](#) ► in Career Site Builder, then select a page for your locale and brand.
2. Select [Custom Plugin](#) by choosing [Add Component](#) on any Career Site Builder page.
3. Create the new component by inserting the custom code in the available text box.

### 19.6.5.10 Uploading Images to Link to in Customized Content to a Career Site Page

Use the Image Selector to upload images to your Career Site Builder image library, so that you can insert its URL to customized content in your career site.

## Context

The Custom Plugin component doesn't let you go over 2 MB or use Base64 raw binary images. It also doesn't let you use the Image Selector to insert an image directly. This means that the only way to display images in your customized content is to add a URL link to the image in the component.

Follow these steps to upload your image to your Career Site Builder image library, and use its link in your customized content. This method also means that you don't need to maintain the image in an online server.

#### ⓘ Note

Instructions are similar to *Adding Images in Career Site Builder Using Image Selector*. Instead of inserting the image from the Image Selector directly, you use the URL that it generates.

## Procedure

1. Go to an existing page in Career Site Builder, or to any other location that lets you access the Image Selector.

For a list of locations where you can access the Image Selector, refer to *Adding Images in Career Site Builder Using Image Selector*.

2. Add a component on the page that uses an image, such as the Image and Text Carousel component.
3. Select the shaded image box in the component.

You see the Styles settings for the image.

4. Select  [Select Image](#).

The Image Selector dialog appears.

5. Select  [Upload Image](#).
6. Select the [Select Image](#)  button.

The Open dialog appears.

7. Select the image you want to upload, and confirm.

The Open dialog closes, and the image name appears in the Image Selector.

8. Select the green  [Add](#) icon to add the image, and accept the confirmation dialog.
9. Select  (left arrow) to return to the main page in the Image Selector.

Your uploaded image now appears in the list of stored images in your Career Site Builder image library.

10. Enter descriptive text in the [Edit Alt Text](#) field for your newly uploaded image.

Assistive technology such as screen readers use alt text, and is a requirement for accessibility.

11. Choose the thumbnail of your uploaded image.

A new window displays your selected image.

12. Right-click on the image and choose [Copy Image Link](#) from the dropdown list.

The link you copy is the URL to the location of the image in your Career Site Builder image library.

13. Save this URL for reference purposes.
14. Close the image display, then close the Image Selector.
15. Delete the component from the page if you added it specifically to access the Image Selector.

## Results

You've completed the upload of the image to your image library. You can now add the URL of the image in the Custom Plugin component.

## 19.6.5.11 Adding Spacing Around Career Site Components

You can customize spacing for your component margins when you turn on the [Enable Spacing](#) toggle in Career Site Builder.

### Context

Spacing controls are available for these career site components:

- Featured Jobs
- Image and Text Carousel
- Image Carousel
- Google Job Map
- Info and Subscribe Form
- Job Tokens
- Large Image
- Subscribe Form
- Text
- Three Column Images with Caption
- Two Columns
- Video

#### ⚠ Caution

Enabling spacing controls removes your existing predefined component spacing completely. Once you've enabled this option, you must reconfigure spacing using this feature.

### Procedure

1. Go to [Pages](#) > [Home](#) > [\(Locale\)](#) > [\(Brand\)](#) > [Home](#).
2. Select the component that you want.
3. Go to the [Styles](#) tab.
4. Turn on the [Enable Spacing](#) toggle switch to enable margin spacing controls for your component.  
The [Spacing](#) area appears, and displays the following: [Top](#), [Bottom](#), [Right](#), and [Left](#).
5. Choose a spacing value that you want to use:
  - [Small](#) – approximately 8 pixels
  - [Medium](#) – approximately 16 pixels
  - [Large](#) – approximately 24 pixels
  - [Custom](#) – an empty box appears for you to enter a custom pixel size for your margin
6. Select [Save Draft](#) to save.

7. Select the preview icon when you want to preview your changes, otherwise, select [Publish](#) to finish.

## 19.6.5.12 Creating a Duplicate Component in a Career Site Page

You can duplicate a page component in a Career Site Builder with all the same settings so that you don't have to configure everything manually for the second component.

### Context

The ability to duplicate an existing component on a career site page means that you don't have to configure everything manually a second time. This option is helpful if you want to create a slightly different user experience between views, such as between desktop and mobile. For example, if you already have a Text component for a page that applies to both desktop and mobile views, you can easily duplicate it to add another Text component on the page, then configure it specifically for mobile.

### Procedure

1. Go to the page in Career Site Builder that includes the component you want to duplicate.

#### → Tip

Your component doesn't already have to be in a career site page. You can add a new component, customize its settings, then duplicate it during the same session.

2. On the row with the component label, select the  [Duplicate Component Below](#) icon.

A new, identical component appears below the component you duplicated.

3. Customize the settings in the new, duplicate component.

For example, if you plan to use your new, duplicate component for mobile view but with simpler color settings, you select [Mobile](#) view, and alter the color settings in the [Styles](#) tab.

4. **Optional:** Make whatever changes you want to your original component if you want to differentiate it from your duplicate component.

For example, if the original component was set to [Desktop](#) and [Mobile](#) and you now only want to apply this component to desktop view, unselect [Mobile](#).

5. Save your page layout by selecting [Publish](#).

## 19.6.6 Appearance

### 19.6.6.1 Configuring the Main Style Settings for the Unified Data Model

Configure the main style settings career site, for a brand in Career Site Builder with the Unified Data Model enabled.

#### Prerequisites

- You've prepared your Recruiting system and enabled the Unified Data Model, at [Settings > Site Configuration > Enable Unified Data Model](#).

#### Procedure

- Go to [Appearance > Styles > Global Styles > <Brand> > Main](#).
- In the [Site](#) section, configure site settings.

| Option                  | Description                                                                                                                            |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Default Font            | Sets the default font and font size for the site.                                                                                      |
| Vertical Spacing        | Sets the vertical space between components on a site.                                                                                  |
| Min. Horizontal Spacing | Sets the minimum horizontal space between parts of a component. For example, in the Three Column component, the space between columns. |

- In the [Styles](#) section, configure general style settings for the career site.

| Option                   | Description                                                                                                                                                                                                                                                       |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| System Link              | The font color of the links generated by the career site. For example, <a href="#">Sign In</a> and <a href="#">Search by Location</a> .                                                                                                                           |
| System Link Hover        | The color of the focus indicator, the outline that appears around the text of a link when the user focuses on it using keyboard navigation. Choose a prominent color to improve accessibility.                                                                    |
| Content Background       | The background color of the content of the site that is between the header and footer. Any page with a main content area displays this color behind the content.                                                                                                  |
| Content Header           | The font color of headings.                                                                                                                                                                                                                                       |
| Content Text             | The font color of nonheader, nonlink text. This is the color of the main text on category pages. This color also populates text in the job grid (except for the jobs title), and any text on a page that's not a search grid header, search text, or system link. |
| Content Style            | Options are <a href="#">Centered</a> and <a href="#">Full</a> .                                                                                                                                                                                                   |
| Content Background Image | The background image of the content of the site between the header and footer. Choose <a href="#">Select Image</a> to select an image from the Image Selector. Then configure the <a href="#">Image Type</a> and <a href="#">Image Position</a> .                 |

| Option                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Site Background</b>       | The background color of the site as a whole. This element doesn't include the background of headers or footers.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Site Background Image</b> | The background image for the site. Choose <a href="#">Select Image</a> to select an image from the Image Selector. Then configure the <a href="#">Image Type</a> and <a href="#">Image Position</a> .                                                                                                                                                                                                                                                                                                                           |
| <b>Meta Image</b>            | <p>A graphic that appears as an OG (Open Graph protocol) image when a career site page is displayed in a social media post on sites like LinkedIn and Facebook. Choose <a href="#">Select Image</a> to select an image from the Image Selector. Size considerations are:</p> <ul style="list-style-type: none"> <li>• Minimum image dimensions – 200 by 200 pixels</li> <li>• Maximum file size – 8 MB</li> <li>• Optimal minimum dimensions – 1200 pixels wide by 630 pixels high</li> <li>• Optimal ratio – 1.91:1</li> </ul> |
| <b>Favicon</b>               | A favicon is a small image that usually appears at the top of a web browser that serves as an icon that represents your brand. Use a square image to prevent the favicon from looking stretched out of proportion.                                                                                                                                                                                                                                                                                                              |

4. In the [Primary Button](#) section, configure the colors and styles of primary buttons.

In places where multiple buttons are present, the primary button is the one that represents the most important or most common action. You may want to make them more prominent.

| Option                         | Description                                                                                                                       |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>Button Background Color</b> | The color of the background of buttons in the site, for example <a href="#">Filter</a> .                                          |
| <b>Button Text Color</b>       | The color of text within buttons.                                                                                                 |
| <b>Button Link Hover Color</b> | The color of the focus indicator, the outline that appears around a button when the user focuses on it using keyboard navigation. |
| <b>Button Highlight Color</b>  | The color of buttons when the cursor moves over it.                                                                               |
| <b>Button Border</b>           | Choose whether to show or hide a border around the button.                                                                        |
| <b>Button Border Color</b>     | The color of the border of buttons.                                                                                               |

5. In the [Secondary Button](#) section, configure the colors and styles of secondary buttons in the same way as primary buttons.

In places where multiple buttons are present, the secondary buttons are ones that represent secondary actions. You may want to make them less prominent.

#### ⓘ Note

[Secondary Button](#) settings are also applied to List View/Map View button on the search results page.

6. Choose [Save](#) to save your settings.

## 19.6.6.2 Configuring Style of the Search Form for the Unified Data Model

Configure style settings for the search form on your career site, for each brand in Career Site Builder.

### Prerequisites

These settings are only available if the Unified Data Model is enabled.

### Context

This page shows you how to configure style settings for the search form on your career site when the Unified Data Model is enabled.

### Procedure

1. Go to ► [Appearance](#) ► [Styles](#) ► [Global Styles](#) ► [<Brand>](#) ► [Search Form](#) ►.
2. Configure colors and styles for search forms.

| Option                                 | Description                                                                                                                                                                                 |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Search Form Background</b>          | The background color of the search bar.                                                                                                                                                     |
| <b>Job Grid Alternating Background</b> | The background color of alternating rows in the job grid.                                                                                                                                   |
| <b>Search Pagination Cell</b>          | The border color of the border cell around each pagination link.                                                                                                                            |
| <b>Search Form Background Image</b>    | The background image on the search. Choose <a href="#">Select Image</a> to select an image from the Image Selector.                                                                         |
| <b>Use Search Pagination Cell</b>      | A slider that shows or hides a border cell around each pagination link.                                                                                                                     |
| <b>Image Type</b>                      | The way the background image appears. Choices are: Unmodified; Tiled; Stretched; Horizontally Scaled; Vertically Scaled; and Vertically & Horizontally Scaled.                              |
| <b>Image Position</b>                  | Specifies where on the page the background image appears. Choices are: Top Left; Top Middle; Top Right; Middle Left; Middle Middle; Middle Right; Bottom left; Bottom Middle; Bottom Right. |

3. Choose [Save](#) to save your settings.

## 19.6.6.3 Configuring Style of Dialog Windows for the Unified Data Model

Configure style settings for dialog windows on your career site, for a brand in Career Site Builder with the Unified Data Model enabled.

### Prerequisites

- You've prepared your Recruiting system and enabled the Unified Data Model, at ► [Settings](#) ► [Site Configuration](#) ► [Enable Unified Data Model](#) ►.

### Procedure

- Go to ► [Appearance](#) ► [Styles](#) ► [Global Styles](#) ► [<Brand>](#) ► [Dialog](#) ►.
- Configure colors and styles for dialog windows.

| Option                       | Description                                                                                                                                                           |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Header Style</b>          | Sets the font settings for the header text in dialog windows.                                                                                                         |
| <b>Background Color</b>      | Sets the background color in dialog windows.                                                                                                                          |
| <b>Body Text Style</b>       | Sets the font settings for the body text in dialog windows.                                                                                                           |
| <b>Loading Message Style</b> | Sets the font settings for the loading message in dialog windows, if some content in the body takes extra time to load (such as skills).                              |
| <b>Corner Style</b>          | Sets the corner style of dialog windows. You can choose from these options: <a href="#">Square</a> , <a href="#">Slightly Rounded</a> , and <a href="#">Rounded</a> . |
| <b>Border Color</b>          | Sets the border color of dialog windows.                                                                                                                              |
| <b>Line Separator</b>        | Sets the color of lines in dialog windows, separating the header, body, and footer.                                                                                   |

- Choose [Save](#) to save your settings.

## 19.6.6.4 Configuring Style of the Search Experience for the Unified Data Model

Configure style settings for the search page and search results page on your career site, for each brand in Career Site Builder.

### Prerequisites

These settings are only available if the Unified Data Model is enabled.

### Procedure

1. Go to **Appearance > Styles > Global Styles > <Brand> > Search Experience**.
2. In the **Panel Elements** section, configure the corner style for job results cards. You can choose from these options: *Square*, *Slightly Rounded*, and *Rounded*.
3. In the **Job Results Card** section, configure colors and styles for the job results cards.

| Option                                | Description                                                                                                    |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Card Background Color</b>          | Sets the color of the background behind the job result card.                                                   |
| <b>Card Background Color on Hover</b> | Sets the color of the background behind the search tiles when the card is selected.                            |
| <b>Vertical Space Between Cards</b>   | Controls the amount of space between cards with these options: <i>None</i> , <i>Narrow</i> , and <i>Wide</i> . |
| <b>Card Border</b>                    | Controls how the border appears on a card with these options: <i>Hide</i> , <i>Show</i> .                      |
| <b>Card Border Color</b>              | Sets the color of the card border.                                                                             |
| <b>Card Line Separator Color</b>      | Sets the color of the line that separates job result cards.                                                    |
| <b>Card Title Style</b>               | Sets the font settings for the title.                                                                          |
| <b>Card Title Hover Color</b>         | Sets the color of the title when the cursor moves over it.                                                     |
| <b>Card Location Style</b>            | Sets the font settings for the location text.                                                                  |
| <b>Card Footer Field Style</b>        | Sets the font settings for the footer text.                                                                    |

4. In the **Job Map** section, configure colors and styles for the Google Job Map component, on the search results page.

| Option                                 | Description                                                                                                        |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Location Marker Color</b>           | Sets the fill color inside the location marker. The default color is blue (#0070F2).                               |
| <b>Selection Location Marker Color</b> | Sets the fill color inside the location marker when the marker is selected. The default color is orange (#FF8000). |
| <b>Location Marker Border</b>          | Sets whether to show or hide the border of the location marker. The default is <i>Show</i> .                       |

| Option                              | Description                                                                                                                                                                                                         |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Location Marker Border Color</b> | Sets the border (stroke) color of the location marker. You can enter a color value here even if you choose to hide the border, in which case the border simply isn't visible. The default color is white (#FFFFFF). |
| <b>Location Marker Style</b>        | Sets how the number looks inside the location marker. The default font color is white (hex code #FFFFFF). The default font stack is Arial, Helvetica, sans-serif, and the default font size is 12.                  |

### → Remember

The integrated Google Job Map only appears in the search results page if you turn on the [Enable Google Job Map](#) setting, located at ► [Layouts](#) ► [Search Results](#) ► [General](#) ►.

5. In the [Pagination](#) section, configure colors and styles for pagination links:

| Option                                | Description                                                                  |
|---------------------------------------|------------------------------------------------------------------------------|
| <b>Pagination Style</b>               | Sets the font settings for the text that indicates pagination (page number). |
| <b>Pagination Hover Color</b>         | Sets the color of the pagination text when the cursor moves over it.         |
| <b>Current Page Number Font Color</b> | Sets the color of the number denoting the current page.                      |

6. In the [Filter Appearance](#) section, configure colors and styles for search filters:

| Option                             | Description                                                     |
|------------------------------------|-----------------------------------------------------------------|
| <b>Filter Background Color</b>     | Sets the background color for the filter.                       |
| <b>Filter Card Border</b>          | Choose whether to show or hide a border around the filter card. |
| <b>Filter Card Border Color</b>    | Sets the border color of the filter card.                       |
| <b>Filter Line Separator Color</b> | Sets the color of the line separating each filter.              |
| <b>Filter Header Style</b>         | Sets the font settings for the job search filter header text.   |
| <b>Filter Field Label Style</b>    | Sets the font settings for the job search filter field text.    |
| <b>Filter Item Style</b>           | Sets the font settings for the filter label text.               |

7. In the [Search Header](#) section, configure colors and styles for the search page:

| Option                                | Description                                                                                                                                                   |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Search Header Title Style</b>      | Sets the font settings for the header title.                                                                                                                  |
| <b>Search Header Style</b>            | Sets the font settings for the header.                                                                                                                        |
| <b>Search Header Background Color</b> | Sets the background color of the header.                                                                                                                      |
| <b>Search Header Outline Color</b>    | Sets the outline color of the header.                                                                                                                         |
| <b>"Sort by" Label Style</b>          | Sets the font settings for the <a href="#">Sort By</a> label.<br>Use the translation editor if you want to change the wording that displays for this label.   |
| <b>"Clear All" Label Style</b>        | Sets the font settings for the <a href="#">Clear All</a> label.<br>Use the translation editor if you want to change the wording that displays for this label. |
| <b>Label Text</b>                     | Sets the font settings for the label.                                                                                                                         |
| <b>Label Text Hover Color</b>         | Sets the color of the label when the cursor moves over it.                                                                                                    |

8. In the [Job Alerts](#) section, configure colors and styles for the job alerts link:

| Option                            | Description                                                          |
|-----------------------------------|----------------------------------------------------------------------|
| <b>Job Alert Link Style</b>       | Sets the font settings for the job alerts link.                      |
| <b>Job Alert Link Hover Color</b> | Sets the color of the job alerts link when the cursor moves over it. |

9. In the [Skills Matching](#) section, configure colors and styles for the [Skills Matching](#) feature on the search results page:

| Option                                   | Description                                                                                                                           |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Skills Matching Title Style</b>       | Sets the font settings for the title of the <a href="#">Skills Matching</a> panel.                                                    |
| <b>Skills Matching Description Style</b> | Sets the font settings for the descriptive message on the <a href="#">Skills Matching</a> panel.                                      |
| <b>Match Indicator Background Color</b>  | Sets the background color of the "tag" next to recommended jobs in search results, indicating that it <a href="#">Skill Matched</a> . |
| <b>Match Indicator Text Style</b>        | Sets the font settings for "tag" next to recommended jobs in search results, indicating that it <a href="#">Skill Matched</a> .       |
| <b>Match Indicator Border Color</b>      | Sets the border color of the "tag" next to recommended jobs in search results, indicating that it <a href="#">Skill Matched</a> .     |
| <b>Skill Label Style</b>                 | Sets the font settings for candidate skills displayed in a "word cloud" in the <a href="#">Skills Matching</a> dialog.                |
| <b>Skill Pill Background Color</b>       | Sets the background color of candidate skills displayed in a "word cloud" in the <a href="#">Skills Matching</a> dialog.              |
| <b>Skill Pill Border Color</b>           | Sets the border color of candidate skills displayed in a "word cloud" in the <a href="#">Skills Matching</a> dialog.                  |

10. In the [Skills Cloud](#) section, configure colors and styles for the [Skills Cloud](#) component, which displays job skills in a panel on the job details page, in the form of a word cloud:

| Option                                | Description                                                                                                                                                                                 |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Panel Border Color</b>             | Sets the border color of the <a href="#">Job Skills</a> panel.                                                                                                                              |
| <b>Panel Corner Style</b>             | Sets the corner style of the <a href="#">Job Skills</a> panel. You can choose from these options: <a href="#">Square</a> , <a href="#">Slightly Rounded</a> , and <a href="#">Rounded</a> . |
| <b>Panel Background Color</b>         | Sets the background color of the <a href="#">Job Skills</a> panel.                                                                                                                          |
| <b>Panel Header Style</b>             | Sets the font settings for the header on the <a href="#">Job Skills</a> panel.                                                                                                              |
| <b>Panel Subheader Style</b>          | Sets the font settings for the subheaders on the <a href="#">Job Skills</a> panel.                                                                                                          |
| <b>Panel Help Text Style</b>          | Sets the font settings for help text on the <a href="#">Job Skills</a> panel.                                                                                                               |
| <b>Pill Background Color</b>          | Sets the <b>default</b> background color of job skills in the "word cloud" on the <a href="#">Job Skills</a> panel.                                                                         |
| <b>Pill Border Color</b>              | Sets the <b>default</b> border color of job skills in the "word cloud" on the <a href="#">Job Skills</a> panel.                                                                             |
| <b>Pill Text Style</b>                | Sets the font settings for job skills in the "word cloud" on the <a href="#">Job Skills</a> panel.                                                                                          |
| <b>Selected Pill Text Color</b>       | Sets the text color for <b>highlighted</b> job skills in the "word cloud" on the <a href="#">Job Skills</a> panel, indicating that they match the candidate's skills.                       |
| <b>Selected Pill Background Color</b> | Sets the background color of <b>highlighted</b> job skills in the "word cloud" on the <a href="#">Job Skills</a> panel, indicating that they match the candidate's skills.                  |
| <b>Selected Pill Border Color</b>     | Sets the border color of <b>highlighted</b> job skills in the "word cloud" on the <a href="#">Job Skills</a> panel, indicating that they match the candidate's skills.                      |

| Option                   | Description                                                                                       |
|--------------------------|---------------------------------------------------------------------------------------------------|
| Expand Skills Text Color | Sets the text color of the link that expands the <i>Job Skills</i> section and shows more skills. |

11. Choose [Save](#) to save your settings.

### 19.6.6.5 Configuring the Career Site Cookie Banner and Cookie Consent Manager

Customize the cookie banner and cookie consent manager settings for the public career site by using the Cookie Manager page in the Career Site Builder's Global menu.

## Prerequisites

Gather your list of elements and components to include, or plan to include in the public career site, so that you know which cookie providers to display in the cookie consent manager.

### → Remember

If you include any element or component to the career site that uses cookies, make sure you add its listing in the cookie consent manager so that the component works correctly. For example, if you include a YouTube video in your career site, enable *Functional Cookies Section* and add *YouTube* in that section. Otherwise, the YouTube video doesn't display on your career site at all because there's no way for the visitor to enable the cookies.

## Context

Use the Cookie Manager to do the following things:

- Configure the cookie banner, which displays automatically when a visitor arrives at any page on your career site. The cookie banner describes how the site uses cookies. This cookie banner replaces the site banner, which you enabled in what is now the *Legacy Site Banner* tab.
- Configure the cookie consent manager, which appears as a dialog when the visitor chooses to view it from the link in the cookie banner. The cookie consent manager displays a list of cookie providers used in the career site. For each cookie provider, visitors can turn on or off all of its associated cookies.

- Select from a list of preset, commonly used cookies for providers such as YouTube and LinkedIn. When selected, the cookie consent manager automatically displays descriptions and links to these corporate sites, without having to maintain the links manually.

#### Note

You can't change the sections that these preset providers are listed in, but you can change the label for the sections. For example, you can't move the [LinkedIn](#) listing out of the [Advertising Cookies](#) section, but you can rename the section by editing the [Section Label](#) field.

- Add a listing of custom cookie providers in the cookie consent manager that allows visitors to enable or disable custom plugins or cookies you use in your career site. You can fully configure your cookie consent manager by just using the standard providers available in the cookie manager.

#### Caution

Adding custom cookie providers is an advanced, technical process that requires knowledge and use of JavaScript code. Only add custom JavaScript if you can troubleshoot it yourself; Technical Support doesn't provide assistance with custom JavaScript.

- Write customized text for the cookie banner and cookie consent manager for different locales by selecting [Edit Translation](#) or the  (double box) icon in the individual fields to open the override text dialog. The dialog lets you change the default text as well as add text for other locales. This may be helpful if your organization has specific compliance requirements for different countries/regions.

#### Note

If your organization has its own corporate cookie policy, you need to decide whether to use it or the Career Site Builder Cookie Manager for your cookie banner and cookie consent manager. If you choose to use your own existing corporate cookie policy, note the following:

- Disable the [Enable Banner and Cookie Consent Manager](#) Career Site Builder setting. You can't use both the Career Site Builder Cookie Manager and your own corporate cookie banner/cookie consent manager at the same time. Choose one.
- You're responsible for meeting compliance requirements. SAP can't guarantee legal compliance on a cookie policy you implement on own.
- Since none of the configuration settings in the [Cookie Manager](#) tab will affect your career site, you need to configure your own settings in your corporate cookie policy for cookie providers (such as LinkedIn).

Both the cookie banner and the cookie consent manager dialog use the career site's global font, text, and color settings.

## Procedure

1. In Career Site Builder, go to [Appearance](#) [Global](#) and select the [Cookie Manager](#) tab.

The Cookie Manager page appears, and you see a popup message that informs you that you need to complete the setup of both the cookie banner and cookie consent manager, as well as adding a link to the cookie consent manager in your site's header or footer.

2. Enable the cookie banner by moving the [Enable Banner and Cookie Consent Manager](#) slider to [YES](#) in the [Cookie Banner Settings](#) section.

If you set this field to **NO**, neither the cookie banner nor the cookie consent manager appear on your public career site. Enabling this setting means a banner automatically appears at the bottom of the page for new visitors to your career site, and they have to accept or reject the terms of the cookie statement, or choose to view the cookie consent manager. The option to reject the terms is an optional setting that is disabled by default.

### Caution

Just turning **Enable Banner and Cookie Consent Manager** on isn't enough. The cookie settings won't work correctly unless you set up the cookie banner and cookie consent manager on this page, and add a link in the site's header or footer.

- Set the rest of the **Cookie Banner Settings** fields:

| Option                           | Description                                                                                                                                                                                                                                                  |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Banner Body Text</b>          | Banner Body Text includes a description of your career site's cookie policy. You can override the default text by selecting <b>Edit Translation</b> . Since this dialog is also the translation editor, use this to create customized text for your locales. |
| <b>Accept Button Label</b>       | The text that appears on the button that lets users accept all cookies. The default text is <b>Accept All Cookies</b> .                                                                                                                                      |
| <b>View Details Button Label</b> | The text that appears on the button that, when selected, takes users to the Cookie Consent Manager dialog. The default text is <b>Modify Cookie Preferences</b> .                                                                                            |
| <b>Banner Location</b>           | The only value in this field is <b>Bottom</b> , which indicates that the banner appears on the bottom of the career site page.                                                                                                                               |
| <b>Enable Reject All Cookies</b> | A slider that controls whether to allow users to reject all cookies. The default setting is <b>NO</b> .                                                                                                                                                      |
| <b>Reject All Button Label</b>   | The text that appears on the button that lets users reject all cookies. The default text is <b>Reject All Cookies</b> .                                                                                                                                      |

- Set the following fields in the **Cookie Policy Settings** section:

| Option                              | Description                                                                                                                       |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>Cookie Consent Manager Title</b> | The title that appears at the top of the Cookie Consent Manager dialog. The default text is <b>Cookie Consent Manager</b> .       |
| <b>Intro Text</b>                   | Intro Text appears at the top of the Cookie Consent Manager dialog.                                                               |
| <b>Accept All Button Label</b>      | The text that appears on the button that lets users accept all cookies. The default text is <b>Accept All Cookies</b> .           |
| <b>Accept Selected Button Label</b> | The text that appears on the button that lets users allow their selected cookies. The default text is <b>Confirm My Choices</b> . |

- Configure the settings for each section, as needed:

| Option                                         | Description                                                                                                                                                                                                 |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enable &lt;Category&gt; Cookies Section</b> | A slider that controls whether to display this section in the Cookie Consent Manager dialog. Enable this slider only when you use providers in the section, and you enable the providers that you're using. |

### Note

**Required Cookies Section** – you can't disable this section or add any custom cookie providers. You can, however, edit the text fields in the section.

| Option                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                     | <p><a href="#">Performance Cookies Section</a> – by default, Career Site Builder doesn't use any performance cookies. For this reason, you don't need to enable <a href="#">Performance Cookies</a> unless you plan to use a custom cookie provider.</p> <p>Make sure the Functional and Advertising sections include the providers you're using but excludes any that you aren't, or else you may encounter issues with the public career site. Change these settings anytime you change what providers you're using.</p> |
| <a href="#">Section Label</a>       | The label for the section. Default text is provided for each category, such as Advertising Cookies.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <a href="#">Section Description</a> | A text field that provides a short description for this section. Select <a href="#">Edit Translation</a> to change the default text, or to add text for additional locales.                                                                                                                                                                                                                                                                                                                                                |
| <a href="#">Cookie Providers</a>    | <p><a href="#">Cookie Providers</a> is where cookie provider information is added.</p> <p>The next step describes how to add a cookie provider.</p> <p>In the <a href="#">Required Cookies Section</a>, <a href="#">SAP as service provider</a> is required and the only option in this category.</p>                                                                                                                                                                                                                      |

- Select **+** [Add Cookie Provider](#) below the [Cookie Providers](#) field in the Functional, Performance, and Advertising sections to add cookie providers, as needed:

| Option                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Third Party Integration</a> | <p>The type of third-party integration. Available values vary by category.</p> <ul style="list-style-type: none"> <li><a href="#">Functional Cookies Section</a> – choose from the following in the dropdown list: <ul style="list-style-type: none"> <li><a href="#">Vimeo</a> – add this option to use Vimeo videos in your career site.</li> <li><a href="#">YouTube</a> – add this option to use YouTube videos in your career site.</li> <li><a href="#">Custom</a> – add this option to include a custom functional cookie provider in the cookie consent dialog.</li> </ul> <p>Career Site Builder also supports Wistia videos, but because Wistia doesn't use cookies, it's not listed as a cookie provider.</p> </li> <li><a href="#">Performance Cookies Section</a> – there are no preconfigured cookie providers in this section. If your external GTM configuration results in the setting of cookies, make sure you enable GTM under this Advertising cookies section.</li> <li><a href="#">Google Analytics</a> – add this option to use Google Analytics in your career site.</li> <li><a href="#">LinkedIn</a> – add this option to use Apply With LinkedIn in your career site.</li> <li><a href="#">Custom</a> – add this option to include a custom advertising cookie provider in the cookie consent dialog.</li> </ul> </li> </ul> |

#### Note

For details on adding custom cookie providers, refer to *Adding Custom Cookie Providers in the Cookie Manager*.

| Option                              | Description                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Provider</a>            | The name of the provider. This required field is empty when the third-party integration is set to <a href="#">Custom</a> .                                                                                                                                                                                                                                                                                             |
| <a href="#">Description</a>         | A text field that provides a short description about the company, or its cookies. Default text is provided unless the third-party integration is set to <a href="#">Custom</a> . Custom cookie providers require more details in this field.                                                                                                                                                                           |
| <a href="#">Provider JavaScript</a> | This field only appears when you add a custom cookie provider, and only accepts pure JavaScript (everything between <code>&lt;script&gt;</code> and <code>&lt;/script&gt;</code> ), and not HTML or CSS. Use this field to add all the JavaScript required for the custom cookie provider to run on the career site.<br><br>This is not the same as the JavaScript code you add when you add a custom cookie provider. |

7. **Optional:** To delete a cookie, select  ([Delete Cookie](#)) on the top-right of the cookie provider's section.

You can't delete [Required Cookies Section](#).

8. Select the  ([Preview](#)) icon to verify that both the cookie banner and cookie consent manager are configured correctly.

The preview first displays the cookie banner. Select [Modify Cookie Preferences](#) (or the value you used in the [View Details Button Label](#) field) in the cookie banner to see the cookie consent manager, which appears as a separate dialog on the screen. The following are objects visitors to your public career site can interact with in the cookie consent manager:

| Option                            | Description                                                                                                                                                                         |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Show More Details</a> | Visitors select this to view the list of cookies in the section. Preconfigured cookie providers such as YouTube and LinkedIn include links to their cookie policies at their sites. |
| <a href="#">Enabled</a>           | Visitors enable or disable cookies using the sliders. When they enable a category, all the cookies in that category become enabled.                                                 |

9. When you've completed all your settings, select [Save](#) (or choose [Cancel](#) to cancel).

You've completed configuring the cookie banner and cookie consent manager for the career site.

The cookie banner now displays on your site, but you now also need to add a link to the cookie consent manager in your site's header or footer so that visitors to your career site have a way to view the cookie consent manager at any time.

10. Add a global link in the career site to the cookie consent manager by going to the Global Styles page at  [Appearance](#) , then expanding either the [Headers](#) or [Footers](#) menu and navigate to the locale and brand of your choice.

| Option                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Headers</a> | Configuring the header results in a link to the cookie consent manager being displayed at the top of the page. <ol style="list-style-type: none"> <li>Choose the layout, such as <a href="#">Desktop Layout</a> or <a href="#">Mobile Layout</a>.</li> <li>Select <a href="#">Add Component</a>, then choose <a href="#">Menu</a> from the dropdown list.</li> <li>Select the gray box to go to the <a href="#">Menu</a> component's Details page.</li> <li>Select <a href="#">+ Add</a>.</li> <li>In the <a href="#">Link Setup</a> dialog, choose <a href="#">Cookie Consent Manager</a> from the <a href="#">Type</a> dropdown list.</li> </ol> |
| <a href="#">Footers</a> | Choose one of these options: <ul style="list-style-type: none"> <li><b>To add a link in the row menu:</b><br/>Go to <a href="#">Row Menu</a>, then select <a href="#">+ Add</a>. In the <a href="#">Link Setup</a> dialog, choose <a href="#">Cookie Consent Manager</a> from the <a href="#">Type</a> dropdown list.</li> </ul>                                                                                                                                                                                                                                                                                                                   |

| Option | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|        | <ul style="list-style-type: none"> <li>• <b>To add a link as a column item:</b> <ol style="list-style-type: none"> <li>1. Go to <a href="#">Column Menu</a>, then select <a href="#">+ Add</a>. The Link Setup dialog displays.</li> <li>2. Select <a href="#">+ Add</a> in the Link List section.</li> <li>3. Select <a href="#">Cookie Consent Manager</a> in the <a href="#">Type</a> dropdown list.</li> </ol> </li> </ul> |

## Results

You've now configured both the cookie banner and cookie consent manager, as well as added a link in either the header or footer of the career site so that visitors can look at the cookie consent manager at any time.

### 19.6.6.6 Adding Custom Cookie Providers in the Cookie Manager

Provide details for custom cookie providers when you configure the Cookie Manager page in the Career Site Builder's Global menu.

## Prerequisites

- You know which custom cookie providers you want to add in the cookie manager.
- You've configured the fields in both the [Cookie Banner Settings](#) and [Cookie Policy Settings](#) sections of the Cookie Manager page according to the steps described in *Configuring the Career Site Cookie Banner and Cookie Consent Manager*.

## Context

### Note

You can fully configure your cookie consent manager by just using the standard providers available in the cookie manager. Adding custom cookie providers is an advanced, technical process that requires the knowledge and use of JavaScript code.

You can add a custom cookie provider for various uses. For example, if your career site's home page has a custom plugin component, you can require visitors to accept it in the cookie consent manager before the component can display.

You can add up to 30 cookie providers in the cookie consent manager.

Unlike the preconfigured cookie providers you can select from the dropdown list that includes default text, custom cookie providers require additional details.

## Procedure

1. Enable the [Enable <Category> Cookies Section](#) slider to **YES** for the section where you want to add the custom cookie provider.
2. Select [+ Add Cookie Provider](#) below the [Cookie Providers](#) field in the Functional, Performance, and Advertising sections to add cookie providers, as needed.
3. In the [Third Party Integration](#) field, select **Custom**.
4. In the [Provider](#) field, enter the name of the provider. For example, **Qualtrics**.
5. In the [Description](#) field, provide all the details that visitors need to know about the cookies used by the custom cookie provider, including:
  - A list of all the cookies the provider uses in the career site.
  - The security domains for all the cookies.
  - The purpose of each cookie.
  - The expiration (or lifespan) of each cookie.

You can present this information in formats such as a list or table. You can also provide this information elsewhere (such as in a Career Site Builder content page), and provide a link to it to reduce the amount of text in the cookie consent manager. You can also add links to the cookie provider's own Web site that describes cookies.

### Note

If you want to use more than a single cookie for a cookie provider, you need to group them all into a single cookie provider entry because you can't enable one but not the other. If you do, even the ones a visitor enables, don't work.

6. In the [Provider JavaScript](#) field, add all the JavaScript required for this cookie provider to run on the career site.

## Results

You've now added custom cookie providers in the Cookie Manager, and can complete the rest of your Cookie Manager configuration.

### 19.6.6.7 Configuring Styles for a Brand

The  [Appearance](#)  [Styles](#)  menu in Career Site Builder allows you to customize colors and background images across the career site.

## Prerequisites

You have configured brands and locales.

## Context

The configured brands for the site can have their own colors for the main areas. They can also have a custom header or footer, with custom colors and images.

Each configured style is associated with a specific brand. Configure each active brand for a site separately. For example, Default Brand A and Sub Brand B can each have its own look, with individual branded colors and images. You can also configure brands to display at the full width of the page by using the [Content Style](#) menu.

In addition to configuring site-wide settings, you can also customize header or footer content by locale and brand. Select [Header](#) or [Footer](#) in the [Styles](#) menu, then select a locale, and brand.

#### Note

In Career Site Builder, public (external) and internal career sites share the same header and footer. This means that you can't specify a header or footer for your organization's internal career site that differs from the public career site.

## Procedure

- **Configure Global Styles.**

Go to ► [Appearance](#) ► [Styles](#) ► [Global Styles](#) ► [<Brand>](#) ► to configure the look of the brand's pages, search form, search tiles, header, row footer, and column footer.

You can configure colors for a number of site-wide elements using the [Main Styles](#) page. Select the color bar to change the color for an element. Select from a list of configured colors, or select [Add](#) to create a new color by using the color picker grid, or entering an RGB or hex code value. To create a color gradient, check the [Is Gradient Color](#) box, and select the two colors you would like to create the gradient.

You can also upload images for the site and content pages using the [Main Styles](#) page. Images uploaded as the [Site Background Image](#) serve as the background for the entire site. Once you've uploaded an image, it's saved in the site's image library. You can also select an alignment for image using the [Image Type](#) and [Image Position](#) dropdowns.

Images uploaded as the [Content Background Image](#) serve as the background on any content pages. You can also select an alignment for the image using the [Image Type](#) and [Image Position](#) dropdowns.

- **Configure headers.**

Go to ► [Appearance](#) ► [Styles](#) ► [Headers](#) ► [<Locale>](#) ► [<Brand>](#) ► to configure the header of the brand's pages, including a logo and menu options.

The [Details](#) tab allows you to specify the look of the site header, including its width and where the logo appears within the header. In addition, [Use Sign In Widget](#) adds a way for candidates to create and access a login, and [Use Locale Selector](#) adds a [Language](#) dropdown list if you enable more than one locale for your career site.

The [Logo](#) tab lets you upload a logo image to display in the header, and add a title, alternate text, and URL for the image.

The [Menu](#) tab by default lets you display menu options, such as [About Us](#).

- **Configure footers.**

The [Footers](#) menu allows you to customize the colors of some elements of the site header.

Go to ► [Appearance](#) ► [Styles](#) ► [Footers](#) ► [<Locale>](#) ► [<Brand>](#) ►. You can configure the text that appears in the footer, menu options for a single row or column, as well as social links.

You can configure links in the footer either as a single row, or as columns of related links. You can also configure both footer menu types, and apply styles for the separately. If you configure both a row and column menu for the footer, the row menu displays above the columns.

To add links to the footer, navigate to ► [Global Styles](#) ► [Footers](#) ► and select the combination of brand and locale you want to configure the footer for. Add links to the footer by choosing either [Row Menu](#) or [Column Menu](#). In the [Row Menu](#) configuration, links appear from left to right in the order they're displayed in the [Global Styles](#) configuration panel.

To configure links in the [Column Menu](#), select [Add](#) to add a new list of links that appear in a column. The text you enter in the [Text](#) field of the link list is the column header for the links. Leaving this field blank means that the link list doesn't display a label in the [Global Styles](#) pane.

Define styles for the column and row menus by going to [Global Styles](#). Choose your brand and locale, then select either [Row Footer](#) or [Column Footer](#).

### 19.6.6.8 Using a Custom Font on the Career Site

Upload a font in Career Site Builder to customize the look of your career site.

#### Context

The size limit for custom fonts is 50 MB.

##### Note

If you're using Apple iOS, use OTF-format fonts instead of TTF fonts (or convert the TTF font to OTF format). TTF fonts don't display correctly on iOS devices.

#### Procedure

1. In Career Site Builder, go to **Appearance > Global > Site**.
2. In the *Edit Custom Fonts* field, select *Open Custom Font Editor*.  
The Custom Font List dialog appears.
3. Select the **+ Upload Fonts** icon on the top-right corner of the dialog.  
The file selector dialog appears.
4. Select the font you want to upload, and choose *Open*.  
If the file uploads correctly, you see a confirmation message, and the font appears in the list.
5. Close the dialog, then verify that the font is now available for your career site by selecting the dropdown list in the *Font* field.  
Your custom font now appears in the field in the following format: **Custom: <font name>**, and you can use it to configure the career site.
6. **Optional:** To edit the name of the font by selecting it in the Custom Font List dialog.  
The Font Edit page in the dialog appears, where you can change and save the name of the font.
7. **Optional:** You can archive and unarchive a custom font:

| Option                               | Description                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>To archive a custom font</b>      | <p>Select the  <i>Archive Font</i> icon.</p> <p>The custom font disappears from the custom font list, and doesn't appear in the list of fonts for the career site.</p>                                                                                                                           |
| <b>To view archived custom fonts</b> | <p>Select the checkbox for the <i>Archived</i> field on the bottom of the Custom Font List dialog.</p> <p>The archived custom font appears in the custom font list.</p>                                                                                                                                                                                                           |
| <b>To unarchive a custom font</b>    | <p>Select the  <i>Unarchive Font</i> icon.</p> <p>The custom font disappears from the list if you have the <i>Archived</i> field selected. Because it's no longer archived, you can verify that the font is now available by checking the list of available fonts in the font dropdown list.</p> |

 **Note**  
 You can't delete custom fonts. If you don't need a font anymore, just archive it.

## 19.6.6.9 Editing Global Search Settings for a Career Site

Set up the basic search settings for a career site.

### Context

These are global settings, so the settings propagate throughout the system, across all your brands.

### Procedure

1. In Career Site Builder, go to the *Search* tab in .
2. Configure the following settings:

| Option                        | Description                                                                                                                                                                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Show Search Labels</i>     | When enabled, search labels appear above search fields and ghost text disappears. When disabled, search boxes on the site are populated with ghost text.                                                                                                               |
| <i>Show Clear Button</i>      | Enable this setting to show a button that clears the search field of any text that was entered there.                                                                                                                                                                  |
| <i>Branded Search Form</i>    | The search form has the visual appearance of the branded career site. Enabled for organizations with multiple brands.                                                                                                                                                  |
| <i>Branded Search Results</i> | This setting, available only when you enable <i>Branded Search Form</i> , changes the behavior of search by limiting the results to just the jobs for the branded career site. When disabled, searches return all jobs that meet the search query regardless of brand. |

| Option                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Limit Search by Locale</a>                   | Limit the results of the search page by locale.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <a href="#">Search by Keyword</a>                        | Enable this field so that candidates can perform job searches on the career site. Don't disable this field; doing so means candidates can't find jobs on your career site.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <a href="#">Search by Location</a>                       | Available only when you turn on <a href="#">Search by Keyword</a> . When enabled, looks for matches in city, state, Zip, and country/region fields.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <a href="#">Search by Radius</a>                         | <p>Available only when you turn on <a href="#">Search by Keyword</a>. Performs a search based on postal codes.</p> <p>The U.S. is the only officially supported country/region for the <a href="#">Search by Radius</a> field, and search results are based on the Zip/postal codes you provide for job locations. Results from the <a href="#">Search by Radius</a> can display inaccuracies for non-U.S. countries/regions. In addition, not all countries/regions support this field.</p> <p>Refer to <i>Countries/Regions Not Supported in Search By Radius Field</i> for details.</p> |
| <a href="#">Imperial (Miles) and Metric (Kilometers)</a> | Enter a set of numeric values for search distances, separating each value with a comma, without using spaces between values (for example, <b>2, 5, 10, 30, 50</b> ). Each value you enter appears in the dropdown list for the postal code search in the public career site.                                                                                                                                                                                                                                                                                                               |
| <a href="#">Default (distance)</a>                       | The default search distance. The value must be one of the list of search distances you provide in the <a href="#">Imperial (Miles)</a> and <a href="#">Metric (Kilometers)</a> fields. If you provide a different value, the system automatically chooses the first distance in your set of search distances.                                                                                                                                                                                                                                                                              |
| <a href="#">Default (search type)</a>                    | This field is visible only when both <a href="#">Search by Keyword</a> and <a href="#">Search by Location</a> are enabled. Allows you to choose the default search method. Candidates can toggle the search method.                                                                                                                                                                                                                                                                                                                                                                        |
| <a href="#">Show Picklist Values for all Locales</a>     | Visible only when you select <a href="#">Picklist Search Enabled</a> , this setting lets you show picklist values for all locales you've configured for your career site.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <a href="#">Picklist Search Enabled</a>                  | Adds a picklist search in addition to the search fields already present (such as keyword or location). Acts as a filter on the main search.                                                                                                                                                                                                                                                                                                                                                                                                                                                |

- If you turned on , select **+** [Add](#) to select the field for the picklist.

#### → Tip

Although you can choose multiple fields, specifying multiple fields could make the search too narrow.

- Select [Save](#) to save the settings.

## 19.6.6.10 Choosing the Color Settings for Search

Use the options in the Search tab to customize color settings in the search form.

### Prerequisites

You've configured the basic settings for the career site's search functionality in [Global Settings](#).

### Context

#### 📘 Note

Unlike the basic search functionality settings you configured in [Global Settings](#), you can set the color settings here at the brand level. In addition to configuring the basic color settings in your default brand, you can specify a different set of color settings for any specific brand career sites you have.

### Procedure

1. In Career Site Builder, go to the [Search](#) tab in [Appearance](#) > [Styles](#) > [Global Styles](#) > [<Brand>](#).
2. Configure the following settings:
  - [Search Form Labels](#)
  - [Search Form Background](#)
  - [Search Form Link](#)
  - [Search Form Link Hover](#)
  - [Search Form Background Image](#)
  - [Image Type](#)
  - [Image Position](#)
3. Select [Save](#).

## 19.6.6.11 Adding Career Site Meta Images for Social Media Posts

You can add meta images in Career Site Builder to associate them with your career site in social media posts.

### Prerequisites

Decide what image you want to use before uploading it to Career Site Builder, using the following OG (Open Graph protocol) sizing considerations:

- Minimum image dimensions – 200 by 200 pixels
- Maximum file size – 8 MB
- Recommended minimum dimensions – 1200 pixels wide by 630 pixels high
- Optimal ratio – 1.91:1

Use a supported media type, as listed here: [Adding Images in Career Site Builder Using Image Selector \[page 438\]](#)

### Context

Some third-party sites, like Facebook, LinkedIn, Twitter, and Microsoft Teams, allow you to associate an image when you post a link and information for your career site. Whether you use a logo, photo, or other graphic, using this setting allows you to add an OG image as part of your post. In LinkedIn, for example, the meta image would display when you add your site as a link to web content from your profile.

You can specify one image per brand with this setting. You can associate a separate meta image for each of your individual brands; otherwise Career Site Builder uses the meta image you specify for your default brand.

You can choose to specify a different meta image for each of your branded career sites.

#### Note

The meta image is associated to the brand, and not to specific pages within the career site (such as landing pages or category pages).

### Procedure

1. In Career Site Builder, go to **Appearance > Styles > Global Styles > <Brand>** and select the *Main* tab.
2. In the *Meta Image* field, select  *Select Image*.  
The Image Selector dialog appears.
3. If you haven't uploaded an image you plan to use for your meta image, select  *Upload Image*.
4. Select the *Select Image*  icon.

The Open dialog appears.

5. Select the image you want to use, and confirm.

The Open dialog closes, and the image name appears in the Image Selector.

6. Select the green ✓ [Add](#) icon to add the image, and accept the confirmation dialog.
7. Select ◀ (left arrow) to return to the first page in the Image Selector.

Your uploaded image now appears in the list of available images.

8. Enter descriptive text in the [Edit Alt Text](#) field.

Alt text is used by assistive technology such as screen readers, and is a requirement for accessibility.

9. Select the ☐ [Select](#) field for your image.

[Meta Image](#) field appears.

10. **Optional:** To change the image, select  [Change Image](#).

11. **Optional:** To remove the image, select  [Remove Image](#).

Removing the image doesn't delete it from the Image Selector.

12. Select [Save](#) on your Global Styles page to save the changes.

## 19.6.6.12 Adding a Logo to the Header of a Career Site

Use the Header Editor to add a logo to your career site.

### Context

There are two ways within the Header Editor in Career Site Builder to add a logo to your career site:

- Upload your logo in the [Logo](#) tab in the Header Editor.
- Create a custom header and add a [Logo](#) component in your desktop layout, mobile layout, or both.

Which method you choose depends on what you want to do, as well as what kind of image format your logo is in:

- If your logo is in SVG format, you can use the [Logo](#) tab without creating a custom header. Because SVG scales to size, your logo renders correctly whether your career site is viewed on a desktop or mobile device.
- If your logo isn't in SVG format, creating a custom header allows you to upload two different versions of your logo; one to the [Desktop Layout](#), and another to the [Mobile Layout](#).

Even if your logo is in SVG format, you can use a custom header if you want the desktop and mobile layouts to show different components.

#### Note

In Career Site Builder, public (external) and internal career sites share the same header and footer. This means that you can't specify a header or footer for your organization's internal career site that differs from the public career site.

## Procedure

1. In Career Site Builder, go to ► *Appearance* ► *Styles* ► *Headers* ► *<Locale>* ► *<Brand>* ►.
2. If you want to use the regular header, select the *Logo* tab in the Header Editor and complete the following fields:
  - *Title*
  - *Alt Text*
  - *Image*
  - *Click URL (href)*
3. If you want to create a custom header, select *Custom* in the *Details* tab's *Header Style* field:
  - a. In the *Desktop Layout* tab that appears, choose + *Add Component*, and select *Logo* from the popup menu.

The *Logo* component appears.

### Note

You can move the placement of the *Logo* component by using the arrows around it.
  - b. Select the gray box for the *Logo* component, and complete the following information:

In the *Details* tab:

    - *Title*
    - *Alt Text*
    - *Image*
    - *Click URL (href)*

In the *Styles* tab, specify the color behind the logo in the *Background Image* field.
  - c. Repeat this process in the *Mobile Layout* tab.
4. Select *Save* to save the header.

### 19.6.6.13 Configuring a Custom Header

As a Career Site Builder administrator, you can configure custom headers for career sites, including headers specific to an organization's brands and locations.

## Context

In Career Site Builder, public (external) and internal career sites share the same header and footer. This means that you can't specify a header or footer for your organization's internal career site that differs from the public career site.

## Procedure

1. Go to ► [Appearance](#) ► [Styles](#) ► [Headers](#) ► [<Locale>](#) ► [<Brand>](#) ►.

The Header Editor appears.

2. Choose [Custom](#) from the [Header Style](#) dropdown list in the [Details](#) tab.
3. Choose the [Desktop Layout](#) tab and select + [Add Component](#) to configure the custom layout for desktop sites using these components:

| Option                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Image</a>                | Select the shaded area to open the image editor and configure the following: <ul style="list-style-type: none"><li>• The <a href="#">Details</a> tab – upload the image. Configure image title, URL link, minimum height, image type (tiled, stretched, and so on), and image position.</li><li>• The <a href="#">Styles</a> tab – configure colors for the background and link hover elements of the component.</li></ul>                                                            |
| <a href="#">Line</a>                 | Add the <a href="#">Line</a> component to add space above or below other components. You can configure the color and height of the line.                                                                                                                                                                                                                                                                                                                                              |
| <a href="#">Logo</a>                 | Use the <a href="#">Details</a> tab to upload the logo, as well as configure image title, alt text, and URL link. Use the <a href="#">Styles</a> tab to configure colors for the background and link hover elements of the component.                                                                                                                                                                                                                                                 |
| <a href="#">Menu</a>                 | Add existing pages to the menu setup to configure a menu to display in the header. Menu options include Category Link, Content, Cookie Consent Manager, External, Home Page, List, TC Join, Top Jobs, and View All Jobs. You can customize the color, alignment, padding, and height of menu items in the <a href="#">Styles</a> tab.                                                                                                                                                 |
| <a href="#">Sign-In and Language</a> | Use the <a href="#">Details</a> tab to configure translations, alignment, padding, and height of the component. Enable <a href="#">Use Sign In Widget</a> for candidates to sign in to the career site. Enable <a href="#">Use Locale Selector</a> so candidates can select their language from a dropdown list of active locales configured for the site. Use the <a href="#">Styles</a> tab to configure colors for the background, link, and link hover elements of the component. |
| <a href="#">Text</a>                 | Add text to the header in the <a href="#">Details</a> tab, and format the text using the options in the formatting menu bar. You can customize alignment, padding, height, and text and background colors for this component.                                                                                                                                                                                                                                                         |

4. Choose [Add](#) to add components to the header.
5. Select [Mobile Layout](#) to configure the custom header for mobile sites.

Components for the mobile headers are the same as those for desktop headers.

6. Choose [Add](#) to add components to the mobile header.
7. Select added components to open each component's customization options.
8. **Optional:** Remove a component by selecting ✕ [Remove Component](#).
9. **Optional:** Expand or contract components by selecting the right and left direction arrows on each component box.

### ⓘ Note

You can't drag and drop components to reposition them.

10. Select [Save](#) when you finish adding and modifying components to the header.

## 19.6.6.14 Configuring Search Tiles Settings Without the Unified Data Model

You can configure the appearance of search tiles to customize them for your brands.

### Prerequisites

- This information only applies if the Unified Data Model is **not** enabled. When it's enabled, you can't configure the settings described here.
- The configuration options in ► [Appearance](#) ► [Global Settings](#) ► [Search](#) ► in Career Site Builder are configured.

### Context

#### → Recommendation

Use **this** tile search results style instead of the grid style to make your career site more accessible to a wider audience — including those individuals who use assistive technologies or who use the Tab key to navigate through a page. This style displays each individual job in its own box (tile) that makes it easier to focus on and navigate.

### Procedure

1. Go to ► [Appearance](#) ► [Search Results](#) ► [Search Details](#) ►, and enable [Use Search Results Tiles](#).

A new tab called [Search Tiles](#) appears in ► [Appearance](#) ► [Styles](#) ► [Global Styles](#) ► [<Brand>](#) ►, where you configure the font and color settings of the job tiles that appear in a search result page.

2. Configure these fields to customize the behavior of the search results:

| Option                             | Description                                                                                                                                                                                                    |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Records Per Page</a>   | Set how many jobs you want to show on a standard job search that returns values.                                                                                                                               |
| <a href="#">No Results Records</a> | Set the value to 0 (zero) to indicate that a search returned zero relevant jobs. The search results page displays unrelated jobs from Top Jobs if you use any value other than 0, which can lead to confusion. |

3. Add any additional fields you want to display in different layouts, in the [Desktop Tile Fields](#), [Tablet Tile Fields](#), and [Mobile Tile Fields](#) tabs.
4. Select [Save](#) to save these settings.
5. Go to ► [Appearance](#) ► [Styles](#) ► [<Brand>](#) ► [Search Tiles](#) ► in Career Site Builder.
6. Configure these settings:

| Option                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Background Color</b>                        |                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Search Result Tile Styling Fields</b>       | <ul style="list-style-type: none"> <li>• Tile Animation (when hovering over the Search Result Tile)</li> <li>• Tile Background Color</li> <li>• Tile Border Color</li> <li>• Shadow Enabled</li> <li>• Tile Shadow Color</li> <li>• Shadow Vertical Offset</li> <li>• Shadow Horizontal Offset</li> <li>• Border Thickness</li> <li>• Border Radius</li> <li>• Padding Inside Tiles</li> <li>• Padding Between Tiles</li> </ul> |
| <b>Title Styling Fields</b>                    | <ul style="list-style-type: none"> <li>• Title Font</li> <li>• Title Font Size</li> <li>• Tile Font Color</li> <li>• Tile Font Hover Color</li> <li>• Padding Between Titles and Subfields</li> </ul>                                                                                                                                                                                                                           |
| <b>Sub Field Label Styling Fields</b>          | <ul style="list-style-type: none"> <li>• Sub Fields Labels Visible</li> <li>• Sub Fields Label Font</li> <li>• Sub Fields Label Font Size</li> <li>• Sub Field Label Color</li> </ul>                                                                                                                                                                                                                                           |
| <b>Sub Field Styling Fields:</b>               | <ul style="list-style-type: none"> <li>• Sub Fields Visible</li> <li>• Sub Field Padding (Mobile)</li> <li>• Sub Fields Font</li> <li>• Sub Fields Font Size</li> <li>• Sub Field Color</li> </ul>                                                                                                                                                                                                                              |
| <b>Show More Results Button Styling Fields</b> | <ul style="list-style-type: none"> <li>• Show More Results Font</li> <li>• Show More Results Font Size</li> </ul>                                                                                                                                                                                                                                                                                                               |

7. Select [Save](#) to save your settings.

## 19.6.6.15 Configuring Search Grid Settings Without the Unified Data Model

Use the global Search Results page to configure how a career site's search results are displayed on the search page.

### Prerequisites

- This information only applies if the Unified Data Model is **not** enabled. When it's enabled, you can't configure the settings described here.
- The configuration options in [Appearance](#) > [Global Settings](#) > [Search](#) in Career Site Builder are configured.

## Context

### ⚠ Caution

This grid format displays the list of jobs in a spreadsheet-like format that's difficult to navigate when using assistive technologies or when using the **Tab** key to navigate through a page. For that reason, use the tile search results style instead so that your career site is more accessible to a wider audience.

## Procedure

1. Go to the *Search Details* tab in ► *Appearance* ► *Search Results* ▾ in Career Site Builder.
2. Disable the *Use Search Result Tiles* setting.

The *Search Details* tab becomes populated with several fields to configure the grid format that the jobs are displayed in.

3. Configure these fields to customize the behavior of the search results:

| Option                    | Description                                                                                                                                                                                                    |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Records Per Page</i>   | Set how many jobs you want to show on a standard job search that returns values.                                                                                                                               |
| <i>No Results Records</i> | Set the value to 0 (zero) to indicate that a search returned zero relevant jobs. The search results page displays unrelated jobs from Top Jobs if you use any value other than 0, which may lead to confusion. |

4. Configure the *Grid Header* fields:
  - *Show Sub Filters*
  - *Show Column Headers*
  - *Show Sort Arrows*
5. Configure the *Pagination* fields:
  - *Pagination Location*
  - *Results Text Location*
  - *Show Top Bar*
  - *Show Bottom Bar*
  - *Link Count*
6. In the *Relevance Columns* tab, specify column names, order, and column width those columns that are used for non-distance searches.

The *Title* field for job titles is required; other column names refer to various job fields.
7. In the *Distance Columns* tab, specify column information for those fields that are distance-related.
8. In the *Mobile Configuration* tab, specify column information without width values.
9. Select *Save* to save your settings.

## 19.6.6.16 Enabling Picklists for Career Site Search Fields

You can enable a picklist search to add more controls to the career site search.

### Context

*Picklist Search* is a global setting you can enable, which gives you the ability to add 18 distinct searchable fields to the career site, which become dynamically populated with data from the site's jobs. For example, if you enabled a picklist search for the *Location* field, the picklist populates with all available locations from jobs on the site, and candidates can choose from among those locations. Depending on the site's configuration, picklist search fields can appear in addition to the standard Keyword and Location search.

### Procedure

1. Go to the *Global Settings* page in *Appearance* > *Global*.
2. In the *Search* tab, set the *Picklist Search Enabled* slider control to *Yes*.
3. Choose *Add* to add a new picklist item.

You can add as many picklist items as you'd like. Available fields are:

- Title
- Location – the Location picklist supports multilocation search. It renders all the location such as City, State, Country/Region, Zip, and location for the multilocation job postings.
- City
- State
- Country/Region
- Zip
- Facility
- Shift Type
- Department
- Dept
- Job Locale
- Language
- Custom Field 1
- Custom Field 2
- Custom Field 3
- Custom Field 4
- Custom Field 5
- Reference Date
- Brand

Once you've added the desired fields, you can move them up and down in the display order using the arrow icons.

4. **Optional:** You can change the wording for a field by selecting it in the [Picklist Search](#) section of the page.

You can use this option to enter custom translations for non-English locales, as well as different words from what's provided as the default. For example, you can change the label "Facility" with **Campus** to more closely match your needs.

- a. Select the field you added.

The [Override Resource Key](#) dialog appears, with the following fields:

- [Locale Selector](#) – by default, shows your primary locale. Change the value by choosing the ▼ (down arrow) and selecting a locale from the dropdown list.
- [Default Value](#) – is the name of the field you added.
- [Override Text](#) – enter the text you want to use to replace the default label for this field.

- b. Select [Save](#) to save your override text, then [Close](#) to close the dialog.

The new field label now displays, with the original default label in parentheses .

5. **Optional:** You can move the display order of your fields using the ▲ (up) and ▼ (down) arrow icons.
6. **Optional:** You can delete a field by selecting the  [Remove](#) icon.
7. **Optional:** Control the values that appear in the picklist fields by locale.

| Option                                                          | Description                                                                                                                                                                                                                                      |
|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Set Show Picklist Values for all Locales to Yes</a> | Displays all picklist options, regardless of locale and language.<br><br>For example, if you select <b>English</b> from the <a href="#">Language</a> selector, the picklist displays all picklist options, even the ones that aren't in English. |
| <a href="#">Set Show Picklist Values for all Locales to No</a>  | Displays only the picklist options that match the locale and language you selected.<br><br>For example, if you select <b>English</b> from the <a href="#">Language</a> selector, the picklist displays only English picklist options.            |

Ensure that any picklist mapped from RCM to RMK for search has translations for each local you've enabled as a recruiting language. If a translation isn't available for a local user on your career site, it causes issues with posting and searching for jobs.

## Results

You've now enabled and chosen all the fields you want to have picklists available for in your career site searches.

## 19.6.7 Tools

### 19.6.7.1 SSL Certificates

#### 19.6.7.1.1 Choosing Your SSL Certificate Renewal Process

Access [SSL Certificates](#) from the [Tools](#) menu in Career Site Builder to manage the SSL certificates for your public career site in a production environment, including obtaining certificate signing requests, as well as renewing, installing, and uninstalling them.

#### Prerequisites

- To have IT or security teams manage SSL certificates instead of Career Site Builder admins, set the Career Site Builder role-based permission to allow certificate managers to have access only to ► [Tools](#) ► [SSL Certificates](#) ►.
- Enable [Manage Career Site Builder](#) from the Admin Center, especially for individuals for whom you're providing access to [SSL Certificates](#) who aren't Career Site Builder admins.

#### Context

For security purposes, SSL certificate-issuing authorities have set the duration of an SSL certificate to 398 days. When you let your certificate expire, visitors see a warning and can't go to your public career site. For this reason, you **never** want to let your SSL certificate expire.

Use [SSL Certificates](#) to manage SSL certificates for your public career site, from generating certificate signing request (CSR) files to installing and uninstalling SSL certificates. You can also upload certificates, without generating CSR files. The page also lets you see installed certificates that are in use, as well as those certificates that are expiring.

Implementation partners can get and install the initial SSL certificate as part of setting up a public career site using [SSL Certificates](#), as long as Career Site Builder is implemented for the organization. Most organizations already have their initial SSL certificate installed for them by their implementation partners. [SSL Certificates](#) does, however, have the ability for organizations to get a brand new certificate.

The [SSL Certificates](#) page provides solutions for the following scenarios. Follow the instructions for the scenario that best fits your situation.

#### 📘 Note

Administrators have the option to subscribe to reminder email about expiring SSL certificates. Refer to *Setting Up Email Reminders About Expiring SSL Certificates*.

## Procedure

Identify what you need to do, and choose option 1 or 2:

| Scenario                                                                                                  | Action                                                                                                                                                                                                                                               |
|-----------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Option 1 (Typical or Recommended) – start from scratch to get a new a certificate signing request.</b> | Follow the instructions in <i>Creating a Certificate Signing Request and Adding a New SSL Certificate</i> .                                                                                                                                          |
| <b>Option 2 – upload an SSL certificate that you got using your own CSR.</b>                              | <p>You got a new SSL certificate from a certificate authority using a CSR file that didn't come from the <a href="#">SSL Certificates</a> page.</p> <p>Follow the instructions in <i>Uploading an SSL Certificate and Creating a New Record</i>.</p> |

### 19.6.7.1.2 Creating a Certificate Signing Request and Adding a New SSL Certificate

Use the [SSL Certificates](#) page in Career Site Builder to manage SSL certificates for public career sites in a production environment.

## Prerequisites

You have the appropriate Career Site Builder role-based permission to access [SSL Certificates](#).

You have all the information you need about your organization and domain information for the certificate signing request (CSR) form.

## Context

The [SSL Certificates](#) page in Career Site Builder lets you generate a certificate signing request (CSR) to get an SSL certificate, then upload and install it in Career Site Builder.

You can also use [SSL Certificates](#) to upload and install an SSL certificate you get without generating a CSR. Refer to *Uploading and Associating an SSL Certificate With an Existing Record* or *Uploading an SSL Certificate and Creating a New Record* for instructions.

## Procedure

### 1. Generate a certificate signing request (CSR) file in Career Site Builder.

- a. Go to **Tools** > [SSL Certificates](#).
- b. Choose **Option 1** > [Generate a CSR](#).

The Generate Certificate Signing Request dialog appears.

- c. Complete all the fields in the Generate Certificate Signing Request Dialog:
  - [Common Name \(CN\)](#) – The fully qualified domain name of the hostname. 64-character limit. Don't include port numbers, path names, or protocol as part of the name (such as [http://](#) or [https://](#)).
  - [Organization \(O\)](#) – The legal name of the organization.
  - [Organizational Unit \(OU\)](#) – The department or division name.
  - [Certificate Manager Email Address](#) – The email address of the person in the organization who is responsible for managing SSL certificates. This individual may or may not be the same as the contact person.
  - [City/Locality \(L\)](#) – The city or locality of the organization. Don't use abbreviations. For example, use **Saint Louis** instead of **St. Louis**.
  - [State/Province \(ST\)](#) – The state or province where the organization is located (state for U.S., province for Canada). Don't use abbreviations. For example, **California** and not **CA**. For U.S. organizations, specify the state they operate from, even if they're incorporated in another state.
  - [Country/Region \(C\)](#) – The country or region of your organization, selected from the dropdown list.
  - [Subject Alternative Name \(SAN\)](#) – The Subject Alternative Name includes any additional hostnames covered by the certificate. 64-character limit. Don't include port numbers, path names, or protocol as part of the name (such as [http://](#) or [https://](#)).
- d. Select [Generate](#).

You see a success message similar to the following:

Your CSR (Reference ID #####) has been successfully generated and is ready to download.  
A private key has also been created and is being stored in the system.  
You can now track your record on the page.

- e. Select [Download CSR](#), which generates and downloads the CSR file to your device's default download location.

You see a new row on the page for the record you created, with the [Status](#) field indicating the generated CSR.

### 2. Go to your certificate authority to request your new SSL certificate.

When you get the new SSL certificate, verify that the compressed file consists of the SSL certificate and the intermediate certificate.

#### Note

Career Site Builder created and saved a private key for your record when you generated the CSR.

### 3. Go back to Career Site Builder to upload and install your new certificate.

- a. Go to **Tools** > **SSL Certificates**.
- b. Choose **Submit SSL** from the **Actions** column in the row that lists the Common Name for your certificate.

The Submit SSL Certificate dialog appears.

- c. Select for upload the primary SSL and intermediate certificate files, then choose **Submit**.

#### Note

If you have multiple intermediate certificates, you need to merge them into a single file before you can upload it. Refer to *SAP Note 3111993 - How to Upload Two Intermediate Certificates in CSB - Recruiting Marketing* for instructions.

If the files are in a single compressed file, uncompress it into individual **.pem**, **.cer**, or **.crt** format files to upload them individually.

The Submit SSL Certificate dialog closes and the files upload.

The **Status** changes to **Ready to Install**, and the **Actions** column shows **Install**.

- d. Select **Install**.

Your request is submitted and the status changes to **Installation Requested**. After about 5 minutes, the process completes, and the status changes to **Installed**, and you also see the **In use** label.

The older certificate for the same hostname now displays the label **Not in Use**. This label differentiates the newer and older certificates for the same hostname.

Your new SSL certificate is now installed for your public career site.

### 4. Verify that the new SSL certificate is associated with your public career site.

Refer to *Reviewing the New SSL Certificate for the Public Career Site*.

## Results

Your site has a new SSL certificate.

## Next Steps

The following are additional tasks you can perform:

- Viewing certificate details – To view the details of the SSL certificate, select its reference ID to view the Certificate Information dialog, which shows you both the CSR fields, as well as an audit history for the certificate.

- Uninstalling the expiring certificate – After you verify that the new certificate is associated with the public career site, you can choose to uninstall the older certificate that's nearing its expiration date.
- Removing a record – To remove a record from the [SSL Certificates](#) page altogether, choose the  *delete* icon.

[SAP Note 3111993](#) 

### 19.6.7.1.3 Uploading an SSL Certificate and Creating a New Record

Use the [SSL Certificates](#) page in Career Site Builder if you've already obtained an SSL certificate that you want to upload for a career site in a production environment.

## Prerequisites

- You have the appropriate Career Site Builder role-based permission to access the [SSL Certificates](#) page.
- You've already obtained a new SSL certificate from a certificate authority using your own certificate signing request (CSR). If you don't have an SSL certificate yet, refer to *Creating a Certificate Signing Request and Adding a New SSL Certificate*.  
If the files are in a single compressed file, you've uncompressed them and saved them as into individual `.pem`, `.cer`, or `.crt` format files to upload them individually.

## Context

The [SSL Certificates](#) page in Career Site Builder is a self-service tool that lets you obtain and install a new SSL certificate for your career site domains. The steps here describe how to upload and install a new SSL certificate with the following conditions:

- You got your SSL certificate from a certificate authority without using [SSL Certificates](#) to generate a certificate signing request.
- The SSL certificate has no association with an existing record in the system.

### Note

You can't upload a new SSL certificate for an existing record.

## Procedure

1. In Career Site Builder, go to ► [Tools](#) ► [SSL Certificates](#) ►.
2. In the [Option 2](#) section, select [Upload SSL Certificate](#).

The Upload SSL Certificate dialog appears.

3. In the Upload SSL Certificate dialog, choose *I want to upload an SSL certificate that I obtained using my own CSR*, then select [Next](#) to proceed to the upload form.
4. Select for upload the primary SSL certificate and the private key.

### Note

- The private key must be unencrypted. Private keys are typically exported as an encrypted file with passphrase. You need to convert it to an unencrypted file.
- RSA private keys are supported.

After you upload a valid SSL certificate, we try to retrieve the intermediate certificate automatically.

5. Upload the intermediate certificate only if required.

If the [Intermediate Certificate](#) field is marked with an asterisk (\*), then it's required. That means we were unable to retrieve the intermediate certificate for your SSL automatically, so you need to upload it manually

### Note

If you have multiple intermediate certificates, you need to merge them into a single file before you can upload it. Refer to [SAP Note 3111993 - How to Upload Two Intermediate Certificates in CSB - Recruiting Marketing](#) for instructions.

6. Choose [Submit](#).

The Upload SSL Certificate dialog closes, you see a success message that the files were uploaded, and a new row appears on the page for your record.

7. Choose [Install](#) from the [Actions](#) column.

Your request is submitted and the status changes to [Installation Requested](#). After about 5 minutes, the process completes, and the status changes to [Installed](#), and you also see the [In use](#) label.

The older certificate for the same hostname now displays the label [Not in Use](#). This label differentiates the newer and older certificates for the same hostname.

Your new SSL certificate is now installed for your public career site.

8. Verify that the new SSL certificate is associated with your public career site.

Refer to [Reviewing the New SSL Certificate for the Public Career Site](#).

## Results

Your site has a new SSL certificate.

## Next Steps

The following are additional tasks you can perform:

- Viewing certificate details – To view the details of the SSL certificate, select its reference ID to view the Certificate Information dialog, which shows you both the CSR fields, as well as an audit history for the certificate.
- Uninstalling the expiring certificate – After you verify that the new certificate is associated with the public career site, you can choose to uninstall the older certificate that's nearing its expiration date.
- Removing a record – To remove a record from the [SSL Certificates](#) page altogether, choose the  [delete](#) icon.

## Related Information

[SAP Note 3111993](#) 

### 19.6.7.1.4 Reviewing the New SSL Certificate for the Public Career Site

Verify that the new SSL certificate is correctly associated with your public career site.

## Procedure

1. Open a browser and go to your public career site.
2. Select the  [padlock \(View site information\)](#) icon that appears to the left of the URL.

The site information dialog appears.

3. Select [Certificate](#) in the site information dialog.

The Certificate dialog appears.

4. Look for an end date in a "valid from" date range to verify that the certificate has a new expiration date.

## 19.6.7.2 Using the Functions Viewer

Use the Functions Viewer to see what implementation partners identified as misconfigurations that needed to be modified in job posting data.

### Context

The original purpose of functions was to optimize job posting content for publication. The current recommended practice is to refine your posting content in the system of record (SAP SuccessFactors Recruiting). In this way, consistent job posting content is available for all downstream publication processes, Career Site Builder, and Recruiting Posting.

If you have existing functions, they're available to view for reference purposes, and to delete, as you transition to refining the job posting data upstream in SAP SuccessFactors Recruiting. Examples of functions can be things like an original string of "California" that's replaced by "CA" or "DESCRIPTION" that's replaced by "Description".

#### Note

The creation of new functions is no longer supported.

When the page is blank, a Career Site Builder admin can disable this page so it doesn't appear anymore.

### Procedure

1. Go to **Tools > Functions Viewer** in Career Site Builder.

The Functions Viewer page appears.

If you don't see anything listed in the Functions Viewer, your implementation partner didn't identify any misconfigurations, and you can ignore this page. You can also disable permissions so the page doesn't appear for users anymore.

If you see any functions listed on the page, they appear in a table with the following fields:

- **Function Name** – The name of the function.
  - **Status** – The status of function: Active or inactive.
  - **Original String** – The text or code string identified as needing to be replaced.
  - **Replacement String** – The text or code string that replaces the original string.
  - **Date Created** – The date when a function was created.
  - **Affected Fields** – The list of fields in job postings that the original strings can appear in.
  - **Delete** – The  (**Delete**) icon permanently deletes the function from the list.
2. Choose **View Fields** in the **Affected Fields** column to see which fields can contain the original string in your job postings, and replace them with the replacement string.

3. After you finish replacing the strings in your job postings, select the  (*Delete*) icon to remove the function from the page.

#### Caution

Deleting a function not only removes it from the list, but also stops it from working. Any misconfigurations you miss in the clean-up process are no longer transformed before they appear on the career site.

## 19.6.7.3 Brands

### 19.6.7.3.1 Creating a Brand in Career Site Builder

You can create multiple brands for your career site and then configure a different career site experience for each your brands.

#### Prerequisites

You have already set up a recruiting site in SAP SuccessFactors Recruiting, and optionally, a microsite ID.

The microsite identifier is generated in SAP SuccessFactors Recruiting during microsite creation. If a brand has an associated microsite, a candidate applying for a job using Candidate Account Simplification has the microsite ID added to the Apply URL. For existing brands, the microsite ID affected some font settings for the candidate profile area, the login page, and other SAP SuccessFactors Recruiting Mobile Apply pages. This field is optional, but omitting it shows the default black and blue theme for the candidate profile area, the login page, and other SAP SuccessFactors Recruiting Mobile Apply pages.

#### Context

When you create brands in Career Site Builder, they're available for various uses, such as landing pages and email layouts.

#### → Recommendation

Although there's no limit to the number of brands you can have for your career site, try to limit the configuration for each to no more than 20 MB for optimal performance.

#### Procedure

1. Go to  **Tools**  **Brand Management**  in Career Site Builder.

2. **Required:** Choose [Save](#) the first time you use [Brand Management](#).

This step saves all existing brands to the MDF object.

3. Create a brand by choosing [+](#) [Add](#).
4. Enter a name for the brand in the [Name](#) field.

Use a standard naming format, and don't include a space or line-break, as these can cause problems with your career site. In addition, avoid the following words, which are reserved keywords in Career Site Builder: content, default, email, errorpage, feed, go, job, lp, map, s, search, services, talentcommunity, topjobs, viewalljobs, unsubscribe.

5. Add text to the [URL Brand Identifier](#) field.

#### → Remember

As you add text to this field, the dialog displays the whole URL that Career Site Builder creates, under the heading [URL Brand Identifier Preview](#).

6. **Optional:** For a more consistent candidate experience, select a theme in the [Theme Name](#) menu.  
The menu lists themes that are defined in [Admin Center](#) > [Theme Manager](#) for the rest of the HCM suite. You can use the [Theme Name](#) setting to map a "brand" in Career Site Builder with a "theme" in Theme Manager, so that consistent branding is applied throughout the candidate experience.
7. **Optional:** To associate a Recruiting site (also known as a microsite) to your brand, enter the microsite ID in the [Microsite Id](#) field.

Associating a microsite ID To find the microsite ID, select [Admin Center](#) > [Recruiting](#) > [Manage Recruiting Sites](#) and choose your desired Recruiting Management site. The characters in its URL that follow `site=` is the microsite ID.

8. Select [Create](#).
9. Choose [Save](#) to save any changes you made to the table of brands.

To cancel this process, select [Cancel](#). Choosing [Yes](#) in the confirmation dialog reloads the page without saving any of the changes you made before the last time you saved the settings.

## Results

The new brand is added to the table of brands.

## Next Steps

You can now configure many different career site settings specifically for each brand in the [Brand Settings](#) section. You can also configure a different look and feel for each brand in the [Appearance](#) section.

## Related Information

[Brand Management in Career Site Builder Tools \[page 620\]](#)

### 19.6.7.3.2 Enabling the Apply with LinkedIn Feature on a Brand-Specific Career Site

If you use the Apply with LinkedIn feature and you've configured a brand-specific site URL in [Brand Settings](#), you need to add the brand-specific site URL to the Apply with LinkedIn configuration.

#### Prerequisites

- You've configured the Apply with LinkedIn feature.
- You've configured at least 1 brand-specific site URL in Career Site Builder.
- You have view and edit permission for the following object: ► [User Permissions](#) ► [MDF Recruiting Permissions](#) ► [LinkedInDeveloperApplication](#) ►.

#### Context

The MDF object `LinkedInDeveloperApplication` stores information about the valid domains that can access the Apply with LinkedIn feature. The site URL for your default brand is recorded in this object when you enabled the Apply with LinkedIn feature for the first time.

However, the site URL for each of additional brand, configured in [Brand Settings](#), isn't recorded automatically and has to be added manually.

If you configure a brand-specific site URL, you need to add it to the `LinkedInDeveloperApplication` object so that visitors to the branded site can use the Apply with LinkedIn feature.

#### Procedure

1. In Career Site Builder, go to ► [Brand Settings](#) ► [<Brand>](#) ► [Site URL](#) ► and copy the full primary URL of the brand site you want to add.
  - a. Find the URL with the [Primary](#) setting set to [Yes](#).
  - b. Choose [Visit Site](#) to open the site in a new browser tab.
  - c. Copy the full site URL, including `https://`.
2. In SuccessFactors HCM, go to ► [Admin Center](#) ► [Manage Data](#) ►.

3. Use search to find the object `LinkedInDeveloperApplication`.
4. Choose  [Take Action](#)  to edit the object.
5. Add the brand-specific site URL to the list of URLs already configured in the [validJsSdkDomains](#) field.
  - Only **add** new URLs to the list. **Don't delete** any of the existing URLs.
  - Include the protocol, like `https://`, in the URL.
  - Each URL in the list is contained within quotation marks and separated by commas. For example:  
`["https://jobs.example", "https://brand.jobs.example"]`
6. Save .
7. Repeat these steps for each brand-specific site URL configured in [Brand Settings](#).

## Results

Visitors to the brand-specific career sites can now see and use the Apply with LinkedIn feature.

### 19.6.7.4 Using Import and Export in Career Site Builder

The [Import & Export](#) page in Career Site Builder enables you to export and import site settings, Career Site Builder contents, as well as category pages.

## Context

The Import & Export feature allows you to export setting information in an XML file. You can store this XML file locally and then import it into a new site, which can exist in the same or in a different environment.

### Note

In order to maintain site integrity, Career Site Builder excludes site integration information (including Company ID and Single Sign-On Security Key fields) and API credentials when you perform an import from its Import & Export page.

Using this method means that you don't have to create Career Site Builder settings from scratch each time a new site is built. This feature is helpful if one or more sites are being constructed by a single user with a specific set of core settings that can be used as-is, or as a base for further settings enhancements.

### Recommendation

To maintain site integrity, import and export Site Settings and Career Site Builder Settings together.

## Procedure

- Export XML files in Career Site Builder

### Note

You can't import site settings from a stage environment to a production environment if the stage environment is using a version with new features that aren't yet available in production. This ensures that any new functionality that you configure in stage won't break your production environment. Career Site Builder prevents you from doing this, and displays a message telling you this.

To perform an export, go to the [Export](#) tab in **Tools > Import & Export** and choose from the following options:

| Option                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Site Settings</a>                | This option exports settings that configure your site, including settings that implement and integrate the career site with SAP SuccessFactors Recruiting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <a href="#">Category Pages</a>               | This option exports a single XML file that includes the information for all active category pages. When you import this XML file back in through Career Site Builder, it either adds new categories or overwrites the existing category pages with the same name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

If you choose [Career Site Builder Settings, Export](#) doesn't become active until you choose your selections from both the [Source](#) and [Contents](#) columns.

Choosing [Export](#) saves XML files to your system.

### Caution

Avoid manually editing the exported XML file to avoid unintentionally introducing code that can cause the career site to break.

- Import XML files in Career Site Builder

### Note

You can't import site settings from a stage environment to a production environment if the stage environment is using a version with new features that aren't yet available in production. This ensures that any new functionality that you configure in stage won't break your production environment. Career Site Builder prevents you from doing this, and displays a message telling you this.

To import XML files, go to the [Import](#) tab in **Tools > Import & Export** and choose from the following options:

| Option                                       | Description                                                                                                                                                                                                                                                               |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Site Settings</a>                | This option imports the Site Settings XML file that you exported. The file consists of settings that implement and integrate the career site with SAP SuccessFactors Recruiting.                                                                                          |
| <a href="#">Career Site Builder Settings</a> | This option imports the Career Site Builder Settings XML file, which consists of settings that configure the look and feel of the career site.                                                                                                                            |
| <a href="#">Category Pages</a>               | This option imports the category pages XML file that includes all active category page information. When you import this XML export file back in through Career Site Builder, it either adds new categories or overwrites the existing category pages with the same name. |

- a. Select [Import](#).

An Open dialog appears.

- b. Select a previously exported XML file, then choose [Open](#).

Choosing [Import](#) allows you to select a previously exported XML file.

When you select an XML file, [Upload Import File](#) appears, and allows you to upload the file.

You see the information about the import in the [Import Details](#) section of the page.

## 19.6.7.5 Using the Locations Editor to Improve the Location of a Job or Company

Use the Locations Editor in Career Site Builder to override the latitude and longitude in Google Maps searches for specific locations.

## Prerequisites

You have active jobs in the career site with recognizable geolocations that can appear in the location or country/region fields in the Locations Editor, or else the Locations Editor appears blank.

## Context

Adding locations in the Locations Editor can improve the radius search and Google Maps search in Career Site Builder, so that candidates can identify exactly where on the map a job is located, rather than what appears in Google Maps. For example, you have a job located on a large campus, and you want to specify the exact location of the office the job is at.

### → Tip

Open Google Maps on a separate screen so you can easily copy and paste the coordinates into the Locations Editor.

## Procedure

1. Go to ► [Tools](#) ► [Locations](#) ► in Career Site Builder.

When opened, the Locations editor shows a list of the locations configured for the site. The default sort order is by ascending location. You can sort and filter the listing by location or country/region by selecting the column headers.

To apply filter text, enter the text and select [Enter](#). To remove filter text, clear the field and select [Enter](#). You can filter on both location and country/region simultaneously.

2. Select the  (edit) icon on the right side of the location you want to edit.

Each location has both the Google Location and Override Location coordinates. The coordinates of the location are shown as a link to that location in Google Maps in a new window. If they're the same, then the Override Location is grayed out and unlinked to show that it hasn't been modified. The coordinates are shown rounded on this screen (the actual value saved for this location is unaffected), but each set of coordinates shows a tooltip containing the unrounded coordinate values if you hover over the coordinate pair. Negative values aren't shown on this page; the cardinal direction shown conveys that information.

3. Go to Google Maps and find the latitude and longitude numbers by placing a pin in the location, which makes the URL contain the exact coordinates of the pin.
4. Copy the coordinate numbers from the URL in Google Maps into the [Latitude](#) and [Longitude](#) fields in the Locations Editor.

Latitude values range from -90 to 90. Negative values indicate south, while positive values indicate north. Longitude values range from -180 to 180. Negative values indicate west, while positive values indicate east.

Two decimal places plot to a town or village, three decimal places plot to a neighborhood, and four decimal places plot to an individual street or land parcel. Customers can't zoom in closer than a neighborhood on the Google Job Map in Recruiting Marketing, so the location doesn't need to be exact.

5. **Optional:** Revert any override location you've customized by choosing  [Revert Override Location](#) in the Locations list page. This setting is disabled if you haven't customized the override location.

When you confirm the revert action, the Override Location value is replaced with the Google Location value.

6. Select [Save](#).

To return to the original coordinates, select the arrows in the center of the screen: [Copy Google Location Latitude to Override Location Latitude](#) or [Copy Google Location Longitude to Override Location Longitude](#).

When location information changes, the system adds the location to a maintenance queue to update the job index before changes are visible on the job map. This process can take a few minutes.

### 19.6.7.6 Activating Site Sources for the Source Tracker

Use the Site Source Editor in Career Site Builder to specify which sources are available to the Recruiting Campaign URL Builder.

## Context

The [Referrer Types](#) list in the left panel displays site source types, and include such categories as [Search Engine](#) and [Social Network](#).

The [Source Engines](#) list on the right displays all the specific sources when you select a referrer type from the left.

## Procedure

1. In Career Site Builder, go to **Tools** > [Site Source Editor](#).

The [Site Source Editor](#) page appears.

2. Choose either method to select a referrer type from the [Referrer Types](#) list on the left:
  - Choose a type from the list
  - Enter a term in the [Search Types](#) field.

Selecting the referrer type displays all of its available options in the [Source Engines](#) section on the right.

3. Enable all the referrer types you want to activate by setting their sliders to [YES](#).
4. Select a referrer type to see its source engines, then enable each source engine that you want to activate.
5. **Optional:** Select [All](#) or [None](#) in the [Activated: All / None](#) setting to enable or disable all entries:

The behavior of [Activated: All / None](#) is as follows:

| Option                | Description                                                                                                                                                                                                                                                                          |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Referrer Types</b> | When you select: <ul style="list-style-type: none"><li>• <a href="#">All</a> – activates all referrer type categories on the list, as well as the individual source engines within each referrer type. This setting activates everything in the entire site source editor.</li></ul> |

| Option         | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | <ul style="list-style-type: none"> <li>• <a href="#">None</a> – disables all referrer type categories on the list, as well as the individual source engines within each referrer type. This setting disables everything in the entire site source editor.</li> </ul>                                                                                                                                                                     |
| Source Engines | <p>When you select:</p> <ul style="list-style-type: none"> <li>• <a href="#">All</a> – activates all individual source engines within the referrer type you're in, as well as activate the referrer type itself if it wasn't activated already.</li> <li>• <a href="#">None</a> – disables all individual source engines within the referrer type you're in, as well as disable the referrer type itself if it was activated.</li> </ul> |

6. Select [Save](#) to save your settings, or [Cancel](#) to revert any changes made to the referrer type and source engine settings.

## Results

You've now configured the settings to enable and disable the referrer types and source engines in the Site Source Editor. The dropdown lists for types and sources in the Source Tracker now reflect these settings.

## 19.6.7.7 Changing the Default Text Using the Translation Editor

The translation editor allows you to override default translations for site elements for any configured locale, including English.

## Context

Only locales configured in Command Center appear in the translation editor. You can import and export your custom translations from this page. These are performed separately from the site import and export.

## Procedure

1. In Career Site Builder, go to  [Tools](#)  [Translations](#) .

The Translations page appears, which shows the locale filter, as well as a table that lists all the site elements that are available for you to edit.

2. Enter the site element in the [Group](#) column or resource key in the [Resource Key](#) column, or scroll down to find the exact site element you want to edit.

#### Note

You can hover over the resource key names to view the text that appears for the key. This text is identical to the ghost text that appears in *Italics* in the Override Text field, until you enter your own text.

3. Select the Override Text field for your site element.

The Override Resource Key dialog appears.

4. Enter your new text in the Override Text box, then choose [Confirm](#).

The Italicized ghost text in the Override Text field is now replaced with your new text in the translation grid, in regular text.

5. Select [Save](#) to save any the changes you make in the translation editor.
6. Revert your changes to the system default by selecting the text, then select [Clear](#).

You've now replaced system default text with your own text.

To revert your changes to the system default, select your override text to go to the Override Resource Key dialog, and select [Clear](#). Don't forget to select [Save](#) when you're done.

## 19.6.8 Layouts

### 19.6.8.1 Creating a Custom Job Layout for the Unified Data Model

You can use Career Site Builder to create custom layouts of the job details page on your career site.

#### Prerequisites

- The Unified Data Model is enabled.

#### Context

You don't need to map fields when you create a custom job layout using the Unified Data Model. Instead, you define your selection criteria by choosing fields and values from your job requisition template.

#### Caution

Existing job layouts aren't ported over when you enable the Unified Data Model.

When you enable the Unified Data Model, a simple default layout is applied to all jobs until you create custom layouts that can then be applied to the jobs based on configured rules.

You can choose to update this simple default layout if all you need is one layout, or create additional custom layouts based on your requirements.

#### → Tip

The flexibility of the Unified Data Model enables you to add many fields as job tokens, but also as filters in your layout rules. The job requisition template fields are directly available for both locales and brands, which means you need far fewer layouts than before.

## Procedure

1. In Career Site Builder, go to **Layouts > Job**.

2. Select **+ Add** at the top of the page.

The *Create Custom Layout* dialog appears.

3. Enter a unique name for your layout in the *Layout Name* field, then save it.

You see the *Details* tab of the *Custom Layouts Editor* for your layout.

4. In the *Details* tab, change the *Two columns* default setting from *No* to *Yes* if you want to have a second column on the job layout.

#### → Tip

When using the Unified Data Model, you don't have to specify site field or job field mappings for your job layout here. Choose what information displays in your job layout by setting the filters in the next step, based on your job requisition template.

The *Active* setting isn't active until you create a rule in the *Layout Rules* tab so that the job layout knows what to display.

5. In the *Layout Rules* tab, select *Add Filter*.

The *Add Filter* dialog appears.

6. In the *Add Filter* dialog, use the dropdown lists for the following:

| Option            | Description                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Field Name</b> | Choose a field from the list. The list shows all the fields that you have in your job requisition template.                                  |
| <b>Values</b>     | The options that appear in this field change dynamically based on which field you choose. You can choose multiple values for the same field. |

The dialog closes, and you see your new filter in the *Define Job Layout Selection Criteria* list.

You can choose to add more fields on this page.

#### ⓘ Note

After you create a filter, The *Active* field becomes available in the *Details* tab.

7. **Optional:** Select the [Job Header](#) tab to any additional components in addition to the search bar that's automatically added here.

To change the visual look of the search bar, go to **Appearance > Styles > Global Styles > Search Form**.

8. Select the [Column 1](#) tab to select [Add Component](#) to add components to the column:

| Option                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Apply Now</b>       | <p>The <a href="#">Apply Now</a> button allows candidates to apply for the job. This component is automatically added to your layout. The settings are:</p> <ul style="list-style-type: none"> <li>• <a href="#">Text Alignment</a>: Specify left, right, or center alignment.</li> <li>• <a href="#">Button Position</a>: Specify whether to position the button on the left, center, or right of the page.</li> <li>• <a href="#">Caret Direction</a>: Specify the direction to which the text appears when selecting the <a href="#">Apply Now</a> button.</li> <li>• <a href="#">Button Width</a>: Use the pulldown menu to specify the size of the button. Options are small, medium, large as well as a full column span.</li> <li>• <a href="#">Override Global Brand Style</a>: When enabled, overrides the settings for the career site's global brand style. You see the following settings to customize the normal and mouseover (hover) colors of the button: <ul style="list-style-type: none"> <li>• Background color</li> <li>• Font color</li> </ul> </li> <li>• <a href="#">Enable Spacing</a>: When enabled, allows you to customize the spacing around the top, bottom, right, and left of the <a href="#">Apply Now</a> button.</li> </ul> |
| <b>Custom Plugin</b>   | The <a href="#">Custom Plugin</a> component inserts custom code for a new component, such as JavaScript and third-party widgets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Featured Jobs</b>   | The <a href="#">Featured Jobs</a> component displays links to featured jobs. You can configure the style and destination of links.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Google Job Map</b>  | The <a href="#">Google Job Map</a> component displays jobs on a map. You can control some aspects of the map's appearance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Job Alerts Link</b> | The <a href="#">Job Alerts Link</a> component displays a link on the job details page that enables candidates to sign up for a job alert. You can choose the horizontal position of the link (left, center, right).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Job Token</b>       | <p>Allows you to add fields from your job requisition template. By default, the <a href="#">Job Title</a> token component is added to your custom layout. Selecting the gray box opens the Job Token details page, where you can choose a specific job token. These job tokens represent the objects in your job requisition template.</p> <p>You can also choose to show the name of the token, as well as whether to add margin spacing around the token using the <a href="#">Enable Spacing</a> field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Large Image</b>     | The <a href="#">Large Image</a> component displays a "hero" image that spans the width of the page. The component includes a large image with a customized dropdown navigation (height 250 px for mobile; 390 px for tablet; 590 px for desktop) (absolute minimum 200 px; maximum 9999 px; default 590 px).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Similar Jobs</b>    | <p>The <a href="#">Similar Jobs</a> component displays other jobs that we've identified as similar to the one that the candidate is viewing, based on criteria such as skills and location. Jobs are displayed as "results card", with the same information and appearance as on the search results page.</p> <p>You can choose to restrict the list to jobs that are within 30 miles of the job being viewed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### ⚠ Caution

Before you enable this feature, you first have to enable [Assisted Job Skills for Career Site Builder](#) and then run a scheduled job to extract skills from existing job requisitions. [Extracting Skills from Job Descriptions with AI](#) [page 281]

| Option              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

The new component displays. By default, Desktop, Tablet, and Mobile views are all enabled for the component.

9. To modify a component, double-click its gray box.
10. **Optional:** Change the order of a component on the job layout by selecting the [△ up arrow](#) or [▽ down arrow](#) for the gray box that represents the component.
11. **Optional:** You can add a new component below a specific component by selecting the [+ plus icon](#) to the right of the component name to view the [Add Component Below](#) dropdown.
12. **Optional:** If you selected *Two columns*, you also see the *Column 2* tab. You can configure it as you did for *Column 1*.
13. You can choose to add a footer component in the *Job Footer* tab. By default, there are no components added here.
14. Select [Publish](#) to save and publish the layouts.

## 19.6.8.2 Configuring Layout of Search Results for the Unified Data Model

Configure the layout of the search results page on your career site. You can add features like AI-assisted skills matching, a job map, job card fields, and search filters.

### Prerequisites

These settings are only available if the Unified Data Model is enabled.

### Context

These steps describe search settings when the Unified Data Model is enabled.

If the Unified Data Model is **not** enabled: [Search-Related Settings in Career Site Builder Without the Unified Data Model \[page 435\]](#)

### Procedure

1. Go to  [Layouts](#)  [Search Results](#)  to specify what to show in your search results.
2. On the [Settings](#) tab, in the [General](#) section, choose whether you want to limit your search by brand, and whether you want to allow location-based searches.

| Option                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enable Google Job Map</b>      | <p>Move the slider to <a href="#">YES</a> to give candidates the option to view search results in a map view.</p> <div> <b>Note</b><ul style="list-style-type: none"><li>• When the Unified Data Model is enabled, you first need to configure the Job Location generic object, before you can use the Google Job Map component.</li><li>• The map view is only available on the site's main search results page (<code>jobs.example.com/search</code>). It isn't available on category pages.</li></ul></div> |
| <b>Enable Branded Search Form</b> | <p>Move the slider to <a href="#">YES</a> to give the search form the visual appearance of the branded career site. The default setting is <a href="#">NO</a>.</p> <p>This switch controls the behavior of the search form placed on a branded (non-default brand) page:</p> <ul style="list-style-type: none"><li>• When the switch is on, the search form on the branded page submits to the branded search results page.</li><li>• When the switch is off, the search form on the branded page submits to the default, main search results page.</li></ul>                                     |

| Option                               | Description                                                                                                                                                                                             |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enable Branded Search Results</b> | Move the slider to <b>YES</b> to limit search results to just the jobs for the branded career site. The default setting of <b>NO</b> displays a result that meets the search query regardless of brand. |
| <b>Enable Location Search</b>        | Move the slider to <b>YES</b> to enable location-based searches. The default setting is <b>NO</b> .                                                                                                     |

- On the **Settings** tab, in the **AI-Assisted Skills** section, enable AI features for your career site.

#### ⚠ Caution

Enabling AI-assisted skills matching on your career site involves multiple steps. Before you enable these settings, review all of the required steps here: [Enabling AI-Assisted Features on Career Sites \[page 126\]](#).

| Option                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Enable AI-Assisted Skills Matching for Resumes</b> | <p>Move the slider to <b>YES</b> to display the Skills Matching feature on the search results page, giving candidates the option to upload a resume and find jobs that match their skills.</p> <div> <p><b>Note</b></p> <ul style="list-style-type: none"> <li>We only use the resume temporarily to identify the candidate's skills and recommend jobs. The resume and identified skills are only stored for 30 minutes and they aren't connected to a job application in any way. When a candidate decides to apply, they need to upload their resume again.</li> <li>Resume analysis isn't available in all languages. If your career site is in an unsupported language, the Skills Matching panel is hidden.</li> <li>The Skills Matching feature is only available on the site's main search results page (<code>jobs.example.com/search</code>) and on the job details page. It isn't available on category pages.</li> </ul> </div> |
| <b>Enable Data Privacy Consent Statement (DPCS)</b>   | Move the slider to <b>YES</b> to display a consent agreement on the career site that candidates must accept before they can use the Skills Matching feature to upload a resume and see recommended jobs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

- In the **Results Cards** tab, choose **+ Add Field** to select fields from the dropdown list if you want to more information in each job result card.

By default, each card displays the job title and location. You can add up to 10 additional fields from the job requisition template.

#### ⓘ Note

Where space is limited, only the first 3 additional fields are shown. For example, only 3 fields are shown when you view search results on a mobile device or when you view information about the job on a job map.

- Optional:** Use the **▼ Down** and **▲ Up** arrows to change the order in which the fields appear.
  - Optional:** Select the checkbox in the **Show Label** column to display the name of the field.
  - Optional:** Choose **✕ Delete** to remove the field.
- In the **Search Filters** tab, add up to 10 fields that you want to display on the left column of your search page.

The fields, which can be picklist, generic object, or enum type, come from the job requisition template, and allow candidates to refine their search.

6. Save your settings.

### 19.6.8.3 Creating a Custom Job Layout in Career Site Builder Without the Unified Data Model

You can use Career Site Builder to create custom layouts of the job details page on your career site.

## Prerequisites

- You've configured the locales and brands you want to use for the career site.
- You've created test requisitions for each layout you configure. For example, if you plan to create layouts by country/region, you want to have a test requisition for each country/region.

## Context

### Note

This information only applies if the Unified Data Model is **not** enabled. When it's enabled, you can't configure the settings described here.

For information about creating a job layout after the Unified Data Model is enabled, refer to [Creating a Custom Job Layout for the Unified Data Model \[page 510\]](#).

## Procedure

1. In Career Site Builder, go to **Layouts > Job > <Locale> > <Brand> > Job Layout > Custom Layouts List**.
2. Select **+ Add** in the top right corner of the page.

The *Create Custom Layout* dialog appears.

3. Complete the fields in the [Create Custom Layout](#) dialog, then choose [Save](#):

| Option                            | Description                                                       |
|-----------------------------------|-------------------------------------------------------------------|
| <a href="#">Name</a>              | Enter the name for the layout.                                    |
| <a href="#">Locale</a>            | Select a preconfigured locale for the layout from the dropdown.   |
| <a href="#">Brand</a>             | Select a preconfigured brand for the layout from the dropdown.    |
| <a href="#">Job Field Mapping</a> | Select the desired value for the layout filter from the dropdown. |

#### Note

You can only use the value you choose for one active job layout for this particular brand and locale.

The layout is created and opens in [Details](#) tab of the Custom Layouts Editor, and the layout appears under [\(Locale\) > \(Brand\) > Job Layout](#) on the Layouts column on the left.

4. In the [Details](#) tab, configure the following fields:

| Option                             | Description                                                                                                                                                                                                                                   |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Site Field Mapping</a> | This read-only field is the site type on which this career site page is categorized. The value is set in the <a href="#">Job Layouts Site Field Mapping</a> field in <a href="#">Settings &gt; Site Configuration &gt; Site Information</a> . |
| <a href="#">Job Field Mapping</a>  | This field shows the value you specified from your job field mapping. You can change the value in this field at any time by selecting its dropdown list.                                                                                      |
| <a href="#">Active</a>             | To activate this job layout, move the slider to <a href="#">YES</a> . Once this layout is activated, it controls the appearance of the career site job page for all active jobs with the locale, brand, and field mapping you chose.          |
| <a href="#">Layout Name</a>        | The name of your job layout.                                                                                                                                                                                                                  |
| <a href="#">Two columns</a>        | To create a layout with two columns, move the slider to <a href="#">YES</a> .                                                                                                                                                                 |
| <a href="#">Column width</a>       | This field appears only when you enable <a href="#">Two columns</a> . Use this slider to adjust the width of the columns.                                                                                                                     |

5. In the [Column 1](#) tab, configure the settings for the default [Token Component: Description](#) component that's automatically added to your new layout.
6. Select the [Column 1](#) tab to select [Add Component](#) to add components to the column:

| Option                         | Description                                                                                                                                                                    |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Custom Plugin</a>  | Allows you to insert custom code for a new component on any career site page created in Career Site Builder, allowing you to differentiate your career site from other sites.  |
| <a href="#">Featured Jobs</a>  | Allows you to display high-profile or high-importance jobs on your career site.                                                                                                |
| <a href="#">Google Job Map</a> | Maps jobs in a map UI.                                                                                                                                                         |
| <a href="#">Job Token</a>      | Allows you to add a Recruiting job field such as Job Title and Description.                                                                                                    |
| <a href="#">Large Image</a>    | Allows you to add a large image. This component also allows you to use what's sometimes called a "hero" image to career site pages, with one image displaying across the page. |
| <a href="#">Text</a>           | The Text component is a single column of text. You can't change the size or orientation of the component.                                                                      |
| <a href="#">Video</a>          | Allows you to add videos to career site pages.                                                                                                                                 |

Unless otherwise noted, these components are the same as what's available when you create a career site page.

## Note

If the element or component uses cookies, make sure to include its related cookie provider in the cookie consent manager at ► [Appearance](#) ► [Global](#) ► [Cookie Manager](#) . If the cookie banner is enabled without including the corresponding cookie provider in the cookie consent manager, this element or component is removed and unavailable to your site's visitors completely.

The new component displays. By default, Desktop, Tablet, and Mobile views are all enabled for the component.

7. Modify a component by double-clicking its gray box as well as component title.
8. **Optional:** Change the order of a component on the job layout by selecting the  (up-arrow) icon or  (down-arrow) icon for the gray box that represents the component.
9. **Optional:** You can add a new component between two components by selecting the  (plus) icon to the right of the component name to view the [Add Component Below](#) dropdown.
10. **Optional:** You can duplicate a component by selecting the  ([Duplicate Component Below](#)) icon to the right of the component name to create an exact duplicate of an existing component, and have it appear directly below the original component.
11. **Optional:** You can look at a preview of the layout by selecting the [Preview](#) icon in the upper right of the Custom Layouts Editor page.
12. **Optional:** You can delete a component by selecting the  ([Delete Component](#)) icon to the right of the component name.

You can't delete [Token Component: Description](#) because it's a required component.

13. **Optional:** If you selected [Show two columns](#), the [Column 2](#) tab is also visible. You can configure this as you did for [Column 1](#).
14. **Optional:** You can view published revisions of a custom layout by selecting [View Published Revisions](#) from the blue  (gear) icon to the left of the layout's status indicator..
15. **Optional:** You can edit a draft of a custom layout by selecting [Edit Draft](#) from the blue  (gear) icon to the left of the layout's status indicator..
16. Select [Publish](#) to save and publish the layouts.

## 19.6.8.3.1 Site Field Mapping and Job Field Mapping in Job Layouts Without the Unified Data Model

Understand how site field mapping and job field mapping work so that you can configure custom job layouts.

### Note

This information only applies if the Unified Data Model is **not** enabled. When it's enabled, you can't configure the settings described here.

Creating a custom job layout in Career Site Builder allows you to have a job page that has attributes beyond just your brands and locales.

Each custom job page layout requires that you specify two fields:

- [Site Field Mapping](#) – is the field type on which you plan to categorize all your custom job page layouts by. For example, choosing Department lets you create different layout pages for your company's departments (such as engineering or administration). Choosing Country/Region lets you create layout pages for the different countries/regions your jobs are in, such as U.S. or Canada.
- [Job Field Mapping](#) – lets you specify a value for all active jobs available in the field that you specified in your site field mapping. For example, if you selected the [Country/Region](#) field, all configured countries/regions for active jobs display in this dropdown. If you select **Canada**, for example, this layout displays for all jobs with a country of Canada (or CA).

The **site field mapping** for your site, on which to base all of your job pages, is controlled in the Career Site Builder [Job Layouts Site Field Mapping](#) field, located in ► [Settings](#) ► [Site Configuration](#) ► [Site Information](#) ►.

### Caution

Carefully decide which site field mapping you choose to map your career site by and treat it like a permanent setting. Every layout relies on the mapping to that one site field to stay the same. If you change what field the site is mapped to, jobs will not appear with the correct layout, which may degrade the candidate experience.

You can choose a single field from any of the following, like Department or Country/Region:

- Job Title
- City
- State
- Country/Region
- Zip/Postal Code
- Department
- Category
- Shift
- Job Type
- Facility
- Product Service
- Business Unit/Division
- Required Travel
- Adcode

- Custom Field 1
- Custom Field 2
- Custom Field 3
- Custom Field 4
- Custom Field 5

Each combination of locale and brand has a default job layout, which you can access in Career Site Builder under [Layouts](#) [Job](#). You can identify these in the Custom Layouts List view by their Job Field Mapping setting of "Default Mapping." The job layout option allows you to create custom job pages using a third parameter, based on the field you map the site by in [Job Layouts Site Field Mapping](#) (this is your site field mapping).

Only those values that are actively being used in job requisitions appear in Job Field Mapping. If you create a custom layout to use with jobs in Canada and you no longer have any jobs in Canada, that custom layout becomes inactive (with the status "Invalid") until you have a Canadian job in your system again.

## 19.6.8.4 Creating Email Layouts in Career Site Builder

Create and edit customized email layouts in Career Site Builder for particular types of candidates, positions, or email campaigns to optimize communications as part of SAP SuccessFactors Recruiting as well as Candidate Relationship Management.

### Prerequisites

You've configured the locales and brands you want to use for the email layout.

### Context

You can customize the templates used for your email messages to candidates. You can use email layouts for creating email campaigns from SAP SuccessFactors Recruiting. After brands have been configured, email layouts allow you to configure brand-approved layouts. General system users can use brand-approved layouts to launch email campaigns.

#### → Tip

If your organization has multiple brands, configure the brands before you set up anything else on the site. You can add additional brands after you've started building the site.

Unlike other Career Site Builder pages, [Email Layout](#) has its own set of components. The set includes [Header](#) for header information, [Text](#) to add body text in the email, [HTML](#) to send HTML-formatted email, [Footer](#) for footer information, and a position-holder component called [Configurable Text Area](#).

## Note

Email that sends job alerts to subscribers is configured using the *Job Alerts Email Template* option in Career Site Builder.

## Procedure

1. In Career Site Builder, go to **Layouts > Email**.

The Email Layouts List page appears.

2. Select **+ Add** in the Email Layouts List page to create a new email layout.

The Create Email Layout dialog appears.

3. Complete the fields in the Create Email Layout dialog, then select **Save**:

| Option        | Description                                                          |
|---------------|----------------------------------------------------------------------|
| <i>Name</i>   | Enter the name for the layout.                                       |
| <i>Locale</i> | Select a preconfigured locale for the layout from the dropdown list. |
| <i>Brand</i>  | Select a preconfigured brand for the layout from the dropdown list.  |

The layout you just created now displays under the locale and brand you selected when you created it.

4. Specify additional configurations in your newly created layout by selecting the  (edit) icon to view its *Email Layout Editor* page.
5. Choose the *Details* tab to access the following fields:

| Option                 | Description                                                                                                |
|------------------------|------------------------------------------------------------------------------------------------------------|
| <i>Email Global Id</i> | This read-only field displays the unique ID for this layout that was assigned when you created the layout. |
| <i>Is Active</i>       | To activate this email layout, move the slider to <b>YES</b> .                                             |
| <i>Name</i>            | The name of your email layout.                                                                             |

6. Choose the *Styles* tab to check the background color specified for this email layout.
7. Choose the *Email Layout* tab and select **Add Component** to add components to the column:

| Option                        | Description                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Header</i>                 | Optional. Enter header information.                                                                                                                                                                                                                                                                                                           |
| <i>Text</i>                   | Text is the only component that can be added multiple times to the same email layout.                                                                                                                                                                                                                                                         |
| <i>HTML</i>                   | Fully supports HTML. HTML emails are displayed correctly designed and formatted. Choose this option to add an HTML area to the configurable text area of the email layout.                                                                                                                                                                    |
| <i>Configurable Text Area</i> | Required. The email layout must include a <i>Configurable Text Area</i> . It identifies the section where the email body text for email campaigns is displayed. Since the <i>Configurable Text Area</i> is a position holder for the text that's added for the campaign, you can't configure or style it from within the Email Layout Editor. |
| <i>Footer</i>                 | Optional. Enter footer information.                                                                                                                                                                                                                                                                                                           |

8. To modify a component indicated by a gray box, double-click the gray box. Modify the component on the *Details* and *Styles* tabs.

9. To change the order of a component on the email layout, use the  (up-arrow) icon or  (down-arrow) icon for the gray box that represents the component.
10. **Optional:** To add a new component between two components, select the  (plus) icon to the right of the component name to view the [Add Component Below](#) dropdown list.
11. **Optional:** Customize the header or footer by double-clicking the gray box that represents the header or the footer. Revise the fields on the [Details](#), [Logo](#), and [Styles](#) tabs as desired.
12. **Optional:** Customize the background color of the configurable text area by double-clicking the gray box that represents the configurable text area. On the [Styles](#) tab, select the desired color for the [Background](#) field.
13. Select [Save](#).

## Results

You've created an email layout.

### 19.6.8.5 Editing the Job Alerts Email Template in Career Site Builder

Customize the job alerts email template in Career Site Builder so that you can specify the exact content and format you want to include in job alerts.

## Prerequisites

You've configured the locales you want to use for the job alerts email template.

You've enabled job alerts.

## Context

The Job Alerts Email Template includes default content in both the Subject and Body fields. You can edit the template using tokens so that you can add elements to the email that are then replaced with text. For a complete list of supported tokens and their descriptions, refer to *Tokens Used in the Job Alerts Email Template*.

The supported list of tokens that appear on the right column of the page are for reference purposes, and aren't interactive; you can't click or drag them into the [Body](#) field.

### Note

If you have multiple brands, keep in mind that the Job Alerts Email Template form configures one email template to use in **all** your brands. You do, however, set up individual templates for each locale you've enabled for your career site.

## Procedure

1. Go to ► [Layouts](#) ► [Job Alerts Email Template](#) ► in Career Site Builder.

You see the following:

- The template form in your default locale, prepopulated with a standard job alerts message.
- The list of locales set up for the career site on the left column. When you select them, you see template forms in the main area of the page for each locale.
- A reference list of tokens on the right column that you can use in the body of the email.

2. Edit the standard job alerts message with any customization you want to add:

| Option                      | Description                                                                                                                                                                                                                                                                                                                                |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Subject</a>     | <p>Enter text that appears as the subject of the email. The tokens you can use in this field are <code>[[jobtitle]]</code>, <code>[[companyname]]</code>, and <code>[[siteurl]]</code>.</p> <p>Any other token you add in <a href="#">Subject</a> could either appear as a blank, or as an unresolved token.</p>                           |
| <a href="#">Body Format</a> | <p>Use the default <a href="#">HTML</a> option. The dropdown list also lets you choose <a href="#">Text</a>.</p>                                                                                                                                                                                                                           |
| <a href="#">Body</a>        | <p>Write the body of the email, using the tokens listed in the <a href="#">Tokens</a> list on the right column to customize the content.</p> <p>You can have up to 8,000 characters in this field.</p> <p>Refer to <i>Tokens Used in the Job Alerts Email Template</i> for a complete list of supported tokens and their descriptions.</p> |

3. Select the [Preview](#) tab to see how the email appears.

Not all tokens are replaced by text in the template preview because of missing data.

4. **Optional:** Send a test email by entering an email address in the [Send To](#) field and choosing [Send](#).
5. Repeat this process for each locale you've enabled for your career site.
6. Select [Save](#).

## Results

You've configured the job alerts email template for each locale.

### 19.6.8.5.1 Tokens Used in the Job Alerts Email Template

A list of tokens you use to customize the job alerts email template.

Refer to *Editing the Job Alerts Email Template in Career Site Builder* for instructions on how to edit the Job Alerts Email Template.

The `[[jobtitle]]`, `[[companyname]]`, and `[[siteurl]]` tokens don't appear in the [Tokens](#) reference list on the right column on the template page. These tokens are valid, and you can use them in the [Subject](#) field.

#### Note

The tokens that are listed in the right column of the [Job Alerts Email Template](#) page are for reference purposes only. Add the tokens into the template manually. Selecting or clicking on a token in the list doesn't move it into the template.

#### Supported Alert Tokens

| Token                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>[[unsubscribe]]</code>      | The <code>[[unsubscribe]]</code> token links to the recruiter alert edit page, so that email can be stopped.                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>[[agentUnsubscribe]]</code> | The <code>[[agentUnsubscribe]]</code> token is the same as <code>[[unsubscribe]]</code> .                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>[[alertname]]</code>        | <p>The <code>[[alertname]]</code> token represents the name of the user-created alert. It will be one of the following: Category Name, Job Title, or search terms entered by the user.</p> <p>It doesn't accept any token variables.</p> <div><h4>Note</h4><p>The <code>[[alertname]]</code> token is supported <b>only</b> when the Unified Data Model is enabled. After you enable the Unified Data Model, you can use it to replace the unsupported <code>[[agent]]</code> token.</p></div> |

## Link Tokens

| Token        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [[agent]]    | <div><div> <b>Note</b></div><p>The [[agent]] token is <b>not supported</b> when the Unified Data Model is enabled. If the Unified Data Model is enabled, remove the [[agent]] token from the template and consider using the [[alertname]] token instead.</p></div> <p>The [[agent]] token links to a search on the site with the specified keyword or location.</p> <ul style="list-style-type: none"><li>• ::keyword::</li><li>• ::location::</li><li>• ::frequency::</li></ul> <p>If you just specify [[agent]] by itself, it uses [[agent ::keyword:: AND ::location::]].</p> <p>If the token is a radius agent, the location is replaced with postal code and distance.</p> <p>The AND operator is omitted if <b>keyword</b> or <b>location</b> is blank.</p> |
| [[modify]]   | <p>The [[modify]] token links to change subscription options. Available variables are:</p> <ul style="list-style-type: none"><li>• ::linktext=This is my clickable text::</li><li>• ::tab=(agents or profile):: – the default is agents.</li><li>• ::field=((k)eywords, (l)ocation, (f)requency):: – the default is k.</li><li>• ::mode=edit:: – sends them to the agent tab in edit mode for the agent.</li></ul> <p>If you just specify [[modify]] by itself, it uses [[modify ::linktext=::Click here:: ::tab=agents::]].</p> <p>For example: [[modify ::linktext=Change my subscription::]]</p> <div><div> <b>Note</b></div><p><b>modify</b> behaves the way that the deprecated <b>clickhere</b> token did.</p></div>                                       |
| [[sitelink]] | <p>The [[sitelink]] token displays the site URL as a link.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Token           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [[tracking]]    | <p>The [[tracking]] token appends tracking information to the URL.</p> <p>For example, <code>http://example.com?[[tracking]]</code> results in the following URL:</p> <div> <div>Sample Code</div> <pre>http://example.com?&amp;utm_source= &lt;sourcetype&gt;&amp;source=5&amp;eid=siteid- yyyymmdd</pre> </div> <div> <div>Note</div> <p>If there's a keyword defined for the template, then <b>utm_campaign</b> is used with that keyword in the tracking string. Make sure your URLs have at least a question mark appended when using a tracking link.</p> </div> |
| [[unsubscribe]] | <p>The [[unsubscribe]] token links to change-subscription options.</p> <p>The default [[unsubscribe]] token is the same as <code>[[unsubscribe ::linktext=::Click here::]]</code>.</p> <p>For example: <code>[[unsubscribe ::linktext=Change my subscription::]]</code></p>                                                                                                                                                                                                                                                                                            |

## Job Tokens

| Token        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [[jobs]]     | <p>The [[jobs]] token creates a string of links to jobs, returning up to 10 jobs ordered by relevance.</p> <div><p><b>Note</b></p><p>The behavior of the [[jobs]] token varies, depending on whether the Unified Data Model is enabled.</p></div> <p>If the Unified Data Model is <b>enabled</b>:</p> <ul style="list-style-type: none"><li>• The [[jobs]] token doesn't accept any token variables.</li><li>• If an email template uses the [[jobs]] token with an additional variable, like <code>::location::</code>, the variable is ignored. The template behaves as if it just used the [[jobs]] token by itself.</li></ul> <p>If the Unified Data Model is <b>not enabled</b>:</p> <ul style="list-style-type: none"><li>• The [[jobs]] token accepts the following additional token variables:<ul style="list-style-type: none"><li>• <code>::title::</code></li><li>• <code>::location::</code></li><li>• <code>::department::</code></li><li>• <code>::country::</code></li><li>• <code>::state::</code></li><li>• <code>::zip::</code></li><li>• <code>::bullet=[ENG:bullet text]::</code></li></ul>Make sure you add a space between <code>jobs</code> and any variables you add. For example: <code>[[jobs ::title:: - ::location:: (::country::)]]</code></li><li>• You can use HTML formatting in conjunction with the variables.</li><li>• If you use [[jobs]] by itself, without any variables, <code>::title::</code> is automatically included as the default.</li></ul> |
| [[jobtitle]] | <p>The [[jobtitle]] token displays the job title. You can also use this token in the <a href="#">Subject</a> field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## User Tokens

User tokens only work in the body of the email. The user refers to the candidate or subscriber for the job alert, not the recruiter.

| Token              | Description                                                                                                                                                    |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [[usercreatedate]] | The [[usercreatedate]] token displays the date (MM/DD/YYYY) of when the candidate (who's subscribing to the job alerts) created an account at the career site. |
| [[firstname]]      | The [[firstname]] token displays the subscriber's first name.                                                                                                  |
| [[lastname]]       | The [[lastname]] token displays the subscriber's last name.                                                                                                    |
| [[email]]          | The [[email]] token displays the subscriber's email address.                                                                                                   |

## Site Tokens

| Token           | Description                                                                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [[companyname]] | The [[companyname]] token displays the company name, as defined in Career Site Builder at <a href="#">Settings &gt; Site Configuration &gt; Site Information</a> . You can also use this token in the <i>Subject</i> field. |
| [[fromaddress]] | The [[fromaddress]] token displays the email address from which recruiter alerts are sent.                                                                                                                                  |
| [[sitename]]    | The [[sitename]] token displays the site name, as defined in Career Site Builder at <a href="#">Settings &gt; Site Configuration &gt; Site Information</a> .                                                                |
| [[siteurl]]     | The [[siteurl]] token displays the site URL. You can also use this token in the <i>Subject</i> field.                                                                                                                       |

## Unsupported Tokens

The following tokens don't work in the job alerts email template:

- [[alertname]] (when Unified Data Model isn't enabled)
- [[alertNameLink]]
- [[categories]]
- [[clickhere]]
- [[criteria]]
- [[formaddress]]
- [[frequency]]
- [[ifnoagents]]
- [[numberOfMatches]]
- [[queryCreateDate]]

### 19.6.8.6 Adding Job Token Components to a Custom Job Layout

Adding a job token component in your custom job layout allows you to display the various fields from a job requisition, and lets you control the information you want to display to candidates.

#### Context

Even though it behaves like a page component, a job token is available only for use in job layouts, and it's what allows you to control what types of information you want to display on a job page. Each job token component you add represents a different part of the job requisition, such as job title or job description.

#### Procedure

1. From the Custom Layouts List page, select your custom layout.
2. Choose the column you want to add your token in (Column 1 or Column 2).
3. Select [Add Component](#).  
The Component menu displays.
4. Choose [Job Token](#).  
A job token component appears.
5. Choose the display type you want this token to appear in: Desktop, Tablet, and Mobile.  
You can select multiple display types.
6. Select the gray box that represents the component.  
The Job Token page appears.
7. Set the fields in the Job Token page:

| Option                               | Description                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Job Token</a>            | Select the field to display the dropdown list, and choose the field you want to assign the token to. To change the text format, select the  (text) icon to display the Job Token Text Styling dialog, where you can customize the font, font size, text alignment, and text color. |
| <a href="#">Show Job Token Label</a> | Enable if you want to display a label for the token.                                                                                                                                                                                                                                                                                                                  |

| Option                          | Description                                                                                                                                                                                                  |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Job Token Label</a> | Displays the default label for the token. Select the field to display the Override Resource Key dialog, where you can specify the label's locale and provide override text.                                  |
| <a href="#">Enable Spacing</a>  | To add space around the component, set the <a href="#">Enable Spacing</a> setting to YES, then choose the spacing setting for the top, bottom, right and left sides of the component from the dropdown list. |

8. Repeat this process to add all the components you want in the layout.
9. **Optional:** Use the arrows to move the order in which the components appear on the layout.
10. **Optional:** To delete a component, select the  (trash) icon for the component.  
Your layout must have at least one job token component, so you can only delete the additional job token components you add.
11. Select [Save Draft](#) to save your settings, or [Publish](#) to publish your layout.
12. **Optional:** Select the  (cog) icon to view published revisions of the layout, or edit the published version of your layout.

## Results

You've added all the parts of your job requisition you want to have appear on your custom job layout. Choose [< left arrow](#) at the top of the Custom Layouts Editor to return to the Custom Layouts List.

## 19.6.9 Settings

### 19.6.9.1 Site Configuration

#### 19.6.9.1.1 Configuring the Site URL for a Career Site

Configure the URL of your career site. You can choose a custom URL or a standard URL.

## Context

You can choose a custom URL or a standard URL for your Production career site.

- A custom URL is a URL that's hosted on your organization's domain (like `jobs.example.com`). It's more closely associated with your brand, but your organization needs to set up the DNS and maintain the SSL certificates.
- A standard URL is a URL that's hosted on an SAP domain (like `jobs.hr.cloud.sap.com` or `jobs.hr.sapcloud.cn`). Choose a standard URL if you want to minimize the cost and effort of setting up the DNS and maintaining the SSL certificates.

For Test or Preview sites, SSL certificates are already managed by SAP, so there's little benefit in defining your own standard URL. Use the appropriate stage URL for your data center. For details, refer to: [How to configure the site URL of Test or Sales Demo instance](#) .

#### → Tip

If you're implementing a new career site, you should only configure 1 site URL. Choose if you want it to be custom or standard.

If your organization is transitioning from 1 site URL to the other, you can have 2 site URLs configured and active at the same time, for up to 6 months. For details, refer to [Transitioning from a Custom Site URL to a Standard Site URL \[page 532\]](#).

## Procedure

1. In Career Site Builder, go to ► [Settings](#) ► [Site Configuration](#) ► [Site URL](#) ►.
2. Configure the URL for your career site.
  - [Custom Site URL](#) - Enter a custom URL that's set up and maintained by your organization.
  - [Standard Site URL](#) - Enter a unique subdomain name for your organization. Then choose [Check Availability](#) to ensure it's unique.
3. If you've configured both a custom URL and a standard URL, you have to choose which one is primary. For the primary URL, set the [Primary](#) setting to [Yes](#).

The primary URL is your site's true web address and the domain on which all other functionality is based, such as job alert emails, campaign emails, and integrations.

The secondary URL redirects automatically to the primary URL for a period of 6 months, while your organization transitions from one URL to the other.
4. Choose [Save](#).

## Results

On save, your career site is available at the primary URL. If you configured 2 site URLs, the secondary URL redirects automatically to the primary URL.

If you changed the primary URL, other configurations based on the site URL, such as sender addresses and integration settings, are updated automatically.

#### 📘 Note

If Career Site Builder integration isn't fully configured yet, the integration settings in Provisioning may not be updated automatically. For new implementations in progress, check Provisioning settings manually to ensure they're using the primary URL.

### 19.6.9.1.2 Transitioning from a Custom Site URL to a Standard Site URL

Learn how to transition your career site from a custom URL to a standard URL.

You can choose to use a standard URL, hosted in an SAP domain, to minimize the cost and effort of setting up the DNS and maintaining SSL certificates.

If your career site previously used a custom URL and you want to move it to a standard URL instead, it may take some time to manage the change. For example, job alerts or email notifications may have already been sent out with links to the custom URL. During this transition period, you want both URLs to work, so we allow you to have 2 active URLs configured at the same time, for up to 6 months.

Here's an overview of the process of transitioning from a custom site URL to a standard site URL.

1. Configure the [Standard Site URL](#) and save.
2. If you use an internal career site powered by Career Site Builder, update the SAML 2.0 configuration in your identity provider (IdP) so that internal candidates can access the site at the new URL with single sign-on.

#### Note

Identity provider configurations are **not** updated automatically when you select a primary URL. To ensure a smooth transition for internal candidates, we recommend updating them beforehand.

3. Review email notification templates to make sure you are using the appropriate tokens to display links to your career site, instead of a hard-coded URL. If you use a hard coded URL, you need manually update it in the templates.
4. Select the standard URL as [Primary](#) and save.  
Your career site now uses the standard URL, hosted in an SAP domain, and the 6-month transition period begins.
5. Continue to maintain the custom URL during the transition period. The custom URL remains active as long as the SSL certificate is valid.

#### Note

The [SSL Certificates](#) tool in Career Site Builder only applies to the custom URL, whether it's primary or secondary.

6. Plan to complete the transition within a 6-month period.  
When the secondary, custom URL is no longer needed, you can let the SSL certificate expire and remove it from the [Custom Site URL](#) field at any time.
7. After 6 months, the secondary URL is removed automatically from Career Site Builder and stops redirecting automatically to the primary URL. To extend the transition period, you need to set up redirection yourself and continue to maintain the SSL certificates outside of Career Site Builder.

## 19.6.9.2 Email Settings

### 19.6.9.2.1 Enabling Job Alerts

Enable job alerts in Career Site Builder so that candidates can receive email notifications when jobs matching their search criteria become available in the career site.

#### Context

##### 📘 Note

There are additional job alert features you can use when you enable the Unified Data Model setting for your career site. Refer to *Job Alerts in the Unified Data Model* for more information.

In addition to enabling job alerts, you also need to design the text that goes into these job alerts by editing the job alert email template.

#### Procedure

1. In Career Site Builder, go to [Settings](#) > [Site Configuration](#) > [Site Information](#) .
2. Scroll down to the [Email Settings](#) section and complete the following fields:

| Option                                    | Description                                                                                                                                                                                                                                                    |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Use Job Alerts</a>            | Enabling this setting gives candidates the ability to subscribe to job alerts from the public career site. Disabling it prevents both the creation of new job alert subscriptions, as well as the sending of emails to candidates for existing subscriptions.  |
| <a href="#">Job Alert Sender Address</a>  | The email address that job alert emails are sent from. You can customize the part of the address before the @ symbol (the "username" or "local-part"). The part after the @ symbol is based on your site's primary URL, with the added subdomain <b>mail</b> . |
| <a href="#">Use Locale for Job Alerts</a> | Enabling this setting restricts the email that candidates receive to only for those jobs that match their chosen locale.                                                                                                                                       |

##### 📘 Note

This information only applies if the Unified Data Model is **not** enabled. When it's enabled, you can't configure the settings described here.

|                                           |                                                                                                                                          |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Use Custom Sender Address</a> | When this setting is enabled, emails are sent from the custom sender address you've configured, based on your career site's primary URL. |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|

| Option | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|        | <div>  <b>Note</b> </div> <p>If you use a custom site URL, don't enable this setting until you've verified that your DNS provider is configured correctly. Otherwise, emails will be sent from the default <code>jobs2web.com</code> domain instead.</p> <p>If you use multiple brands, you need to enable this setting for each brand, at <a href="#">Brand Settings</a></p> <p><a href="#">(Brand)</a> <a href="#">Email Settings</a></p> |

3. Scroll back up to the top of the page and select [Save](#) to save these settings.

## Results

You have now enabled job alerts for the career site.

## Next Steps

Configure the contents of the job alert email template.

## Related Information

[Job Alerts in the Unified Data Model \[page 430\]](#)

[Editing the Job Alerts Email Template in Career Site Builder \[page 522\]](#)

[Site Configuration in Career Site Builder Settings \[page 640\]](#)

[Job Alerts Email Template Settings in Career Site Builder Layouts \[page 639\]](#)

## 19.6.9.2.2 Custom Sender Addresses

You can customize the sender address for job alert emails and campaign emails, so that they're sent from your organization's domain.

By default, job alert emails and campaign emails are sent from the default `jobs2web.com` domain. Many organizations want these emails to be sent from the same domain as their career site. For example, if your site URL is `jobs.example.com`, you could configure a custom sender address like `no-reply@mail.jobs.example.com`.

In Career Site Builder, you can:

- Enable the use of custom sender addresses that are based on your career site's primary URL, whether it's custom or standard. We automatically add the subdomain `mail` to the site URL. For example, if your site's domain is `jobs.example.com`, the email domain is `mail.jobs.example.com`.

- Customize the part of the sender address before the at-symbol, called the "local-part". For example, `noreply@mail.jobs.example.com`.
- Choose to configure different sender addresses for job alerts and email campaigns. For example, `jobalerts@mail.jobs.example.com` and `campaigns@mail.jobs.example.com`.
- Choose to configure a brand-specific sender address for each of your brands. For example, `yourbrand@mail.jobs.example.com`.

### Custom Sender Addresses for a Custom Site URL

If your primary site URL is a custom URL (maintained by your organization), setting up customer sender addresses is a multi-step, technical process:

1. First, you need to request a public key for your domain from SAP. (For production systems only. Email notifications are only sent out by production systems.)
2. Next, you need to verify that your DNS provider is configured correctly.
3. Finally, when the email infrastructure is set up, you can enable the use of custom sender addresses.

#### Note

This is a technical process that's best performed by your organization's IT personnel, or someone with technical knowledge of your email infrastructure and access to your organization's DNS provider account.

### Custom Sender Addresses for a Standard Site URL

If your primary site URL is a standard URL (ending with `jobs.hr.cloud.sap.com` or `jobs.hr.sapcloud.cn`), no technical setup is required because SAP maintains the email infrastructure for you. Job alert emails and campaign emails are sent from a standard email domain (`mail.jobs.hr.cloud.sap.com` or `mail.jobs.hr.sapcloud.cn`). You can customize the local-part for each sender address, if you choose, then enable them.

## Related Information

[Requesting a Public Key for Your Domain from SAP \[page 535\]](#)

[Verifying DNS Configuration for a Custom Sender Address \[page 537\]](#)

[Enabling the Use of Custom Sender Addresses for Career Site Emails \[page 539\]](#)

## 19.6.9.2.2.1 Requesting a Public Key for Your Domain from SAP

Request a public key for your domain from SAP so that you can use a custom sender address for job alerts and email campaigns.

### Prerequisites

Before you request a public key, confirm that the primary site URL for your career site is a custom URL.

- For your default brand, go to ► [Settings](#) ► [Site Configuration](#) ► [Site URL](#) ►.
- For an additional brand, go to ► [Brand Settings](#) ► [\[Brand\]](#) ► [Site URL](#) ►.

If you the primary site URL for your career site is a standard URL, you don't need to request a public key. It's maintained by SAP.

## Context

If you use a custom site URL, your domain is used in the sender address for job alerts and email campaigns. For SAP email servers to safely use a custom sender address, based on your custom domain, certain records must be configured with your DNS provider.

The first step in this process is to submit a request to SAP for a public key for the domain of your career site. This is done by creating a ServiceNow ticket.

### Note

We only provide a public key for production systems, because email notifications are only sent out by production systems. You don't need to request a public key for your staging or preview systems.

## Procedure

1. Create a ticket for SAP in [SAP for Me](#).
2. Provide the following information.
  - **Business Unit:** SuccessFactors (SF)
  - **Service:** SAP SuccessFactors Recruiting Marketing
  - **Service Offering:** SAP SuccessFactors Recruiting Marketing
  - **Subject:** SFSF RMK DKIM Certificate
3. In the body of the ticket, provide the following information.
  - **Site ID:** Your Site ID, found at ► [Settings](#) ► [Site Configuration](#) ► [Site Information](#) ►.
  - **Email Domain:** The subdomain `mail.` followed by your Custom Site URL. For example, `mail.jobs.example.com`.
    - For your default brand, your Custom Site URL is found at ► [Settings](#) ► [Site Configuration](#) ► [Site URL](#) ►.
    - For an additional brand, it's found at ► [Brand Settings](#) ► [\[Brand\]](#) ► [Site URL](#) ►.

### Note

Always prepend the [Custom Site URL](#) with the subdomain `mail.` Custom sender domains are always a combination of the subdomain `mail` and the career site domain or branded domain. For example, if your site URL is `jobs.example.com`, then your email domain is `mail.jobs.example.com`.

The subdomain `mail` is a technical requirement. Because career site DNS requires the use of a CNAME which points to the SAP-owned ANAME record, emails must be sent from a subdomain of your career site domain.

- **Datacenter:** Your Deployment Data Center, found at ► [Settings](#) ► [Site Configuration](#) ► [Site Integrations](#) ►.
4. Submit the ticket.
  5. Repeat these steps for each domain and branded domain that you wish to use a customer sender address for. If you're using branded custom domains, create a ticket for each branded domain.

## Results

SAP processes the request and assigns a public key to your domain. When the process is complete, you can see information about your DNS configurations at ► [Email Settings](#) ► [Verify DNS Configuration for Custom Site Sender Address](#) ► in Career Site Builder.

You can use this information to confirm that your DNS configurations are set up correctly.

## Next Steps

[Verifying DNS Configuration for a Custom Sender Address \[page 537\]](#)

### 19.6.9.2.2 Verifying DNS Configuration for a Custom Sender Address

Verify the status of your DNS configurations, to confirm that they're set up correctly for you to use custom sender addresses.

## Prerequisites

- [Requesting a Public Key for Your Domain from SAP \[page 535\]](#)
- The primary site URL for your career site is a custom URL.
- SAP has processed your request and configured a public key for your domain.

## Context

### 📘 Note

This task is best performed by your organization's IT personnel, or someone with technical knowledge of your email infrastructure and access to your organization's DNS provider account.

After SAP has configured a public key for your domain, you can use the [Verify DNS Configuration for Custom Site Sender Address](#) section to verify your DNS configuration.

## Procedure

1. In Career Site Builder, go to [Email Settings](#).
  - For your default brand, go to [Settings](#) > [Site Configuration](#) > [Site Information](#) > [Email Settings](#).
  - For an additional brand, go to [Brand Settings](#) > [\[Brand\]](#) > [Email Settings](#).
2. Use information displayed in the [Verify DNS Configuration for Custom Site Sender Address](#) section to verify that DNS records are configured correctly.

For each record type, you can see the status, the subdomain, the currently configured value, and the expected value.

### Note

DNS configurations are only shown if your primary site URL is a custom URL and if SAP has finished processing your request for a public key. If you haven't requested a public key yet, do that first.

3. Configure the following records in your DNS provider as required.
  - SPF
  - MX
  - DKIM
  - DMARC

For each record, the [Currently Configured Value](#) and [Expected Value](#) should match. When the record is configured correctly in your DNS provider, it shows the status [Active](#) in the table.
4. Verify that all 4 records are configured correctly, with status [Active](#).

## Results

When all 4 records configured correctly, you can enable the use of custom sender addresses for job alert emails and campaign emails.

## Next Steps

[Enabling the Use of Custom Sender Addresses for Career Site Emails \[page 539\]](#)

## 19.6.9.2.2.3 Enabling the Use of Custom Sender Addresses for Career Site Emails

Enable the use of custom sender addresses, so that job alert emails and campaign emails are sent from your organization's domain.

### Prerequisites

- If the primary site URL for your career site is a custom URL, complete these tasks first:
  - [Requesting a Public Key for Your Domain from SAP \[page 535\]](#)
  - [Verifying DNS Configuration for a Custom Sender Address \[page 537\]](#)
- If the primary site URL for your career site is a standard URL, there aren't any prerequisite tasks. You don't need to request a public key or configure DNS because SAP maintains it for you.

### Context

By default, job alert emails and campaign emails are sent from the default `jobs2web.com` domain. Many organizations want these emails to be sent from the same domain as their career site. For example, if your site URL is `jobs.example.com`, you might want to use a custom sender address like `noreply@mail.jobs.example.com`.

Once your email infrastructure is set up correctly, with a public key and correct DNS configuration, you can enable the use of custom sender addresses.

### Procedure

1. In Career Site Builder, go to [Email Settings](#).
  - For your default brand, go to [Settings](#) > [Site Configuration](#) > [Site Information](#) > [Email Settings](#).
  - For an additional brand, go to [Brand Settings](#) > [\[Brand\]](#) > [Email Settings](#).
2. **Optional:** If you choose, you can customize the part of the sender address before the at-symbol, called the "local-part". For example, `noreply`.

You can use the same local-part for both types of email, like `noreply`, or you can choose to make them different, like `jobalerts` and `campaigns`.

If you have multiple brands, you can configure a brand-specific local-part, like `mybrand-noreply`.

3. Turn on the [Use Custom Sender Address](#) setting, by moving the slider to [Yes](#).

#### Note

If you're using a custom URL, the [Use Custom Sender Address](#) setting is disabled until email infrastructure is set up correctly yet. If you can't turn the setting on, use the [Verify DNS Configuration for Custom Site Sender Address](#) section to double check your DNS configurations.

4. Save.

## Results

Job alert emails and campaign emails are now sent from the custom sender address you've configured.

## 19.6.9.3 Security

### 19.6.9.3.1 Enabling the Content Security Policy for a Career Site

Prevent cross-site scripting attacks for your career site pages generated by Career Site Builder by enabling [Content Security Policy](#).

## Context

#### Caution

Until you thoroughly test your career site in the stage environment with all the domains you manually add to the Allowed Domains list, do **not** enable Content Security Policy in your production environment.

Enabling [Content Security Policy](#) defines the `Content-Security-Policy` HTTP header. Enabling the setting automatically disallows all external domains.

The content security policy is designed to guard against cross-site scripting (XSS) attacks through the use of a `Content-Security-Policy` HTTP response header. The header lets you control the resources allowed to load for a web page. They're used in an organization's career site pages (such as `jobs.example.com`, where `<example>` is your organization's name), but not in the Candidate Profile and other pages generated within SAP SuccessFactors Recruiting.

#### Note

Along with SAP domains, a number of domains are automatically included in the allowlist when you enable the Content Security Policy setting. You can view the list and manually disable individual domains from the allowlist.

## Procedure

1. Go to ► [Career Site Builder](#) ► [Settings](#) ► [Data Privacy & Security Settings](#) ►.
2. Scroll down to the [Content Security Policy](#) section and read onscreen guidance. If you choose to proceed and the content security policy, move the switch to [ON](#).

The following settings are shown:

- [Allow 'unsafe-eval' in Content Security Policy](#)
  - [Allowed Domains](#)
3. Under [Allow 'unsafe-eval' in Content Security Policy](#), read onscreen guidance. If you choose to proceed and disallow the unsafe-eval expression, move the switch to [OFF](#).

By default, the unsafe-eval expression is allowed in the content security policy, to prevent any disruption to custom JavaScript. If you don't use custom JavaScript or you don't require the use of unsafe-eval, you can disallow it.

4. **Optional:** Review the list of allowed domains. If you want to remove any of them from your allowlist, move the switch from [YES](#) to [NO](#).

By default, the following domains are automatically allowed:

- \*.sapsf.eu
- \*.sapsf.com
- \*.successfactors.com
- \*.successfactors.eu
- \*.sapsf.cn
- \*.qualtrics.com
- d3537c9nadz1.cloudfront.net
- \*.linkedin.com
- \*.googleapis.com
- \*.gstatic.com
- \*.googletagmanager.com
- \*.google-analytics.com
- \*.googlesyndication.com
- \*.tagmanager.google.com
- \*.youtube.com
- \*.youtu.be
- \*.youtube-nocookie.com
- \*.vimeo.com
- vimeo.com
- \*.vimeocdn.com
- \*.wistia.net
- \*.pinterest.com
- \*.xing-share.com
- \*.xing.com
- \*.facil-iti.com
- \*.moatads.com

- \*.yimg.com
- \*.twitter.com
- \*.facebook.com
- \*.facebook.net
- \*.doubleclick.net
- \*.adobedtm.com
- \*.adobe.com

### ⚠ Caution

Disable an automatically allowed domain only if you don't use its feature in your career site. For example, if you disable the [\\*.googleapis.com](#) setting but you use the Google job map, you see an error message where the map would otherwise appear.

5. Scroll past the list of automatically allowed domains, to the [Custom Allowed Domains](#) section to explicitly allow additional domains.

Make sure you add all necessary domains if you're using any custom JavaScript on your career site. To determine what domains you need to add for your career site, refer to *Finding and Manually Adding Domains to the Content Security Policy Allowlist* for details.

6. If you use embedded images, add "data:" to your Content Security Policy.

### ⚠ Caution

- Your Content Security Policy doesn't work if you use embedded images and you don't add "data:".
- Adding "data:" in [Allowed Domains](#) introduces potential security risks. Consult your organization's security team to determine if you're allowed to add this for your career site.
- The best practice is to avoid embedding images altogether, and to use a content delivery network to display your images instead.

### 📌 Note

The Custom Plugin component doesn't support Base64 images. Link to them instead.

7. Select [Save](#) to save your settings.

## Results

You've now enabled the Content-Security-Policy HTTP response header for pages in your career site.

## Related Information

[Finding and Manually Adding Domains to the Content Security Policy Allowlist \[page 543\]](#)

[Data Privacy & Security Settings in Career Site Builder Settings \[page 649\]](#)

## 19.6.9.3.2 Finding and Manually Adding Domains to the Content Security Policy Allowlist

Add domains to *Allowed Domains* in *Content Security Policy* to avoid blocking any third-party scripts your career site uses to function.

### Prerequisites

You've enabled the *Content Security Policy* setting in ► *Career Site Builder* ► *Settings* ► *Data Privacy & Security Settings* ► *Data Protection* , so that you can view its automatically allowed domains list.

### Context

If you don't add all the domains to the allowlist, any custom JavaScript you use on your career site fail to work. Find and add domains to your allowlist so that the content security policy doesn't cause any errors.

#### Note

Until you thoroughly test your career site in the stage environment with all the domains you manually add to the Allowed Domains list, do **not** enable Content Security Policy in your production environment.

### Procedure

1. Compare the domains you're using on your career site to the list of automatically allowed domains that appeared in ► *Content Security Policy* ► *Allowed Domains* when you enabled the policy setting.
2. Go to your career site, such as `jobs.example.com`, in a browser window.
3. Open the browser's developer console.

The command to open the console differs based on the browser, but you typically access it from the upper-right dropdown list by selecting ► *More Tools* ► *Developer Tools* .

The developer console appears as a side pane on your browser window.

4. Look for text blocks similar to the following that reference the content security policy, and identify the domain — in this case, `doubleclick.net`:

```
Refused to connect to 'https://stats.g.doubleclick.net/j/collect?
t=ab&cde=1&_f=3&g=1&_h=i92&klm=N0-12345678-1&pqr=12345678.1234567890&stu=123456789&
wxyz=1234567890&_abc=123456789.1234567890&_d=ABCDEFGhIJKLMN~&o=1234567890' because
it violates the following Content Security Policy directive...
```

5. Copy the domain and manually add it to a field in *Allowed Domains*, using the `*.example.com` format.

By including the asterisk, you're telling the content security policy that you trust everything in that domain.

6. Repeat this process for every domain you see in the developer console that violates the content security policy.

#### → Tip

You can include multiple domains in an *Allowed Domains* field. Use spaces to separate them instead of commas or semicolons. There's no character limit to each field, so you don't have a space constraint on the number of domains to add to your allowlist. The fields let you keep the list organized and make it easier for you to manage.

7. Test the career site in your stage environment thoroughly to make sure everything, such as links and JavaScript, work as intended.

## Related Information

## 19.6.9.4 Configuring Locale Settings for a Career Site

Set locale settings for your career site, including choosing a default locale, enabling multiple locales, and overriding default system-supplied text for your locales.

## Context

Career Site Builder lets you configure these locale-related settings for your career site:

- Choose the site's default locale. The default locale is the first locale candidates see when they go to your career site, such as the home page.
- Enable your career site for multiple locales in addition to the default locale.
- Add a *Language* dropdown list in the career site header to allow candidates to choose to view the site in one of the nondefault locales you enable and set up for your career site.
- Choose to override system-supplied text for the enabled locales.  
When you change what locale to view the career site in, Career Site Builder automatically shifts many of the system-supplied texts on the screen to the changed locale. For example, the *Register now* button automatically changes to *Registrarse ahora* when you switch from U.S. English (en\_US) to Español (es\_ES). Change such system-supplied text in the Translations tool.

To turn job segments on and off by locale, contact an implementation partner.

## Procedure

- **Choose all the locales** you want to make available for your career site by going to [Settings > Site Configuration > Site Locales](#) and selecting the checkboxes to the left of all the locales you want to make available, then save your settings.

### Note

Although Career Site Builder displays system-supplied text (such as button labels) in the locales you enable, it doesn't automatically translate the career site content itself (for example, the text in your career site's home page). The content displays in the locale it's already in **unless** you provide locale-specific text for the Career Site Builder components and pages.

For this reason, plan your locale settings carefully. Enabling multiple locales involves additional work because you need to provide translated content for **all** your pages and components. Just because you have a license for five locales, doesn't mean you want to enable all five of them for the career site — unless you plan to provide translated content for all pages and components for all five locales.

- **Choose the default locale** by selecting a locale from the dropdown list in [Settings > Site Configuration > Site Locales > Default Locale](#), then save your settings.

The system uses the default locale when a locale isn't specified for a page or by the user. This feature isn't apparent and happens on occasion. For example, candidates who find a link to the Job Search page then navigate to that page directly from outside the career site, and the system presents that page to the candidates in the default system locale. Normally, the candidates arrive from another career site page with a predefined locale that passes the locale information to the destination page during their navigation.

### Note

Jobs imported into the system that don't contain a locale defaults to a locale of en\_US, so make sure that all jobs contain a locale when defining a job import.

- **Add the *Language* dropdown list** to the header of your career site pages by going to the [Details](#) tab in [Appearance > Styles > Headers > <Brand> > Default Brand](#), and setting *Use Locale Selector* to *YES*.

If you're using a custom header, the *Use Locale Selector* setting is in the *Sign in & Language* component in the *Desktop Layout* and *Mobile Layout* tabs.

Turn on this setting for all the locales you're enabling for the career site, then save your settings.

- **Optional:** Edit any default system-supplied text in [Tools > Translations](#), as described in *Changing the Default Text Using the Translation Editor*.

## Related Information

[Changing the Default Text Using the Translation Editor \[page 509\]](#)

## 19.6.9.5 Using Search Engine Optimization Settings

You can refine your search-engine optimization settings in Career Site Builder.

### Prerequisites

You have admin access to Career Site Builder.

### Context

By default, Career Site Builder generates a Top Jobs page that lists links to search results pages based on the most frequently searched terms. You can disable this setting to have better control over how you present jobs in your career site. In addition, you can demote specific terms to display at the end of the result set, or prevent search engines from indexing jobs with certain terms entirely.

In addition, SEO Settings also allow you to control whether search engines should index user-generated search page links.

### Procedure

1. In Career Site Builder, go to ► [Settings](#) ► [Site Configuration](#) ► and select the [SEO Settings](#) tab.

The SEO Settings page appears.

2. Configure the following fields on the page:

| Option                          | Description                                                                                                                                                                                                                                                                                                       |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Terms to Demote</a> | Terms you include in this field are automatically demoted to the end of the result set. Start each new term or phrase in a new line, and don't include the word "job" in your terms (for example, use "technical recruiter" instead of "technical recruiter jobs").                                               |
| <a href="#">Terms to Avoid</a>  | When you add terms in this field, Career Site Builder adds a <b>noindex</b> value to prevent search engines from indexing them, and also suppresses them from being part of the Top Jobs results. That means user-generated search pages aren't indexed when the URL string contains a term you add to the field. |

#### Note

If [Noindex Search Pages](#) is turned off, user-generated search pages that contain words listed in [Terms to Avoid](#) will have the **noindex** value.

|                                  |                                                                                                                                                                                                                                                                                                                        |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Noindex Top Jobs</a> | By default, Career Site Builder generates a Top Jobs page that lists links to search results pages based on the most frequently searched terms. When you select <b>YES</b> to disable Top Jobs, Career Site Builder adds a <b>noindex</b> value to these auto-generated pages, as well as to the Top Jobs page itself. |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Option                               | Description                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                      | <div>  <b>Note</b> <p>If you enable this setting, make sure to remove any links to the Top Jobs page from your career site's headers and footers. Doing so avoids having a blank Top Jobs page that only displays a header, search form, and footer.</p> </div> |
| <a href="#">Noindex Search Pages</a> | <p>When you select <b>YES</b>, Career Site Builder adds a <b>noindex</b> value to all search pages. This setting doesn't affect category pages.</p> <p>Enable this option to prevent search engines from indexing links to user-generated search pages, in which users may include inappropriate or undesired words.</p>                         |

3. Select [Save](#).

## 19.6.9.6 Removing the Ability to Manually Add Talent Community Members

Disable the manual addition of candidates to the talent pool so that you can have greater control over the selection of candidates.

### Procedure

1. In Career Site Builder, go to the [Global](#) section in [Settings](#) [Data Privacy & Security Settings](#) [Data Protection](#).
2. Set the slider to **OFF** for the [Allow Manual Public User Creation](#) setting.

You can no longer manually add candidates to the talent pool, including through the Talent Community member API.

## 19.6.10 Users

### 19.6.10.1 Creating a Permission Role for Career Site Builder

Create a new role and its associated permissions for Career Site Builder.

#### Context

You can create permissions for the [Global](#), [Layouts](#), [Pages](#), and [Tools](#), sections of Career Site Builder. You can also control the upload of images and fonts individually.

Roles and permissions allow you to limit Career Site Builder access based on your organization's needs.

#### Procedure

1. Go to [Users > Roles](#), and enable the [CSB Role Based Permission](#) slider.
2. In the [Roles](#) tab, choose [Create Role](#).

The [Create Role](#) dialog appears.

3. Enter a name and description for the role and choose [Save](#).

The [Edit Role](#) page appears.

4. In the Edit Role page, enable the desired permissions for the role.

| Option                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Locales</a>             | <p>Grants role permissions for any locale enabled for the site. For example, you may want to configure different roles for users who can edit pages in the <b>en_US</b> locale, and those who can edit pages in other locales.</p> <p>Select <a href="#">Select All</a>, or expand the <a href="#">Locales</a> menu to specify which locales you want to enable. To apply this setting to future locales, select <a href="#">Include all future locales with this role</a>.</p> |
| <a href="#">Brands</a>              | <p>Grants role permissions for any configured site brands. Use this where different groups of recruiters should only be able to access pages for certain brands.</p> <p>Select <a href="#">Select All</a>, or expand the <a href="#">Brands</a> menu to specify which brands you want to enable. To apply this setting to future brands, select <a href="#">Include all future brands with this role</a>.</p>                                                                   |
| <a href="#">Appearance Settings</a> | Grants role access to <a href="#">Appearance &gt; Global</a> . Options are <a href="#">JavaScript &amp; Cookie Manager</a> and <a href="#">Custom Plugin</a> .                                                                                                                                                                                                                                                                                                                  |
| <a href="#">Appearance Styles</a>   | Grants role access to <a href="#">Appearance &gt; Styles</a> . You can set permission access to <a href="#">Color Editing</a> specifically.                                                                                                                                                                                                                                                                                                                                     |
| <a href="#">Search</a>              | Grants role access to the <a href="#">Appearance &gt; Search Results</a> .                                                                                                                                                                                                                                                                                                                                                                                                      |
| <a href="#">Import Export</a>       | Grants role access to <a href="#">Tools &gt; Import &amp; Export</a> .                                                                                                                                                                                                                                                                                                                                                                                                          |

| Option                                               | Description                                                                                                                                                                                             |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Manage API Credentials</a>               | Grants role access to <a href="#">Tools &gt; Manage API Credentials</a> .                                                                                                                               |
| <a href="#">Job Alerts Email Template</a>            | Grants role access to <a href="#">Layouts &gt; Job Alerts Email Template</a> .                                                                                                                          |
| <a href="#">Social Apply</a>                         | Grants role access to <a href="#">Tools &gt; Social Apply</a> .                                                                                                                                         |
| <a href="#">Translation Editor</a>                   | Grants role access to the Translation Editor in <a href="#">Tools &gt; Translations</a> .                                                                                                               |
| <a href="#">Data Privacy &amp; Security Settings</a> | Grants role access to <a href="#">Settings &gt; Data Privacy &amp; Security Settings</a> . Options are <a href="#">Data Protection</a> and <a href="#">Data Subject Reports</a> .                       |
| <a href="#">Data Privacy Consent Statement</a>       | Grants role access to <a href="#">Settings &gt; Data Privacy Consent Statement</a> .                                                                                                                    |
| <a href="#">Brand Management</a>                     | Grants role access to <a href="#">Tools &gt; Brand Management</a> .                                                                                                                                     |
| <a href="#">Locations</a>                            | Grants role access to <a href="#">Tools &gt; Locations</a> .                                                                                                                                            |
| <a href="#">Email Layout</a>                         | Grants role access to <a href="#">Layouts &gt; Email</a> .                                                                                                                                              |
| <a href="#">Data Capture Form</a>                    | Grants role access to <a href="#">Tools &gt; Data Capture Forms</a> .                                                                                                                                   |
| <a href="#">Site Configuration</a>                   | Grants role access to <a href="#">Settings &gt; Site Configuration</a> .                                                                                                                                |
| <a href="#">IDP Configuration</a>                    | Grants role access to <a href="#">Settings &gt; IDP Configuration</a> .                                                                                                                                 |
| <a href="#">Upload</a>                               | Grants role access to uploading either images or fonts, or both. Options are <a href="#">Image Uploading</a> and <a href="#">Font Uploading</a> .                                                       |
| <a href="#">Pages</a>                                | Grants role access to pages. Options are <a href="#">Home Pages</a> , <a href="#">Category Pages</a> , <a href="#">Job Layout</a> , <a href="#">Content Pages</a> , and <a href="#">Landing Pages</a> . |

5. Select [Save](#) to finalize the role configuration.

Your role is configured. You can select [< \(Back\)](#) to return to the Roles page, which displays the list of roles.

6. **Optional:** Edit an existing role at any time by selecting the [✎ \(Edit Role\)](#) icon for your role.

The Edit Role page appears, and displays the role name, role description, last updated date, and the name of the person who last updated it.

7. **Optional:** To delete a role, select the [⊗ \(Delete Role\)](#) icon for the role.

A delete confirmation dialog appears.

## Results

You've created a role and configured Career Site Builder access for it.

## Next Steps

You're now ready to assign your role to users.

[Roles in Career Site Builder Users Menu \[page 654\]](#)

### 19.6.10.2 Assigning Roles to Users in Career Site Builder

Add admin users to configured Career Site Builder roles.

## Context

Once you've configured the roles for Career Site Builder, you can assign these roles to Career Site Builder administrative users. Users are designated as Admin Users during the Recruiter SSO import. Refer to *Roles in Career Site Builder Users Menu* for a list of all the Career Site Builder role settings.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Career Site Builder](#) ► [Users](#) ► [Roles](#) and select [Admin Users](#).
2. Select the user you'd like to assign a role to, and choose the  (pencil) icon.

You can sort the columns of users, or filter for specific values in the Roles page.

The Edit Admin User page appears.

3. Choose the desired role from the [Role](#) dropdown, which displays all the roles you created.

#### Note

You can only assign one role per user.

4. **Optional:** Slide the [Is CSB Admin](#) setting to [ON](#) to grant Career Site Builder admin permission to the user.
5. **Optional:** Slide the [Enable SSL Notifications](#) setting to [ON](#) to enable email reminders so that user is given advance notice when the career site's SSL certificate is expiring.
6. Choose [Save](#) to save the role settings, then select < (Back) to return to the Roles page.

## 19.6.10.3 Setting Up Email Reminders About Expiring SSL Certificates

Set up email reminders for specific individuals in your organization to receive, who are responsible for renewing SSL certificates.

### Context

If an SSL certificate for your career site expires, it prevents visitors from going to the site. When certificates are set to expire, a popup message appears when you sign into Career Site Builder, reminding you to renew them.

In addition to the popup message, you can also choose specific roles or specific individuals to receive email reminders about SSL certificate renewals. The email includes details about the certificate that's set to expire. The setting is turned off by default for new roles and users, so you need to configure your settings if you want specific individuals in your organization, such as members of your security IT team, to receive these reminders.

Organizations can manage SSL certificates in Career Site Builder, at ► [Tools](#) ► [SSL Certificates](#) ►.

#### Note

These instructions include what to do if you **just** want individuals to get email reminders, without being Career Site Builder administrators.

### Procedure

1. If the person who you want to receive reminders **isn't** already a Career Site Builder administrator, ensure that they're in a role that has the ► [User Permissions](#) ► [Recruiting Permissions](#) ► [Recruiter RMK SSO Permission](#) ► permission.
2. Log in to Career Site Builder as an administrator and select the [Admin Users](#) tab in ► [Users](#) ► [Roles](#) ►.

You see a list of individuals by name. If you see a list of role names, you're viewing the [Roles](#) tab instead of [Admin Users](#).

#### → Tip

If you just added individuals from the previous step and you don't see them in the Admin Users list, perform a recruiter sync.

3. Choose  [Edit User](#) for individual you want to enable email reminders for.  
The Edit Admin User page appears.
4. Verify that the slider for the [Enable SSL Notification](#) field is set to [ON](#), the default setting.

#### Note

If you don't want a Career Site Builder user to get an email reminder at all, change their [Enable SSL Notification](#) setting to [OFF](#).

The setting automatically sends an email reminder at regular intervals until the new SSL certificate is installed by SAP SuccessFactors. The email includes details that identify the specific career site associated with the expiring SSL certificate, for example RCM Company ID, Career Site Builder Site ID, Site Name, and Career Site URL. If the renewal process has already started, the email recipients can ignore these reminders.

5. **Optional:** If role-based permissions for Career Site Builder are enabled, slide the *Is CSB Admin* setting to *ON* to grant Career Site Builder admin permission to the user.
6. **Optional:** Disable the following settings if you only want the individual to receive email notifications without having access to Career Site Builder as an administrator or user:

| Option                                   | Description                                                                                                                  |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Disable Career Site Builder admin access | If role-based permissions for Career Site Builder are enabled, set <i>Is CSB Admin</i> to <i>OFF</i> .                       |
| Disable Career Site Builder user access  | Deselect the ► <i>Administrator Permissions</i> ► <i>Manage Recruiting</i> ► <i>Manage Career Site Builder</i> ► permission. |

7. Repeat this process for every individual you want email reminders sent to.
8. Save your settings.

[Using Role-Based Permissions](#)

## 19.6.10.4 Canceling Subscriptions to SSL Expiration Reminder Notices

Unsubscribe from email reminders about SSL certificates that are going to expire.

### Context

To augment the Career Site Builder popup notice about the pending expiration of SSL certificates, **existing** Career Site Builder administrators have automatically been subscribed by default to email reminders about SSL certificate renewals. **New** Career Site Builder administrators, however, are not automatically subscribed. Existing administrators can also choose to unsubscribe themselves, and organizations can choose to unsubscribe all administrators.

#### ❗ Note

Unsubscribing all administrators is done in the back-end Command Center.

As a customer, you don't have access to Command Center. To complete tasks in Command Center, contact your implementation partner or your Account Executive. For any non-implementation tasks, contact Technical Support.

## Procedure

- Choose any of the following methods:

| Option                                                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Unsubscribe all Career Site Builder administrative users at once from Command Center</b> | In Command Center, select the site, then go to ► <a href="#">Site Details</a> ► <a href="#">Additional Options</a> ► and choose <a href="#">Unsubscribe All Admin Users from SSL Expiration Email</a> . This setting stops all Career Site Builder admin users from getting these notices.                                                                                                                                                                                                                        |
| <b>Turn off subscriptions for individual users from Career Site Builder</b>                 | Turning subscriptions on or off for users is done in Career Site Builder itself. Go to ► <a href="#">Users</a> ► <a href="#">Roles</a> ► <a href="#">Admin Users</a> ► and select the <a href="#">Edit User</a> for the admin user. In the <a href="#">Edit Admin User</a> page, turn the <a href="#">Enable SSL Notification</a> slider to <i>Off</i> .                                                                                                                                                          |
| <b>Unsubscribe from within the email notification</b>                                       | Career Site Builder administrators can unsubscribe directly from within the email notices. A link at the bottom of the email, labeled <a href="#">To unsubscribe from SSL Expiration Emails, click here</a> , takes subscribers to the <a href="#">Manage Email Subscriptions</a> page. Choosing the <a href="#">Unsubscribe</a> button on the page shows the following message: <b>If the information you provided matches an account, you will no longer receive email notifications about SSL expirations.</b> |

## 19.7 Creating an Internal Career Site with Career Site Builder

You can use Career Site Builder to create an internal career site, in addition to an external career site, so that all candidates, internal and external, have the same experience. Using Career Site Builder for your internal career site reduces the overhead of maintaining two different career sites.

The primary difference between the public and internal career sites is in permissions. Configuring the career site to recognize visitors as your employees can allow them to view things like salary information that you might not want to display in a public job listing. This configuration is done by integrating your SAP SuccessFactors system with the Identity Authentication service, so that internal candidates can navigate back and forth between the SAP SuccessFactors system and the career site.

## Prerequisites

Complete the following prerequisites before start setting up your internal career site.

- [Implementing Career Site Builder \[page 344\]](#)
- Setting up the integration between SAP SuccessFactors and Identity Authentication service.
- Career Site Builder is set up and integrated into your Recruiting system.
- Recruiter single sign-on is enabled.
- Career site-Recruiting Management redirects are enabled.

## Overview

The following is an overview of the process:

1. Add SAP SuccessFactors Recruiting service providers in Identity Authentication service.
2. Configure integration between the Identity Authentication service and Career Site Builder.
3. Configure integration between the Identity Authentication service and the Recruiting Management Careers page.
4. Configure SAML 2.0 for career site identity provider (IdP) in Admin Center.
5. Manage recruiting sites under Admin Center.
6. Enable internal career site in Career Site Builder.

## Related Information

[Setting Up SAP SuccessFactors with Identity Authentication and Identity Provisioning Services](#)

### 19.7.1 Adding SAP SuccessFactors Recruiting Service Providers in Identity Authentication

Configure SAML 2.0 Recruiting service providers (SP) in the Identity Authentication administration console.

## Prerequisites

You've configured the SAP SuccessFactors system to use Identity Authentication service for single sign-on (SSO).

## Context

Configure Recruiting service providers in the Identity Authentication service.

## Procedure

1. Go to the Identity Authentication administration console, using the pattern `https://<tenantID>.accounts.ondemand.com/admin`. The `<tenantID>` is the system-generated tenant ID that was part of the URL included in the activation email sent to the first administrator created for the tenant.

### Note

If you're an implementation consultant, contact your customer for permissions and access to the administration console.

2. Go to [Applications & Resources](#) > [Applications](#).
3. Choose [+ Add](#) to add your Recruiting applications.

### Remember

Add both Recruiting Management Careers and Career Site Builder Career Sites as two separate tenants in Identity Authentication service. Ensure that they're **not** configured as child applications of the BizX application.

4. Go to the [Subject Name Identifier](#) area and select [Login Name](#) from the list (to override the default selection [Username](#)).

In your system, the name of the Subject Name Identifier could be [Name ID Attribute](#).

To ensure that the Identity Authentication service works as expected, make sure you use the same [Subject Name Identifier](#) value when configuring the integration with SAP SuccessFactors, Career Site Builder, and SAP SuccessFactors Recruiting.

5. Provide a unique name for your application and choose [Save](#).

### Recommendation

Use a consistent naming convention for all of your applications in Identity Authentication service. For example:

- Recruiting\_Management\_Companyname
- Career\_Site\_Builder\_Sitename

## Results

You've completed the required configurations.

## Next Steps

Configure SAML 2.0 integration between Identity Authentication and Career Site Builder.

## Related Information

[Setting Up SAP SuccessFactors with Identity Authentication and Identity Provisioning Services](#)

### 19.7.2 Configuring Integration Between Identity Authentication and Career Site Builder

Configure a trusted connection between the Identity Authentication service and Career Site Builder, so that internal candidates can access your internal career site with single sign-on (SSO).

#### Prerequisites

You've added Career Site Builder as an application in the Identity Authentication service.

#### Context

##### → Tip

Open both Career Site Builder and the Identity Authentication administration console side by side, so that you can copy information back and forth between them.

##### → Remember

Setting up an internal career site requires integrating Identity Authentication with Career Site Builder and SAP SuccessFactors Recruiting. To ensure that it works as expected, make sure you use the following values across all three configurations:

- *Subject Name Identifier* – select *Login Name*
- *Conditional Authentication* – use SAP Cloud Platform Identity Authentication

#### Procedure

1. In Career Site Builder, go to ► [Settings](#) ► [IDP Configuration](#) ►.
2. Choose [Generate](#) to generate a new certificate.
3. Select [Save](#).
4. Select [Export Metadata](#) in the [Export SAML Metadata](#) section and save the file to your computer.
5. In Identity Authentication, go to ► [Applications & Resources](#) ► [Applications](#) ►.

- a. Choose the Career Site Builder application and select the [SAML 2.0 Configuration](#) page.
  - b. In the [Upload Metadata](#) section, upload the metadata file you saved to your computer by selecting [Browse](#) and navigating to the file location.
  - c. In the [Signing Options](#) section, select [SHA-256](#) from the [Algorithm](#) section's dropdown list.
  - d. Save.
6. **Optional:** If you have any alternative domains for your career site, return to the [SAML 2.0 Configuration](#) page to add them to your settings.

For example, if your career site's main URL is `jobs.example.com`, an alternative domain could be `www.jobs.example.com`.

- a. Copy the main URL from the [Name](#) field at the top of the [SAML 2.0 Configuration](#) page.
- b. For both the [Assertion Consumer Service Endpoint](#) and [Single Logout Endpoint](#) sections, select [+ Add URL](#).

A new row appears in the section with a blank [URL](#) field.

- c. Paste the main URL into the blank [URL](#) field, then replace the portion of the string that's specific to your alternative domain.

Repeat this process for each additional alternative domain for your career site that you want the Identity Authentication service to recognize.

#### Restriction

We don't support IP addresses in URLs as part of our reference architecture. Use domain names instead. If you think you have a special case that requires IP addresses instead of domain names, contact Technical Support.

7. In Identity Authentication, go to [Applications & Resources](#) [Tenant Settings](#) [SAML 2.0 Configuration](#) [Identity Provider Settings](#) [Name](#) and take note of the name.
8. Return to [Career Site Builder](#) [Settings](#) [IDP Configuration](#).
  - a. In the [Tenant Name](#) field, enter the name that you copied in the previous step, without the `https://` portion.
  - b. Save.
9. Select [View metadata details](#) in the [Export SAML Metadata](#) section to verify that the certificates match between Career Site Builder and the corresponding application in the SAML 2.0 configuration page at [Identity Authentication Service \(IAS\)](#) [Applications & Resources](#).

## 19.7.3 Configuring Integration Between Identity Authentication and Recruiting Management

Configure a trusted connection between the Identity Authentication service and the Recruiting Management Careers page.

### Prerequisites

- You've opened your Recruiting Management Careers instance in the Identity Authentication administration console.
- You have the *Manage Service Provider Configuration for Identity Authentication service* permission.

### Context

#### → Remember

Setting up an internal career site requires integrating Identity Authentication with Career Site Builder and SAP SuccessFactors Recruiting. To ensure that it works as expected, make sure you use the following values across all three configurations:

- *Subject Name Identifier* – select *Login Name*
- *Conditional Authentication* – use SAP Cloud Platform Identity Authentication

### Procedure

1. Go to ► *Admin Center* ► *Manage Service Provider Configuration for Identity Authentication service* ► to open the *Career Site Identity Provider (IDP) Configuration* page.
2. In the *Export SAML Metadata* section, select *Export Metadata* and save the exported file.
3. In Identity Authentication, go to ► *Applications & Resources* ► *Applications* ►.
  - a. Choose the Recruiting Management application and select the *SAML 2.0 Configuration* page.
  - b. Choose *Upload Metadata*.
  - c. Browse to locate the metadata file and choose *Upload*.
  - d. In the *Signing Options* section, select *SHA-256* from the *Algorithm* section's dropdown list.
  - e. Save.
4. In Identity Authentication, go to ► *Applications & Resources* ► *Tenant Settings* ► *SAML 2.0 Configuration* ►, and take note of the Tenant ID located in the *Name* field.
5. Return to ► *Admin Center* ► *Career Site Identity Provider (IDP) Configuration* ►.
6. In the *Import IDP SAML Metadata* section:

- a. Set *SAML Integration* to *On*.
  - b. Enter the Tenant ID copied from Identity Authentication into the *Tenant Name* field.
7. Save.

## Results

When the data saves, you can view details of the imported SAML information.

## Related Information

[Setting Up SAP SuccessFactors with Identity Authentication and Identity Provisioning Services](#)

## 19.7.4 Enabling the Internal Career Site

Enable your internal career site, powered by Career Site Builder.

### Prerequisites

You've configured the following integrations:

- Between Identity Authentication and Career Site Builder
- Between Identity Authentication and SAP SuccessFactors Recruiting system.

### Procedure

1. In the SAP SuccessFactors Recruiting system, go to ► [Admin Center](#) ► [Manage Recruiting Sites](#) ►.
2. Select [Enable Internal Career Site powered by Career Site Builder](#).
3. In Career Site Builder, go to ► [Settings](#) ► [Site Configuration](#) ► and open the [Internal Career Site](#) tab.
4. Set the [Internal Career Site](#) field to *Yes*.

#### ⓘ Note

If Identity Authentication isn't configured yet, the field is inactive and the message "Identity Authentication Services (IAS) is not configured," is displayed.

## Results

You've enabled the internal career site.

You can now configure the mapping for 2 new job requisition fields:

- [Internal Job Title](#)
- [Internal Job Description](#)

If configured, employees are shown internal content that isn't available to external candidates.

### Note

In Career Site Builder, public (external) and internal career sites share the same header and footer. This means that you can't specify a header or footer for your organization's internal career site that differs from the public career site.

## 19.7.5 Configuring the Mapping of Recruiting Management Fields to Internal Career Site for Internal Jobs

Map internal fields in a job requisition template with the corresponding fields on your internal career site, so that internal candidates can be shown internal content.

### Prerequisites

- You've enabled an internal career site, powered by Career Site Builder.
- You have the [Set Up Recruiting Marketing Job Field Mapping](#) permission.

### Context

After the internal career site is enabled, you can configure a mapping for 2 new job requisition fields: [Internal Job Title](#) and [Internal Job Description](#). You can use these fields to display internal content to internal candidates.

### Note

This mapping is only required if the Unified Data Model is **not** enabled.

When the Unified Data Model is enabled, a mapping isn't necessary. Your internal career site displays content that comes directly from the job requisition. A mapping is only required if you use XML feeds.

### Note

There's no default field mapping for the internal career site, and if fields aren't mapped for the internal career site, validations are shown on the [Job Posting](#) page to map the fields.

## Procedure

1. Go to ► [Admin Center](#) ► [Set Up Recruiting Marketing Job Field Mapping](#) ►.
2. Select a job requisition from the [Job Requisition Template](#) dropdown list.
3. Select [Internal Job Title](#) in the [Job Title](#) dropdown list.
4. Select [Internal Job Description](#) in the [Job Description](#) dropdown list.
5. Choose the relevant [Location](#) fields ([City](#), [State](#), [Country/Region](#), and [Postal/Zip Code](#), location\_obj).

Mapping RMK Fields to RCM Fields

| RMK Field       | Supported RCM Field Types/Field           |
|-----------------|-------------------------------------------|
| City            | derived, text, picklist, and location_obj |
| State           | derived, text, picklist, and location_obj |
| Country/Region  | derived, text, picklist, and location_obj |
| Zip/Postal Code | text, picklist, and location_obj          |

### Note

If a client is using radial search, Postal Code can't be set to type="picklist".

6. Choose [Save](#).

## Results

You've enabled an internal career site with Career Site Builder, and your customers can experience the new look and feel of it in their instances.

## Next Steps

If you enabled an internal career site for an existing customer, run a Real Time Job Sync full feed to send all internal and external postings to the career site so that internal candidates can search for a job on the internal career site and apply. You can now also choose to make certain pages or page components visible only on the internal career site.

## 19.8 Career Site Builder Reference

### 19.8.1 Pages

#### 19.8.1.1 Pages Types in Career Site Builder

Learn about the different types of pages you can create in Career Site Builder , for different purposes.

You can create the following page types, then customize them by adding page components.

##### Home Pages

The home page editor allows you configure home pages for each active locale and brand.

Career Site Builder path: ► [Pages](#) ► [Home](#) ► [<Locale>](#) ► [<Brand>](#) ► [Home](#) ►

There are no tabs; add your components directly onto the home page. Select each of the components you add here to configure the settings.

##### Content Pages

The home page editor allows you to create web pages in your career site that contains different types of content based on the components you add.

Career Site Builder path: ► [Pages](#) ► [Content](#) ► [<Locale>](#) ► [<Brand>](#) ►

There are no tabs; add your components directly onto the content page. Select each of the components you add here to configure the settings.

##### Category Pages

The category page editor allows you to create career site pages based on different categories, which you specify using category rules.

Career Site Builder path: ► [Pages](#) ► [Category](#) ►

| Category Page Tabs | Description                                                                                                                                                                                                                                                                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Details            | Displays the page name, locale, and brand. Also includes an <a href="#">Active</a> field that you can set to <a href="#">Yes</a> to make this category page visible in your career site.                                                                                                                                                                   |
| Component Layout   | Allows you to insert components for the category page.                                                                                                                                                                                                                                                                                                     |
| Rule Editor        | <p>Allows you to specify conditions based on what types of jobs you want to display on the category page.</p> <p>Make sure that all jobs on a Category page are relevant to the page. Jobs are directed to pages based on the configured rules. Jobs can, and often do, belong to more than one category and can appear on more than on category page.</p> |

Category pages display jobs grouped together based on keyword, location, or other job data. Rules are written for some types of category pages in order to create specific types of pages.

For page titles, use whole words, without acronyms, and words that make sense to candidates outside the organization. Make sure that category pages also have unique copy and unique images to highlight the jobs they're advertising.

If no jobs fit the rules written for a Category page, a message displays and the job seeker sees that the last 10 jobs posted to the site, in any category. This option mitigates the negative impact empty pages can have on SEO.

## Landing Pages

Allows you to create a landing page within your career site.

Career Site Builder path: ► [Pages](#) ► [Landing](#) ►

Use Career Site Builder to set up the following:

- Create and manage a library of landing pages for external career sites.
- Define multiple-column landing pages.
- Include all supported Career Site Builder components.

Landing pages support all configured brands and locales in the Career Site Builder instance.

Landing pages aren't indexed by search engines, and aren't available in the Career Site Builder link editor.

On systems enabled for Candidate Relationship Management features, you can do the following:

- Brand the landing pages appropriately for specific types of candidates
- Include Candidate Relationship Management custom lead-generation data capture forms on landing pages.

[Creating and Configuring Landing Pages in Career Site Builder \[page 456\]](#)

### 19.8.1.2 Page Components

You can use any combination of page components in Career Site Builder to build pages of your career site. By adding these components, you can customize the text, media, links, and functionality that appear on your site.

- Many components share the style attributes (such as background color, background image, background image type, font color, link color, and button color) that affect the styling of the component (without affecting anything outside the component).
- Many components share text fields that you can use to enter text, which appears in different parts of the component.
- Many components share links or lists of links, which you can change as desired. Unlike in the header, however, a link can't be a link list.

- Many components share the font style attributes of font family and font size, which you can specify.
- Components can appear differently depending on the width of the browser, but there isn't always a difference between two widths (for example, tablet and desktop can look the same).
- Page components aren't visible on pages that use the Mobile Apply wrapper. Such pages only show the header and footer from Career Site Builder, with what appears in the body of the page being specific to each individual user (such as logging in, uploading a resume, and so on). Mobile Apply isn't the same as selecting the Mobile setting on your component.

| Component                        | Description                                                                                                                                                                                                                                                                                                  |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Custom Plugin                    | The <a href="#">Custom Plugin</a> component inserts custom code for a new component, such as JavaScript and third-party widgets.                                                                                                                                                                             |
| Data Capture Form                | The <a href="#">Data Capture Form</a> component displays a data capture form. Only available for landing pages, after you create and configure the contents of the data capture form.                                                                                                                        |
| Featured Jobs                    | The <a href="#">Featured Jobs</a> component displays links to featured jobs. You can configure the style and destination of links.                                                                                                                                                                           |
| Google Job Map                   | The <a href="#">Google Job Map</a> component displays jobs on a map. You can control some aspects of the map's appearance.                                                                                                                                                                                   |
| Image Carousel and Text          | The <a href="#">Image Carousel and Text</a> component displays a rotating series of images and/or text, as a slide show. You can configure the content of each slide, as well as the appearance of the component as a whole.                                                                                 |
| Image Carousel                   | The <a href="#">Image Carousel</a> component displays a rotating series of images, as a slide show. You can configure the content of each slide, as well as the style and colors of the component as a whole.                                                                                                |
| Info and Subscribe Form          | The <a href="#">Info and Subscribe Form</a> component displays information about the company, side by side with the Talent Community Subscribe form.                                                                                                                                                         |
| Large Image                      | The <a href="#">Large Image</a> component displays a "hero" image that spans the width of the page. The component includes a large image with a customized dropdown navigation (height 250 px for mobile; 390 px for tablet; 590 px for desktop) (absolute minimum 200 px; maximum 9999 px; default 590 px). |
| Search Bar                       | The <a href="#">Search Bar</a> component displays the search bar that people can use to search for jobs. Settings are located in Global Styles.                                                                                                                                                              |
| Subscribe Form                   | The <a href="#">Subscribe Form</a> component displays an email sign-up form for the Talent Community.                                                                                                                                                                                                        |
| Text                             | The <a href="#">Text</a> component displays a single column of text. You can't change the size or orientation of the component.                                                                                                                                                                              |
| Three Column Images with Caption | The <a href="#">Three Column Images with Caption</a> component displays three columns of content in a set layout. The content can be images or text.                                                                                                                                                         |
| Two Columns                      | The <a href="#">Two Columns</a> component displays a banner that spans the width of the page. It can include an image, a background color, and text. The text is always on the right side. The image doesn't display on mobile devices.                                                                      |
| Upload Resume                    | The <a href="#">Upload Resume</a> component displays a banner where people can upload a resume to find jobs that match their skills. The component spans the width of the page and supports a variety of layouts. You can include images, background colors, and text.                                       |

| Component | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Video     | <p>The <a href="#">Video</a> component enables you to add (embed) videos on a career site page. It supports videos from YouTube, Vimeo, and Wistia.</p> <div> <p><b>Note</b></p> <p>For this functionality to be visible to visitors in your career site, make sure to include its related cookie provider in the cookie consent manager at <a href="#">Appearance &gt; Global &gt; Cookie Manager</a>. If the cookie banner is enabled without including the corresponding cookie provider in the cookie consent manager, this functionality is removed and unavailable to your site's visitors completely.</p> </div> |

## Bulleted Lists

Bulleted lists, in those page components that accept them, don't use a hanging indent after the first line of text. This means that the second line of text is aligned with the bullet, and not the first word in the first line of text. The page components that can include bulleted lists are:

- Text
- Image and Text Carousel
- Three Column Images with Caption
- Info and Subscribe Form
- Subscribe Form
- Two Columns
- Video

### Note

Bulleted lists within a job description don't follow this formatting; subsequent lines of text are aligned with the text, and not the bullet.

### 19.8.1.2.1 Custom Plugin Component Settings in Career Site Builder

The Custom Plugin component allows you to insert custom code for a new component on any career site page created in Career Site Builder, such as JavaScript and third-party widgets.

### Caution

Any custom JavaScript code that's added to your career site for purposes other than tracking, can cause pages to not display the configured content across the application process, and also affect the site theme and styling.

The following could result in the breakdown of some or all career site functionality, possibly rendering the site unusable:

- Introducing other versions than the one provided for JQuery or Bootstrap.
- Introducing any third-party libraries.
- Changing the layout (such as CSS or JavaScript) of any components other than the Custom Plugin component.
- Manipulating of external resources that SAP doesn't support, and which SAP won't fix if they're found to be the cause of any issues.

Such customizations, if they're the cause of problems, are removed or deactivated.

The Custom Plugin component allows Career Site Builder administrators to add whatever they want to the career site, introducing unique, standalone layout components.

For example, you can create page components with different layouts than the standard Career Site Builder components, include custom HTML, gadgets, or widgets and interactive elements such as videos, sliders, and animations, provide custom forms, or create a photo gallery.

### Note

If the element or component uses cookies, make sure to include its related cookie provider in the cookie consent manager at ► [Appearance](#) ► [Global](#) ► [Cookie Manager](#) ►. If the cookie banner is enabled without including the corresponding cookie provider in the cookie consent manager, this element or component is removed and unavailable to your site's visitors completely.

Multiple components are allowed on the same page.

Custom plugins, depending on how they're written, don't necessarily correspond at all to any other Career Site Builder configuration, and can optionally exist as a separate page displayed within the career site.

The component exists like other components, and can be added to any page and individually controlled.

Career Site Builder surrounds the Custom Plugin component with a CSS `customPlugin` class to make the content easily identifiable.

Each Custom Plugin component is limited to 2 MB, regardless of what content you add. This is the equivalent of approximately 2,000,000 characters. If your custom content is too large, consider the following possible solutions:

- Minify the code for your custom plugin to reduce all unnecessary characters from your code.
- Split your custom plugin in half, or in smaller increments. You can have multiple custom plugins on a single page, as long as each is no larger than 2 MB.
- Host the code externally and link to that script.

### Note

The Custom Plugin component doesn't support Base64 images. Link to them instead.

The Image Selector is not available for the Custom Plugin component. To upload an image to your Career Site Builder image library so that you can link to it in your customized content, refer to *Uploading Images to Link to in Career Site Builder Custom Plugin Components*.

## Considerations

Platform updates are supposed to not break the custom component "plug ins", but such defects are theoretically possible.

Configurable visibility checkboxes (desktop/tablet/mobile) of the component may or may not have the expected effect, depending on how the custom plugin is written. The visibility checkboxes just add `display:none` to different device widths. This means that if the custom plugin contains JavaScript or CSS, that custom JavaScript or custom CSS are still applied to the page (unless that custom code is device-specific).

### 19.8.1.2.2 Data Capture Form Component Settings in Career Site Builder

The Data Capture Form component allows you to insert a Data Capture Form into a Landing Page.

#### → Recommendation

Job alerts you create in the Data Capture Form component in Career Site Builder differ from the job alerts you can set up in SAP SuccessFactors Recruiting. Use the latter only if you don't use Career Site Builder to develop your career site.

In addition to customizing how the data capture form component will appear on a landing page, the Data Capture Form component allows you to configure and add a job alert to the Data Capture Form.

When you add Job Alert to a form, a successful submission of a form by a candidate triggers the predefined job alert. Only the first form that's completed by a candidate will generate a job alert.

#### ⓘ Note

Before you use this component, make sure you've created the Data Capture Form itself, so that you have a form to specify in the component. This component doesn't create the form.

## Details Tab

| Field                                  | Description                                                                                                                                                              |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Data Capture Form</a>      | A dropdown list where you select the data capture form you created.                                                                                                      |
| <a href="#">Data Capture Form Code</a> | To search for a candidate who submits a data capture form, you must assign a code to the form at the creation of the form. The code must contain 40 characters or fewer. |

| Field                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Data Capture Form Header</i>       | Enter a name for the header. There's no default value. To change the header style, select the  <i>style</i> icon to display the <i>Data Capture Form Header Styling</i> dialog. There, you can specify the font, font size, text alignment, and text color. You can also hide the header by enabling the <i>Hide Header Text</i> field.                                 |
| <i>Data Capture Form Instructions</i> | Enter instructional text. There's no default value. To change the text style, select the  <i>style</i> icon to display the <i>Data Capture Form Instructions Styling</i> dialog. There, you can specify the font, font size, text alignment, and text color.                                                                                                            |
| <i>Button Text</i>                    | The text for the <i>Submit</i> button. The default text is <b>Submit</b> . To change the text style, choose  <i>style</i> to display the <i>Data Capture Form Button Styling</i> dialog. There, you can specify the font, font size, and text color.                                                                                                                    |
| <i>Success Message</i>                | The text that appears when the data capture form was submitted successfully. The default text is <b>Thank you. Your information has been submitted.</b> To change the text style, choose  to display the <i>Data Capture Form Success Message Styling</i> dialog. There, you can specify the font, font size, text alignment, text color, and background color.         |
| <i>Completed Message</i>              | The text that appears if the candidate has already completed their form. The default text is <b>You have already completed and submitted all requested information.</b>                                                                                                                                                                                                                                                                                  |
| <i>Existing User Message</i>          | The text that appears for existing users who update their profile. To change the default message, " <b>Thank you for submitting your information to our company. Your existing profile will be updated.</b> " choose  <i>double-square</i> . The <i>Override Resource Key</i> dialog appears, and you can provide override text as well as choose a different locale. |

## Styles Tab

| Fields                           | Description                                                                                                                                                                                                                         |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Body Background</i>           | Specify the background color.                                                                                                                                                                                                       |
| <i>Button Highlight</i>          | Specify the highlight color for the button.                                                                                                                                                                                         |
| <i>Button Background</i>         | Specify the button's background color.                                                                                                                                                                                              |
| <i>Background Image</i>          | Allows you to choose an image on the Data Capture Form. Choosing  <i>Select Image</i> or <i>Change Image</i> displays the Image Selector dialog. |
| <i>Required Field Identifier</i> | Specify the color of the asterisk that indicates whether a field requires a value.                                                                                                                                                  |
| <i>Field Alignment</i>           | Specifies how you want the field labels to align to their corresponding fields. Options are: Left Align, Center, and Right Align.                                                                                                   |

| Fields                | Description                                                                                                                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Image Type</i>     | Choose how you want the image to appear. Options are: Unmodified, Tiled, Stretched, Horizontally Scaled, Vertically Scaled, and Vertically & Horizontally Scaled.                               |
| <i>Image Position</i> | Choose where you want the focal point of the image to be. Options are: Top Left, Top Middle, Top Right, Middle Left, Middle Middle, Middle Right, Bottom Left, Bottom Middle, and Bottom Right. |

## DPCS Tab

The DPCS tab allows you to customize the font and colors in the Data Privacy Consent Statement.

| Fields                   | Description                                                                                                                                                                                    |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Font</i>              | The color of the text font.                                                                                                                                                                    |
| <i>Background</i>        | The color of the background.                                                                                                                                                                   |
| <i>Button Background</i> | The background color of the button.                                                                                                                                                            |
| <i>Button Hover</i>      | The color of the button when a user mouses or tabs over it.                                                                                                                                    |
| <i>Button Font</i>       | The color of the text in the button.                                                                                                                                                           |
| <i>Button Font Hover</i> | The color of the button text when a user mouses or tabs over it.                                                                                                                               |
| <i>Link Hover</i>        | The color of the focus indicator, the outline that appears around the text of a link when the user focuses on it using keyboard navigation. Choose a prominent color to improve accessibility. |
| <i>Link Font (color)</i> | The color of the link text.                                                                                                                                                                    |
| <i>Link Font (font)</i>  | The font of the link text.                                                                                                                                                                     |
| <i>Link Font Size</i>    | The font size of the link text.                                                                                                                                                                |
| <i>Font</i>              | The font of the text on the Data Privacy Capture Statement.                                                                                                                                    |
| <i>Font Size</i>         | The font size of the text.                                                                                                                                                                     |
| <i>Button Font</i>       | The font of the button text.                                                                                                                                                                   |
| <i>Button Font Size</i>  | The font size of the button text.                                                                                                                                                              |

## Job Alerts Tab

The Job Alerts tab allows you to create a filter rule so that the candidates who complete the data capture form receive only those alerts related to those jobs that meet the filter settings.

Make sure you enable job alerts, and set up a job alert email template.

| Fields           | Description                                                                                                                                                                                                                                                                 |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Keyword</i>   | Specify keywords for your filter. The fields that Keyword searches in are: Title; Internal Title; Department; Description; Internal Description; Facility; Business Unit; Company Location; Location; City; State; State Name; Country/Region; Country/Region Name; Req Id. |
| <i>Location</i>  | Specify locations for your filter. The fields that Location searches in are: Company Location; Location; City; State; State Name; Country/Region; Country/Region Name; Zip.                                                                                                 |
| <i>Frequency</i> | Specify how often, in days, that candidates receive job alert email. The default is 7; the range is 1 to 99 days.                                                                                                                                                           |

Perform the search by selecting [Search](#). Add additional filters by choosing **+** [add](#), and selecting a field from the dropdown list. You can remove these additional fields from your filter by choosing  [delete](#).

### 19.8.1.2.3 Featured Jobs Component Settings in Career Site Builder

The Featured Jobs component allows you to display high-profile or high-importance jobs on your career site. You can also edit styles and control the appearance and destination link of a button in this component.

#### Details Tab

| Field              | Description                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Header Text</i> | Enter a name for the header. There's no default value. To change the header style, select the  <a href="#">style</a> icon to display the <a href="#">Open Styling</a> dialog. There, you can specify the font, font size, text alignment, and text color. You can also hide the header by enabling the <a href="#">Hide Header Text</a> field. |

| Field                       | Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Show Button</a> | Enable this field to show a hyperlinked button. Choose <a href="#">Edit Button</a> to use the Button Editor dialog to specify what to link to. Options include Category Link, Content, External, Home Page, TC Join, Top Jobs, and View All Jobs. All options allow you to specify your own title as well as add brief text. Some, like the Category Link option, lets you choose which specific page to link to. |

## Menu Tab

By default, the Menu tab is empty. Use the Menu tab to add links to category pages.

Links display in three columns within the component, and is not configurable.

Choose  [Add](#) to open the Link Setup dialog. The Link Setup dialog includes the same options as the Button Editor dialog for [Show Button](#).

Choose  [Open Styling](#) to open the Featured Jobs Link Styling dialog, and specify the font and size.

## Styles Tab

Configure the color of the links, the header text, and the background of the component.

| Field                            | Description                                                                                                                                                                                    |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Background</a>       | Specify the background color.                                                                                                                                                                  |
| <a href="#">Link</a>             | Specify the color of the link text.                                                                                                                                                            |
| <a href="#">Link Hover</a>       | The color of the focus indicator, the outline that appears around the text of a link when the user focuses on it using keyboard navigation. Choose a prominent color to improve accessibility. |
| <a href="#">Background Image</a> | Choose  <a href="#">Select Image</a> to open the Image Selector dialog and choose an image.                 |
| <a href="#">Image Type</a>       | Specify how you want the image to appear. Options are: Unmodified, Tiled, Stretched, Horizontally Scaled, Vertically Scaled, and Vertically & Horizontally Scaled.                             |
| <a href="#">Image Position</a>   | Specify where you want the image to appear. Options are: Top Left, Top Middle, Top Right, Middle Left, Middle Middle, Middle Right, Bottom Left, Bottom Middle, and Bottom Right.              |
| <a href="#">Enable Spacing</a>   | When enabled, allows you to customize the spacing around the top, bottom, right, and left of the component.                                                                                    |

## 19.8.1.2.4 Google Job Map Component Settings in Career Site Builder

Adding the [Google Job Map](#) component allows your jobs to appear in the map UI on your career site.

### Note

If the Unified Data Model is enabled, you first need to configure the Job Location generic object, before you can use the Google Job Map component.

### Details Tab

| Field                                                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Zoom Level</a>                                                   | A range of 1 (furthest away) to 10 (closest zoom), this setting designates the default zoom level on the Google job map.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <a href="#">Map Center Latitude</a> and <a href="#">Map Center Longitude</a> | Use these two settings together to designate a default focus location of the Google job map. For example, if a company's headquarters is in a specific city, you can enter its coordinates. You can find the latitude and longitude by locating the area using Google Maps and choosing <a href="#">What's Here</a> .                                                                                                                                                                                                                                                                                                                                                                   |
| <a href="#">Predefined Map Center Options</a>                                | The three options (USA, Europe, World) affect the focus location in the <a href="#">Map Center Latitude</a> and <a href="#">Map Center Longitude</a> fields.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <a href="#">Search Filtered by Locale</a>                                    | If enabled, job searches performed on the Google job map are filtered by locale.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <a href="#">Max Height of Job Map</a>                                        | Designates the maximum height of the map in pixels.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <a href="#">Region Code</a>                                                  | <p>Google Maps applies a set of standards skewed toward audiences in the United States. To present your map with a different regional focus, override this default behavior by entering a standard code into this box.</p> <p>For a list of accepted codes and their behavior, refer to the Google developer documentation.</p>                                                                                                                                                                                                                                                                                                                                                         |
| <a href="#">Show Heading</a>                                                 | <p>By enabling this option, Google Job Map displays the following messages:</p> <p><b>Screen readers cannot read the following searchable map.</b></p> <p>This second message directs you to the Job Search page:</p> <p><b>Follow this link to reach our Job Search page to search for available jobs in a more accessible format.</b></p> <p>You can change the default wording of both messages in <a href="#">Tools &gt; Translations</a> in the <a href="#">GoogleJobMapHeading</a> and <a href="#">GoogleJobMapLink</a> fields. You can also change the default value of <b>Google job map</b> as the HTML iFrame value in the <a href="#">GoogleJobMapiFrameTitle</a> field.</p> |

## Styles Tab

| Field                          | Description                                                                                                 |
|--------------------------------|-------------------------------------------------------------------------------------------------------------|
| <a href="#">Enable Spacing</a> | When enabled, allows you to customize the spacing around the top, bottom, right, and left of the component. |

## 19.8.1.2.5 Image and Text Carousel Component Settings in Career Site Builder

The Image and Text Carousel component allows you to add a gallery of images in slide format on a career site page, with accompanying text.

### Slides Tab

| Fields                                                                                                      | Description                                                                                                                                                                                                                                                  |
|-------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  <a href="#">styling</a> | Select the icon to display the Image and Text Carousel Styling dialog. In it, you can specify the body font and body font size of the text of your carousel slides.                                                                                          |
|  <a href="#">Add</a>     | Select to add additional image and text entries in your component. By default, the component includes one slide, and you can have up to four slides.                                                                                                         |
| <a href="#">Display Interval</a>                                                                            | Allows you to specify the number of seconds (up to 10) before the carousel moves to the next slide. The default value is 0 (where you navigate the slides manually).                                                                                         |
| <a href="#">Auto Focus</a>                                                                                  | Places the focus on the image carousel when the slides advance. When the display interval is set to greater than 0 and auto focus is on, the focus repositions you to the active carousel regardless of where you are on the page.                           |
| <a href="#">Slide &lt;Number&gt;</a>                                                                        | <p>Allows you to choose an image to display. Choose <a href="#">Select Image</a> or <a href="#">Change Image</a> to open the Image Selector dialog.</p> <p>The number on the field label changes depending on how many slides you add in this component.</p> |
| <a href="#">Image Type</a>                                                                                  | Choose how you want the image to appear in the slide. Options are: Unmodified, Tiled, Stretched, Horizontally Scaled, Vertically Scaled, and Vertically & Horizontally Scaled.                                                                               |

| Fields                                                                                                                                                                                                                                                                                                                                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Image Position</i>                                                                                                                                                                                                                                                                                                                                                               | Sets the focal point of the image. Options are: Top Left, Top Middle, Top Right, Middle Left, Middle Middle, Middle Right, Bottom Left, Bottom Middle, and Bottom Right.                                                                                                                                                                                                                                                           |
| <i>Header Text</i>                                                                                                                                                                                                                                                                                                                                                                  | The text field allows you to provide a header for the text block. To change the header style, choose  <i>style</i> to display the <i>Image and Text Carousel Header Styling</i> dialog. There, you can specify the font, font size, text alignment, and text color. You can also hide the header by enabling the <i>Hide Header Text</i> field. |
| <i>Body Text</i>                                                                                                                                                                                                                                                                                                                                                                    | Enter your body text in the field. You can configure how the text appears by using its style menu.                                                                                                                                                                                                                                                                                                                                 |
| <i>Background Image</i>                                                                                                                                                                                                                                                                                                                                                             | Allows you to choose an image to display behind the body text. Choose <i>Select Image</i> or <i>Change Image</i> to open the Image Selector dialog.                                                                                                                                                                                                                                                                                |
| <div>  <b>Note</b> </div> <div> <p>Use a plain or subtle image for your background image, so that your body text is visible and legible.</p> <p>If you want to use the same background image for all your slides, leave this field blank and use the settings in the <i>Styles</i> tab.</p> </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <i>Image Type</i>                                                                                                                                                                                                                                                                                                                                                                   | Choose how you want the image to appear.                                                                                                                                                                                                                                                                                                                                                                                           |
| <i>Image Position</i>                                                                                                                                                                                                                                                                                                                                                               | Choose where you want the focal point of the image to be.                                                                                                                                                                                                                                                                                                                                                                          |

## Styles Tab

| Fields                 | Description                                                                                                                                                                                          |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Text</i>            | Specify the text color.                                                                                                                                                                              |
| <i>Background</i>      | Specify the color of the background.                                                                                                                                                                 |
| <i>Chevron</i>         | Specify the color of the navigational arrows on the slides.                                                                                                                                          |
| <i>Chevron Hover</i>   | Specify the color of the arrows when the mouse hovers over them.                                                                                                                                     |
| <i>Active Slide</i>    | Specify a different color to indicate which number slide is being displayed.                                                                                                                         |
| <i>Slide Indicator</i> | Specify a color for the slide indicator, which are small squares that appear on the bottom right of your slide images.                                                                               |
| <i>Link</i>            | Specify a color for the link text.                                                                                                                                                                   |
| <i>Link Hover</i>      | Specify a color of the focus indicator, the outline that appears around the text of a link when the user focuses on it using keyboard navigation. Choose a prominent color to improve accessibility. |

| Fields                           | Description                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Background Image</a> | Allows you to choose an image to display behind the body text. Choose <a href="#">Select Image</a> or <a href="#">Change Image</a> to open the Image Selector dialog.                                                                                                                                                                                                          |
|                                  | <div>  <b>Note</b> </div> <p>Use a plain or subtle image for your background image, so that your body text is visible and legible.</p> <p>If you want to use different background images for your slides, leave this field blank and use the settings in the <a href="#">Details</a> tab.</p> |
| <a href="#">Image Type</a>       | Choose how you want the image to appear.                                                                                                                                                                                                                                                                                                                                       |
| <a href="#">Image Position</a>   | Choose where you want the focal point of the image to be.                                                                                                                                                                                                                                                                                                                      |
| <a href="#">Enable Spacing</a>   | When enabled, allows you to customize the spacing around the top, bottom, right, and left of the component.                                                                                                                                                                                                                                                                    |

## 19.8.1.2.6 Image Carousel Component Settings in Career Site Builder

The [Image Carousel](#) component adds a rotating selection of images to a career site page.

### Details Tab

| Fields                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Header Text</a>          | The text field allows you to provide a header for the text block. To change the header style, select the  (style) icon to display the <a href="#">Image Carousel Header Styling</a> dialog. There, you can specify the font, font size, text alignment, and text color. You can also hide the header by enabling the <a href="#">Hide Header Text</a> field. |
| <a href="#">Visible Images</a>       | Specify the number of images to be visible at one time on the carousel.                                                                                                                                                                                                                                                                                                                                                                           |
| <a href="#">Move Per Page</a>        | Specify how many images to scroll when the navigation arrows are selected.                                                                                                                                                                                                                                                                                                                                                                        |
| <a href="#">Space Between Images</a> | Specify the amount of space between each image, ranging from 0 to 100 pixels.                                                                                                                                                                                                                                                                                                                                                                     |
| <a href="#">Height</a>               | Specify the height of the carousel, ranging from 50 to 500 pixels.                                                                                                                                                                                                                                                                                                                                                                                |
| <a href="#">Display Interval</a>     | Specify the number of seconds (up to 10) before the carousel moves to the next slide. The default value is 0 (where you navigate the slides manually).                                                                                                                                                                                                                                                                                            |

| Fields                     | Description                                                                                                                                                                                                                        |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Auto Focus</a> | Places the focus on the image carousel when the slides advance. When the display interval is set to greater than 0 and auto focus is on, the focus repositions you to the active carousel regardless of where you are on the page. |

## Images Tab

| Fields                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Image</a>          | Allows you to choose an image to display. Choosing the  <a href="#">Select Image</a> or <a href="#">Change Image</a> displays the Image Selector dialog.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <a href="#">Image Type</a>     | Choose how you want the image to appear in the slide. Options are: Unmodified, Tiled, Stretched, Horizontally Scaled, Vertically Scaled, and Vertically & Horizontally Scaled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <a href="#">Image Position</a> | Sets the focal point of the image. Options are: Top Left, Top Middle, Top Right, Middle Left, Middle Middle, Middle Right, Bottom Left, Bottom Middle, and Bottom Right.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <a href="#">Is Link</a>        | <p>Enabling this setting turns the image into a link. Choose <a href="#">Edit Link</a> to configure the link in the <a href="#">Link Setup</a> dialog. The fields you can configure are:</p> <ul style="list-style-type: none"> <li>Type – choose from Category Link, Content, External, Home Page, TC Join, Top Jobs, or View All Jobs.</li> <li>Title – enter text for the link title</li> <li>Text – enter text for link.</li> <li>Source – appears when you choose External, to specify your external URL.</li> <li>New Session – appears when you choose External. Enabling this opens a new browser window for the link.</li> <li>Category Link – appears when you choose Category Link. Select a category page from the dropdown list.</li> <li>Content Link – appears when you choose Content. Select a content page from the dropdown list.</li> </ul> |

## Styles Tab

| Fields                             | Description                                                                                                                                                                                            |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Content Background</a> | Specify the content background color.                                                                                                                                                                  |
| <a href="#">Image Background</a>   | Specify the image background color.                                                                                                                                                                    |
| <a href="#">Header Background</a>  | Specify the header background color.                                                                                                                                                                   |
| <a href="#">Link Hover</a>         | Specify the color of the focus indicator, the outline that appears around the text of a link when the user focuses on it using keyboard navigation. Choose a prominent color to improve accessibility. |
| <a href="#">Chevron</a>            | Specify the color of the navigational arrows on the slides.                                                                                                                                            |

| Fields                           | Description                                                                                                                                                                                                                                                |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Chevron Hover</a>    | Specify the color of the arrows when the mouse hovers over them.                                                                                                                                                                                           |
| <a href="#">Active Slide</a>     | Specify a different color to indicate which number slide is being displayed.                                                                                                                                                                               |
| <a href="#">Background Image</a> | Allows you to choose an image to display behind the body text. Choosing  <a href="#">Select Image</a> or <a href="#">Change Image</a> displays the Image Selector dialog. |
| <a href="#">Image Type</a>       | Choose how you want the image to appear.                                                                                                                                                                                                                   |
| <a href="#">Image Position</a>   | Choose where you want the focal point of the image to be.                                                                                                                                                                                                  |
| <a href="#">Enable Spacing</a>   | When enabled, allows you to customize the spacing around the top, bottom, right, and left of the image carousel.                                                                                                                                           |

## 19.8.1.2.7 Info and Subscribe Component Settings in Career Site Builder

The Info and Subscribe Form component displays an image or information about the company, alongside the Talent Community Subscribe Form.

### Details Tab

Fields in this screen that have the  [double-square](#) icon allow you to override the default text. Select the icon to display the [Override Resource Key](#) dialog, where you can provide your own text as well as choose a different locale for the field.

Fields in this screen that have the  [text](#) icon allow you to customize the look of the field's text, such as the font and font size. Some fields also allow you to customize the text alignment, and text color, or hide the label altogether by enabling the [Hide Header Text](#) field.

| Fields                      | Description                                                                                                                                                                                                                               |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Header Text</a> | The text field allows you to provide a header for the text block.                                                                                                                                                                         |
| <a href="#">Image</a>       | Allows you to choose an image to display. Choosing  <a href="#">Select Image</a> or <a href="#">Change Image</a> displays the Image Selector dialog. |

| Fields                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Treat Image as Link</a> | <p>Enabling this setting turns the image into a link. Choose <a href="#">Edit Link</a> to configure the link in the <a href="#">Link Setup</a> dialog. The fields you can configure are:</p> <ul style="list-style-type: none"> <li>Category Link – displays the Title and Text fields, and includes a dropdown list from which to select a category page.</li> <li>Content – displays the Title and Text fields, and includes a dropdown list from which to select a content page.</li> <li>External – displays the Title, Text, and Source (URL) fields. Enable the New Session setting if you want the link to open in a new browser window.</li> <li>Home Page – displays the Title and Text fields, both of which are set to display <b>Home Page</b> by default.</li> <li>TC Join – displays the Title and Text fields, both of which are set to display <b>Join Talent Community</b> by default.</li> <li>Top Jobs– displays the Title and Text fields, both of which are set to display <b>Top Jobs</b> by default.</li> <li>View All Jobs– displays the Title and Text fields, both of which are set to display <b>View All Jobs</b> by default.</li> </ul> <p>The <a href="#">Link Type</a> field shows what you choose.</p> |
| <a href="#">Body Text</a>           | <p>Allows you to enter text that appears above the subscription field. Use the field's formatting menu to change the look of your text.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <a href="#">Show Button</a>         | <p>Enable this field to show a hyperlink button. Choose <a href="#">Edit Button</a> to use the Button Editor dialog to specify what to link to. Options are the same as what appear in <a href="#">Edit Link</a> for <a href="#">Treat Image as Link</a>: Category Link, Content, External, Home Page, TC Join, Top Jobs, and View All Jobs.</p> <p>The <a href="#">Button Type</a> field shows what you choose. Select the  <a href="#">text</a> icon next to the <a href="#">Button Text</a> field to set the font and size in the <a href="#">Info and Join Button Styling</a> dialog.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <a href="#">Subscribe Header</a>    | <p>The default header text is <b>JOIN OUR TALENT NETWORK</b>.</p> <p>Change the field's text with the  <a href="#">double-square</a> icon and its style with the  <a href="#">text</a> icon.</p> <p>The <a href="#">Info and Join Subscribe Header Styling</a> dialog lets you specify the font, font size, text alignment, and text color. You can also hide the header by enabling the <a href="#">Hide Header Text</a> field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Fields                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <a href="#">Text</a>             | Specify the text color.                                                                                                                                                                                                                                    |
| <a href="#">Background</a>       | Specify the background color.                                                                                                                                                                                                                              |
| <a href="#">Link</a>             | Specify a color for the link text.                                                                                                                                                                                                                         |
| <a href="#">Link Hover</a>       | Specify a color of the focus indicator, the outline that appears around the text of a link when the user focuses on it using keyboard navigation. Choose a prominent color to improve accessibility.                                                       |
| <a href="#">Background Image</a> | Allows you to choose an image to display behind the body text. Choosing  <a href="#">Select Image</a> or <a href="#">Change Image</a> displays the Image Selector dialog. |
| <a href="#">Image Type</a>       | Choose how you want the image to appear.                                                                                                                                                                                                                   |
| <a href="#">Image Position</a>   | Choose where you want the focal point of the image to be.                                                                                                                                                                                                  |
| <a href="#">Enable Spacing</a>   | When enabled, allows you to customize the spacing around the top, bottom, right, and left of the component.                                                                                                                                                |

### 19.8.1.2.8 Large Image Component Settings in Career Site Builder

The large image component allows you to add a prominently placed banner — sometimes called hero image — to Career Site Builder pages.

## Styles Tab

| Fields                           | Description                                                                                                                                                                                                                                                                |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Background Image</a> | Allows you to choose an image to display behind the body text. Selecting the  <a href="#">Select Image</a> or <a href="#">Change Image</a> buttons displays the Image Selector dialog. |
| <a href="#">Image Type</a>       | Choose how you want the image to appear. Options are: Unmodified, Tiled, Stretched, Horizontally Scaled, Vertically Scaled, and Vertically & Horizontally Scaled.                                                                                                          |
| <a href="#">Image Position</a>   | Choose where you want the focal point of the image to be. Options are: Top Left, Top Middle, Top Right, Middle Left, Middle Middle, Middle Right, Bottom Left, Bottom Middle, and Bottom Right.                                                                            |

| Fields                              | Description                                                                                                                                                                                                                                                                                               |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Max Height of Image</a> | <p>Allows you to specify the maximum height of your large image. The valid height range 0 to 9,999 pixels.</p> <p>The following are the default, optimal heights:</p> <ul style="list-style-type: none"> <li>• Desktop: 590 pixels</li> <li>• Mobile: 250 pixels</li> <li>• Tablet: 390 pixels</li> </ul> |
| <a href="#">Enable Spacing</a>      | When enabled, allows you to customize the spacing around the top, bottom, right, and left of the image carousel.                                                                                                                                                                                          |

### 19.8.1.2.9 Search Bar Component Settings in Career Site Builder

The Search Bar component adds a search bar in your page.

The Search Bar component is a global setting that is added at the component level, but not edited there. The Search Bar layout reflects what's selected for the specific locale and brand under [Global Styles](#) > [Search](#).

Leading practice is for prominent place of the search bar, that is, "above the fold," which doesn't require scrolling, and to use a strong background color.

### 19.8.1.2.10 Subscribe Form Component Settings in Career Site Builder

The Subscribe Form component adds an email sign-up form for the Talent Community.

The Subscribe Form is a smaller page element within a box that is the full width of the page. You can't change the orientation of the Subscribe Form inside the box, or the size of the form.

#### Details Tab

Fields in this screen that have the  [double-square](#) icon allow you to override the default text. Select the icon to display the [Override Resource Key](#) dialog, where you can provide your own text as well as choose a different locale for the field.

Fields in this screen that have the  [text](#) icon allow you to customize the look of the field's text, such as the font and font size. Some fields also allow you to customize the text alignment, and text color, or hide the label altogether by enabling the [Hide Header Text](#) field.

| Fields                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Header Text</a>       | <p>The text field allows you to provide a header for the text block. The default text is <b>Join Our Talent Community</b>.</p> <p>Change the field's style with the  <a href="#">text</a> icon.</p> <p>The <a href="#">Subscribe Form Header Styling</a> dialog lets you specify the font, font size, text alignment, and text color. You can also hide the header by enabling the <a href="#">Hide Header Text</a> field.</p> |
| <a href="#">Body Text</a>         | <p>Allows you to enter text that appears above the subscription field. The following is the default text:</p> <p><b>Stay connected by joining our network!</b><br/> <b>Enter your e-mail and tell us a bit about yourself, and we'll keep you informed about upcoming events and opportunities that match your interests.</b></p> <p>Use the field's formatting menu to change the look of your text.</p>                                                                                                         |
| <a href="#">Show E-mail Label</a> | <p>Enable this option to display a label for the email field. The behavior of the <a href="#">Label Text</a> and <a href="#">Placeholder Text</a> fields depending on your settings for this field.</p>                                                                                                                                                                                                                                                                                                           |
| <a href="#">Label Text</a>        | <p>Set the <a href="#">Show E-mail Label</a> field to <b>YES</b> to enable this field, and display a label for the email address. The default text is <b>E-Mail Address</b>.</p> <p>Change the field's style with the  <a href="#">text</a> icon.</p> <p>The <a href="#">Subscribe Form E-mail Label Styling</a> dialog lets you specify the font and font size.</p>                                                         |
| <a href="#">Placeholder Text</a>  | <p>Set the <a href="#">Show E-mail Label</a> setting to <b>NO</b> to enable this field, and display placeholder text in the email address. The default value for this field is <b>Enter E-Mail Address</b>.</p>                                                                                                                                                                                                                                                                                                   |
| <a href="#">Button Text</a>       | <p>Specify the text that appears on the subscribe button. The default text is <b>Sign up now</b>.</p> <p>Change the field's style with the  <a href="#">text</a> icon.</p> <p>The <a href="#">Subscribe Form Button Styling</a> dialog lets you specify the font and font size.</p>                                                                                                                                          |

## Styles Tab

| Fields                     | Description                                                                                                                                                                                            |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Body Text</a>  | Specify the text color.                                                                                                                                                                                |
| <a href="#">Background</a> | Specify the background color.                                                                                                                                                                          |
| <a href="#">Link Hover</a> | Specify the color of the focus indicator, the outline that appears around the text of a link when the user focuses on it using keyboard navigation. Choose a prominent color to improve accessibility. |

| Fields                           | Description                                                                                                                                                                                                                                                 |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Background Image</a> | Allows you to choose an image to display behind the body text. Selecting  <a href="#">Select Image</a> or <a href="#">Change Image</a> displays the Image Selector dialog. |
| <a href="#">Image Type</a>       | Choose how you want the image to appear. Options are: Unmodified, Tiles, Stretched, Horizontally Scaled, Vertically Scaled, and Vertically & Horizontally Scaled.                                                                                           |
| <a href="#">Image Position</a>   | Choose where you want the focal point of the image to be. Options are: Top Left, Top Middle, Top Right, Middle Left, Middle Middle, Middle Right, Bottom Left, Bottom Middle, and Bottom Right.                                                             |
| <a href="#">Enable Spacing</a>   | When enabled, allows you to customize the spacing around the top, bottom, right, and left of the component.                                                                                                                                                 |

## 19.8.1.2.11 Text Component Settings in Career Site Builder

The Text component allows you to add a single column of text on a page.

This reference page describes the settings in the [Text](#) component. For instructions on how to add a text component to a career site page, refer to [Adding a Text Component to a Career Site Page](#).

### Details Tab

| Fields                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Header Text</a> | The text field allows you to provide a header for the text block. To change the header style, select the  (style) icon to display the <a href="#">Text Header Styling</a> dialog. There, you can specify the font, font size, text alignment, and text color. You can also hide the header by enabling the <a href="#">Hide Header Text</a> field. |
| <a href="#">Body Text</a>   | Enter your body text in the field. You can configure how the text appears by using its style menu.                                                                                                                                                                                                                                                                                                                                    |
| <a href="#">Show Button</a> | Enable this field to show a hyperlinked button. Select <a href="#">Edit Button</a> to use the Button Editor dialog to specify what to link to. Options include Category Link, Content, External, Home Page, TC Join, Top Jobs, and View All Jobs. All options allow you to specify your own title as well as add brief text. Some, like the Category Link option, lets you choose which where to link to.                             |

### Styles Tab

| Fields                     | Description                         |
|----------------------------|-------------------------------------|
| <a href="#">Background</a> | Specify the background color.       |
| <a href="#">Body Text</a>  | Specify the text color.             |
| <a href="#">Link</a>       | Specify the color of the link text. |

| Fields                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <a href="#">Link Hover</a>                             | The color of the focus indicator, the outline that appears around the text of a link when the user focuses on it using keyboard navigation. Choose a prominent color to improve accessibility.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <a href="#">Background Image</a>                       | Allows you to choose an image to display behind the body text. Selecting  <a href="#">Select Image</a> or <a href="#">Change Image</a> displays the Image Selector dialog.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <a href="#">Image Type</a>                             | Choose how you want the image to appear. Options are: Unmodified, Tiles, Stretched, Horizontally Scaled, Vertically Scaled, and Vertically & Horizontally Scaled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <a href="#">Image Position</a>                         | <p><a href="#">Image Position</a> determines which section of the image is the focal point when the image is resized for responsive sites. For example, if the image features a person, you can choose an <a href="#">Image Position</a> that ensure that person's face always remains in the image.</p> <p>Options are: Top Left, Top Middle, Top Right, Middle Left, Middle Middle, Middle Right, Bottom Left, Bottom Middle, and Bottom Right.</p>                                                                                                                                                                                                                                                 |
| <a href="#">Enable Spacing</a>                         | When enabled, allows you to customize the spacing around the top, bottom, right, and left of the component.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <a href="#">Remove Existing Left and Right Padding</a> | <p>When you turn on <a href="#">Enable Spacing</a>, an additional setting, <a href="#">Remove Existing Left and Right Padding</a>, appears. This setting is available only for the Text component, and allows you to remove the default 20-pixel padding that's added automatically to the left and right of text components.</p> <div> <p> <b>Note</b></p> <p>Turning this setting on doesn't remove the default margins for the text components.</p> </div> <p>Turn on this setting, then configure the spacing above and below your text using the Top and Bottom fields of <a href="#">Enable Spacing</a>.</p> |

### 19.8.1.2.12 Three Column Images with Caption Component Settings in Career Site Builder

The Three Column Image with Caption component uses a set layout for information on the career site, in which you can present images, text, and a link for three horizontally displayed images on a page.

Each of the three columns in this component has several available features. In each of the columns you can do the following:

- Upload an image
- Enter header text and body text

- Display a link by enabling the Show Link option. You can then use the Edit Link menu to choose what type of link you want to add and the text that will display for the link

You can't adjust the width of the columns in the component or the size of the images.

Use the Styles and Font Styles tabs to adjust colors and fonts.

## Column Tabs

The fields for *Column 1*, *Column 2*, and *Column 3* are the same, and you can configure each independently of each other.

| Fields                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Header Text</i>         | The text field allows you to provide a header for the text block. To change the header style, select the  (style) icon to display the <i>Three Column Images with Caption Header Styling</i> dialog. There, you can specify the font, font size, text alignment, and text color. You can also hide the header by enabling the <i>Hide Header Text</i> field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <i>Treat Image as Link</i> | Enabling this setting turns the image into a link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <i>Show Link</i>           | <p>Enabling this setting turns the image into a link. Choose <i>Edit Link</i> to configure the link in the <i>Link Setup</i> dialog. The fields you can configure are:</p> <ul style="list-style-type: none"> <li>• Category Link – displays the Title and Text fields, and includes a dropdown list from which to select a category page.</li> <li>• Content – displays the Title and Text fields, and includes a dropdown list from which to select a content page.</li> <li>• External – displays the Title, Text, and Source (URL) fields. Enable the New Session setting if you want the link to open in a new browser window.</li> <li>• Home Page – displays the Title and Text fields, both of which are set to display <b>Home Page</b> by default.</li> <li>• TC Join – displays the Title and Text fields, both of which are set to display <b>Join Talent Community</b> by default.</li> <li>• Top Jobs– displays the Title and Text fields, both of which are set to display <b>Top Jobs</b> by default.</li> <li>• View All Jobs– displays the Title and Text fields, both of which are set to display <b>View All Jobs</b> by default.</li> </ul> <p>The <i>Link Type</i> field shows what you choose.</p> |
| <i>Image</i>               | Allows you to choose an image to display. Choosing  <i>Select Image</i> or <i>Change Image</i> displays the Image Selector dialog.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <i>Body Text</i>           | Enter your body text in the field. You can configure how the text appears by using its style menu.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Styles Tab

| Fields                   | Description                                                                                                                                                                                                                                                |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Body Background</i>   | Specify the background color.                                                                                                                                                                                                                              |
| <i>Header Background</i> | Specify the background color of the header.                                                                                                                                                                                                                |
| <i>Body Text</i>         | Specify the text color.                                                                                                                                                                                                                                    |
| <i>Link</i>              | Specify the color of the link text.                                                                                                                                                                                                                        |
| <i>Link Hover</i>        | The color of the focus indicator, the outline that appears around the text of a link when the user focuses on it using keyboard navigation. Choose a prominent color to improve accessibility.                                                             |
| <i>Background Image</i>  | Allows you to choose an image to display behind the body text. Choosing  <a href="#">Select Image</a> or <a href="#">Change Image</a> displays the Image Selector dialog. |
| <i>Image Type</i>        | Choose how you want the image to appear. Options are: Unmodified, Tiles, Stretched, Horizontally Scaled, Vertically Scaled, and Vertically & Horizontally Scaled.                                                                                          |
| <i>Image Position</i>    | Choose where you want the focal point of the image to be. Options are: Top Left, Top Middle, Top Right, Middle Left, Middle Middle, Middle Right, Bottom Left, Bottom Middle, and Bottom Right.                                                            |
| <i>Enable Spacing</i>    | When enabled, allows you to customize the spacing around the top, bottom, right, and left of the component.                                                                                                                                                |

## Font Styles Tab

| Fields                | Description                                         |
|-----------------------|-----------------------------------------------------|
| <i>Body Font</i>      | Specify the font for the body text.                 |
| <i>Link Font</i>      | Specify the font for the link.                      |
| <i>Body Font Size</i> | Specify the font size for the body text, in pixels. |
| <i>Link Font Size</i> | Specify the font size for the link, in pixels.      |

### 19.8.1.2.13 Two Columns Component Settings in Career Site Builder

The Two Columns component consists of an image on the left and text on the right. You can't configure the size or orientation of the columns.

Text is entered on the Details tab. From the Styles tab, select the image plus the colors for the text and background of the component. The options for Image Position apply to the full width of the component. For example, if you select Center, the image appears centered across the width of both columns.

## Details Tab

| Fields                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Header Text</a> | The text field allows you to provide a header for the text block. To change the header style, select the  <a href="#">style</a> icon to display the <a href="#">Two Column Header Styling</a> dialog. There, you can specify the font, font size, text alignment, and text color. You can also hide the header by enabling the <a href="#">Hide Header Text</a> field. |
| <a href="#">Body Text</a>   | Enter your body text in the field. You can configure how the text appears by using its style menu.                                                                                                                                                                                                                                                                                                                                                        |

## Styles Tab

| Fields                                 | Description                                                                                                                                                                                                                                                                      |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Background</a>             | Specify the background color.                                                                                                                                                                                                                                                    |
| <a href="#">Body Text</a>              | Specify the text color.                                                                                                                                                                                                                                                          |
| <a href="#">Link</a>                   | Specify the color of the link text.                                                                                                                                                                                                                                              |
| <a href="#">Link Hover</a>             | The color of the focus indicator, the outline that appears around the text of a link when the user focuses on it using keyboard navigation. Choose a prominent color to improve accessibility.                                                                                   |
| <a href="#">Background Image</a>       | Allows you to choose an image to display behind the body text. Selecting the  <a href="#">Select Image</a> or <a href="#">Change Image</a> buttons displays the Image Selector dialog.       |
| <a href="#">Refine Image Alignment</a> | When enabled, causes the background image to take 50% of the available screen, with the image never being wider than half the page. Depending on your <a href="#">Image Position</a> setting, this could mean the left or right half of the page, or the center 50% of the page. |
| <a href="#">Image Type</a>             | Choose how you want the image to appear. Options are: Unmodified, Tiles, Stretched, Horizontally Scaled, Vertically Scaled, and Vertically & Horizontally Scaled.                                                                                                                |
| <a href="#">Image Position</a>         | Choose where you want the focal point of the image to be. Options are: Top Left, Top Middle, Top Right, Middle Left, Middle Middle, Middle Right, Bottom Left, Bottom Middle, and Bottom Right.                                                                                  |
| <a href="#">Enable Spacing</a>         | When enabled, allows you to customize the spacing around the top, bottom, right, and left of the component.                                                                                                                                                                      |

## 19.8.1.2.14 Upload Resume Component Settings in Career Site Builder

The [Upload Resume](#) component displays a banner where people can upload a resume to find jobs that match their skills. The component spans the width of the page and supports a variety of layouts. You can include images, background colors, and text.

### ⚠ Caution

Enabling AI-assisted skills matching on your career site involves multiple steps. Before you add this component, review all of the required steps here: [Enabling AI-Assisted Features on Career Sites \[page 126\]](#).

## Layout Templates

First, choose a layout for the component, by selecting one of the available templates:

In order, the layout options are:

1. Background with Text - Displays a page-wide background (image or color) with overlaid text. The text appears directly on the background with no text box around it.
2. Background with Text Box - Displays a page-wide background (image or color) with a text box that's positioned within the background container. The text box doesn't extend past the edge of the background.
3. Background with Offset Text Box - Displays a page-wide background (image or color) with a text box that extends past the edge of the background, either on top or bottom ("offset"). You can configure the amount of offset, in pixels.
4. Background with Text and Image - Displays a page-wide background (image or color) with overlaid text and a decorative image that's positioned within the background container. The decorative image doesn't extend past the edge of the background. The text appears directly on the background with no text box around it.
5. Background with Text and Offset Image - Displays a page-wide background (image or color) with overlaid text and a decorative image that extends past the bottom of the banner ("offset"). You can configure the amount of offset, in pixels. The text appears directly on the background with no text box around it.

### 📘 Note

All layouts include a button, labeled [Upload Resume](#) by default, that opens the [Skills Matching](#) dialog, where people can upload a resume and view matching skills, just as they can on the search results page.

All layouts span the full width of the page, so the component is only available on single-column pages (not on landing pages).

## Background Settings

| Fields                           | Description                                                                                                                                                                                                                                                                                                                         |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Background Image</a> | Choose whether to display a background image, behind all other content in the component. Choose <a href="#">Select Image</a> or <a href="#">Change Image</a> to open the Image Selector dialog. <div><div>→ Tip</div><div>For best results, use a high resolution image, at least 1920 px wide, for display on desktop.</div></div> |
| <a href="#">Background Color</a> | If you don't want a background image, specify a background color instead.                                                                                                                                                                                                                                                           |

| Fields                       | Description                                                                                                                                                                               |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Background Image Type</i> | Choose how you want the image to appear.<br><br>Options: Unmodified, Tiled, Stretched, Horizontally Scaled, Vertically Scaled, and Vertically & Horizontally Scaled.                      |
| <i>Background Height</i>     | Specify the maximum height of the component.<br><br><div> → Tip<br/> For best results, if you're using a background image, make the component height the same as the image height. </div> |

## Image Settings

| Fields                     | Description                                                                                                                                                                               |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Image</i>               | Allows you to choose a decorative image that's displayed on top of the background. Choose <a href="#">Select Image</a> or <a href="#">Change Image</a> to open the Image Selector dialog. |
| <i>Image Height</i>        | Specify the height of the image.                                                                                                                                                          |
| <i>Image Width</i>         | Specify the width of the image.                                                                                                                                                           |
| <i>Image Offset</i>        | Choose whether the image extends past the bottom edge or top edge of the background container.                                                                                            |
| <i>Image Offset Amount</i> | Specify how far the image extends past the edge of the background container.                                                                                                              |
| <i>Image Corner Radius</i> | If you want the image to have rounded corners, specify the corner radius.                                                                                                                 |

## Text Box

| Fields                         | Fields                                                                                                                                                                                                                                 |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Box Position</i>            | Choose the position of the text box within the background container (when there's no offset).<br><br>Options: Top Left, Top Middle, Top Right, Middle Left, Middle Middle, Middle Right, Bottom Left, Bottom Middle, and Bottom Right. |
| <i>Box Horizontal Position</i> | Choose the horizontal position of the text box in the background container (when there's a vertical offset on top or bottom).<br><br>Options: Left, Middle, Right.                                                                     |

| Fields                   | Fields                                                                                            |
|--------------------------|---------------------------------------------------------------------------------------------------|
| <i>Box Offset</i>        | Choose whether the text box extends past the bottom edge or top edge of the background container. |
| <i>Box Offset Amount</i> | Specify how far the image extends past the edge of the background container.                      |
| <i>Box Color</i>         | Specify the color of the text box.                                                                |
| <i>Box Color Opacity</i> | Specify the opacity of the text box. The default is 80%.                                          |
| <i>Box Corner Radius</i> | If you want the text box to have rounded corners, specify the corner radius.                      |
| <i>Box Border</i>        | Choose whether to hide or show a border on the text box.                                          |
| <i>Box Border Color</i>  | Specify the color of the border on the text box.                                                  |

## Text Settings

| Fields                   | Description                                                                                                                                |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Text Position</i>     | Choose the position of text, within a text box or within the background container.<br><br>Options vary based on the layout.                |
| <i>Text Alignment</i>    | Choose the text alignment.<br><br>Options: Left, Middle, Right.                                                                            |
| <i>Header Text Style</i> | Specify the font, font size, and color of the header text.                                                                                 |
| <i>Header Text</i>       | Enter the header text.                                                                                                                     |
| <i>Body Text Style</i>   | Specify the font, font size, and color of the body text.                                                                                   |
| <i>Body Text</i>         | Enter the body text.                                                                                                                       |
| <i>Button Text</i>       | Provide a label for the button that opens the <a href="#">Skills Matching</a> dialog. The default label is <a href="#">Upload Resume</a> . |

## 19.8.1.2.15 Video Component Settings in Career Site Builder

The Video component allows you to add videos to Career Site Builder pages.

You can choose the following options for the Video component:

- Embed videos from YouTube, Vimeo, and Wistia.
- Whether the video is presented in full width, or left- or right-justified with text.
- Whether to have the video start automatically.
- Selecting the background and font color from the Styles tab.

If the cookie banner is enabled without including the corresponding cookie provider in the cookie consent manager, this functionality is removed and unavailable to your site's visitors completely.

## Details Tab

| Fields                           | Description                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Video URL or ID</a>  | Enter the full video URL or the video's ID.                                                                                                                                                                                                                                                                                                                                |
| <a href="#">Video Type</a>       | If not automatically detected, select the Video Type that matches the video URL or ID specified from the dropdown list. Options are: Youtube, Vimeo, and Wistia.                                                                                                                                                                                                           |
| <a href="#">Layout</a>           | Choose how you want the video to appear on the page. Options are: <ul style="list-style-type: none"><li>• Full Width Centered – a centered video takes up the entire width</li><li>• Left Justified With Text – left- or right-justified take ups half the available width, with the option of having text next to the video</li><li>• Right Justified With Text</li></ul> |
| <a href="#">Auto Start Video</a> | Auto start controls whether or not the video starts playing when the page is loaded.                                                                                                                                                                                                                                                                                       |
| <a href="#">Alternative Text</a> | Descriptive text about the video that's read by a screen reader.                                                                                                                                                                                                                                                                                                           |

## Styles Tab

| Fields                         | Description                                                                                                                                                                                    |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Body Text</a>      | Specify the text color.                                                                                                                                                                        |
| <a href="#">Link</a>           | Specify the color of the link text.                                                                                                                                                            |
| <a href="#">Link Hover</a>     | The color of the focus indicator, the outline that appears around the text of a link when the user focuses on it using keyboard navigation. Choose a prominent color to improve accessibility. |
| <a href="#">Background</a>     | Specify the background color.                                                                                                                                                                  |
| <a href="#">Enable Spacing</a> | When enabled, allows you to customize the spacing around the top, bottom, right, and left of the component.                                                                                    |

| <a href="#">Show Search Labels</a>                       | When enabled, search labels appear above search fields and ghost text disappears. When disabled, search boxes on the site are populated with ghost text.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <a href="#">Show Clear Button</a>                        | Enable this setting to show a button that clears the search field of any text that was entered there.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <a href="#">Branded Search Form</a>                      | The search form has the visual appearance of the branded career site. Enabled for organizations with multiple brands.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <a href="#">Branded Search Results</a>                   | This setting, available only when you enable <a href="#">Branded Search Form</a> , changes the behavior of search by limiting the results to just the jobs for the branded career site. When disabled, searches return all jobs that meet the search query regardless of brand.                                                                                                                                                                                                                                                                                                                     |
| <a href="#">Limit Search by Locale</a>                   | Limit the results of the search page by locale.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <a href="#">Search by Keyword</a>                        | Enable this field so that candidates can perform job searches on the career site. Don't disable this field; doing so means candidates can't find jobs on your career site.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <a href="#">Search by Location</a>                       | Available only when you turn on <a href="#">Search by Keyword</a> . When enabled, looks for matches in city, state, Zip, and country/region fields.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <a href="#">Search by Radius</a>                         | <p>Available only when you turn on <a href="#">Search by Keyword</a>. Performs a search based on postal codes.</p> <p>The U.S. is the only officially supported country/region for the <a href="#">Search by Radius</a> field, and search results are based on the Zip/postal codes you provide for job locations. Results from the <a href="#">Search by Radius</a> can display inaccuracies for non-U.S. countries/regions. In addition, not all countries/regions support this field.</p> <p>Refer to <a href="#">Countries/Regions Not Supported in Search By Radius Field</a> for details.</p> |
| <a href="#">Imperial (Miles) and Metric (Kilometers)</a> | Enter a set of numeric values for search distances, separating each value with a comma, without using spaces between values (for example, <b>2, 5, 10, 30, 50</b> ). Each value you enter appears in the dropdown list for the postal code search in the public career site.                                                                                                                                                                                                                                                                                                                        |
| <a href="#">Default</a> (distance)                       | The default search distance. The value must be one of the list of search distances you provide in the <a href="#">Imperial (Miles)</a> and <a href="#">Metric (Kilometers)</a> fields. If you provide a different value, the system automatically chooses the first distance in your set of search distances.                                                                                                                                                                                                                                                                                       |
| <a href="#">Default</a> (search type)                    | This field is visible only when both <a href="#">Search by Keyword</a> and <a href="#">Search by Location</a> are enabled. Allows you to choose the default search method. Candidates can toggle the search method.                                                                                                                                                                                                                                                                                                                                                                                 |
| <a href="#">Show Picklist Values for all Locales</a>     | Visible only when you select <a href="#">Picklist Search Enabled</a> , this setting lets you show picklist values for all locales you've configured for your career site.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <a href="#">Picklist Search Enabled</a>                  | Adds a picklist search in addition to the search fields already present (such as keyword or location). Acts as a filter on the main search.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## 19.8.2.1.2.1 Countries/Regions Not Supported in Search by Radius Field

The following countries/regions aren't supported in the [Search by Radius](#) field in Career Site Builder global search settings.

The [Search by Radius](#) field performs a search based on postal codes. The field is located in ► [Appearance](#) ► [Global Search](#) ►, and is available when you enable [Search by Radius](#).

### ⓘ Note

The U.S. is the only officially supported country/region for the [Search by Radius](#) field, and search results are based on the Zip/postal codes you provide for job locations. Results from the [Search by Radius](#) can display inaccuracies for non-U.S. countries/regions. In addition, not all countries/regions support this field.

| Country/Region Code | Country/Region Display Name               |
|---------------------|-------------------------------------------|
| CN                  | <a href="#">China</a>                     |
| CY                  | <a href="#">Cyprus</a>                    |
| GR                  | <a href="#">Greece</a>                    |
| HK                  | <a href="#">Hong Kong</a>                 |
| ID                  | <a href="#">Indonesia</a>                 |
| IL                  | <a href="#">Israel</a>                    |
| SA                  | <a href="#">Saudi Arabia</a>              |
| TW                  | <a href="#">Taiwan, Province of China</a> |
| VE                  | <a href="#">Venezuela</a>                 |
| VN                  | <a href="#">Vietnam</a>                   |

### Job Page Settings

| Setting                            | Description                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Show Similar Jobs</a>  | Controls the display of the <a href="#">Find similar jobs</a> section on job pages. The pages linked in this section are other strategy or SEO pages where the job appears.                                                                                                                                                                                                                                     |
| <a href="#">Show Segments</a>      | Controls the display of the <a href="#">Job Segment</a> section on job pages. Segments aid in site SEO, and the segments available for a site are enabled in Command Center. How jobs are assigned to segments are controlled on a system level, and can't be customized on a per site basis.                                                                                                                   |
| <a href="#">Show Major Markets</a> | Controls the display of the <a href="#">Nearest Major Market</a> and <a href="#">Nearest Secondary Market</a> sections of the job page. These sections aid in SEO, and the major markets are assigned based on the job's location and system-wide rules for assigning locations to major and secondary markets. You can't adjust the assignment of locations to major or secondary markets on a per site basis. |

## 19.8.2.1.4 Legacy Site Banner Settings in Career Site Builder Global Appearance

The [Legacy Site Banner](#), which let you configure a site-wide banner that asks site visitors to acknowledge that the site uses cookies, is superseded by the Cookie Manager.

### → Recommendation

If you haven't yet configured a cookie banner for the career site, use the Cookie Manager tab instead of this Legacy Site Banner page. The Cookie Manager tab offers highly configurable settings for both a cookie banner and cookie consent manager for your career site. If you used this Site Banner page to set up a basic cookie banner, this page is available for your use until you're ready to configure the advanced settings that are available in the Cookie Manager tab.

### Legacy Site Banner Settings

| Tab                           | Description                                                                                                                                                                                                                                                          |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">General</a>       | Controls the visibility of the site banner with an activation slider.                                                                                                                                                                                                |
| <a href="#">Localizations</a> | Allows for configuration of the site banner content across locales. This tab only displays default text for locales enabled for the site in ► <a href="#">Settings</a> ► <a href="#">Site Configuration</a> ► <a href="#">Site Locales</a> ► in Career Site Builder. |
| <a href="#">Main Styles</a>   | Sets the various colors used in the site banner. These color selections are independent of the selections for the rest of the site.                                                                                                                                  |

## 19.8.2.1.5 Cookie Manager Settings in Career Site Builder Global Appearance

Options in the [Cookie Manager](#) tab let you customize the settings for your career site's cookie banner as well as cookie consent manager.

### → Remember

If you include any element or component to the career site that uses cookies, make sure you add its listing in the cookie consent manager so that the component works correctly. For example, if you include a YouTube video in your career site, enable [Functional Cookies Section](#) and add [YouTube](#) in that section. Otherwise, the YouTube video doesn't display on your career site at all because there's no way for the visitor to allow its cookie to work.

For detailed instructions on how to configure the cookie banner and cookie consent manager using this Cookie Manager tab, refer to *Configuring the Career Site Cookie Banner and Cookie Consent Manager*.

## Cookie Banner Settings

| Field                                                    | Description                                                                                                                                                                                                                                                           |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Enable Banner and Cookie Consent Manager</a> | A slider that controls whether to enable or disable the cookie banner on the career site.                                                                                                                                                                             |
| <a href="#">Banner Body Text</a>                         | Banner Body Text includes a description of your career site's cookie policy. You can override the default text by selecting <a href="#">Edit Translation</a> . Since this dialog is also the translation editor, use this to create customized text for your locales. |
| <a href="#">Accept Button Label</a>                      | The text that appears on the button that lets users accept all cookies. The default text is <a href="#">Accept All Cookies</a> .                                                                                                                                      |
| <a href="#">View Details Button Label</a>                | The text that appears on the button that, when selected, takes users to the Cookie Consent Manager dialog. The default text is <a href="#">Modify Cookie Preferences</a> .                                                                                            |
| <a href="#">Banner Location</a>                          | The only value in this field is <a href="#">Bottom</a> , which indicates that the banner appears on the bottom of the career site page.                                                                                                                               |
| <a href="#">Enable Reject All Cookies</a>                | A slider that controls whether to allow users to reject all cookies. The default setting is <a href="#">NO</a> .                                                                                                                                                      |
| <a href="#">Reject All Button Label</a>                  | The text that appears on the button that lets users reject all cookies. The default text is <a href="#">Reject All Cookies</a> .                                                                                                                                      |

## Cookie Policy Settings

The fields in this section configure the contents of the cookie consent manager dialog, which appears when a user chooses to view it from the cookie banner.

| Field                               | Description                                                                                                                       |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <i>Cookie Consent Manager Title</i> | The title that appears at the top of the Cookie Consent Manager dialog. The default text is <i>Cookie Consent Manager</i> .       |
| <i>Intro Text</i>                   | Intro Text appears at the top of the Cookie Consent Manager dialog.                                                               |
| <i>Accept All Button Label</i>      | The text that appears on the button that lets users accept all cookies. The default text is <i>Accept All Cookies</i> .           |
| <i>Accept Selected Button Label</i> | The text that appears on the button that lets users allow their selected cookies. The default text is <i>Confirm My Choices</i> . |

## Section Cookies

The Cookie Manager page also allows you to enable and display categories of cookies in the following sections:

- *Advertising Cookies Section*
- *Functional Cookies Section*
- *Required Cookies Section* – you can't disable this section or add any custom cookie providers. You can, however, edit the text fields in the section.
- *Performance Cookies Section* – by default, Career Site Builder doesn't use any performance cookies. For this reason, you don't need to enable *Performance Cookies* unless you plan to use a custom cookie provider.

| Field                                          | Description                                                                                                                                                                                                 |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Enable &lt;Category&gt; Cookies Section</i> | A slider that controls whether to display this section in the Cookie Consent Manager dialog. Enable this slider only when you use providers in the section, and you enable the providers that you're using. |
| <i>Section Label</i>                           | The label for the section. Default text is provided for each category, such as Advertising Cookies.                                                                                                         |

| Field                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Section Description</a> | <p>A text field that provides a short description for this section. Select <a href="#">Edit Translation</a> to change the default text, or to add text for additional locales.</p> <p>The default text for the different categories are:</p> <ul style="list-style-type: none"> <li>• <a href="#">Required Cookies Section</a>:<br/>These cookies are required and can not be turned off since they are required to use this website.</li> <li>• <a href="#">Functional Cookies Section</a>:<br/>These cookies provide a better customer experience on this site, such as by remembering your log-in details, optimizing video performance, or providing us information about how our site is used. | <i>Cookie Providers</i>    | <p><i>Cookie Providers</i> is where cookie provider information is added.</p> <ul style="list-style-type: none"> <li>In the <i>Required Cookies Section</i>, <i>SAP as service provider</i> is required and the only option in this category.</li> <li><i>Functional Cookies Section</i> – choose from the following in the dropdown list: <ul style="list-style-type: none"> <li><i>Vimeo</i> – add this option to use Vimeo videos in your career site.</li> <li><i>YouTube</i> – add this option to use YouTube videos in your career site.</li> <li><i>Custom</i> – add this option to include a custom functional cookie provider in the cookie consent dialog.</li> </ul> <p>Career Site Builder also supports Wistia videos, but because Wistia doesn't use cookies, it's not listed as a cookie provider.</p> </li> <li><i>Performance Cookies Section</i> – there are no preconfigured cookie providers in this section. When you add a new cookie provider, your only option is <i>Custom</i>.</li> <li><i>Advertising Cookies Section</i> – choose from the following in the dropdown list: <ul style="list-style-type: none"> <li><i>Google Tag Manager</i> – the standard Google Tag Manager configuration doesn't create cookies, but you <b>can</b> do so from within Google itself. If your external GTM configuration results in the setting of cookies, make sure you enable GTM under this Advertising cookies section.</li> <li><i>Google Analytics</i> – add this option to use Google Analytics in your career site.</li> <li><i>LinkedIn</i> – add this option to use Apply With LinkedIn in your career site.</li> <li><i>Custom</i> – add this option to include a custom advertising cookie provider in the cookie consent dialog.</li> </ul> </li> </ul> |
| <i>Description</i>         | A text field that provides a short description about the company, or its cookies. Default text is provided unless the third-party integration is set to <i>Custom</i> . Custom cookie providers require more details in this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <i>Provider JavaScript</i> | This field only appears when you add a custom cookie provider, and only accepts pure JavaScript (everything between <code>&lt;script&gt;</code> and <code>&lt;/script&gt;</code> ), and not HTML or CSS. Use this field to add all the JavaScript required for the custom cookie provider to run on the career site.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Cookie Providers

These fields appear when you add a new cookie.

| Field                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <i>Third Party Integration</i> | <p>The type of third-party integration. Available values vary by category.</p> <ul style="list-style-type: none"> <li>• <i>Functional Cookies Section</i> – choose from the following in the dropdown list: <ul style="list-style-type: none"> <li>• <i>Vimeo</i> – add this option to use Vimeo videos in your career site.</li> <li>• <i>YouTube</i> – add this option to use YouTube videos in your career site.</li> <li>• <i>Custom</i> – add this option to include a custom functional cookie provider in the cookie consent dialog.</li> </ul> <p>Career Site Builder also supports Wistia videos, but because Wistia doesn't use cookies, it's not listed as a cookie provider.</p> </li> <li>• <i>Performance Cookies Section</i> – there are no preconfigured cookie providers in this section. When you add a new cookie provider, your only option is <i>Custom</i>.</li> <li>• <i>Advertising Cookies Section</i> – choose from the following in the dropdown list: <ul style="list-style-type: none"> <li>• <i>Google Tag Manager</i> – the standard Google Tag Manager configuration doesn't create cookies, but you <b>can</b> do so from within Google itself. If your external GTM configuration results in the setting of cookies, make sure you enable GTM under this Advertising cookies section.</li> <li>• <i>Google Analytics</i> – add this option to use Google Analytics in your career site.</li> <li>• <i>LinkedIn</i> – add this option to use Apply With LinkedIn in your career site.</li> <li>• <i>Custom</i> – add this option to include a custom advertising cookie provider in the cookie consent dialog.</li> </ul> </li> </ul> |
| <i>Provider</i>                | The name of the provider. This required field is empty when the third-party integration is set to <i>Custom</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <i>Description</i>             | A text field that provides a short description about the company, or its cookies. Default text is provided unless the third-party integration is set to <i>Custom</i> . Custom cookie providers require more details in this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <i>Provider JavaScript</i>     | This field only appears when you add a custom cookie provider, and only accepts pure JavaScript (everything between <code>&lt;script&gt;</code> and <code>&lt;/script&gt;</code> ), and not HTML or CSS. Use this field to add all the JavaScript required for the custom cookie provider to run on the career site.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### 19.8.2.1.6 JavaScript Settings in Career Site Builder Global Appearance

The *JavaScript* page lets you add custom JavaScript code to the header and footer on the career site.

#### ⚠ Caution

Any custom JavaScript code that's added to your career site for purposes other than tracking could cause pages not to display the configured content across the application process. It could also affect the site theme

and styling. The following could result in the breakdown of some or all career site functionality, possibly rendering the site unusable:

- Introducing other versions than the one provided for JQuery or Bootstrap.
- Introducing any third-party libraries.
- Changing the layout (such as CSS or JavaScript) of any components other than the *Custom* component.
- Manipulating external resources that SAP doesn't support, and which SAP won't fix if they're the cause of any issues.

Such customizations, if they're the cause of problems, will be removed or deactivated.

In the *Header/Footer* menu, you can enter site-wide settings for the header and footer. You can select to display the header and footer either full width of site or centered. You can also enter custom JavaScript for tracking purposes in the *Head Javascript* and *Footer JavaScript* fields.

#### Note

In Career Site Builder, public (external) and internal career sites share the same header and footer. This means that you can't specify a header or footer for your organization's internal career site that differs from the public career site.

#### JavaScript Settings

| Setting                | Description                                                                                                        |
|------------------------|--------------------------------------------------------------------------------------------------------------------|
| <i>Head JavaScript</i> | A text field that allows you to add custom JavaScript that appears in the header of all of your career site pages. |
| <i>Foot JavaScript</i> | A text field that allows you to add custom JavaScript that appears in the footer of all of your career site pages. |

## 19.8.2.2 Styles in Career Site Builder Appearance Menu

The Career Site Builder *Styles* menu allows you to set global styles, as well as customize the way headers and footers look throughout your entire career site.

For every background image, there is a corresponding background color. For the background image to be visible, this background color must be partially or fully transparent, and not a background color.

In Career Site Builder, public (external) and internal career sites share the same header and footer. This means that you can't specify a header or footer for your organization's internal career site that differs from the public career site.

## Global Styles

| Tab                           | Description                                                                  |
|-------------------------------|------------------------------------------------------------------------------|
| <a href="#">Main</a>          | Set the font and background colors for the career site in general.           |
| <a href="#">Search</a>        | Set the color and background image of the search area.                       |
| <a href="#">Search Tiles</a>  | Set the font and color of, and spacing around search tiles.                  |
| <a href="#">Header</a>        | Set the colors of the various components in the career site's header.        |
| <a href="#">Row Footer</a>    | Set the colors of the various components in the career site's footer.        |
| <a href="#">Column Footer</a> | Set the colors of the various components in the career site's column footer. |

## Headers

The Headers menu gives you access to the Header Editor, where you can customize the details of the header portion of your career site pages.

| Tab                     | Description                           |
|-------------------------|---------------------------------------|
| <a href="#">Details</a> | Set details such as location of logo. |
| <a href="#">Logo</a>    | Set logo information.                 |
| <a href="#">Menu</a>    | Set menu options.                     |

## Footers

The Footers menu gives you access to the Footer Editor, where you can customize the details of the footer portion of your career site pages.

| Tab                          | Description                      |
|------------------------------|----------------------------------|
| <a href="#">Details</a>      | Set the text of your footer.     |
| <a href="#">Logo</a>         | Set logo information.            |
| <a href="#">Row Menu</a>     | Set menu options.                |
| <a href="#">Column Menu</a>  | Add a list of links.             |
| <a href="#">Social Links</a> | Add links to social media sites. |

| Option                                  | Description                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Default Font</a>            | Sets the default font and font size for the site.                                                                                                                                                                                                                                                                                                                                                      |
| <a href="#">Vertical Spacing</a>        | Sets the vertical space between components on a site. <div><h3>Note</h3><p>This setting doesn't work in job layouts.</p></div>                                                                                                                                                                                                                                                                         |
| <a href="#">Min. Horizontal Spacing</a> | Sets the minimum horizontal space between parts of a component. For example, in the Three Column component, the space between columns. <div><h3>Note</h3><p>These settings only determine the amount of space between components or parts of components. You can't adjust the relative size or positioning of components or component parts.</p><p>This setting doesn't work in job layouts.</p></div> |

### Styles

| Option                             | Description                                                                                                                                                                                                                                                       |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">System Link</a>        | The font color of the links generated by the career site. For example, <a href="#">Sign In</a> and <a href="#">Search by Location</a> .                                                                                                                           |
| <a href="#">System Link Hover</a>  | The color of the focus indicator, the outline that appears around the text of a link when the user focuses on it using keyboard navigation. Choose a prominent color to improve accessibility.                                                                    |
| <a href="#">Content Background</a> | The background color of the content of the site that is between the header and footer. Any page with a main content area displays this color behind the content.                                                                                                  |
| <a href="#">Content Header</a>     | The font color of headings.                                                                                                                                                                                                                                       |
| <a href="#">Content Text</a>       | The font color of nonheader, nonlink text. This is the color of the main text on category pages. This color also populates text in the job grid (except for the jobs title), and any text on a page that's not a search grid header, search text, or system link. |
| <a href="#">Content Style</a>      | Options are <a href="#">Centered</a> and <a href="#">Full</a> .                                                                                                                                                                                                   |

| Option                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Content Background Image</i> | <p>The background image of the content of the site between the header and footer. Choose <a href="#">Select Image</a> to select an image from the Image Selector. Then configure:</p> <ul style="list-style-type: none"> <li>• <a href="#">Image Type</a> (Tiled; Unmodified; Stretched; Horizontally Scaled; Vertically Scaled.)</li> <li>• <a href="#">Image Position</a> (Top Left; Top Middle; Top Right; Middle Left; Middle Middle; Middle Right; Bottom Left; Bottom Middle; Bottom Right)</li> </ul>                    |
| <i>Site Background</i>          | The background color of the site as a whole. This element doesn't include the background of headers or footers.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <i>Site Background Image</i>    | <p>The background image for the site. Choose <a href="#">Select Image</a> to select an image from the Image Selector. Then configure:</p> <ul style="list-style-type: none"> <li>• <a href="#">Image Type</a> (Tiled; Unmodified; Stretched; Horizontally Scaled; Vertically Scaled.)</li> <li>• <a href="#">Image Position</a> (Top Left; Top Middle; Top Right; Middle Left; Middle Middle; Middle Right; Bottom Left; Bottom Middle; Bottom Right)</li> </ul>                                                                |
| <i>Meta Image</i>               | <p>A graphic that appears as an OG (Open Graph protocol) image when a career site page is displayed in a social media post on sites like LinkedIn and Facebook. Choose <a href="#">Select Image</a> to select an image from the Image Selector. Size considerations are:</p> <ul style="list-style-type: none"> <li>• Minimum image dimensions – 200 by 200 pixels</li> <li>• Maximum file size – 8 MB</li> <li>• Optimal minimum dimensions – 1200 pixels wide by 630 pixels high</li> <li>• Optimal ratio – 1.91:1</li> </ul> |
| <i>Favicon</i>                  | A favicon is a small image that usually appears at the top of a web browser that serves as an icon that represents your brand. Use a square image to prevent the favicon from looking stretched out of proportion.                                                                                                                                                                                                                                                                                                              |

## Primary Button

In places where multiple buttons are present, the primary button is the one that represents the most important or most common action. You may want to make them more prominent.

| Option                         | Description                                                                                                                       |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <i>Button Background Color</i> | The color of the background of buttons in the site, for example <a href="#">Filter</a> .                                          |
| <i>Button Text Color</i>       | The color of text within buttons.                                                                                                 |
| <i>Button Link Hover Color</i> | The color of the focus indicator, the outline that appears around a button when the user focuses on it using keyboard navigation. |
| <i>Button Highlight Color</i>  | The color of buttons when the cursor moves over it.                                                                               |
| <i>Button Border</i>           | Choose whether to show or hide a border around the button.                                                                        |
| <i>Button Border Color</i>     | The color of the border of buttons.                                                                                               |

## Secondary Button

In places where multiple buttons are present, the secondary buttons are ones that represent secondary actions. You may want to make them less prominent.

You can configure the same settings for secondary buttons as you can for primary buttons.

## 19.8.2.2.2 Search Settings in Career Site Builder Global Styles Without the Unified Data Model

The Search tab in the Career Site Builder Global Styles menu allows you to configure the way the career site's search form looks.

### Note

This information only applies if the Unified Data Model is **not** enabled. When it's enabled, you can't configure the settings described here.

For information about configuring the search experience after the Unified Data Model is enabled, refer to [Search Experience Settings for the Unified Data Model \[page 429\]](#).

The [Search](#) settings in the [Global Styles](#) menu lets you customize color settings in the search form. To enable different **functionality** in the career site's search, use the [Search](#) tab in [Global Settings](#).

Career Site Builder path: ► [Appearance](#) ► [Styles](#) ► [Global Styles](#) ► [<Brand>](#) ► [Search](#) ►

### Note

Some fields are only visible when the [Use Search Result Tiles](#) setting is disabled in ► [Career Site Builder](#) ► [Appearance](#) ► [Search Results](#) ►. These fields are identified as a **search grid setting**.

| Option                                          | Description                                                                                                                                                                                     |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Search Form Labels</a>              | The font color of labels in the search form.                                                                                                                                                    |
| <a href="#">Search Form Background</a>          | The color of the background of the search form.                                                                                                                                                 |
| <a href="#">Search Form Link</a>                | The font color of the link.                                                                                                                                                                     |
| <a href="#">Search Form Link Hover</a>          | The color for the focus indicator, the outline that appears around the text of a link when the user focuses on it using keyboard navigation. Choose a prominent color to improve accessibility. |
| <a href="#">Job Grid Alternating Background</a> | <b>[Search grid setting]</b> The background color of alternating rows in the job grid.                                                                                                          |
| <a href="#">Search Pagination Cell</a>          | <b>[Search grid setting]</b> The border color of the border cell around each pagination link.                                                                                                   |
| <a href="#">Use Search Pagination Cell</a>      | <b>[Search grid setting]</b> A slider that shows or hides a border cell around each pagination link.                                                                                            |
| <a href="#">Search Form Background Image</a>    | The background image on the search. Choose <a href="#">Select Image</a> to select an image from the Image Selector.                                                                             |
| <a href="#">Image Type</a>                      | The way the background image appears. Choices are: Tiled, Unmodified, Stretched, Horizontally Scaled, and Vertically Scaled.                                                                    |
| <a href="#">Image Position</a>                  | Specifies where on the page the background image appears. Choices are: Top Left; Top Middle; Top Right; Middle Left; Middle Middle; Middle Right; Bottom Left; Bottom Middle; Bottom Right.     |

## Related Information

[Search-Related Settings in Career Site Builder Without the Unified Data Model \[page 435\]](#)

### 19.8.2.2.3 Search Tiles Settings in Career Site Builder Global Styles Without the Unified Data Model

The configuration options in the Search Tiles tab of the Career Site Builder Global Styles menu.

#### Note

This information only applies if the Unified Data Model is **not** enabled. When it's enabled, you can't configure the settings described here.

For information about configuring the search experience after the Unified Data Model is enabled, refer to [Search Experience Settings for the Unified Data Model \[page 429\]](#).

Career Site Builder supports two types of Search Results layouts: Grid and tile list. You choose which you want in by setting the [Use Search Results Tiles](#) option in [► Appearance ► Search Results ► Search Details ►](#). When you enable the search tiles, Career Site Builder hides the grid layout settings on the page, and displays the [Search Tiles](#) tab appears [► Appearance ► Styles ► Global Styles ► \(Brand\) ►](#). This topic describes the settings for these search tiles.

#### Career Site Builder Path

[► Appearance ► Styles ► Global Styles ► \(Brand\) ► Search Tiles ►](#)

#### Note

This tab is visible only when you enable the [Use Search Results Tiles](#) setting in [► Appearance ► Search Results ► Search Details ►](#). This location also includes some search tile settings you can customize.

#### Search Tiles Tab Settings

| Option                                   | Description                                                                                           |
|------------------------------------------|-------------------------------------------------------------------------------------------------------|
| <a href="#">Background Color</a>         | The color of the background behind the search tiles.                                                  |
| <a href="#">Tile Animation</a>           | When enabled, the tile moves up and to the left by 3 pixels when a cursor moves over it.              |
| <a href="#">Tile Background Color</a>    | The color of the background of an individual search tile.                                             |
| <a href="#">Tile Border Color</a>        | The color of the tile border.                                                                         |
| <a href="#">Tile Shadow Color</a>        | The color of the tile shadow.                                                                         |
| <a href="#">Shadow Enabled</a>           | When enabled, gives the tile a shadow effect.                                                         |
| <a href="#">Shadow Vertical Offset</a>   | A slider that controls the number of pixels to vertically offset when the shadow effect is enabled.   |
| <a href="#">Shadow Horizontal Offset</a> | A slider that controls the number of pixels to horizontally offset when the shadow effect is enabled. |

| Option                                     | Description                                                                                             |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------|
| <i>Title Font</i>                          | The font of the job title in the tile.                                                                  |
| <i>Title Font Size</i>                     | The font size of the job title the tile.                                                                |
| <i>Title Font Color</i>                    | The font color of the job title in the tile.                                                            |
| <i>Title Font Hover Color</i>              | The font color of the title when the cursor moves over it.                                              |
| <i>Show More Results Font</i>              | The font for the <a href="#">Show More Results</a> link.                                                |
| <i>Show More Results Font Size</i>         | The font size for the <a href="#">Show More Results</a> link.                                           |
| <i>Sub Fields Visible</i>                  | When enabled, displays the sub fields such as date and location.                                        |
| <i>Sub Fields Labels Visible</i>           | When enabled, displays the sub field labels.                                                            |
| <i>Sub Field Padding (Mobile)</i>          | A slider that controls the number of pixels there is in padding in the sub fields in mobile view.       |
| <i>Sub Fields Font</i>                     | The font of sub fields.                                                                                 |
| <i>Sub Fields Font Size</i>                | The font size of sub fields.                                                                            |
| <i>Sub Fields Color</i>                    | The color of sub fields.                                                                                |
| <i>Sub Fields Label Font</i>               | The font of sub field labels.                                                                           |
| <i>Sub Fields Label Font Size</i>          | The size of sub fields.                                                                                 |
| <i>Sub Fields Label Color</i>              | The color of sub field labels.                                                                          |
| <i>Padding Between Tiles</i>               | A slider that specifies the amount of spacing between tiles.                                            |
| <i>Border Thickness</i>                    | A slider that controls the width of the border around the tiles; a setting of 0 removes the border.     |
| <i>Border Radius</i>                       | A slider that controls how much of curve to add to the tiles corners; a setting of 0 removes the curve. |
| <i>Padding Inside Tiles</i>                | A slider that controls how much padding to have inside a tile.                                          |
| <i>Padding Between Title and Subfields</i> | A slider that controls the amount of space between the job title and subfields.                         |

## 19.8.2.2.4 Header Settings in Career Site Builder Global Styles

The configuration options in the Header tab of the Career Site Builder Global Styles menu.

Career Site Builder path: [Appearance](#) > [Styles](#) > [Global Styles](#) > [<Brand>](#) > [Header](#)

| Option                     | Description                                                       |
|----------------------------|-------------------------------------------------------------------|
| <i>Menu Background</i>     | The color of the background of menu.                              |
| <i>Menu Link</i>           | The font color of the menu links.                                 |
| <i>Menu Link Hover</i>     | The font color of the menu link when the cursor moves over it.    |
| <i>Sub-Menu Background</i> | The background color for the submenu area.                        |
| <i>Sub-Menu Link</i>       | The font color of the submenu links.                              |
| <i>Sub-Menu Link Hover</i> | The font color of the submenu link when the cursor moves over it. |

| Option                     | Description                                                        |
|----------------------------|--------------------------------------------------------------------|
| <i>Dropdown Background</i> | The color of the background of the dropdown.                       |
| <i>Dropdown Link</i>       | The font color of the dropdown links.                              |
| <i>Dropdown Link Hover</i> | The font color of the dropdown link when the cursor moves over it. |
| <i>Trim</i>                | A contrasting color for the trim.                                  |
| <i>Mobile Link</i>         | The font color of links in mobile view.                            |

## 19.8.2.2.5 Row Footer Settings in Career Site Builder Global Styles

The configuration options in the Row Footer tab of the Career Site Builder Global Styles menu.

Career Site Builder path: ► [Appearance](#) ► [Styles](#) ► [Global Styles](#) ► [\(Brand\)](#) ► [Row Footer](#) ►

| Option             | Description                                          |
|--------------------|------------------------------------------------------|
| <i>Background</i>  | The footer background color.                         |
| <i>Font</i>        | The footer font color.                               |
| <i>Link</i>        | The footer link color.                               |
| <i>Link Hover</i>  | The footer link color when the cursor moves over it. |
| <i>Social Link</i> | The font color of links to social sites.             |

## 19.8.2.2.6 Column Footer Settings in Career Site Builder Global Styles

The configuration options in the Row Footer tab of the Career Site Builder Global Styles menu.

Career Site Builder path: ► [Appearance](#) ► [Styles](#) ► [Global Styles](#) ► [<Brand>](#) ► [Column Footer](#) ►

| Option                    | Description                                                      |
|---------------------------|------------------------------------------------------------------|
| <i>Background</i>         | The color of the column footer background.                       |
| <i>Column Footer Font</i> | The column footer font color.                                    |
| <i>Link</i>               | The font color of the footer link.                               |
| <i>Link Hover</i>         | The font color of the footer link when the cursor moves over it. |

## 19.8.2.2.7 Header Editor Settings in Career Site Builder Styles

The [Details](#) tab of the [Header Editor](#) allows you to customize the way the header portion of your career site looks.

Headers are unique to a locale and brand, and can only have one configuration for that locale and brand.

In Career Site Builder, public (external) and internal career sites share the same header and footer. This means that you can't specify a header or footer for your organization's internal career site that differs from the public career site.

| Option                                                                                                                                                                                                     | Description                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Fixed Header (Desktop)</a>                                                                                                                                                                     | When enabled, always shows the header.                                                                                                                                                                                                                                                                                |
| <a href="#">Header Style</a>                                                                                                                                                                               | Specifies where in the header the logo appears. Choices are: <a href="#">Logo Left of Menu</a> , <a href="#">Logo Left and Below Menu</a> , and <a href="#">Custom</a> .                                                                                                                                              |
| <div><div> ⓘ Note</div><div>When you select <a href="#">Custom</a>, the tab menu changes to display <a href="#">Desktop Layout</a>, <a href="#">Mobile Layout</a>, and <a href="#">Styles</a>.</div></div> |                                                                                                                                                                                                                                                                                                                       |
| <a href="#">Header Width</a>                                                                                                                                                                               | Specifies whether the header is centered or full: <ul style="list-style-type: none"><li>• <a href="#">Centered</a> – aligns with the page component width and the template background margins are visible.</li><li>• <a href="#">Full</a> – spans the full path width, and template margins aren't visible.</li></ul> |
| <a href="#">Use Sign In Widget</a>                                                                                                                                                                         | When enabled, shows a sign-in widget, and displays user-specific details on the site, such as user profile, sign-in, log-out, bookmarks, and so on. This option isn't available when you choose a custom header style.                                                                                                |
| <a href="#">Use Locale Selector</a>                                                                                                                                                                        | When enabled, shows a dropdown selector for locales a page can be displayed in. This option isn't available when you choose a custom header style.                                                                                                                                                                    |

### Logo Tab Settings

| Option                                                                                                  | Description                                                                                     |
|---------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| <a href="#">Title</a>                                                                                   | The title when the cursor moves over the logo.                                                  |
| <a href="#">Alt Text</a>                                                                                | The alt text for the logo, useful for screen readers.                                           |
| <a href="#">Image</a>                                                                                   | The logo image. Choose <a href="#">Select Image</a> to select an image from the Image Selector. |
| <a href="#">Click URL (href)</a>                                                                        | A URL that directs users who click on the logo.                                                 |
| <div><div> ⓘ Note</div><div>If you don't set this field, clicking on the logo does nothing.</div></div> |                                                                                                 |

## Menu Tab Settings

A menu is a list of elements that can be links. Change the order of the links by dragging them up or down on the [Menu](#) page. The order is vertical in the editor and mobile/tablet public site view, horizontal in desktop public site view.

| Setting                                | Description                                                                        |
|----------------------------------------|------------------------------------------------------------------------------------|
| <a href="#">Category Link</a>          | Allows the user to choose a site configured Category page for the link.            |
| <a href="#">Content</a>                | Allows the user to choose a site configured Content page for the link.             |
| <a href="#">Cookie Consent Manager</a> | Adds a link in the header to the cookie consent manager dialog.                    |
| <a href="#">External</a>               | Allows the user to input their own URL.                                            |
| <a href="#">Home Page</a>              | Sets up a link that navigates to the brands home page when selected.               |
| <a href="#">List</a>                   | Creates a dropdown list that then can be configured with a separate list of links. |
| <a href="#">TC Join</a>                | Navigates the user to the Talent Community Join page for the site.                 |
| <a href="#">Top Jobs</a>               | Navigates the user to the Top Jobs page for the site.                              |
| <a href="#">View All Jobs</a>          | Navigates the user to the View All Jobs page for the site.                         |

## Desktop Layout and Mobile Layout Tab Settings

The [Desktop Layout](#) and [Mobile Layout](#) tabs appear only when you set the [Header Style](#) option to **Custom**.

### → Recommendation

Unless you require exacting specifications for your career site headers, use the global header styles instead of creating custom headers.

You can add different components to each layout by choosing **+** [Add Component](#). Select the gray box that represents the component to go to the [Details](#) and [Styles](#) tabs for the component.

| Component             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Image</a> | <p>The <a href="#">Details</a> tab allows you to add a background image to your custom header by using the image selector. You can also specify:</p> <ul style="list-style-type: none"><li>• <a href="#">Title</a> of your image.</li><li>• <a href="#">Click URL (href)</a> – turns the image into a URL link.</li><li>• <a href="#">Min. Height</a> – specifies the minimum height for the image.</li><li>• <a href="#">Image Type</a> – options are Unmodified, Tiled, Stretched, Horizontally Scaled, Vertically Scaled, and Vertically &amp; Horizontally Scaled.</li><li>• <a href="#">Image Position</a> – Top Left, Top Middle, Top Right, Middle Left, Middle Middle, Middle Right, Bottom Left, Bottom Middle, and Bottom Right.</li></ul> <p>The <a href="#">Styles</a> tab lets you specify the background color behind the image.</p> <p>Don't use this setting to specify a logo. Use the <a href="#">Logo</a> component instead.</p> |
| <a href="#">Line</a>  | <p>Inserts a horizontal block, where you specify its color and height. You can use this, for example, to display your logo in a color bar.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Component            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Logo</a> | <p>The <a href="#">Logo</a> component allows you to use a logo to your custom header that's optimized for the layout. This allows you to choose different images for the component for both the desktop and mobile layouts.</p> <div> <p>→ Recommendation</p> <p>If you have a logo in SVG (scalable vector graphics) format, the image renders correctly regardless of layout style so that you can specify it in your global header settings without having to create a custom header.</p> </div> <p>The <a href="#">Details</a> tab allows you to add a logo to your custom header by using the image selector. You can also specify:</p> <ul style="list-style-type: none"> <li>• <a href="#">Title</a> of your image.</li> <li>• <a href="#">Alt Text</a> – alternate text that is read by a screen reader.</li> <li>• <a href="#">Click URL (href)</a> – turns the image into a URL link.</li> </ul> <p>The <a href="#">Styles</a> tab lets you specify the color behind the image.</p> |

| Component            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <a href="#">Menu</a> | <p>The <a href="#">Details</a> tab lets you add a link. Choose <a href="#">+</a> <a href="#">Add</a> to add a link. The fields you can add in the Link Setup dialog are:</p> <ul style="list-style-type: none"> <li>• Category Link – displays the Title and Text fields, and includes a dropdown list from which to select a category page.</li> <li>• Content – displays the Title and Text fields, and includes a dropdown list from which to select a content page.</li> <li>• Cookie Consent Manager – displays the Title and Text fields, both of which are set to display <b>Cookie Consent Manager</b> by default. To use this option, you need to configure the cookie consent manager in the Cookie Manager in <a href="#">► Appearance ► Global ► Cookie Manager ►</a>.</li> <li>• External – displays the Title, Text, and Source (URL) fields. Enable the New Session setting if you want the link to open in a new browser window.</li> <li>• Home Page – displays the Title and Text fields, both of which are set to display <b>Home Page</b> by default.</li> <li>• TC Join – displays the Title and Text fields, both of which are set to display <b>Join Talent Community</b> by default.</li> <li>• Top Jobs– displays the Title and Text fields, both of which are set to display <b>Top Jobs</b> by default.</li> <li>• View All Jobs– displays the Title and Text fields, both of which are set to display <b>View All Jobs</b> by default.</li> </ul> <p>The <a href="#">Styles</a> tab lets you specify the following:</p> <ul style="list-style-type: none"> <li>• Menu background color</li> <li>• Menu link color</li> <li>• Menu link hover color</li> <li>• Dropdown background color</li> <li>• Dropdown link color</li> <li>• Dropdown link hover color</li> <li>• Horizontal alignment</li> <li>• Vertical alignment</li> <li>• Top padding</li> <li>• Bottom padding</li> <li>• Minimum height</li> </ul> |

| Component                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Sign-In and Language</a> | <p>By default, the <a href="#">Sign-In and Language</a> component is automatically added to the layout, and includes two additional components you can add to the row. You can add additional rows by selecting <a href="#">Add Row</a>.</p> <p>The <a href="#">Details</a> tab lets you customize the following settings:</p> <ul style="list-style-type: none"> <li>• <a href="#">Use Sign In Widget</a> – use the slider to enable or disable the sign-in widget.</li> <li>• <a href="#">Use Locale Selector</a> – use the slider to enable or disable a language selector.</li> <li>• <a href="#">Language Dropdown</a> – specifies the label for the language selector. Select the field to display the Override Resource Key dialog, where you can specify the local and also override the default label for the field name. Select  (text) icon to change the field name's font and size.</li> <li>• <a href="#">Employee Login</a> – specifies the label for the login field. Select the field to display the Override Resource Key dialog, where you can specify the local and also override the default label for the field name. Select  (text) icon to change the field name's font and size.</li> <li>• <a href="#">View Profile Link</a> – specifies the label for the profile link. Select the field to display the Override Resource Key dialog, where you can specify the local and also override the default label for the field name. Select  (text) icon to change the field name's font and size.</li> <li>• <a href="#">Horizontal Alignment</a> –</li> <li>• <a href="#">Vertical Alignment</a> –</li> <li>• <a href="#">Top Padding</a> –</li> <li>• <a href="#">Bottom Padding</a> –</li> <li>• <a href="#">Min Height</a> –</li> </ul> <p>The <a href="#">Styles</a> tab lets you set the color for the following settings:</p> <ul style="list-style-type: none"> <li>• Background color</li> <li>• Link color</li> <li>• Link hover color</li> <li>• Dropdown background color</li> <li>• Dropdown link color</li> <li>• Dropdown link hover color</li> </ul> |
| <a href="#">Text</a>                 | <p>The <a href="#">Details</a> tab lets you write a text block in the header and format it. It also lets you format the following</p> <ul style="list-style-type: none"> <li>• Body Text</li> <li>• Horizontal Alignment</li> <li>• Vertical Alignment</li> <li>• Top Padding</li> <li>• Bottom Padding</li> <li>• Min Height</li> </ul> <p>The <a href="#">Styles</a> tab lets you specify the color of the background and body text.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Styles Tab Settings

The Styles tab appears only when you set the [Header Style](#) option to Custom.

| Setting                          | Description                                                                                                                         |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Background Image</a> | Lets you choose a background image.                                                                                                 |
| <a href="#">Image Type</a>       | Options are Unmodified, Tiled, Stretched, Horizontally Scaled, Vertically Scaled, and Vertically & Horizontally Scaled              |
| <a href="#">Image Position</a>   | Options are Top Left, Top Middle, Top Right, Middle Left, Middle Middle, Middle Right, Bottom Left, Bottom Middle, and Bottom Right |

## 19.8.2.2.8 Footer Editor Settings in Career Site Builder Styles

The [Details](#) tab of the [Footer Editor](#) allows you to add a copyright notice to the bottom of your career site pages.

In Career Site Builder, public (external) and internal career sites share the same header and footer. This means that you can't specify a header or footer for your organization's internal career site that differs from the public career site.

### Career Site Builder Path

► [Appearance](#) ► [Styles](#) ► [Footers](#) ► [<Brand>](#) ► [Details](#) ►

### Details Settings

| Option                       | Description                                                                                                                                                                                                                                                                          |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Footer Text</a>  | Displays any line of text (for example, a copyright message). Shown at the bottom of the footer area.                                                                                                                                                                                |
| <a href="#">Footer Width</a> | Specifies whether the footer is centered or full: <ul style="list-style-type: none"> <li>Centered – aligns with the page component width and the template background margins are visible.</li> <li>Full – spans the full path width, and template margins aren't visible.</li> </ul> |
| <a href="#">Footer Image</a> | When enabled, allows you to add an image to the footer using the <a href="#">Logo</a> tab.                                                                                                                                                                                           |

### Logo Settings

This option displays only when you enable the [Footer Image](#) option in the Footer Editor's Details tab.

| Option                           | Description                                                                                                                                                                      |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Title</a>            | The title when the cursor moves over the logo.                                                                                                                                   |
| <a href="#">Image</a>            | The logo image. Choose <a href="#">Select Image</a> to select an image from the Image Selector.                                                                                  |
| <a href="#">Click URL (href)</a> | A URL that directs users who select the image.                                                                                                                                   |
|                                  | <div>  <b>Note</b><br/> If you don't set this field, selecting the image does nothing. </div> |
| <a href="#">Image Position</a>   | Specifies where on the footer the image appears. Choices are Right and Left.                                                                                                     |

## Row and Column Menu Settings

A menu is a list of elements that can be links. Change the order of the links by dragging them up or down on the [Menu](#) page. The order is vertical in the editor and mobile/tablet public site view, horizontal in desktop public site view.

| Setting                                | Description                                                                   |
|----------------------------------------|-------------------------------------------------------------------------------|
| <a href="#">Category Link</a>          | Allows the user to choose a site configured Category page for the link.       |
| <a href="#">Content</a>                | Allows the user to choose a site configured Content page for the link.        |
| <a href="#">Cookie Consent Manager</a> | Adds a link to the Cookie Consent Manager dialog.                             |
| <a href="#">External</a>               | Allows the user to input their own URL.                                       |
| <a href="#">Home Page</a>              | Sets up a link that navigates to the brands home page when selected.          |
| <a href="#">List</a>                   | Creates a dropdown that then can be configured with a separate list of links. |
| <a href="#">TC Join</a>                | Navigates the user to the Talent Community Join page for the site.            |
| <a href="#">Top Jobs</a>               | Navigates the user to the Top Jobs page for the site.                         |
| <a href="#">View All Jobs</a>          | Navigates the user to the View All Jobs page for the site.                    |

## Social Links Settings

The links added on the [Social Links](#) tab link to the related social media icons on the career site, typically in the footer, but anywhere on the site where social media icons appear. You can configure different sets of social links by brand and locale by configuring the footers for the individual brands and locales.

Available social networks:

- Facebook
- Instagram
- Pinterest
- Twitter
- Xing – Xing no longer distributes API keys. If you haven't already enabled Xing, you can't turn on Xing Social Apply.
- YouTube

## 19.8.2.3 Search Results in Career Site Builder Appearance Menu Without the Unified Data Model

The configuration options in the Search Results page of the Career Site Builder Global Styles menu.

### Note

This information only applies if the Unified Data Model is **not** enabled. When it's enabled, you can't configure the settings described here.

For information about configuring the search experience after the Unified Data Model is enabled, refer to [Search Experience Settings for the Unified Data Model \[page 429\]](#).

Career Site Builder supports two types of Search Results layouts: Grid and tile list. You choose which you want by setting the *Use Search Results Tiles* option in [Appearance > Search Results > Search Details](#). When you enable search tiles, Career Site Builder hides the grid layout settings on the page, and displays the *Search Tiles* tab appears [Appearance > Styles > Global Styles > <Brand>](#).

## Career Site Builder Path

[Appearance > Search Results > Search Details](#)

## General Settings

| Setting                         | Description                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Use Search Results Tiles</i> | <ul style="list-style-type: none"> <li>When enabled – search results display in tile layout mode. Customize settings in the Search Results tab in <a href="#">Appearance &gt; Styles &gt; Global Styles &gt; (Brand)</a></li> <li>When not enabled – search results display in grid layout mode, and you configure the settings on this page.</li> </ul> |
| <i>Records Per Page</i>         | Indicates how many jobs are shown on a standard job search that returns values. Loading more jobs from a search will also use this number to get the next batch of search results. For example, if you set this setting to 10 and a search yields 12 results, the last two results appear on a second page.                                              |
| <i>No Results Records</i>       | Indicates how many jobs to return if the job search returns zero jobs. If no jobs are returned, the system falls back to returning the top jobs from all the jobs of the site.                                                                                                                                                                           |

## Grid Header Settings

These settings are only visible when the *Use Search Results Tiles* setting is **disabled**.

| Setting                    | Description                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------|
| <i>Show Sub Filters</i>    | When enabled, shows search boxes that allow you to filter on any of the search results columns.           |
| <i>Show Column Headers</i> | Controls the display of the title of the search results columns.                                          |
| <i>Show Sort Arrows</i>    | Controls the display of arrows that allow you to sort results based on any of the search results columns. |

## Pagination Settings

These settings are only visible when the *Use Search Results Tiles* setting is **disabled**.

| Setting                      | Description                                                                                                                                                    |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Pagination Location</i>   | Controls the alignment of the pagination control, which shows how many pages of search results were returned and allows you to move between pages.             |
| <i>Results Text Location</i> | Controls the alignment of the text showing the number of search results (which appear in the format <i>Results 1 to 50 of 200</i> ) as left, center, or right. |

| Setting                         | Description                                                                                                                                                                              |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Show Top Bar</a>    | When enabled, shows the pagination and search results text at the top of the page.                                                                                                       |
| <a href="#">Show Bottom Bar</a> | When enabled, shows the pagination and search results text at the bottom of the page.                                                                                                    |
| <a href="#">Link Count</a>      | Controls the number of pages that displays in the pagination. For example, when set to 5, the pagination displays 1–5 pages, and you select the next arrow to advance to the sixth page. |

## Relevance Columns

These settings are only visible when the [Use Search Results Tiles](#) setting is **disabled**.

Use Relevance Columns to control which information to display about a job in search results. You can add or remove columns, or change their display order. The [Title](#) column is always required and displays the job title. Relevance Columns are used for nondistance searches such as date, location, and state.

| Setting      | Description                                                                             |
|--------------|-----------------------------------------------------------------------------------------|
| Order        | Move columns up and down using the arrows to control the order.                         |
| Width        | Choose pixels or percent and choose a number to control the width of different columns. |
| Column names | Job title is required; other column names refer to job fields.                          |

## Distance Columns

These settings are only visible when the [Use Search Results Tiles](#) setting is **not enabled**.

[Distance Columns](#) is only available if you have configured Radius Search for your career site. Using this page, you can control which location information about a job displays in search results. The same columns are available as in the Relevance Columns menu, with one addition column, Distance. You can add or remove columns, or change their display order. You can also change the width of the columns, based on percentage of the page or number of pixels. This page controls search results for desktop and tablet devices. Mobile search results are controlled with a separate configuration.

## Mobile Configuration

These settings are only visible when the [Use Search Results Tiles](#) setting is **disabled**.

The [Mobile Configuration](#) page controls the job information that displays on mobile search results. You can add or remove attributes, or change their display order. You can't change the appearance of the attributes for mobile search results. Settings on this page only apply to mobile search results. Desktop and tablet display are controlled in the [Relevance Columns](#) or [Distance Columns](#) configuration.

## Tile Fields Tabs

These tabs are only visible when the [Use Search Results Tiles](#) setting is enabled, and you can configure each of these settings independently of each other:

- Desktop Tile Fields
- Tablet Tile Fields
- Mobile Tile Fields

Static fields on a job:

- Title – is always displayed.
- Distance – only displays during a postal code search, and in a set location on the tile.

Fields that can be displayed and customized:

- Department
- Location
- Date
- Facility
- Shift Type
- State

## 19.8.3 Tools

### 19.8.3.1 Brand Management in Career Site Builder Tools

The Brand Management tool allows you to set up a branded career site that has a different look from your main career site.

You can also associate an SAP SuccessFactors Recruiting microsite ID to a brand. Using this option can affect some font settings for the candidate profile area, as well as the login page and other Mobile Apply pages.

#### → Recommendation

Although there's no limit to the number of brands you can have for your career site, try to limit the configuration for each to no more than 20 megabytes for optimal performance.

#### Career Site Builder Path

## 19.8.3.2 Data Capture Forms Settings in Career Site Builder Tools

Data capture forms enable recruiting users to request additional information from leads, candidates, and employees, that can be used for such things as lead generation.

You can add data capture forms in candidate profiles, landing pages, email campaigns, and offer letters.

### Career Site Builder Path

► [Tools](#) ► [Data Capture Forms](#) ► [\(Locale\)](#) ► [Data Capture Form List](#) ►

The Data Capture Form List shows no forms until you create and save them.

### Data Capture Forms Settings

The [Details](#) tab appears when you edit an existing data capture form.

| Details Tab Settings       | Description                                                                                  |
|----------------------------|----------------------------------------------------------------------------------------------|
| <a href="#">Global Id</a>  | This read-only field displays the unique ID for this form that assigned when you created it. |
| <a href="#">Is Active</a>  | Move the slider to <a href="#">Yes</a> to activate form.                                     |
| <a href="#">Name</a>       | The name of the data capture form.                                                           |
| <a href="#">Label Type</a> | Choose how the field label information appears: Label only, ghost text, or both.             |

The [Layout](#) tab allows you to specify which fields appear in the data capture form. By default, a new form includes the following:

- Primary email
- First name
- Last name
- Country/region

You can add additional fields by choosing the + [Add](#) icon.

### Importing and Exporting Data Capture Forms

During the Career Site Builder export process, when the [Core CSB Settings](#) option is checked, the data capture forms of the site are also exported. This process doesn't have an explicit Content check box to make sure that landing pages with DCF components still work. The export includes all the currently configured DCF of the site/company.

#### ⚠ Caution

During the import process of a [Core CSB Settings](#) export, all existing data capture forms are **deleted** from the site/company.

Each data capture form has its own global identifier; the import process only includes the **last** data capture form in the export that matches any duplicate global IDs.

### 19.8.3.3 Functions Viewer Settings in Career Site Builder Tools

The Functions Viewer displays functions that were created by partners as a way to modify job posting data that contained misconfigurations.

The original purpose of functions was to optimize job posting content for publication. The current recommended practice is to refine your posting content in the system of record (SAP SuccessFactors Recruiting). In this way, consistent job posting content is available for all downstream publication processes, Career Site Builder, and Recruiting Posting.

If you have existing functions, they're available to view for reference purposes, and to delete, as you transition to refining the job posting data upstream in SAP SuccessFactors Recruiting. Examples of functions can be things like an original string of "California" that's replaced by "CA" or "DESCRIPTION" that's replaced by "Description".

#### Note

The creation of new functions isn't supported.

A Career Site Builder administrator can disable this Functions Viewer page so it doesn't appear anymore if you don't have any functions, or you processed and deleted the functions you had.

## Career Site Builder Path

► [Tools](#) ► [Functions Viewer](#) ►

## Functions Viewer Fields

| Field                              | Description                                                                                                                                                             |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Function Name</a>      | The name of the function.                                                                                                                                               |
| <a href="#">Status</a>             | The status of function: Active or inactive.                                                                                                                             |
| <a href="#">Original String</a>    | The text or code string identified as needing to be replaced.                                                                                                           |
| <a href="#">Replacement String</a> | The text or code string that replaces the original string.                                                                                                              |
| <a href="#">Date Created</a>       | The date when a function was created.                                                                                                                                   |
| <a href="#">Affected Fields</a>    | The list of fields in job postings that you search through to replace strings.                                                                                          |
| <a href="#">Delete</a>             | The  ( <a href="#">Delete</a> ) icon permanently deletes the function from the list. |

## 19.8.3.4 Import & Export Settings in Career Site Builder Tools

The Import & Export page allows you to export site settings, Career Site Builder settings, and category pages, as well as import them back into Career Site Builder.

### Career Site Builder Path

► [Tools](#) ► [Import & Export](#) ►

### Import Tab

The Career Site Builder import option doesn't create a new site, but overwrites the existing site XML. The site import on an individual site level is typically used to move a site from a Stage to Production environment.

When you import site settings, all site configurations and database records are updated. The following data is deleted and replaced: site locales, site brands, site settings, and site segments. Existing SSL configurations stays the same when the import is done.

#### 📘 Note

In order to maintain site integrity, Career Site Builder excludes site integration information (including Company ID and Single Sign-On Security Key fields) and API credentials when you perform an import from its Import & Export page.

You can't import site settings from a stage environment to a production environment if the stage environment is using a version with new features that aren't yet available in production. This ensures that any new functionality that you configure in stage won't break your production environment. Career Site Builder prevents you from doing this, and displays a message telling you this.

The site import doesn't create new UTMSourceEngine records, default roles and permissions, or create site email templates.

| Import Tab Settings                          | Description                                                                                                                                                                                                                                                               |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Site Settings</a>                | This option imports the Site Settings XML file that you exported. The file consists of settings that implement and integrate the career site with SAP SuccessFactors Recruiting.                                                                                          |
| <a href="#">Career Site Builder Settings</a> | This option imports the Career Site Builder Settings XML file, which consists of settings that configure the look and feel of the career site.                                                                                                                            |
| <a href="#">Category Pages</a>               | This option imports the category pages XML file that includes all active category page information. When you import this XML export file back in through Career Site Builder, it either adds new categories or overwrites the existing category pages with the same name. |

### Export Tab

Export allows you to export a career site in XML format. This process can be used for testing a site.

| Export Tab Settings                           | Description                                                                                                                                                                                                                                                       |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Site Settings</a>                 | This option exports settings that configure your site, including settings that implement and integrate the career site with SAP SuccessFactors Recruiting.                                                                                                        |
| <a href="#">Career Site Builder Settings</a>  | This option exports Career Site Builder settings that configure the look and feel of the career site.                                                                                                                                                             |
| <a href="#">Source</a>                        | Source lets you choose whether to export a current or previously saved configuration.                                                                                                                                                                             |
| <a href="#">As currently configured</a>       | This option exports the currently saved Career Site Builder settings into an XML file.                                                                                                                                                                            |
| <a href="#">From a previous configuration</a> | This option exports the settings from a previously saved Career Site Builder configuration. Selecting this option allows you to choose from a list of available backups in the dropdown list.                                                                     |
| <a href="#">Contents</a>                      | The <a href="#">Contents</a> fields allow you to configure which Career Site Builder settings to include in the export file.                                                                                                                                      |
| <a href="#">Core CSB Settings</a>             | Select this option to export the main Career Site Builder settings. This option is required if you are exporting using the <a href="#">From a previous configuration</a> option.                                                                                  |
| <a href="#">Fonts and Images</a>              | This optional setting exports both fonts and images used for the career site, in addition to the core Career Site Builder settings.                                                                                                                               |
| <a href="#">Email Layouts</a>                 | This optional setting exports all the email layouts for both brand and locale that are saved in the Email Layout page in Career Site Builder, into an XML file.                                                                                                   |
| <a href="#">Category Pages</a>                | This option exports a single XML file that includes the information for all active category pages. When you import this XML file back in through Career Site Builder, it either adds new categories or overwrites the existing category pages with the same name. |

## Importing and Exporting Data Capture Forms

During the Career Site Builder export process, when the [Core CSB Settings](#) option is checked, the data capture forms of the site are also exported. This process doesn't have an explicit Content check box to make sure the Landing Pages, which could include data capture form components, still work. The export includes all the currently configured data capture forms of the site or organization.

### ⚠ Caution

During the import process of a [Core CSB Settings](#) export, all existing data capture forms are **deleted** from the site or organization.

Each data capture form has its own global identifier; the import process only includes the **last** data capture form in the export that matches any duplicate global IDs.

## 19.8.3.5 Locations Editor Settings in Career Site Builder Tools

The Locations editor in Career Site Builder allows you to override the latitude and longitude in Google Maps searches for specific locations.

### Career Site Builder Path

► [Tools](#) ► [Locations](#) ►

### Location Editor Settings

Add locations in the Locations editor to improve the radius search and Google Maps search in Career Site Builder. Candidates can identify exactly where on the map a job is located, rather than what appears in Google Maps. For example, you have a job located on a large campus, and you want to specify the exact location of the office the job is at.

When opened, the Locations editor shows a list of the locations configured for the site. The default sort order is by ascending location. You can sort and filter the locations in both Location or Country/Region fields by selecting the column headers. When you do, you see the following options:

- ≡ [Sort Ascending](#) – select to sort in ascending order.
- ≡ [Sort Descending](#) – select to sort in descending order.
- ⚑ [Filter](#) – enter the text in the field and press the  key. To remove filter text, clear the field and press the  key.

Each location has both the Google Location and Override Location coordinates. The coordinates of the location appear as a link to that location in Google Maps in a new window. If they're the same, then the Override Location is grayed out and unlinked to show that it hasn't been modified. The coordinates display rounded on this screen — the actual value saved for this location is unaffected — but each set of coordinates shows a tooltip containing the unrounded coordinate values if you hover over the coordinate pair. Negative values aren't shown on this page; the cardinal direction shown conveys that information.

You can use the  ([Edit Override Location](#)) icon to change the override location coordinates.

Also in the list for each row is the  ([Revert](#)) icon. This button is disabled if Override Location hasn't been customized. The button is enabled if Override Location has been customized. When selected, it prompts you to confirm that you want to revert the location. If you confirm the revert action, the Override Location values are replaced with the Google Location values.

## 19.8.3.6 Manage API Credentials Settings in Career Site Builder Tools

The Manage API Credentials page allows you to enter or modify authentication information that connects SAP SuccessFactors Recruiting with Career Site Builder for Real Time Job Sync.

### Note

In most cases, you only need a single credential on this page. Some organizations have multiple entries on this page if they manage multiple systems using multi-ATS (applicant tracking software).
