| Field                                                      | Description                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Provider ID</a>                                | A read-only, system-generated ID number for the provider. Choosing <a href="#">Regenerate</a> replaces the ID with another system-generated ID.                                                                                                                                                                                                                            |
| <a href="#">Provider Name</a>                              | The name of the provider that you're providing API credentials for. Enter the folder name from the Command Center Site Details page, then a dash, then the site ID using this format: <b>Folder Name-Site ID</b> . The site ID is located in Career Site Builder, at ► <a href="#">Settings</a> ► <a href="#">Site Configuration</a> ► <a href="#">Site Information</a> ►. |
| <a href="#">Username</a>                                   | Use the Provider Name ( <b>Folder Name-Site ID</b> ) as the username used to gain access to the Career Site Builder system.                                                                                                                                                                                                                                                |
| <a href="#">Password</a>                                   | A password for the user. Choosing <a href="#">Regenerate</a> replaces the password with a system-generated password. Select the  (hide) icon to mask the password.                                                                                                                      |
| <a href="#">Recruiting Management (Real Time Job Sync)</a> | Selecting this field allows you to specify that the API credential is being used for Career Site Builder to use Real Time Job Sync with SAP SuccessFactors Recruiting.                                                                                                                                                                                                     |

## 19.8.3.7 Site Source Editor Settings in Career Site Builder Tools

The Site Source Editor allows you to specify which sources are available to the Recruiting Campaign URL Builder.

### Career Site Builder Path

► [Career Site Builder](#) ► [Tools](#) ► [Site Source Editor](#) ►

### Details

The [Referrer Types](#) list on the left displays site source types. Referrer types include such categories as [Search Engine](#) and [Social Network](#).

The [Source Engines](#) list on the right displays all the specific sources when you select a type from the left table.

### Referrer Types and Source Engines

The following table lists all the source types in the [Referrer Types](#) section of the Site Source Editor, their descriptions, as well as a small sample of source engines.

| Referrer Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Sample Search Engines                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| Alumni          | Rather than targeting a university or association, some cases focus on engaging with specific alumni of these organizations. This type allows the targeting and tracking of such audiences.                                                                                                                                                                                                                                                                                                                               | Intern Alumni<br>MIT Sloan Alumni<br>ParisTech Alumni                         |
| Banner Campaign | When there's an option to run targeted banner ads on sites or splash pages instead of standard job ads, Banner Campaign allows for the specific tracking of these efforts, which can then be differentiated from the standard advertising options.                                                                                                                                                                                                                                                                        | Google Display Ads<br>Indeed ITA<br>LinkedIn Sponsored Updates<br>Xing Banner |
| Blogs           | Blogs are content-rich, targeted information for their subscribers and audiences. There are cases where these blog sites have a jobs section as a tertiary option, or have job links embedded in their content.                                                                                                                                                                                                                                                                                                           | Coroflot<br>Git Hub<br>Sharepoint<br>Stack Over Flow<br>Tech Crunch           |
| Career Site     | <p>The career site takes a company's job postings from behind the gate of a traditional Applicant Tracking System (ATS) and allows them to be searched and scraped by search engines:</p> <ul style="list-style-type: none"><li>• RCM Redirect source type refers to visitors or candidates that were re-directed from SAP SuccessFactors Recruiting to Career Site Builder.</li><li>• Career Site source type refers to visitors or candidates that have accessed the career site directly to search for jobs.</li></ul> | Career Site<br>RCM Redirect                                                   |

| Referrer Type        | Description                                                                                                                                                                                                                                                                                                                                     | Sample Search Engines                                                                                                                                                                                                        |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Career Site Services | These "services" are considered career site add-ons, widgets, or site-supporting functions that are outside the primary career site features.                                                                                                                                                                                                   | Eightfold<br>HireVue<br>Search Box (widget)                                                                                                                                                                                  |
| Custom Campaigns     | If a customer wants to do custom tracking of an effort without giving it a specific source, they can do so using the Custom Campaign options. This type is rare.                                                                                                                                                                                | Custom Campaigns<br>Vanity URL                                                                                                                                                                                               |
| Direct               | If there's no referring URL captured and properly hard-coded landing page, the system identifies the candidate as "Direct." These visits are when a candidate lands on a specific page on the career site outside the home page (such as a job page, strategy page, landing page, or content page).                                             | Direct                                                                                                                                                                                                                       |
| Email                | Email-based activity, by way of job alerts, targeted campaigns, or referrals from email-based domains.                                                                                                                                                                                                                                          | Email Campaign<br>Email Subscription (Job Alerts)<br>Online Email (mail.yahoo.com, etc.)<br>RCM Invite to Apply                                                                                                              |
| Employee Referral    | Employee referral.                                                                                                                                                                                                                                                                                                                              | Employee Referral<br>Rolepoint<br>Xing Employee Referral (XRM)                                                                                                                                                               |
| Events               | This type is intended for the specific tracking of hosted events in order to identify and capture the candidates as new applicants or subscribers. Ideally, this type allows for easy re-engagement following events through Talent Landing Pages and CRM activities.                                                                           | Campus/Graduate Career Fair<br>Hiring Event<br>Job Fair<br>Open House<br>Virtual                                                                                                                                             |
| Industry Groups      | Industry-focused organizations, associations, unions, or groups are focused on their collective patrons and members. Secondly, these sites have hosted job boards for their group, which allows companies to target these audiences.                                                                                                            | American Hospital Association (AHA)<br>Association for Financial Professionals (AFP)<br>National Association of Black Accountants (NABA)<br>Society for Human Resource Management (SHRM)<br>Society of Women Engineers (SWE) |
| Job Aggregator       | A job aggregator collects job postings from job boards around the Internet and consolidates them into one site so they're easily searchable based on keywords and location. These aggregators tend to be part of or hosting their own network of job boards that they spider out to. Ex. Indeed feeds jobs to SimplyHired as they own the site. | Adzuna<br>CareerJet<br>Indeed<br>JobRobot (DE)<br>JobSpreader<br>Recruit.net<br>Talent.com/Neuvo<br>TipTopJob<br>ZipRecruiter                                                                                                |

| Referrer Type      | Description                                                                                                                                                                                                                                                                                                     | Sample Search Engines                                                                                                            |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Job Boards – Major | Job Boards – Major are considered historically major use job boards.                                                                                                                                                                                                                                            | CareerBuilder<br>Dice<br>The Ladders                                                                                             |
| Job Boards – Niche | A niche job board is a Web site that is primarily used for companies to find strong job candidates. They're typically specific audience-focused (such as advertising, government, pharmacy, human resources) and allow companies to post job openings so that targeted candidates can locate them in one place. | Craigslist<br>eFinancialCareers<br>Glassdoor<br>Reed UK<br>Seek<br>Snag/SnagAJob<br>Stepstone (multiple country/region entities) |
| Jobs2web           | Legacy system tracking and stage site referring URLs.                                                                                                                                                                                                                                                           |                                                                                                                                  |

### 19.8.3.8 Social Apply Settings in Career Site Builder Tools

The Social Apply page in Career Site Builder enables the displaying of links so that candidates can apply for jobs through their social networking profiles.

#### Career Site Builder Path

► [Tools](#) ► [Social Apply](#) ►

#### Social Apply Page

The page displays a list of locales on the left column. You can customize what social networks to enable based on locale.

Save the social apply settings by selecting [Save](#) in the upper right corner of the page.

The page displays the following columns:

- [Site](#) – a list of social networks, as well as the [Apply Now](#) option. [Apply Now](#) allows candidates to apply directly from the career site.
- [Enabled](#) – a slider you select for each site option to enable or disable them.
- [Visibility Order](#) – choose the order in which the options appear on the career site.

Career Site Builder can allow you to see and enable the following:

- [Apply Now](#) – this option is enabled by default, and can't be disabled.
- [LinkedIn](#) – even if you enable LinkedIn here, it isn't visible on your public career site until you establish a contract with LinkedIn, and provide LinkedIn credentials in your SAP SuccessFactors system.

#### Note

For this functionality to be visible to visitors in your career site, make sure to include its related cookie provider in the cookie consent manager at ► [Appearance](#) ► [Global](#) ► [Cookie Manager](#) . If the cookie banner is enabled without including the corresponding cookie provider in the cookie consent manager, this functionality is removed and unavailable to your site's visitors completely.

- [Seek](#) – Career Site Builder doesn't support adding the Apply with Seek option for new career site implementations, so this option is visible only if you've an existing Seek configuration for your system.
- [Xing](#) – available only if you already have an existing Xing configuration in your system. If you don't, this option isn't visible.

#### Note

You can change how these labels appear in the career site by editing them in the translation editor in Career Site Builder, at ► [Tools](#) ► [Translations](#) . Enter **social** in the Group field filter to view all the button labels you can edit.

## 19.8.3.9 SSL Certificates Settings in Career Site Builder Tools

Use this page to manage SSL certificates for public career sites. Options include generating certificate signing request (CSR) files to obtain new SSL certificates from certificate authorities, as well as installing, viewing, renewing, and uninstalling certificates.

### Career Site Builder Path

► [Tools](#) ► [SSL Certificates](#) ►

[SSL Certificates](#) is only available in the production environment of Career Site Builder.

### SSL Certificates Options

The page displays two options you can use based on your scenario:

- [Option 1](#) describes the typical process, where you fill out a Certificate Signing Request (CSR) form that you use to obtain an SSL certificate from a certificate authority.

- [Option 2](#) allows you to upload an SSL certificate that you obtained using your own CSR.

## SSL Certificates Fields

| Field                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <a href="#">Reference ID</a>                | An autogenerated number assigned to a record.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <a href="#">Common Name (CN)</a>            | The fully qualified domain name of the hostname.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <a href="#">Status</a>                      | The status of the record. Values are: <ul style="list-style-type: none"> <li>• <a href="#">CSR Generated</a> – CSR has been generated.</li> <li>• <a href="#">Installation Requested</a> – the new certificate has been uploaded and is awaiting installation by Technical Support.</li> <li>• <a href="#">Installed</a> – the certificate is active.</li> <li>• <a href="#">Inactive</a> – the certificate isn't active and no longer applies to the domain.</li> <li>• <a href="#">Uninstallation Requested</a> – a request has been made to uninstall the certificate.</li> <li>• <a href="#">Reinstallation Requested</a> – a request has been made to reinstall the uninstalled certificate.</li> </ul> |
| <a href="#">Days to Expiry</a>              | The number of days until the SSL certificate is no longer valid.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <a href="#">Valid From</a>                  | The first date that the SSL certificate is valid.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <a href="#">Valid To</a>                    | The last date that the SSL certificate is valid.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <a href="#">Last Modified Date and Time</a> | The last date and time that the record was modified. Modifications can include actions such as uploading or installing certificates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <a href="#">Actions</a>                     | An interactive column that allows you to perform actions for the record, such as installing or uninstalling the SSL certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <a href="#">(Delete)</a>                    | The  ( <a href="#">Delete</a> ) icon permanently deletes the record from the list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Generate Certificate Signing Request Fields

| Field                                             | Description                                                                                                                                                                                                  |
|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Common Name (CN)</a>                  | The fully qualified domain name of the hostname. 64-character limit. Don't include port numbers, path names, or protocol as part of the name (such as <a href="#">http://</a> or <a href="#">https://</a> ). |
| <a href="#">Organization (O)</a>                  | The legal name of the organization.                                                                                                                                                                          |
| <a href="#">Organizational Unit (OU)</a>          | The department or division name.                                                                                                                                                                             |
| <a href="#">Certificate Manager Email Address</a> | The email address of the person in the organization who is responsible for managing SSL certificates. This individual may or may not be the same as the contact person.                                      |
| <a href="#">City/Locality (L)</a>                 | The city or locality of the organization. Don't use abbreviations. For example, use <a href="#">Saint Louis</a> instead of <a href="#">St. Louis</a> .                                                       |

| Field                                 | Description                                                                                                                                                                                                                                                                            |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>State/Province (ST)</i>            | The state or province where the organization is located (state for U.S., province for Canada). Don't use abbreviations. For example, <b>California</b> and not <b>CA</b> . For U.S. organizations, specify the state they operate from, even if they're incorporated in another state. |
| <i>Country/Region (C)</i>             | The country or region of your organization, selected from the dropdown list.                                                                                                                                                                                                           |
| <i>Subject Alternative Name (SAN)</i> | The Subject Alternative Name includes any additional host-names covered by the certificate. 64-character limit. Don't include port numbers, path names, or protocol as part of the name (such as <b>http://</b> or <b>https://</b> ).                                                  |

## 19.8.3.10 Translation Editor in Career Site Builder Tools

The Translations menu in Career Site Builder gives you access to the Translation Editor, which allows you to provide your own wording in place of default labels in your career site.

You aren't restricted to customizing text for nondefault languages. You can use the translation editor to change the wording for labels anywhere in your career site. For example, you can override *Find similar jobs* with **I want to see more jobs like this**.

### Translation Editor Options

| Options              | Description                                                                                                                                                                                                         |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Cancel</i>        | Select <i>Cancel</i> to display a confirmation dialog to make sure you want to cancel. Choosing <i>Yes</i> reloads the page without saving any of the changes you made before the last time you saved the settings. |
| <i>Save</i>          | Select <i>Save</i> to save all the changes you made in the Translation Editor.                                                                                                                                      |
| <i>Locale Filter</i> | The Locale filter determines what locales are displayed in the translation grid. To add a locale, select it from the dropdown list. The only locales you select are the ones you've configured and enabled.         |

| Options                       | Description                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Export</a>        | Select <a href="#">Export</a> to export an XML file of your translation configuration.                                                                                                                                                                                                                                                                                           |
| <a href="#">Import</a>        | Select <a href="#">Import</a> to import an XML file of your translation configuration. When you do choose this option, a dialog appears so that you can specify what file to use.                                                                                                                                                                                                |
| <a href="#">Group</a>         | The Group column lists the groups to which translation resource keys belong. Enter a word in the search field above the column to view all the groups that use that word as part of its name.                                                                                                                                                                                    |
| <a href="#">Resource Key</a>  | The Resource Key column lists the names of the translation resource keys. Enter a word in the search field above the column to view all the resource keys that use that word as part of its name.                                                                                                                                                                                |
| <a href="#">Override Text</a> | By default, the Override Text column displays ghost text of the labels that appear on your career site. To override this default text, select the field to display the <a href="#">Override Resource Key</a> dialog. Enter your custom text in the <a href="#">Override Text</a> field and select <a href="#">Confirm</a> . The ghost text is then replaced by your custom text. |

 **Note**  
You still need to select [Save](#) to save your confirmed changes.

## 19.8.4 Layouts

### 19.8.4.1 Email Layouts Settings in Career Site Builder Layouts

Settings in the Email Layout List page in the Career Site Builder Email Layout menu allow you to customize email layouts for particular types of candidates, positions, or email campaigns to optimize communications as part of Candidate Relationship Management.

Email layouts are used for creating email campaigns for SAP SuccessFactors Recruiting as part of Candidate Relationship Management.

#### Career Site Builder Path

- [Layouts](#) ▸ [Email](#) ▸ [\(Locale\)](#) ▸ [Email Layout List](#) ▾

#### Email Layout List View

The Email Layout List page displays your email layouts. You can use the following filter fields on the top of the page to look for specific email layouts: email layout name, locale, brand, and status.

#### Create Email Layout Dialog

The following fields appear when you create a new email layout.

| Field                  | Description                              |
|------------------------|------------------------------------------|
| <a href="#">Name</a>   | The name of the layout.                  |
| <a href="#">Locale</a> | The preconfigured locale for the layout. |

| Field        | Description                             |
|--------------|-----------------------------------------|
| <i>Brand</i> | The preconfigured brand for the layout. |

## Email Layout Editor Details Settings

| Field                  | Description                                                       |
|------------------------|-------------------------------------------------------------------|
| <i>Email Global Id</i> | An auto-generated identifier for the email layout you're editing. |
| <i>Is Active</i>       | Specifies whether the layout is active.                           |
| <i>Name</i>            | The name of the layout.                                           |

## Styles Settings

Specify the background color of the email layout.

## Email Layout Settings

This tab is where you can add the following components to your email layout:

| Option                        | Description                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Header</i>                 | Header information. You can configure the following for this component: <ul style="list-style-type: none"> <li>Details tab – specify the header style and header text.</li> <li>Logo tab – upload and select an image, and give the image a title.</li> <li>Styles tab – specify the color of the header background and header text.</li> </ul>                                  |
| <i>Text</i>                   | Text is the only component that can be added multiple times to the same email layout.<br>You can configure the following for this component: <ul style="list-style-type: none"> <li>Details tab – add the text that goes in the email, and use its format menu to format the text.</li> <li>Styles tab – specify the color of the body text background and body text.</li> </ul> |
| <i>HTML</i>                   | Fully supported HTML. HTML emails are displayed correctly designed and formatted. <ul style="list-style-type: none"> <li>Details tab – insert the HTML in the text box.</li> <li>Styles tab – specify the background color.</li> </ul>                                                                                                                                           |
| <i>Configurable Text Area</i> | A required component, Configurable Text Area identifies the section where the email body text for email campaigns is displayed. Since the Configurable Text Area is a position holder for the text that's added later for the campaign, it can't be configured or styled within Email Layout.                                                                                    |
| <i>Footer</i>                 | Footer text.                                                                                                                                                                                                                                                                                                                                                                     |

| <a href="#">Active</a>                                                  | To activate this job layout, move the slider to <a href="#">YES</a> . Once this layout is activated, it controls the appearance of the career site job page for all active jobs with the locale, brand, and field mapping you chose.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <a href="#">Name</a>                                                    | The name of your job layout.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <a href="#">Show two columns</a>                                        | To create a layout with two columns, move the slider to <a href="#">YES</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <a href="#">Column width</a>                                            | This field appears only when you enable <a href="#">Two columns</a> . Use this slider to adjust the width of the columns.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### Column Settings

By default, all custom job layouts include one column. A [Column 2](#) tab appears when you enable the [Show two columns](#) setting. The same components are available for you to add to either column:

- [Custom Plugin](#)
- [Featured Jobs](#)
- [Google Job Map](#)

- [Job Token](#)
- [Large Image](#)
- [Text](#)
- [Video](#)

#### ⓘ Note

If the element or component uses cookies, make sure to include its related cookie provider in the cookie consent manager at [► Appearance ► Global ► Cookie Manager ►](#). If the cookie banner is enabled without including the corresponding cookie provider in the cookie consent manager, this element or component is removed and unavailable to your site's visitors completely.

## 19.8.4.3 Job Alerts Email Template Settings in Career Site Builder Layouts

Settings in the Job Alerts Email Template page in Career Site Builder allow you to create and save a template used when sending job alert email notices.

You create an email template for job alerts for each locale you use for your career site.

### Career Site Builder Path

[► Layouts ► Job Alerts Email Template ► <Locale> ►](#)

### Email Template Tab

The Email Template tab displays the form in which you design your template.

| Field                       | Description                                                                                                                                                                       |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Subject</a>     | Text that appears as the subject of the email. The tokens you can use in this field are <code>[[jobtitle]]</code> , <code>[[companyname]]</code> , and <code>[[siteurl]]</code> . |
| <a href="#">Body Format</a> | Options from the dropdown list are <a href="#">HTML</a> and <a href="#">Text</a> . The default is <a href="#">HTML</a> .                                                          |

#### ⓘ Note

Make sure you choose [HTML](#) if you're using any HTML code in the content of the email. Setting it to [Text](#) when you use HTML causes the code to be visible in the email.

| Field       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Body</i> | <p>A text field where you build the content of the email. All the supported tokens — text of field variables that are replaced by real data in the actual email — are listed in the <a href="#">Supported Tokens</a> list on the right column.</p> <p>The <i>Body</i> field allows up to 8,000 characters.</p> <p>Refer to <i>Tokens Used in the Job Alerts Email Template</i> for a complete list of supported tokens and their descriptions.</p> |

## Preview Tab

The [Preview](#) tab displays how an email using the template would appear.

### Note

Some tokens may not be replaced with text in the preview if data is missing.

## 19.8.5 Settings

### 19.8.5.1 Site Configuration in Career Site Builder Settings

Use the site configuration menu to set up basic configuration options for your career site.

#### Career Site Builder Path

► [Settings](#) ► [Site Configuration](#) ►

#### Site Information Tab

Use the site settings menu to select basic site configuration options.

| Setting             | Description                                                                                                   |
|---------------------|---------------------------------------------------------------------------------------------------------------|
| <i>Site ID</i>      | This read-only field displays the career site ID.                                                             |
| <i>Site Name</i>    | (Required) The go-to-market name of the career site.                                                          |
| <i>Company Name</i> | (Required) The company name of your career site, it can be a shortened version of <a href="#">Site Name</a> . |

| Setting                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Google Tag Manager ID</a>                         | Allows you to specify a Google Tag Manager ID. After you obtain the ID from Google and add it in this field, Career Site Builder incorporates the necessary code in your career site for you to use Google Tag Manager. <div>  <b>Note</b><br/> This field only enables Google Tag Manager for your career site; it doesn't manage the tags or perform any analysis or reporting for you. </div>                                                                                                                                                                                                                                                                                   |
| <a href="#">Use Google Tag Manager in Career Site Wrapper</a> | Adds Google Tag Manager to all the pages that use the career site wrapper, including <a href="#">Job Application</a> , <a href="#">Candidate Profile</a> , <a href="#">Login</a> , and <a href="#">Create an Account</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <a href="#">Google Analytics (Universal Analytics) ID</a>     | (Deprecated) Google's Universal Analytics ID that you have set up for your career site.<br>Google has announced its retirement of Universal Analytics on July 1, 2023. Don't use this field to add a new ID number. Use <a href="#">Google Analytics 4 ID</a> instead after you configure your Google Analytics 4 account.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <a href="#">Google Analytics 4 ID</a>                         | The Google Analytics 4 ID that you have set up for your career site. <div>  <b>Note</b><br/> If you have a cookie banner enabled for your career site at <a href="#">Appearance</a> &gt; <a href="#">Global</a> &gt; <a href="#">Cookie Manager</a>, make sure to include the <b>Google Analytics</b> cookie provider in the cookie consent manager, or else Google Analytics 4 functionality is removed and unavailable for your site completely.<br/><br/> Google Analytics 4 recognizes the value of <b>Google Analytics</b> in the cookie manager, so you don't need to make any cookie manager changes when you switch from Universal Analytics to Google Analytics 4. </div> |
| <a href="#">Use Google Analytics in Career Site Wrapper</a>   | When you provide the Google Analytics ID, enabling this field adds Google Analytics to all the pages that use the career site wrapper ( <a href="#">Job Application</a> , <a href="#">Candidate Profile</a> , <a href="#">Login</a> , and <a href="#">Create an Account</a> pages).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <a href="#">Google Webmaster ID</a>                           | The Google Webmaster account.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <a href="#">Bing Webmaster ID</a>                             | The Bing Webmaster Tools account.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <a href="#">Site Map</a>                                      | This field includes <a href="#">Main</a> and <a href="#">Category</a> . Choosing them takes you a list of URLs for your career site, and of your category pages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <a href="#">Candidate Relationship Management Customer ID</a> | A read-only customer identifier used for reporting purposes, that's assigned when the site is provisioned through the SAP internal process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <a href="#">Page Title</a>                                    | The page title of your career site.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <a href="#">Meta Description</a>                              | A text field to provide a description of your career site.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Setting                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Use Redirect</a>                   | <p>Use this field to specify another URL from which traffic automatically redirects to your career site's primary URL, as configured on the <a href="#">Site URL</a> tab.</p> <div> <p><b>Note</b></p> <ul style="list-style-type: none"> <li>The URL can't include capital letters, underscores, slashes, or spaces. Don't include <code>http://</code> or <code>https://</code> in the field.</li> <li>If the redirect URL is in a different domain than the primary URL, it may need its own SSL certificate. Install the SSL certificate at <a href="#">Tools &gt; SSL Certificates</a>. A separate certificate may not be required if your primary URL is using wildcard certificates or certificates with a SAN entry that covers the additional domain.</li> <li>Have your organization's IT department add a DNS CNAME record so that the source domain you add as the redirect URL points to the same value as the primary URL that the DNS entry points to. Depending on the date of the original implementation, this would be either <code>&lt;companyname&gt;.jobs2web.com</code> or <code>&lt;SiteId&gt;.jobs2web.com</code>.</li> </ul> </div> |
| <a href="#">Use CRM</a>                        | <p>Enabling this field allows Career Site Builder sites to use of forms and email templates on career sites and capture the information in Candidate Relationship Management (CRM).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <a href="#">Use Real Time Job Sync</a>         | <p>This field enables Real Time Job Sync between your career site and SAP SuccessFactors Recruiting, so that jobs posted externally in SAP SuccessFactors Recruiting are sent to the career site in near-real time. Real Time Job Sync requires a separate configuration process, which is typically performed as part of the initial implementation of Career Site Builder.</p> <div> <p><b>Note</b></p> <p>Once this field is enabled, the slider becomes noninteractive so that you can't disconnect SAP SuccessFactors Recruiting from Career Site Builder.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <a href="#">Job Layouts Site Field Mapping</a> | <div> <p><b>Note</b></p> <p><b>Not</b> available when the Unified Data Model is enabled. With the Unified Data Model, this setting is no longer relevant, so it's removed.</p> </div> <p>The field type on which you plan to categorize all your custom job page layouts by. For example, choosing Department lets you create different layout pages for your company's departments (such as engineering or administration). Choosing Country/Region lets you create layout pages for the different countries/regions your jobs are in, such as U.S. or Canada.</p> <div> <p><b>Caution</b></p> <p>Changing the Site Field Mapping value can break its association to all the Job Field Mapping values you have in existing job layouts, making the layouts no longer valid. To reactivate them, manually choose a valid Job Field Mapping value for each invalid job layout you have.</p> </div>                                                                                                                                                                                                                                                             |

## Email Settings

| Setting                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Use Job Alerts</a>                | Enabling this setting gives candidates the ability to subscribe to job alerts from the public career site. Disabling it prevents both the creation of new job alert subscriptions, as well as the sending of emails to candidates for existing subscriptions.                                                                                                                                                                                                                                                                                                                      |
| <a href="#">Job Alert Sender Address</a>      | The email address that job alert emails are sent from. You can customize the part of the address before the @ symbol (the "username" or "local-part"). The part after the @ symbol is based on your site's primary URL, with the added subdomain <b>mail</b> .                                                                                                                                                                                                                                                                                                                     |
| <a href="#">Use Locale for Job Alerts</a>     | Enabling this setting restricts the email that candidates receive to only for those jobs that match their chosen locale. <div><p><b>Note</b></p><p>This information only applies if the Unified Data Model is <b>not</b> enabled. When it's enabled, you can't configure the settings described here.</p></div>                                                                                                                                                                                                                                                                    |
| <a href="#">Email Campaign Sender Address</a> | The email address that campaign emails are sent from. You can customize the part of the address before the @ symbol (the "username" or "local-part"). The part after the @ symbol is based on your site's primary URL, starting with the added subdomain <b>mail</b> .                                                                                                                                                                                                                                                                                                             |
| <a href="#">Use Custom Sender Address</a>     | When this setting is enabled, emails are sent from the custom sender address you've configured, based on your career site's primary URL. <div><p><b>Note</b></p><p>If you use a custom site URL, don't enable this setting until you've verified that your DNS provider is configured correctly. Otherwise, emails will be sent from the default <b>jobs2web.com</b> domain instead.</p><p>If you use multiple brands, you need to enable this setting for each brand, at ► <a href="#">Brand Settings</a> ► <a href="#">(Brand)</a> ► <a href="#">Email Settings</a> ►.</p></div> |

| Setting                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Verify DNS Configuration for Use of Custom Sender Address</a> | <p>If you use a custom URL as your primary site URL, the <a href="#">Verify DNS Configuration for Use of Custom Sender Address</a> section is displayed, so that you can verify that your DNS configurations are set up correctly.</p> <p>If you use a standard URL as your primary site URL, this section isn't displayed because SAP maintains the DNS configuration for you.</p> <div> <p><b>Note</b></p> <p>DNS information is only displayed in the <a href="#">Verify DNS Configuration for Use of Custom Sender Address</a> section if you've already requested a public key from SAP for your domain. If you haven't done that yet, a message is displayed with instructions how to do so.</p> </div> |

## Verify DNS Configuration for Use of Custom Sender Address

If you use a custom URL as your primary site URL, you can verify within Career Site Builder that your email infrastructure is configured correctly, to support the configured sender addresses for job alerts or email campaigns.

First, you have to submit a request to SAP for a public key for your domain. You have to submit a separate request for each domain that you want to use a custom sender address for. Once that process is completed, you can see the status of your DNS configuration in the [Verify DNS Configuration for Use of Custom Sender Address](#) section.

You can see the status of the following DNS records:

- SPF
- MX
- DKIM
- DMARC

For each record type, you can see the status, subdomain, and value. If the status is [Active](#), the configuration is correct. When all 4 records are correct, emails can be sent from the configured sender addresses.

If any of the records are incorrect and emails **can't** be sent from the configured addresses, we use the default `jobs2web.com` domain as a fallback. Emails are sent from the default domain instead.

## Site URL

| Setting                         | Description                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Custom Site URL</a> | <p>Enter a custom URL that's set up and maintained by your organization. It must be unique, in comparison to all other websites. You need to set up the DNS (Domain Name Services) and maintain the SSL certificates.</p> <p>The URL can't include capital letters, underscores, slashes, or spaces. Don't include <code>http://</code> or <code>https://</code> in the field.</p> |

| Setting                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Standard Site URL</a> | <p>To minimize the cost and effort of maintaining SSL certificates, you can choose a standard URL with a generic domain name that SAP manages for you (<code>jobs.hr.cloud.sap.com</code> or <code>jobs.hr.sapcloud.cn</code>)</p> <p>Enter a unique subdomain name for your organization. Then choose <a href="#">Check Availability</a> to ensure it's unique.</p> <p>The subdomain can't include capital letters, underscores, slashes, or spaces. Don't include <code>http://</code> or <code>https://</code> in the field.</p> |

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Primary</a> | <p>Select one URL as primary. The primary URL is your site's true web address and the domain on which all other functionality is based, such as job alerts and integrations.</p> <p>When you change which URL is selected as <a href="#">Primary</a>, other configurations that use the site URL (job alert email address, integration settings in Provisioning) are automatically updated to reflect the new primary URL.</p> |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Note

To facilitate a transition from 1 URL to the other, you can maintain 2 active URLs for up to 6 months. The transition period starts whenever you select a different URL as [Primary](#). During that period, the secondary URL redirects automatically to the primary URL, for up to 6 months. After 6 months, the secondary URL is removed automatically from the site configuration and no longer redirects automatically.

A secondary [Custom Site URL](#) remains active as long as the SSL certificate is valid. When it's no longer needed, you can let the SSL certificate expire and remove it from Career Site Builder at any time. To extend the transition period beyond 6 months, you need to set up the redirection yourself and maintain the SSL certificates outside of Career Site Builder.

Here's an overview of the process of transitioning from a custom site URL to a standard site URL.

1. Configure the [Standard Site URL](#) and save.
2. If you use an internal career site powered by Career Site Builder, update the SAML 2.0 configuration in your identity provider so that internal candidates can access the site at the new URL with single sign-on.
3. Select the standard URL as [Primary](#) and save. All career site functionality now uses the standard URL with the SAP domain.
4. Continue to maintain your secondary, custom URL during the transition period, while you manage the change within your organization. The custom URL remains active as long as the SSL certificate is valid. (The [SSL Certificates](#) tool in Career Site Builder only applies to the custom URL, whether it's primary or secondary.
5. Plan to complete the transition within a 6-month period:
  - When the secondary custom URL is no longer needed, you can let the SSL certificate expire and remove it from the [Custom Site URL](#) field at any time.
  - After 6 months, the secondary custom URL stops redirecting automatically. To extend the transition period, you need to set up the redirection yourself and continue to maintain the SSL certificates.

| Setting                    | Description                                       |
|----------------------------|---------------------------------------------------|
| <a href="#">Visit Site</a> | Use this link to open either URL in a new window. |

## Site Locales

The Site Locales page allows you to configure locales for a site and to configure the site default locale.

The locales for the site can be selected via checking the check boxes to the left in the data grid.

## SmartRecruiters

If you have a license for SmartRecruiters Winston for SAP SuccessFactors, you can embed Winston Chat on your career site. For more information: [Embedding SmartRecruiters Winston on a Career Site in Career Site Builder \[page 407\]](#)

| Setting                                             | Description                                                                                                             |
|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Enable SmartRecruiters Winston Chat</a> | This setting enables SmartRecruiters Winston Chat to appear on your career site, using the provided embed code snippet. |
| <a href="#">Snippet</a>                             | Enter the embed code for SmartRecruiters Winston, retrieved from your SmartRecruiters system.                           |

## Internal Career Site

The Internal Career Site page allows you to enable an internal career site powered by Career Site Builder. You can't enable this switch until you configure the Identity Authentication service for your career site.

## Site Integrations Tab Settings

The Site Integrations page provides information about the integration between your career site instance and SAP SuccessFactors.

In order to maintain site integrity, Career Site Builder excludes site integration information (including Company ID and Single Sign-On Security Key fields) and API credentials when you perform an import from its Import & Export page.

### ⚠ Caution

Don't change the values on this page; misconfiguring the fields can cause the integration between your career site and SAP SuccessFactors to break.

| Setting                                | Description                                                   |
|----------------------------------------|---------------------------------------------------------------|
| <a href="#">Company ID</a>             | The company ID for your organization.                         |
| <a href="#">Deployment Data Center</a> | The deployment data center where your career site is located. |

| Setting                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Single Sign-On Security Key</a> | <p>The single sign-on security key. Values entered in this field are masked for security purposes.</p> <p>By default, the value in this field is masked for security purposes. Select <a href="#">Show the Value/Key</a> if you want the characters to be visible.</p> <div> <p><b>⚠ Caution</b></p> <p>Don't change the value of this field on your own. The security key has to match the security key in Provisioning, or else your integration breaks. To change your security key, contact Technical Support, Professional Services, or an implementation partner.</p> </div> |

|                                |                                 |
|--------------------------------|---------------------------------|
| <a href="#">Recruiter Sync</a> | The setting synchronizes users. |
|--------------------------------|---------------------------------|

### 📘 Note

If you don't see the Site Integration tab, your Career Site Builder implementation settings could be misconfigured. Refer to [SAP Note 3008375 – How to Display Site Integrations tab in Career Site Builder – Recruiting Marketing](#) for more information, and contact Technical Support for assistance.

## SEO Settings Tab Settings

Use the SEO Settings tab in the Site Configuration menu to refine your search-engine optimization settings.

| Setting                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Terms to Demote</a>  | Terms you include in this field are automatically demoted to the end of the result set. Start each new term or phrase in a new line, and don't include the word "job" in your terms (for example, use "technical recruiter" instead of "technical recruiter jobs").                                                                                                                                                                                                                                                                                                                                   |
| <a href="#">Terms to Avoid</a>   | <p>When you add terms in this field, Career Site Builder adds a <b>noindex</b> value to prevent search engines from indexing them, and also suppresses them from being part of the Top Jobs results. That means user-generated search pages aren't indexed when the URL string contains a term you add to the field.</p> <div> <p><b>📘 Note</b></p> <p>If <a href="#">Noindex Search Pages</a> is turned off, user-generated search pages that contain words listed in <a href="#">Terms to Avoid</a> have the <b>noindex</b> value.</p> </div>                                                       |
| <a href="#">Noindex Top Jobs</a> | <p>By default, Career Site Builder generates a Top Jobs page that lists links to search results pages based on the most frequently searched terms. When you select <b>YES</b> to disable Top Jobs, Career Site Builder adds a <b>noindex</b> value to these auto-generated pages, as well as to the Top Jobs page itself.</p> <div> <p><b>📘 Note</b></p> <p>If you enable this setting, make sure to remove any links to the Top Jobs page from your career site's headers and footers. Doing so avoids having a blank Top Jobs page that only displays a header, search form, and footer.</p> </div> |

| Setting                              | Description                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Noindex Search Pages</a> | <p>When you select <b>YES</b>, Career Site Builder adds a <code>noindex</code> value to all search pages. This setting doesn't affect category pages.</p> <p>Enable this option to prevent search engines from indexing links to user-generated search pages, including pages containing inappropriate or undesired words.</p> |

## 19.8.5.2 IDP Configuration in Career Site Builder Settings

The IDP Configuration page allows you to configure the IDP settings for a career site.

### Career Site Builder Path

### Export SAML Metadata

You can choose [Generate](#) to generate a new certificate and private key, but once generated, Single Sign-On isn't available until the new certificate has been implemented.

After a certificate is generated, [Export Metadata](#) and [View metadata details](#) become enabled. You can then export the metadata for this site to an XML file, or view the same without exporting it to a file.

### Import IDP SAML Metadata

[Tenant Name](#) displays the Tenant ID. The value for this field is provided in the SAML 2.0 Configuration page you set up when you're integrating Identity Authentication service with SAP SuccessFactors, Career Site Builder, and SAP SuccessFactors Recruiting.

When you choose [Save](#), the metadata endpoint for the tenant name is contacted, the last successful date and time display. The following information becomes available when you select [View Details](#):

- [Entity ID](#)
- [Single Sign-On Endpoint](#)
- [Single Sign-On HTTP Binding](#)

- [Single Logout Endpoint](#)
- [Single Logout HTTP Binding](#)
- [Certificate Algorithm](#)
- [Signing Certificate](#)

The Tenant Name value and the extracted data aren't saved if the endpoint can't be contacted or the information can't be extracted.

### 19.8.5.3 Data Privacy & Security Settings in Career Site Builder Settings

Use the [Data Privacy & Security Settings](#) page to control privacy and data protection settings for a site, as well as generate change and information reports for users.

[Data Privacy & Security Settings](#) (DPSS), which controls user data change logging in the system, can be turned on or off for an entire site. If DPSS is enabled, then:

- If DPSS is enabled, Candidate and Client Admin Data Retention Management (DRM) is automatically enabled and can't be disabled, while Capture Public User IP Address is automatically disabled and can't be enabled.
- If DPSS is disabled, you can turn Capture Public User IP Address and Candidate and Client Admin DRM on or off independently.

#### Career Site Builder Path

► [Settings](#) ► [Data Privacy & Security Settings](#) ►

## Data Protection Tab

### Global Settings

The following are legacy settings with no impact on your career site:

- [Data Privacy Consent Statement](#)
- [Allow Manual Public User Creation](#)

### Data Retention Management Settings

The following are legacy settings with no impact on your career site:

- [Candidate](#)
- [Client Admin](#)

## Content Security Policy

Enabling the [Content Security Policy](#) field defines the `Content-Security-Policy` HTTP header. Enabling the setting automatically disallows all external domains. By including domains in this list, you're explicitly adding them to the allowlist.

### ⚠ Caution

Until you thoroughly test your career site in the stage environment with all the domains you manually add to the Allowed Domains list, do **not** enable Content Security Policy in your production environment.

The content security policy is designed to guard against cross-site scripting (XSS) attacks through the use of a `Content-Security-Policy` HTTP response header that lets you control the resources allowed to load for a web page. The headers are used in career site pages owned by the organization (such as `jobs.example.com`, where `<example>` is your organization's name), but not in the Candidate Profile and other pages generated within SAP SuccessFactors Recruiting.

The default setting is [OFF](#).

When you move the slider to [ON](#), the following settings are shown:

- [Allow 'unsafe-eval' in Content Security Policy](#)
- [Allowed Domains](#)

By default, the following domains are automatically allowed:

- \*.sapsf.eu
- \*.sapsf.com
- \*.successfactors.com
- \*.successfactors.eu
- \*.sapsf.cn
- \*.qualtrics.com
- d3537c9nadzkz1.cloudfront.net
- \*.linkedin.com
- \*.googleapis.com
- \*.gstatic.com
- \*.googletagmanager.com
- \*.google-analytics.com
- \*.googlesyndication.com
- \*.tagmanager.google.com
- \*.youtube.com
- \*.youtu.be
- \*.youtube-nocookie.com
- \*.vimeo.com
- vimeo.com
- \*.vimeocdn.com
- \*.wistia.net
- \*.pinterest.com
- \*.xing-share.com

- \*.xing.com
- \*.facil-iti.com
- \*.moatads.com
- \*.yimg.com
- \*.twitter.com
- \*.facebook.com
- \*.facebook.net
- \*.doubleclick.net
- \*.adobedtm.com
- \*.adobe.com

Below the list of automatically allowed domains is the [Custom Allowed Domains](#) section, which allows you to specify domains that you explicitly want to allow, such as domains you reference in custom scripts. Add your allowed domains in this list, then select [Save](#).

#### Note

Along with SAP domains, a number of domains are automatically included in the allowlist when you enable the Content Security Policy setting. You can view the list and manually disable individual domains from the allowlist.

## Data Subject Reports Tab

This page generates information and change reports for admin and public users.

Enter an email address in the [User Search](#) field. Career Site Builder performs a search for both admin and regular users in the same search, but it needs a complete address; the search doesn't work with a partial email address.

For each row in the search results, you can choose [Download](#) to download these two types of reports:

- [Information Report](#) – includes all the data associated with the person. Examples include name, email address, phone number, current employer, and social media profile URL.
- [Change Report](#) – contains data about the historical changes to a user's account.

## 19.8.5.4 Data Privacy Consent Statement in Career Site Builder Settings

The [Data Privacy Consent Statement](#) page is visible only when Career Site Builder is a stand-alone solution **without** an integration with SAP SuccessFactors Recruiting.

If you're using Career Site Builder as a stand-alone solution, create consent statements from [Settings](#) [Data Privacy Consent Statement](#)  manage versions of the statement, and edit detail documents per locales for your site. Refer to *Data Privacy Consent Statements for Career Sites* in *Setting Up and Using Data Protection and Privacy* for details on creating consent statements in Career Site Builder.

If you have an integrated system between SAP SuccessFactors Recruiting and Career Site Builder, create consent statements for Recruiting in [Manage Data Privacy Consent Statements](#), from the Admin Center. Refer to *Consent Agreements* in *Setting Up and Using Data Protection and Privacy* for details on creating Recruiting consent statements in Admin Center.

## 19.8.6 Brand Settings

Learn which settings in Career Site Builder are available for a brand-specific career site.

Brand settings enable you to configure some settings in Career Site Builder specifically for a given brand.

### Site Information

To configure site information for a brand, go to [Brand Settings](#) [<Brand>](#) [Site Information](#) .

On the [Site Information](#) tab, you can configure the following settings specifically for each brand.

- [Internal Career Site](#)
- [Google Tag Manager ID](#)
- [Use Google Tag Manager in Career Site Wrapper](#)
- [Google Analytics 4 ID](#)
- [Google Webmaster ID](#)
- [Bing Webmaster ID](#)
- [Page Title](#)

- [Meta Keywords](#)
- [Meta Description](#)

For more information about these settings, refer to [Site Configuration in Career Site Builder Settings \[page 640\]](#).

You can also use the [Internal Career Site](#) setting to make the brand site an internal career site. As with any internal career site, you may have to make further configurations to ensure that internal candidates can access the site, such as updating your IDP configuration in global site settings.

## Site URL

To configure the site URL for a brand, go to ► [Brand Settings](#) ► [<Brand>](#) ► [Site URL](#) ►.

On the [Site URL](#) tab, you can configure the following settings specifically for each brand.

- [Custom Site URL](#)
- [Standard Site URL](#)

As for the default brand, you can mark either the custom URL or the standard URL as [Primary](#).

For more information about these settings, refer to [Site Configuration in Career Site Builder Settings \[page 640\]](#).

The [Path-Based Site URL](#) field is a read-only field that displays the default URL for the brand. A branded career site is always available at this URL. If you configure a brand-specific URL in [Brand Settings](#), the path-based site URL redirects to the brand-specific URL.

### ⚠ Caution

If the Apply with LinkedIn feature is enabled and you configure a brand-specific URL, you need to update the configuration for Apply with LinkedIn by adding the branded domain to the MDF object `LinkedInDeveloperApplication`.

For more information, refer to [Enabling the Apply with LinkedIn Feature on a Brand-Specific Career Site \[page 503\]](#).

## Email Settings

To configure email settings for a brand, go to ► [Brand Settings](#) ► [<Brand>](#) ► [Email Settings](#) ►.

On the [Email Settings](#) tab, you can configure the following settings specifically for each brand.

- [Job Alert Sender Address](#)
- [Email Campaign Sender Address](#)
- [Use Custom Sender Address](#)
- [Verify DNS Configuration for Use of Custom Sender Address](#)

For more information about these settings, refer to [Site Configuration in Career Site Builder Settings \[page 640\]](#).

## Result Cards

To configure results cards for a brand, go to ► [Brand Settings](#) ► [<Brand>](#) ► [Result Cards](#) ►.

On the [Result Cards](#) tab, you can configure fields to display on results cards, in search results on the brand site.

For more information about these settings, refer to [Configuring Layout of Search Results for the Unified Data Model \[page 514\]](#).

## Search Filters

To configure search filters for a brand, go to ► [Brand Settings](#) ► [<Brand>](#) ► [Search Filters](#) ►.

On the [Search Filters](#) tab, you can configure search filters to display on the search page on the brand site.

For more information about these settings, refer to [Configuring Layout of Search Results for the Unified Data Model \[page 514\]](#).

## 19.8.7 Users

### 19.8.7.1 Roles in Career Site Builder Users Menu

The Roles menu allows you to create a new role and set its permissions.

#### Career Site Builder Path

► [Users](#) ► [Roles](#) ►

The main page includes the slider setting to enable role-based permissions specifically for Career Site Builder, and [Roles](#) and [Admin Users](#) tabs. Creating a new or editing an existing role displays the [Edit Role](#) page. Creating a new or editing an admin user displays the [Edit Admin User](#) page.

After you create your roles, you can assign individual users to specific roles.

#### Edit Role Settings

| Field                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Locales</a> | <p>Grants role permissions for any locale enabled for the site. For example, you may want to configure different roles for users who can edit pages in the <b>en_US</b> locale, and those who can edit pages in other locales.</p> <p>Select <a href="#">Select All</a>, or expand the <a href="#">Locales</a> menu to specify which locales you want to enable. To apply this setting to future locales, select <a href="#">Include all future locales with this role</a>.</p> |

| Field                                                | Description                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Brands</a>                               | Grants role permissions for any configured site brands. Use this where different groups of recruiters should only be able to access pages for certain brands.<br><br>Select <a href="#">Select All</a> , or expand the <a href="#">Brands</a> menu to specify which brands you want to enable. To apply this setting to future brands, select <a href="#">Include all future brands with this role</a> . |
| <a href="#">Appearance Settings</a>                  | Grants role access to <a href="#">Appearance &gt; Global</a> . Options are <a href="#">JavaScript &amp; Cookie Manager</a> and <a href="#">Custom Plugin</a> .                                                                                                                                                                                                                                           |
| <a href="#">Appearance Styles</a>                    | Grants role access to <a href="#">Appearance &gt; Styles</a> . You can set permission access to <a href="#">Color Editing</a> specifically.                                                                                                                                                                                                                                                              |
| <a href="#">Search</a>                               | Grants role access to the <a href="#">Appearance &gt; Search Results</a> .                                                                                                                                                                                                                                                                                                                               |
| <a href="#">Import Export</a>                        | Grants role access to <a href="#">Tools &gt; Import &amp; Export</a> .                                                                                                                                                                                                                                                                                                                                   |
| <a href="#">Manage API Credentials</a>               | Grants role access to <a href="#">Tools &gt; Manage API Credentials</a> .                                                                                                                                                                                                                                                                                                                                |

## 19.9 Guidelines for Creating a Career Site

### 19.9.1 Accessibility Guidelines for a Career Site

Optimize the settings of your career site for accessibility. Doing so allows it to be usable by people who have a limited range of abilities, making your site available to as many people as possible.

Many parts of the world adhere to accessibility laws, and private, public, and nonprofit organizations are required to ensure Web site accessibility based on their number of employees. International standards are developed under the Web Content Accessibility Guidelines (WCAG) by the World Wide Web Consortium (W3C), in cooperation with individuals and organizations around the world. The goal is to provide a single shared standard for Web content accessibility that meets the needs of individuals, organizations, and governments internationally.

WCAG uses three levels of conformance: A, AA, and AAA.

#### → Recommendation

Although requirements differ for each country/region, configure newly created or refreshed career sites to meet at least level A, with a goal of meeting level AA for WCAG 2.0.

In the U.S., Section 508 of the Rehabilitation Act (29 U.S.C. §794d), as amended by the Workforce Investment Act of 1998 (P.L. 105–220), requires federal agencies to develop, procure, maintain, and use information and

communications technology (ICT) that's accessible to people with disabilities. Regardless of whether individuals work for the federal government, this requirement includes both online training and Web sites, which need to be accessible for everyone.

### **Tips for Testing Web site Accessibility**

One way to test the accessibility of your career site is to use an evaluation tool such as WAVE. Developed by WebAIM.org, the WAVE Web accessibility evaluation tool allows you to enter your site's URL into its free online form to obtain feedback about the accessibility of your site content. WAVE is also available as extensions to popular browser software such as Firefox and Chrome. Whether you use WAVE or other evaluation tools, consider the following:

- Evaluation tools can flag accessibility issues within sites, but they don't tell you if your content is accessible. They evaluate the accessibility of the content instead; the final determination of true accessibility is still made by people.
- Although evaluation tools include many checks for accessibility, they're not comprehensive.
- Evaluation tools typically don't evaluate mouseover text, because they only look at a static page.

There are a number of ways to know if your Web site is accessible:

- Automatic assessment and assistive technology – for example, you can review your site using assistive technology such as a screen reader to make sure the design and technical aspects of the site are accessible. Examples of third-party screen reader programs include Job Access with Speech (JAWS), Dolphin Screen Reader, NonVisual Desktop Access (NVDA), COBRA, and System Access.
- User testing and feedback – if possible, ask people with disabilities to test your site. Get feedback from customers and other site users to find out if there are any improvements needed.
- Review key milestones and changes – keep a record of the accessibility issues that have been repaired, or ask your web developer to maintain such a record. This record shows you the completed work and the new level of accessibility. Such a record is also helpful if your organization is asked to show that your Web site follows WCAG 2.0 guidelines.
- Online accessibility checker – you can use an online tool to check if your Web site is accessible. Using an online accessibility checker doesn't guarantee that you find all accessibility issues with your Web site. It's important to have a person review the site as well.

### **Configurations Using Career Site Builder**

Consider configuring the following in Career Site Builder to address the accessibility of your site:

- Metadata – populate both sitewide and page metadata.
- Headings – populate first-level headings (H1), and check for empty headings.
- Images – populate image alt text, check for nearby images that have the same alt text, and avoid using embedded text on images.
- Links – check for empty links, replace or remove redundant title text, and remove redundant links.
- Contrast – ensure adequate differentiation between foreground text and background colors.
- Search results – use search results tiles instead of the search results grid.
- Google Job Map – enable it to show a heading, to make it more accessible, and edit the heading in the translation editor.

## 19.9.1.1 Career Site Accessibility for Screen Readers

Screen readers are software programs that convert digital text into synthesized speech. They allow blind or visually impaired users to read the text that is displayed on the computer screen.

Consider how screen readers process web pages, and how they impact the way you design your career site:

- Screen readers announce the page title (the HTML `<title>` element) when first loading a web page.
- Screen readers announce headings and identify the heading level. For example, two screen readers, NVDA and JAWS, precede `<h1>` headings with "Heading level 1."
- Screen readers generally inform users that a piece of text (or a graphic) is a link. Most screen readers say "link" before each link. For example, JAWS would read a link labeled "Products" as "link products."
- Alt text or alternate text is an attribute added to an image tag in HTML. This text appears inside the image container when the image can't be displayed, and helps search engines understand what an image is about.
- If alt text is present, screen readers read the alternative text of images. JAWS precedes the alternative text with the word "graphic." If the image is a link, JAWS precedes the alternative text with "graphic link."
- Screen readers ignore images without alternative text and say nothing, but users can set their preferences to read the file name.

The following are specific to the way screen readers navigate through a web page:

- Linear content – audio interfaces present content linearly to users, one item at a time.
- The **Tab** key – despite the linear nature of audio interfaces, screen readers do provide ways for users to navigate content quickly. One way is to use the **Tab** key to jump from link to link. This option gives the user an idea of where the page links to, and can be a useful way to run through the content if the user is looking for a specific link.  
A related technique is to obtain a list of the links on the page, arranged alphabetically. The drawback of these methods is that users don't hear any of the nonlink content, resulting in their missing important information.
- Heading to heading – another way to get an overall impression of a page's content is to jump from heading to heading. Users can hear an outline of the page's main ideas, then backtrack to read the parts they're most interested in. The main drawback to this technique is that it relies on headings, so it's important that they're included. To the extent possible, the headings represent an accurate outline of the content.
- Landmarks and sections – users can navigate through ARIA landmarks and HTML5 sectioning elements, such as `<main>`, `<nav>`, `<header>`, and so on.
- Paragraphs – users can jump from paragraph to paragraph, listening to the first sentence or two before moving on to the next paragraph. When possible, place the distinguishing information of a paragraph in the first sentence.
- Bypassing the main navigation – users can skip links at the top of the page, allowing them to bypass the main navigation and go directly to the main content. They speed up the reading process and help users distinguish between the main navigation and the main content.

## 19.9.1.2 Configuring Career Site Metadata for Accessibility

Metadata, also called meta tags, describes individual pages on a Web site, allowing search engines to understand what each page contains. This data helps search engines evaluate the relevance of a page content, thus determining whether a page is displayed within search results.

### Context

Metadata contains three main elements:

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Page Title (Title tag)         | <p>Your site's page title is the heading that's displayed as a blue link in the search results. The page title is considered the single most important element on the page for telling the search engines what the page is about and which keywords to focus on.</p> <p>Keep titles to 70 characters or less including spaces, and lead with the most important keyword.</p> <p>In addition to site-wide metadata, every page has a unique title and description.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Description (Meta Description) | <p>The description appears directly below the title and URL in the search engine listing. Your page's description contains similar information to your page title (namely, a targeted keyword), but not be exactly the same — use it to describe concisely what the Web page is about.</p> <p>Limit the page description to approximately 160 characters including spaces; search engine results pages truncate and cut off the text that extends beyond this limit.</p> <p>Avoid using the same keyword more than once in your description. Search engines could consider this "keyword stuffing," which could downgrade you in search results.</p> <p>A well-written description not only tells users what's on your page, but also entices them to visit your site. A description is what shows up here in the search engine results. It is like good window dressing. Sites with poor descriptions get fewer click-throughs and the search engines demote your site in favor of other sites.</p> <p>Don't use quotes or any nonalpha characters (Google cuts them out of the meta description).</p> |
| Keywords                       | <p>The importance of including keywords has decreased in recent years, as search engines no longer view the keyword tag as a major factor when ranking results.</p> <p>However, it's still important to conduct keyword research, keeping you aware of what terms visitors are searching for in order for you to optimize for those phrases.</p> <p>Using keywords in the content is much more important than populating the keywords in the metadata.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

#### Note

Metadata can be translated.

## Procedure

- **Populate site-wide metadata.**

Set sitewide metadata in [Settings](#) > [Site Configuration](#) > [Site Information](#). This metadata is used throughout the pages on your site, except in pages that override it with their own metadata.

For the *Meta Description* field, include the company name, the words "jobs" or "careers," strategic positions the company is hiring for (for hospitals, for example, list doctors, nurses, and so on.). If the company has just one location, include that as well.

*Page Title:* **Jobs at Best Run**

*Meta Keywords:* **Apply online for jobs at Best Run. Sales, Engineering, Human Resources, and more.**

*Meta Description:* **Apply online for jobs at Best Run. Sales, Engineering, Human Resources, and more.**

- **Populate page metadata.**

Specifying unique metadata for every page of the site is a leading practice that increases SEO value:

- Each page type, except for Landing pages: Home, Content, and Category pages. On a Category page for sales jobs, for example, include a description such as **Apply online for Best Run Sales Jobs.**
- Each locale, in the appropriate language.
- Each brand.

To add meta tags at the page level, go to the page in Career Site Builder, select the blue  (gear) icon, then choose  *Meta Tags*.

### 19.9.1.3 Using Headings in a Career Site That Are Optimized for Accessibility

Populate first-level headings and check for empty headings to make your site more accessible.

## Context

Organize content on pages using headings, structuring them in a hierarchical manner. Start with one level 1 header (H1) for page titles or main content heading, level 2 headers (H2) for major section headings, level 3 headers (H3) for subsection headings, and so on.

In WAVE, use the Structure tab to view the headings.

Assistive technologies and other browsers rely on header tags to determine page structure, so don't use text formatting such as font size or bold to give the visual appearance of headings.

Avoid using headers for the sole purpose of visual appearance. To highlight or emphasize an element within your content that's not an actual heading, use font size, bold, or italics instead.

## Procedure

- **Populate level 1 headings for all your pages and job layouts.**

H1 headings contain the most important heading of the page, generally the document title, to convey what the page is about.

Career Site Builder adds an <h1> tag for each page automatically, from the [Page Title](#), but it's typically not displayed. The site is still considered to be within accessibility guidelines.

The home page of a Career Site Builder site takes on the Page Title from [Settings](#) > [Site Configuration](#) > [Site Information](#), but it's not displayed on the page.

For other page types, the <h1> tag is taken from the Page Title for that page, and is hidden by default.

The <h1> is required on Category pages. You can opt to hide it by enabling the [Hide Category Title](#) setting in the [Category Title Style](#) dialog by choosing the ⚙️ (gear) icon from the top of the Category Pages screen and selecting [Category Title Style](#).

### Note

If you display a level 1 title on a category page, make sure the text doesn't match or repeat the header text you add in page components. For example, the [Two Columns](#) component, which renders on the page as an H2 heading.

- **Check for empty headings.**

Screen reader and keyboard users often navigate by heading elements. An empty heading presents no information and introduces confusion.

Basically, either populate any element that has a header, or hide it.

## 19.9.1.4 Setting Up Accessibility-Friendly Images for a Career Site

Images you use on a career site aren't accessible if you don't provide alt text — also referred to as alternative text or alt tags — used to describe the images on your Web page.

## Context

In general, include alt text for your career site for these reasons:

- If images fail to load – if an image doesn't render on a Web page for any reason, the alt tag displays in its place. The alt tags help visitors to that Web page to understand what image is expected to be there even though they can't see it.
- For search engines – search engines, such as Google and Bing, regularly crawl Web pages. It's easy for them to understand text copy on a page, but images are difficult to read. For this reason, use alt text to improve your page. Alt text is used to describe to search engines what the image is showing, allowing them to give users better results when performing an image search. Alt text also improves the SEO value of the site.

- For the visually impaired – the visually impaired use screen readers in order to browse Web pages. These screen readers identify and interpret what's being displayed on their screen. For this reason, it's important to convey contextual information in alt text that explains the image in more detail.

You may not need to provide alt text if you plan to use an image strictly for decorative reasons. Determine how to treat each image based the definitions W3.org provides for decorative images:

- Visual styling, such as borders, spacers, and corners.
- Supplementary to link text, to improve its appearance or increase the selectable (clickable) area.
- Illustrative of adjacent text but not providing contributing information.
- Identified and described by surrounding text.

#### → Recommendation

Unless you have a compelling reason, provide alt text for all the images you use in Career Site Builder.

## Procedure

- **Populate all images with alt text**, for all languages (locales) you've configured for your career site, making sure that the alt text is descriptive and meaningful for each image; that is, avoid generic alt text like **This is a photo**.

In Career Site Builder, you add alt text by choosing [Edit Alt Text](#) in the Image Selector dialog. The [Image Alt Text](#) screen allows you to provide alt text for the locales you've configured for your career site.

#### → Remember

Don't forget to include alt text for your logo in the [Alt Text](#) field in ► [Appearance](#) ► [Styles](#) ► [Headers](#) ► [<Brand>](#) ► [Logo tab](#) .

- **Check for nearby images that have the same alt text.**

Two images having the same alt text can often cause redundancy or indicate incorrect alt text.

Remove unnecessary redundancy and ensure that the alt text for each image is appropriate.

- **Remove any embedded text you have in images.**

Text that is written into an image can't be read by screen readers or search engines, nor is it detected by Web accessibility tools such as WAVE.

If you want to keep images that contain embedded text, add alt text to the image.

## 19.9.1.5 Reviewing Links in a Career Site for Accessibility

Check for empty links, replace or remove redundant title text, and remove redundant links to make the career site more accessible to all visitors.

### Context

Consider the following leading practices for linking:

- Use meaningful text for hyperlinks:
  - Linking to a [Click here](#) or [\(link\)](#) label is bad for search-engine optimization. It also forces users to have to hunt for more information on what exactly they're clicking on.
  - Add a title tag to every link so that users feel confident as they navigate from page to page.
- Use consistent styling by picking a design and sticking to it. Avoid varying the way links are visualized across the site.
- Avoid using blue nonlink text. Blue is associated with clickability, so any blue text that's not selectable on your site results in frustration.
- Avoid applying underlines to text that's not a link, since that's also associated with links.
- Specify a different color for hover-over links to emphasize to users that the text they're mousing over is a link.
- Padding – ensure that links have enough space to be selectable on mobile devices.

### Procedure

- **Check for empty links.**

Links that contain no text are confusing to screen reader users because their function and purpose aren't clear.

The most common issue is when you write text as part of an image, then use that image as a link. By itself, users have no idea what the image is linking to, and there's no text for them to read.

To remedy this issue, remove the empty link or provide title text within the link that describes the functionality or target of the link. Alternatively, add alt text to the image.

- **Replace or remove redundant title text.**
  - Anything that has a link also needs a title tag. The title text typically appears when users hover the mouse over a link.
  - Use the title text to indicate what the link actually does. What's actually on that page? What's there to learn?
  - As a leading practice, make the title text different from the link name; but it's better to use redundant title text than to not populate it.

For an example of link title and text fields, go to the global header editor at ► [Appearance](#) ► [Styles](#) ► [Headers](#) ► [\(Brand\)](#) ► [Menu](#) and add or edit a link. The [Link Setup](#) dialog shows the [Title](#) and [Text](#) fields. Rather than using [Company](#) in both fields, use a descriptive sentence, such as [Learn more about our company](#),

- **Remove redundant links.**

- Adjacent links that to the same location (such as to a product page) result in additional navigation and repetition for screen reader and keyboard users. Either combine them, or remove one.
- In Career Site Builder, three-column components use the same link for the header, link, and image. To improve accessibility, remove the link from the image, remove the header and/or separate link.

## 19.9.1.6 Using High-Contrast Color Settings in a Career Site

Configuring a career site to provide adequate color contrast helps offer more accessibility for everyone, but is especially helpful for the readability of individuals with low vision.

### Context

The contrast tools in WAVE can assist you in determining whether the colors you use on your career site provide high enough contrast for accessibility. For example, you can change the colors within WAVE to check which color combinations pass its evaluation.

The following are the primary locations in Career Site Builder where you change color contrast:

- Global styles for each brand, at **Appearance > Styles > Global Styles > <Brand>**:
  - **Main** tab – sets site-level colors for the brand, including links, buttons, content text, background color, and so on.
  - **Search** tab – sets site-level colors for search-related settings for the brand, including search form labels, links, background, and so on.
  - **Header** tab – sets site-level header colors for the brand, including links, background color, and so on.
  - **Row Footer** tab – sets site-level row footer colors for the brand, including text, links, background color, and so on.
  - **Column Footer** tab – sets site-level column footer colors for the brand, including links, background color, and so on.
- Cookie consent banner – the banner that appears on your career site that declares the use of cookies and tracking on the site. If you're using the legacy site banner, the colors are controlled at **Appearance > Global > Legacy Site Banner > Main Styles tab**. If you're using the **Cookie Manager** page instead, the cookie banner and cookie consent dialog use the global color settings for the site.
- Styles for page components – most page and custom job layout components include a **Styles** tab, where you specify the colors that appear in the component.

### Note

Color settings on the login page for View Profile aren't set in Career Site Builder, but in SAP SuccessFactors Recruiting. To coordinate the color settings between the login page and your branded career site, associate a microsite ID to the brand in the brand management tool at **Tools > Brand Management**.

## Procedure

- **Increase the contrast between the foreground text and background color** to a contrast ratio greater than 4:5:1.
- **Larger text doesn't require as much contrast as smaller text** — ensure a contrast ratio greater than 3:1 for larger text; that is, larger than 18 points, or 14-point bold.
- **Evaluate your brand colors** and make sure they provide enough contrast. If not, consider using colors on the career site that fall within contrast guidelines.
- **Set the color of hover (mouseover) text** so that it still provides high contrast against the background color (either the page background or button background). Hover text that's too close in color to its background looks like it disappears when moving the mouse over it.

WAVE doesn't evaluate mouseover text, because it only looks at a static page.

### 19.9.1.7 Choosing Search Results Tiles for Improved Accessibility Without the Unified Data Model

Setting the career site to display search tiles instead of the search grid greatly improves the accessibility of the search results page.

## Prerequisites

- This information only applies if the Unified Data Model is **not** enabled. When it's enabled, you can't configure the settings described here.

## Context

The search grid format is an alternate to the search tile. The search tile is difficult to navigate when using the Tab key to move through the page or when using a screen reader.

## Procedure

1. In Career Site Builder, go to ► [Appearance](#) ► [Search Results](#) ► [Search Details](#) ►.
2. Enable [Use Search Results Tiles](#) by moving the slider to *ON*.
3. Select [Save](#).

## Results

Search results now appear in the tile format. You can configure the appearance of your search results tiles in

► [Appearance](#) ► [Styles](#) ► [Global Styles](#) ► [<Brand>](#) ► [Search Tiles](#) ►.

### 19.9.1.8 Displaying Helpful Text in a Google Job Map

Improve the accessibility of the Google Job Map component by displaying text that guides the candidate to the Job Search page.

## Prerequisites

You have a page or job layout that has the Google Job Map component in it.

## Context

These settings allow your career site to display a message that's otherwise only recognized by a screen reader. The settings offer the option to view jobs in a format that's easier to read than from a map.

## Procedure

1. Go to the Google Job Map component in your page or job layout in Career Site Builder.
2. In the [Details](#) tab, enable the [Show Heading](#) field by moving the slider to [YES](#).
3. Select [Publish](#) to save your page or job layout.

The Google job map on the career site page now displays the following lines of text:

- Header text – Screen readers cannot read the following searchable map.
- Link text – Follow this link to reach our Job Search page to search for available jobs in a more accessible format.

4. **Optional:** If you want to change the default wording that's used in the header and link text, go to ► [Tools](#) ► [Translations](#) ► and edit the following fields:

| Option      | Description                         |
|-------------|-------------------------------------|
| Header text | <a href="#">GoogleJobMapHeading</a> |
| Link text   | <a href="#">GoogleJobMapLink</a>    |

## 19.9.1.9 Deactivating the Auto Focus Setting in Image Carousels

Disable the default auto focus setting in the *Image Carousel* and *Image and Text Carousel* components in Career Site Builder so that visitors navigating a Web page aren't forced back to a different portion of the page.

### Context

The auto focus setting, which is enabled by default when you add an image carousel or image and text carousel component, shifts the focus back to the image carousel when the slides advance. This setting becomes confusing and distracting when the browser recenters the page on its own while users are looking at a different part of the page.

At the same time that you disable this auto focus setting, make sure *Display Interval* is set to 0 to prevent the images from progressing through the carousel on its own. Setting this feature to zero allows users to control the speed at which they navigate through the series of images.

Disabling this setting also removes an extra tab for users who are using the **Tab** key to navigate the page.

### Procedure

1. In Career Site Builder, go to your page or job layout that includes *Image Carousel* or *Image and Text Carousel* components.
2. Double-click on the *Image Carousel* or *Image and Text Carousel* component to get to its *Details* tab.
3. Verify that *Display Interval* is set to zero (0), its default value.
4. Disable the *Auto Focus* field by moving the slider to *NO*.

#### → Tip

Make sure to check the settings for all your pages or job layouts that use *Image Carousel* or *Image and Text Carousel*. By default, the behavior of *Auto Focus* when you add these components is set to *YES*.

5. Select *Publish* to save the page or job layout.

### Results

Visitors to the Web page no longer experience the browser shifting focus to a different area on the page, and they control when to move to a different image on the carousel.

## 19.9.2 Usability Guidelines for a Career Site

### 19.9.2.1 Guidelines for Content

Guidelines to organize web content in a way that is easy to comprehend for users.

#### Maintain User Interest

In a best case scenario, a web user reads about 28% of the text on a page. When reading a web page, users search for keywords and skip around the page instead of reading from top to bottom. Reduce nonessential information and organize essential information in a way that engages users.

- Display the company's name visibly on the page.
- Get to the point as quickly as possible. Use short, easy to understand words and phrases.
- Avoid subjective claims and embellishment.
- Split separate ideas into their own paragraphs.

#### Writing Style

##### The Inverted Pyramid

The most important information takes up the most space and be closest to the top of the page. Supporting details and related information takes up less space further down the page.

When reading, users prioritize the top of the page, so this style ensures that they retain the most important information.

##### Paragraph Format

Large blocks of unbroken text can feel intimidating to users. Users prefer to read content divided into smaller paragraphs, as it allows for easy skimming of content. Using the correct headings directs users to relevant information quickly. This style also improves search engine optimization of pages.

- Make headings and subheadings stand out from the text.
- Use numerals for large numbers up to a billion.
- Spell out numbers that do represent specific quantities.

### 19.9.2.2 Guidelines for Links

Guidelines for using links on a web page.

When creating a link, use plain language to describe its purpose and destination. When a user has a clear understanding of what the link is for, they're more likely to use it. Generic link labels create user uncertainty.

To maintain user interest and confidence, immediately display what the user expects on the link's destination page. For example, an Apply to Jobs link takes users to the page where they can apply for jobs.

## General Guidelines

- Use bold, underline, or color to make links stand out from normal text
- Avoid underline for text that isn't a link
- Set links apart from normal text or at the end of normal text

### Note

Users ignore words they don't recognize. Use familiar terms, not jargon, or company-specific labels. If these terms are necessary, give users context for the new term.

## Navigation Links

Place the main navigation menu at the top of the page. Only include links that help the user complete the main objective: applying to a job or completing the online business card.

Users look for familiar word when viewing their options, so keep titles of pages simple. Make sure the user isn't overwhelmed by avoiding too many options in the header or drop down menus.

Suggested links:

- Featured Jobs (drop down for all category pages)
- About Us (drop down for all content pages)
- Jobs by Location (link to Google maps page)
- Sign Up for Job Alerts (link to online business card)

### → Recommendation

Avoid using the header to link out to external URLs, which creates a disjointed experience and causes user frustration when they try to navigate between sites.

## Footer Links

Suggested links:

- Careers Home
- Corporate Home- Creating a link between the corporate site and career site raises the SEO value of the career site
- Top Jobs- Valuable for SEO purposes
- View All Jobs- Valuable for SEO purposes

## Social Links

Keep links to social networks in the footer, or near the bottom of the page, to discourage site drop-off. Use social networking links that direct users to pages relevant to company culture or jobs only.

### 19.9.2.3 Guidelines for Other Site Elements

Guidelines for buttons, forms and input fields, the business card, and search widgets.

#### Buttons

Use a button that is clearly visible to the user. If the button is easy to identify, you have more success at driving applicants where you want them to go. Brightly colored buttons draw more user attention. Use colors that provide a contrast between the button text and background. Use a highlight color that is noticeable different from the color that's not highlighted.

Make sure the destination page is what the user expects based on what the button says.

#### Forms and Input Fields

When creating a form, choose appropriate language and remove excess text. Always use labels or suggested text when possible for input fields to avoid user confusion.

#### Business Card

Place the registration link in the upper right-hand corner. Use a simple layout and explain the benefits of registration on the sign-up form. The fewer fields the better.

- Highlight titles of input fields in bold
- Arrange fields vertically rather than horizontal

#### Search Widget

The search widget is the first thing the user sees on the page. Make sure the widget's function is clear, that it accepts text input. Additionally, make sure it's wide enough to accommodate the majority of queries.

Users expect search widgets to appear at the top of the page. Place search widgets as close to the top of the page as possible.

Choose a color for the search widget that helps it stand out.

#### → Recommendation

Enable both keyword and location search. Each searches job data differently, so it's best to give job seekers both options

## 19.9.2.4 Guidelines for Text

Guidelines for text content on a Web page.

### Legibility

When selecting the text format for your site, follow these guidelines:

- Use high-contrast text (black text on a white background) to allow scanning by the user, reduce eye strain, and increase accessibility for users with low visibility or cognitive impairments. This format also creates a better mobile experience, as high-contrast text is easier to view while in the sun.
- Choose a font that's easy to read.
- Save decorative and narrow fonts for headlines and decorative text only.
- Keep font use consistent across all sections, on all pages.

#### → Recommendation

The recommended font size for body text on desktop and mobile is from 14 through 16 pixels. Limiting line length to 50–80 characters allows users to move to the next line before losing interest and increases user comprehension.

### Alt Text

Alt text is a short description that accompanies an image. Alt text is important for accessibility, since it's what screen readers access for images. Additionally, if the image can't load, the user can access the alt text.

Including alt text increases the SEO value of your site.

When alt text isn't available, use a caption or an image title — otherwise, don't use an image.

#### Guidelines for Effective Alt Text

- Be descriptive but succinct.
- Place images with alt text near relevant text to help create a coherent experience for nonvisual users.
- Use keywords.

### 📘 Note

If you overuse keywords or use them inappropriately, search engines could identify them as spam, which can hurt your SEO value.

## Using HTML Heading Tags

The heading elements are H1, H2, H3, H4, H5, and H6, with H1 being the highest (or most important) level and H6 the least.

### Benefits of Using HTML Heading Tags

- These tags help users who use assistive technologies to navigate the page via the header tag structure.
- These tags appropriately make it easier for search engines to review and rank the career site.

### Default HTML Heading Tags

- Page titles are always H1, and Career Site Builder component titles are H2 tags.
- Search bar component isn't tagged with H2. This setting is to allow the user to navigate to jobs.
- Jobs in the Tiles/Cards are H2.

### → Tip

- Configure descriptive, yet succinct headers for all Career Site Builder components with a heading field.
- Don't use *Hide Header Text* settings.
- If the body content of a Career Site Builder component includes headings and subheadings, use the appropriate lesser HTML heading tags (H3, H4, H5, and H6) to clearly define the hierarchy of information on the page.
- Don't add more H1 tags to the page; the only H1 tag on the page is the page title.

### 📘 Note

Multiple H1 tags on a page can adversely affect SEO value of the page. It's the industry standard to have one H1 tag on a page for this reason.

## 19.9.2.5 Guidelines for Color Use

Understand how the Career Site Builder color palette is used throughout the career site.

The color palette lets you add, edit, and assign colors to use in standard Career Site Builder components. You can configure the following in the palette:

- Hex code (Hexadecimal Color Value) – is a six-digit code that represents a color that's supported by all browsers. For example FFFFFFFF represents the color white.

#### Note

The hex code automatically changes when you change a color's RGB values. RGB values also change automatically when you change the hex code.

- RGB color values – represent the intensity of the red, green, and blue colors in the form of integers, from 0 through 255. For example, RGB (255, 255, 255) represents the color white.
- Alpha – sets the level of opacity, with zero (0) representing full transparency and 1.0 representing full opacity. For example, RGBA (255, 255, 255, 1.0) represents a fully opaque color white.

#### Note

Changing the opacity settings for a color doesn't change its hex value in the color palette. For this reason, any color that has a specific opacity setting needs its own label with this information.

- Labels – allows you to add a name to a color, making it easier for you to select the correct color for a specific use (such as a corporate brand color). Also helpful to indicate an opacity setting.
- Gradient – allows you to select two colors for gradient effect.

## 19.9.2.5.1 Adding and Editing Colors in Career Site Builder

Add a new color or edit an existing color in the color palette in Career Site Builder to assign colors to elements in your career site.

### Context

#### → Tip

Always provide a label for any color you add or edit. Labels makes it easier to find the correct color when you need to apply it to multiple elements. It's also essential if you change a color's opacity, because its hex value doesn't change when you change a color's alpha setting.

### Procedure

1. Select the element's color settings.

The *Color Palette* dialog box appears.

2. Choose an option in the color palette based on what you want to do:

| Option                    | Description                                                                                                                                                     |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| To add a new color        | Select <b>+</b> <i>Add</i> .                                                                                                                                    |
| To edit an existing color | Find the color you want to edit, then select the  <i>Edit</i> icon for it. |

The color editor appears.

3. **Optional:** To use two colors for a gradient effect, select *Is Gradient Color*.

The Color Palette editor displays a second color, labeled *Color Value 2* in the dialog. After you define your color values, a preview of the gradient color appears to the right of the *Is Gradient Color* field.

4. Make sure the *Label* field has a name for the color.

#### → Tip

Use an easy-to-identify color name, such as **Corporate Blue** or **Brand Logo Green**. Names makes it easy to select these colors for your frequently used colors, and also differentiates it from the standard colors in your palette.

5. Define the color values.

You can choose a value in the color value map or use the sliders to choose the hue and opacity. If you're following exacting color requirements for your organization, however, enter the numeric values in the following fields instead:

| Option         | Description                                                                                                           |
|----------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>R, G, B</i> | Enter numeric values, ranging from 0 to 255 for Red, Green, and Blue.                                                 |
| <i>Hex</i>     | Optionally, enter the six-digit hexadecimal code for your color.                                                      |
| <i>A</i>       | Enter a value ranging from 0 to 1.0 for Alpha (the level of opacity of the color), whether you use RGB or Hex values. |

6. **Optional:** If you selected *Is Gradient Color*, configure the settings for *Color Value 2*.

7. When you finish defining the color, select < (left arrow) to navigate back to the main Color Palette page.

The new color you added appears in the palette, and you see both its hex value and label name.

8. **Optional:** If you no longer need to use the color have it appear in the color palette, select  (*Archive*) to archive the color.

If the color is in active use, you see a message telling you that you can't archive it.

#### ⓘ Note

You can't delete a color; you can only archive it.

9. **Optional:** To recover an archived color, choose  *Archived* at the top right of the Color Palette dialog.

You see the list of colors that were archived and allows you to recover an archived color to the active color list.

## 19.9.2.5.2 Applying Labels to Colors

You use this procedure to label your colors to allow easy updates.

### Context

Add a label to the colors to use, without touching the color or hex values. Labels give them names, and are helpful when you use branded colors. For example, if you use hex value #123456 for your official corporate blue, by labeling

it **Corporate Blue**, you can just select "Corporate Blue" from the color palette anytime you want to use it to specify a color in the career site. Not only does this provide convenience, but it also reduces potential confusion between two similar colors. In addition, labels can be helpful if you change the transparency setting (Alpha) for a color, because doing so doesn't change the hex value of a color in the palette.

## Procedure

1. Open the color palette by selecting the color setting for an element you want to apply the labeled color to.

The *Color Palette* dialog appears.

2. Select the  (*Edit*) icon for the color.

The color editor appears.

3. Enter a name for the color in the *Label* field.

### → Tip

Use an easy-to-identify color name, such as **Corporate Blue** or **Brand Logo Green**. A name makes it easy to select these colors for your frequently used colors, and also differentiates it from the standard colors in your palette.

4. When you finish adding the label, select  (left arrow) to navigate back to the main Color Palette page.

The label name now appears after the hex value of the color.

5. Add a default brand color one time and apply to all elements linked to it.

If you edit the color at a later time, it impacts all elements that it's applied to.

6. Add a default brand color multiple times and label them according to the element they control.

## 19.9.2.6 Guidelines for Images

Guidelines for effective use of images.

Images increase the readability of lengthy content and attract user interest by breaking up large blocks of text. Make sure the images on your site are easy to see and understand on all devices. Consult the image guides to choose the best image to meet your need.

Users ignore images that are for decoration only, so use images that are relevant to the text.

## Optimizing Images

The maximum file size for images is 500 KB. However, a file of this size isn't always required.

Optimizing images decreases site load speed. To optimize an image, use an image compressor, which can be found free online if a designer can't do it in a proprietary graphics program.

## Logo

Include the logo of your company in your site's navigation section.

The preferred dimensions for logos are 170 by 67 pixels. This size keeps the links lined up rather than having them drop below the logo. While .png, .svg, and .jpg files are allowed, the recommended file type is .png, which creates a logo that blends seamlessly into the navigation menu background.

For logo alt text, use [Company Name] Career Home.

## Text on Image

Avoid text on images, an outdated practice, for the following reasons:

- Negatively impacts search engine optimization (SEO) value and load speed of the site.
- Impacts usability for users with disabilities.
- Affects visual clarity on retina display devices.
- Creates text that doesn't scale and can be unreadable on mobile devices.
- Prevents translation.

## Image Sliders

Image sliders, or image carousels, are most effective when they convey a single message. Users don't pay attention when there's too many messages.

On each slide, keep the content the same and change only the background image. At most, use three to four slides.

Make the button to change slides obvious to give users control over what displays.

Avoid image sliders for the following reasons:

- Decreases load speed because of multiple large images.
- Reduces visibility.
- Limits effectiveness compared to a button or direct link.

Sites still use image sliders despite these drawbacks because they're a familiar and traditional method of conveying information to users. They're easy to update and allow for multiple messages in a single space. Additionally, they draw user attention because of their movement.

### 19.9.2.6.1 Image Recommendations for Career Site Builder

Guidelines for configuring images for Career Site Builder sites.

- For background images, choose subtle patterns and colors, in order to minimize distraction and maximize visibility of text.

- Don't configure an image as tiled or stretched, unless it's a background pattern or subtle image. Double-check the display of any tiled or stretched images.
- Orient all Career Site Builder images as landscape, not portrait.

The following are recommendations when using images for mobile career sites:

- The career site is built on a flexible grid that's optimized for mobile image sizes that are 320 to 767 pixels wide.
- If you choose to scale your image, the only thing that determines what's cropped is the ratio between the image's width and height.
- The larger the image, the longer it takes to download on your mobile career site. While large images look good on many devices, some devices with smaller displays don't benefit from the use of larger images.

The following table describes the image size recommendations for Career Site Builder components.

Component Image Size Recommendations

| Career Site Builder Component | Recommendation                                                                                                                                                                                                                                                                                                                             |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Subscribe Form                | 1200 by 485 pixels. Choose the focal point of the image using the <a href="#">Image Position</a> dropdown list.                                                                                                                                                                                                                            |
| Featured Jobs                 | <p>This image can either of the following, as long as it doesn't distract from the text or render text unreadable:</p> <ul style="list-style-type: none"> <li>• A subtle background image tiled across the page</li> <li>• A single image – the recommended size is 1200 by 337 pixels</li> </ul>                                          |
| Image and Text Carousel       | <p>If you use:</p> <ul style="list-style-type: none"> <li>• Slide images – 760 by 500 pixels. Use the <a href="#">Image Position</a> dropdown list to select the image focal point.</li> <li>• A background image – 760 by 360 pixels. Make it subtle so as not to distract from the main content.</li> </ul>                              |
| Image Carousel                | <p>The <a href="#">Width between Images</a> setting determines the width of image slides. Choosing between 250 and 400 pixels. That setting determines the height of the image.</p> <div> <p><b>Note</b></p> <p>Best practice is to disable the Image Carousel component for desktop and mobile sizes.</p> </div>                          |
| Info and Subscribe Form       | 700 by 500 pixels.                                                                                                                                                                                                                                                                                                                         |
| Large Image                   | 1200 by 400 pixels. The second value is the height of the images, which is dictated in the <a href="#">Max Height of Image</a> field. This value defaults to 590 pixels, but 400 pixels is the recommended maximum height for optimum display. Choose the focal point of the image using the <a href="#">Image Position</a> dropdown list. |
| Text                          | The image size in the Text component is determined by the amount of text added. As for all background images, choose something subtle that doesn't distract from the text itself. If using a full-size image, set the width to 1200 pixels.                                                                                                |

| Career Site Builder Component                                                                                                                                                                       | Recommendation                                                                                                                                                                                                                                                                              |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Three Column Images with Caption                                                                                                                                                                    | 760 by 500 pixels. The background image is drastically cropped for the tablet size, so make sure to choose the focal point using the <a href="#">Image Position</a> dropdown list. <a href="#">Image Position</a> doesn't let you resize or refocus the three-column images.                |
| Two Columns                                                                                                                                                                                         | <p>For decorative images that overlap with the text and not scale, use 500 by 333 pixels.</p> <p>For an image with content that you don't want to overlap with text, make the right half of the image transparent, and aligned at the "top" or "bottom," or be "scaled" or "stretched."</p> |
| <div>  <b>Note</b><br/>           Images in a two-column component don't display on mobile devices.         </div> |                                                                                                                                                                                                                                                                                             |

The following table lists image recommendations for strategy pages.

Strategy Page Image Recommendations

| Image Use   | Recommendation                                                                               |
|-------------|----------------------------------------------------------------------------------------------|
| Two Columns | 500 by 333 pixels                                                                            |
| Large Image | Width of 1200 pixels and height of fewer than 400 pixels.                                    |
| No image    | Not using an image on the Strategy Page keeps the main content of the page close to the top. |

## 19.9.2.7 Guidelines for Video

Guidelines for effective use of video content.

Videos draw and keep user attention. On average, users spend more time on Web sites with videos than without. If both are available, users prefer video to text.

When creating a video, keep these guidelines in mind:

- Create an informative title that uses SEO keywords.
- Don't use autoplay.
- Keep videos from 30 through 60 seconds for maximum views.
- Include a brief description of the video.
- Host videos on a secure server, or else they don't play.

### Note

For this functionality to be visible to visitors in your career site, make sure to include its related cookie provider in the cookie consent manager at ► [Appearance](#) ► [Global](#) ► [Cookie Manager](#) . If the cookie banner is enabled without including the corresponding cookie provider in the cookie consent manager, this functionality is removed and unavailable to your site's visitors completely.

## Related Information

### 19.9.2.8 Guidelines for Job Descriptions

Guidelines for adding content in a job requisition's *Internal Job Description* field.

Don't include inline images, HTML, or CSS in the *Internal Job Description* field in job requisitions because doing so can cause unwanted behavior in a Career Site Builder career site.

When you add content in *Internal Job Description*, SAP SuccessFactors Recruiting automatically converts the content to CSS with the appropriate tags. Copying and pasting material from a word-processing program (such as Word) without using the appropriate icons also results in errors on the Career Site Builder career site.

### 19.9.2.9 Applying Search Engine Optimization to a Career Site

Search Engine Optimization (SEO) value considers a number of aspects of a site to search their users' queries and provide optimal search results.

## Context

Consider both usability and accessibility needs when planning and designing your career site to improve its SEO value.

- Make the site available to a search engine. For example, you can open all pages of the site through the navigation and/or footer.
- Make the site's content readable to a search engine. For example, providing alt text for images to allow Google to read what an image is, even if it can't view the actual image.
- Structure the site content in a way that's easy to understand:
  - Use HTML heading tags to structure relevant and unique content.
  - Avoid static words for keywords and hidden texts (such as links in the code), as they lower the rank and negatively impact SEO value.
- Optimize the site for different types of users, such as those using screen readers or other accessibility tools.
- Optimize the site for different types of devices, such as desktop, tablet, and mobile.

## Procedure

- Consider the following configurations for your career site to improve SEO value:

| Option                                             | Description                                                                                                                                                                                                                                                            |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Page Title</a>                         | Provide a page title of the site to reflect the organization and its purpose. This setting is located in <a href="#">► Settings ► Site Configuration ► Site Information ►</a> .                                                                                        |
| <a href="#">Meta Keywords and Meta Description</a> | Use the <a href="#">Meta Keywords</a> and <a href="#">Meta Description</a> fields to reflect the organization and purpose of the site. These settings are located in <a href="#">► Settings ► Site Configuration ► Site Information ►</a> .                            |
| <a href="#">Show Segments</a>                      | If your career site is configured segments (a display of a list of job areas related to the job listing), enable this setting. This setting is located in <a href="#">► Appearance ► Global ► Job Page ►</a> .                                                         |
| <a href="#">Show Major Markets</a>                 | Enable this setting so that a job listing's ZIP code associates it with the nearest metropolitan area. This setting is in <a href="#">► Appearance ► Global ► Job Page ►</a> .                                                                                         |
| <a href="#">View All Jobs</a>                      | Add the <a href="#">View All Jobs</a> link to the footer of all your pages in the career site, found in <a href="#">► Global ► Styles ► Footers ►</a> . This setting is located in <a href="#">► Appearance ► Styles ► Footers ► (Locale) ► (Brand) ► Row Menu ►</a> . |
| <b>Alt text</b>                                    | Add descriptive and accurate alt text to all images, icons, and logos.                                                                                                                                                                                                 |
| <b>Text in images</b>                              | All text on the site is live text. Don't use images with headings or important text in them.                                                                                                                                                                           |
| <b>Readability of text</b>                         | All text is easy to read, with a color contrast ratio that meets WCAG level AA guidelines.                                                                                                                                                                             |
| <b>Links to all site pages</b>                     | All site pages are linked to, via the navigation or footer.                                                                                                                                                                                                            |
| <b>Updated site content</b>                        | All site content is current, unique, and succinct, refer also to <i>Guidelines for Content</i> for composing content                                                                                                                                                   |
| <b>H1 tags</b>                                     | Use the H1 tag for the page title only, as it's the default tag on most Career Site Builder (CSB) pages                                                                                                                                                                |
| <b>Heading field</b>                               | Use Heading option in components with a Heading field, as it applies the SAP HANA 2 tag to the heading by default                                                                                                                                                      |
| <b>Heading tags</b>                                | Apply H2-H6 tags to subheadings appropriately for a search engine or screen reader to understand the structure & hierarchy of the content.                                                                                                                             |
| <b>Video content</b>                               | All video content has a clear informative title, has a brief description, and has an attached or linked transcript.                                                                                                                                                    |
| <b>Custom components</b>                           | All custom components are available to WCAG level AA, and follow SEO best practices.                                                                                                                                                                                   |

### ⚠ Caution

- Avoid using more than one H1 tag per page, as multiple H1 tags on a page can adversely affect Search Engine Optimization value of the page. It's the industry standard to have one H1 tag on a page for this reason.
- Avoid hiding created headings in a component with code or the [Hide Header](#) option in Career Site Builder.

## 19.10 Cookies and Career Sites

A cookie is a small piece of data that web browsers store on a computer, that tracks, personalizes, and saves information about visitor preferences. Career Site Builder allows you to enable the cookie banner to notify visitors that you use cookies. You also configure the cookie consent manager, which allows visitors to accept or decline the use of specific cookies while they visit your career site.

The ability to configure a cookie consent manager is important for organizations that need to meet compliance requirements for different countries/regions. In addition, enabling a cookie banner allows you to make sure that site visitors consent to the cookies that are placed on their computers.

Career Site Builder allows you to configure the following:

- The cookie banner, which appears at the bottom of the page when visitors first go to your career site.
- The cookie consent manager, which appears as a dialog when visitors choose to modify their preferences from the cookie banner. Visitors can view descriptions of the cookies used in the organization's career site, and accept or decline them.
- Place a link to the cookie consent manager in the header or footer of every page in your organization's career site designed by Career Site Builder.

You configure all of these Career Site Builder settings in the ► [Global](#) ► [Cookie Manager](#) ▾, after which you add a link to the cookie consent manager in the header or footer.

For information on all the cookies Career Site Builder uses, refer to *List of Cookies in SAP SuccessFactors in Setting Up and Using Data Protection and Privacy*.

### 📘 Note

The [Cookie Manager](#) tab replaces the functionality of the [Site Banner](#) tab, which allowed you to set up a basic cookie banner. This option is available in the [Legacy Site Banner](#) tab until you're ready to configure your comprehensive settings with the Cookie Manager.

## 19.10.1 Cookies Used in Career Site Builder Career Sites

There are cookies related to Career Site Builder career sites, as well as load balancer cookies.

Refer to *List of Cookies in SAP SuccessFactors in Setting Up and Using Data Protection and Privacy* for the following:

- Cookies related to Career Site Builder career sites, and which are hosted in the Career Site Builder system.
- Load balancer cookies – used by the load balancers in Production and Stage environments, and which are used to maintain sticky sessions on customer career sites.

### Note

As new DCs come online, their new Load Balancer cookies follow this pattern: **BIGipServer~partition-saas\_prod-dc<DC number><random key>**.

## 19.11 Career Site Admin for Custom Career Sites

If you maintain a custom career site with SAP SuccessFactors Recruiting, there are some settings you can configure in Career Site Builder to administer the site even if you don't have a fully implemented Career Site Builder.

Grant the following role-based permission to enable access to Career Site Builder: ► [Manage Recruiting](#) ► [Manage Career Site Builder](#) ►.

Persons who have been given permission can access Career Site Builder from the Admin Center.

Only those menu options that are available to administer custom career sites are visible. Using all Career Site Builder functionality requires a full implementation.

## 19.11.1 Career Site Admin Settings in Career Site Builder

The following administrative pages and features are available to perform some functions for **custom** career sites that use SAP SuccessFactors Recruiting without a full implementation of Career Site Builder.

### Pages Menu

#### Category

- Settings allow you to create, edit, activate, disable, and delete category pages, including creating rules.
- Career Site Builder path: ► [Pages](#) ► [Category](#) ►.
- Refer to *Creating Category Pages using Career Site Builder*.

### Appearance Menu

#### Global

- Search settings enable different types of search on the custom career site. Available search types are Keyword Search, Location Search, and Radius Search (Search by postal code and distance).
- Career Site Builder path: ► [Global](#) ► [Search](#) ►.
- Refer to *Career Site Admin Search Settings*.

### Tools Menu

#### Brand Management

- You can configure career sites so that they have the look and feel of your brands, which differentiate them from your main corporate career site.
- Career Site Builder path: ► [Tools](#) ► [Brand Management](#) ►.
- Refer to *Configuring a Brand in Career Site Builder*.

#### Functions Viewer

- Use the Functions Viewer to see what implementation partners identified as misconfigurations that needed to be modified in job posting data.
- Career Site Builder path: ► [Tools](#) ► [Functions Viewer](#) ►.
- Refer to *Using the Functions Viewer*.

#### Import & Export

- The Import & Export page enables you to export and import site settings, Career Site Builder contents, as well as category pages.

- Career Site Builder path: [Tools](#) > [Import & Export](#).
- Refer to *Using Import and Export in Career Site Builder*.

## Manage API Credentials

- The Manage API Credentials page allows you to enter or modify authentication information that connects SAP SuccessFactors Recruiting with Career Site Builder for Real Time Job Sync.
- Career Site Builder path: [Tools](#) > [Manage API Credentials](#).
- Refer to *Manage API Credential Settings in Career Site Builder Tools*.

## Site Source Editor

- Use the Site Source Editor in Career Site Builder to specify which sources are available to the Recruiting Campaign URL Builder.
- Career Site Builder path: [Tools](#) > [Site Source Editor](#).
- Refer to *Activating Site Sources for the Source Tracker*.

## Social Apply

- Settings in the [Social Apply](#) allow candidates to apply for jobs using social media networks.
- Career Site Builder path: [Tools](#) > [Social Apply](#).
- Refer to *Configuring Social Apply*.

## SSL Certificates

- Settings let you manage the SSL certificates for your public career site in a production environment, including obtaining certificate signing requests, as well as renewing, installing, and uninstalling them.
- Career Site Builder path: [Tools](#) > [SSL Certificates](#).
- Refer to *Choosing Your SSL Certificate Renewal Process*.

## Translations

- The translation editor allows you to override default translations for site elements for any configured locale, including English.
- Career Site Builder path: [Tools](#) > [Translations](#).
- Refer to *Changing the Default Text Using the Translation Editor*.

## Layouts Menu

### Job Alerts Email Template

- You can enable job alerts, as well as configure job alert email templates for different locales. Settings in the Job Alerts Email Template page allow you to customize a template to use when sending job alert emails.
- Career Site Builder paths:
  - The switch to enable job alerts is located in [Career Site Builder](#) > [Settings](#) > [Site Configuration](#) > [Site Information](#).

- Template page settings are located in ► [Career Site Builder](#) ► [Layouts](#) ► [Job Alerts Email Template](#) ►.
- Refer to *Enabling Job Alerts and Editing the Job Alerts Email Template in Career Site Builder*.

## Settings Menu

### Site Configuration

Use the site configuration menu to set up basic configuration options for the career site.

Career Site Builder path: ► [Settings](#) ► [Site Configuration](#) ►.

| Tab                                  | Description                                                                                                                                                                                                                                                              |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Site Information</a>     | Use the site settings menu to select basic site configuration options.                                                                                                                                                                                                   |
| <a href="#">Site Locales</a>         | Use the site settings menu to select basic site configuration options.                                                                                                                                                                                                   |
| <a href="#">Internal Career Site</a> | The Internal Career Site page allows you to enable Internal Career Site powered by Career Site Builder. You can't enable this switch until you configure Identity Authentication service for your career site.                                                           |
| <a href="#">SEO Settings</a>         | Use the SEO Settings tab in the Site Configuration menu to refine your search-engine optimization settings.                                                                                                                                                              |
| <a href="#">Map Settings</a>         | <p>Map settings allow jobs to appear in the map UI on a career site.</p> <p>The <a href="#">Map Settings</a> tab displays only if you're accessing Career Site Builder to administer your custom career site.</p> <p>Refer to <i>Career Site Admin Map Settings</i>.</p> |

### IDP Configuration

- The IDP Configuration page allows you to configure the IDP settings for a careers site.
- Career Site Builder path: ► [Settings](#) ► [IDP Configuration](#) ►.
- Refer to *IDP Configuration in Career Site Builder Settings*.

### Data Privacy & Security Settings

- Use the Data Privacy & Security Settings page to control privacy and data protection settings for a site, as well as generate change and information reports for users.
- Career Site Builder path: ► [Settings](#) ► [Data Privacy & Security Settings](#) ►.
- Refer to *Data Privacy & Security Settings in Career Site Builder Settings*.

### Data Privacy Consent Statement

- The Data Privacy Consent Statement page is visible only when Career Site Builder is a stand-alone solution without an integration with SAP SuccessFactors Recruiting.
- Career Site Builder path: ► [Settings](#) ► [Data Privacy Consent Statement](#) ►.

- Refer to *Data Privacy Consent Statement in Career Site Builder Settings*.

## Users Menu

### Roles

- The Roles menu allows you to create a new role and set its permissions.
- Career Site Builder path:  [Users](#)  [Roles](#) .
- Refer to *Roles in Career Site Builder Users Menu*.

## 19.11.2 Career Site Admin Map Settings

If you maintain a custom career site with SAP SuccessFactors Recruiting, [Map Settings](#) let you display your jobs in a map UI.

### Note

Custom career sites can still use [Map Settings](#) even if you don't use a fully integrated Career Site Builder.

If you have a Career Site Builder career site, your map-related fields are part of the [Google Job Map](#) component, which you add as part of a job layout.

## Career Site Admin Navigation Path

From the Admin Center, go to ► [Career Site Builder](#) ► [Settings](#) ► [Site Configuration](#) ► [Map Settings](#) ► [Map Settings](#) displays only if you're accessing Career Site Builder to administer your custom career site.

### Map Settings Tab

| Setting                                                                      | Description                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Zoom Level</a>                                                   | A range of 1 (furthest away) to 10 (closest zoom), this setting designates the default zoom level on the Google job map.                                                                                                                                                                                              |
| <a href="#">Map Center Latitude</a> and <a href="#">Map Center Longitude</a> | Use these two settings together to designate a default focus location of the Google job map. For example, if a company's headquarters is in a specific city, you can enter its coordinates. You can find the latitude and longitude by locating the area using Google Maps and choosing <a href="#">What's Here</a> . |
| <a href="#">Predefined Map Center Options</a>                                | The three options (USA, Europe, World) affect the focus location in the <a href="#">Map Center Latitude</a> and <a href="#">Map Center Longitude</a> fields.                                                                                                                                                          |
| <a href="#">Search Filtered by Locale</a>                                    | If enabled, job searches performed on the Google job map are filtered by locale.                                                                                                                                                                                                                                      |

## 19.11.3 Career Site Admin Search Settings

If you maintain a custom career site with SAP SuccessFactors Recruiting, the [Search](#) tab in [Global Settings](#) allows you to administer some search functionality in your career site.

### Note

Custom career sites can still use [Search](#) even if you don't use a fully integrated Career Site Builder.

If you have a Career Site Builder career site, the [Search](#) tab offers additional fields. Refer to [Search Tab in Career Site Builder Global Settings](#) for more information.

## Career Site Admin Navigation Path

From the Admin Center, go to ► [Career Site Builder](#) ► [Appearance](#) ► [Global](#) ► [Search](#) ►.

### Search Tab Settings

| Setting                            | Description                                                                                                                                                                |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Search by Keyword</a>  | Enable this field so that candidates can perform job searches on the career site. Don't disable this field; doing so means candidates can't find jobs on your career site. |
| <a href="#">Search by Location</a> | Available only when you turn on <a href="#">Search by Keyword</a> . When enabled, looks for matches in city, state, Zip, and country/region fields.                        |

| Setting                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Search by Radius</a>                                   | Available only when you turn on <a href="#">Search by Keyword</a> . Performs a search based on postal codes. The U.S. is the only officially supported country/region for the <a href="#">Search by Radius</a> field, and search results are based on the Zip/postal codes you provide for job locations. Results from the <a href="#">Search by Radius</a> can display inaccuracies for non-U.S. countries/regions. In addition, not all countries/regions support this field.<br><br>Refer to <a href="#">Countries/Regions Not Supported in Search By Radius Field</a> for the details. |
| <a href="#">Search by Imperial (Miles) and Metric (Kilometers)</a> | Enter a set of numeric values for search distances, separating each value with a comma, without using spaces between values (for example, <b>2, 5, 10, 30, 50</b> ). Each value you enter appears in the dropdown list for the postal code search in the public career site.                                                                                                                                                                                                                                                                                                               |
| <a href="#">Search by Default (distance)</a>                       | The default search distance. The value must be one of the list of search distances you provide in the <a href="#">Imperial (Miles)</a> and <a href="#">Metric (Kilometers)</a> fields. If you provide a different value, the system automatically chooses the first distance in your set of search distances.                                                                                                                                                                                                                                                                              |
| <a href="#">Search by Default (search type)</a>                    | This field is visible only when both <a href="#">Search by Keyword</a> and <a href="#">Search by Location</a> are enabled. Allows you to choose the default search method. Candidates can toggle the search method.                                                                                                                                                                                                                                                                                                                                                                        |

## Related Information

[Search Settings in Career Site Builder Global Appearance Without the Unified Data Model \[page 594\]](#)

## 19.12 Career Portals

If you haven't adopted Career Site Builder yet, you can also create a simple Career Portal with SAP SuccessFactors Recruiting.

Career Portals include:

- Internal postings
- External postings
- Internal private postings
- External private postings

Career portals are available to internal users on the [Careers](#) tab in SAP SuccessFactors Recruiting and to external users on a **microsite**.

## 19.12.1 Permission to Access the Careers Page

You can use role-based permission to control access to the [Careers](#) page.

### Employees

Use the [Careers Tab Permission](#) permission to give people access to the [Careers](#) page.

By default, this permission is granted automatically to all newly created users. But if your organization requires it, you can use this permission to restrict access to certain populations. For example, you might use different applicant systems for different employee populations or you might not want contingent workers to appear as internal candidates.

### Proxy Users

Use the [Hide Careers Tab for Proxy User](#) permission to prevent proxy users from viewing the [Careers](#) page when acting on another person's behalf.

#### Note

You grant this permission to the permission role for people who use the [Careers](#) page, not to the permission role for proxy users.

### Related Information

[List of Role-Based Permissions](#)

## 19.12.2 Search for Openings Box

The fields in the Search for Openings box are configurable.

To configure job requisition fields that can be used in job search, configure Internal and External Applicant Search Settings and the **field-definition** elements in the Job Requisition template.

- The Search for Openings box cannot be moved to another place on the page or configured with client-specific branding
- Job search results pagination supports displaying 10, 20, 50 or 100 jobs per page. View All jobs in the list is not supported, due to the impact on system speed that occurs when displaying a large number of job postings on a single page. The default number of job postings per page cannot be configured
- Boolean search (such as enclosing phrases in quotes, use of AND / OR operators, asterisk as a wild card, and other Boolean standards) is supported in the keyword field

- If a Candidate searches for jobs using the “word or part of a word in the job title and/or job description” all jobs containing these characters are returned. For example, a search for “Manage” returns results containing “Manage,” “Manager” and “Management” (b1402).

The content to the right of the Search for Openings box is also configurable.

## 19.12.3 Create an External Candidate Account

A candidate who wishes to apply for a job position must create an account to begin with.

- Candidate can access the [Create an Account](#) page from the career opportunities [Sign In](#) page.
- The fields on the account page can vary based on Provisioning settings but otherwise the fields on the account creation screen aren't configurable.
- The system uses the e-mail address to determine whether or not the applicant already exists in the database. Therefore, if an internal user creates a new profile in the external career site using a different e-mail address, the system considers the candidate as an external applicant. The newly created profile doesn't have a relation with the existing internal candidate profile.

### 19.12.3.1 Configuring an External Candidate Account

There are several options that affect the [Create an Account](#) screen.

#### Prerequisites

Some of the steps require that you have access to Provisioning.

##### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

#### Procedure

- **Standard Fields** – the [Create an Account](#) screen includes the following nonconfigurable fields:
  - First Name
  - Last Name
  - Country/Region of Residence
  - Terms of Use

The First Name, Last Name, and Country/Region fields are related to the Candidate Profile XML.

The Terms of Use link is populated by data from the Data Privacy Consent Statement.

- **Username and Email Address** – navigate to ► [Provisioning](#) ► [Company Settings](#) ► [Use email as external applicant user ID](#) ►.

- When this option is disabled, the primaryEmail (username) and contactEmail (email) fields are both available on the create account screen.
- When this option is enabled, only the contactEmail (email) field is available on the create account screen. The primaryEmail (username) field is hidden and is set to the same value, by default. This is the preferred setting for most client instances.
- Candidates can't change the primaryEmail field value. They can update the contactEmail field value but this change doesn't update the value stored in primaryEmail field. Therefore, candidates need to continue using the value specified in the primaryEmail field when they log in to their accounts.
- The primaryEmail field is the unique identifier for the external candidate. It isn't possible to create two external candidates in a single instance with the same primaryEmail value.

- **Password** – navigate to ► [Admin Center](#) ► [Manage External Password Policy](#) ►.

Candidates must specify a password when creating an account. Clients can choose to provide different password creation rules for external candidates than are enforced for employees with the SAP SuccessFactors HCM suite user accounts.

- **CAPTCHA** – serves as a means to ensure that the candidate creating an account is a real person and not a bot, hacker, or other automated attack.

By default, CAPTCHA is enabled on all instances. SAP SuccessFactors use the Google-provided ReCAPTCHA. Disable it only in exception scenarios where the customer is facing issues with the feature, such as in the following scenario:

As Google ReCAPTCHA doesn't work in China, this feature isn't supported for Chinese customers nor for candidates applying from China. If these customers are facing issues with CAPTCHA, the only option would be to disable CAPTCHA.

To disable CAPTCHA on the account creation pages, select [Disable CAPTCHA on the External Career Site for Account Creation](#) option in ► [Admin Center](#) ► [Manage Recruiting Settings](#) ►.

- **One-Time Password (OTP) for Email Address Verification**

#### → Recommendation

Email address verification using one-time password provides an added security to candidate accounts from bot attacks, phishing, and other threats. This prevents the exposure of existing candidates' email addresses to attackers.

In order to ensure the successful delivery of OTP emails, read the following Knowledge Base Articles before enabling this feature:

- [SAP Note 2087468 - Emails Blocked or Not Delivered Due to Spam Filters, Spoofing, Bombing \(mass mail\), IP Address Allowlists](#)
- [SAP Note 2688533 - DKIM or SPF | SAP SuccessFactors Email Security](#)

- When an external candidate creates an account or updates the contact email address in the Candidate Profile, a one-time password is sent to the candidate's email address. Once a valid OTP is provided:
  - An account is created for the candidate.
  - The contact email address is successfully updated in the Candidate Profile.

- During a session, the candidate can request for a new passcode for a maximum of three times, each after an interval of two minutes. After three unsuccessful attempts, candidate has to refresh the page to retry.
- The verification email that is sent to candidates for account creation and the updation of contact email in Candidate Profile is based on a default email template.
- The triggered OTP is valid for ten minutes and the default email template mentions the passcode validity period. We recommend you to mention this validity period if you are using your own email template.
- To enable the email verification with one-time password, unselect [Disable One-Time Password based Email Verification](#) option in ► [AdminCenter](#) ► [Manage Recruiting Settings](#) ►.
- OTP verification scenarios:
  - Creating an account for a candidate
    - For the account creation scenario, you can also choose to use your own email template. Enable the [One-Time Password for External Candidate Account Creation](#) email trigger in ► [Admin Center](#) ► [Recruiting Email Triggers](#) ► and associate it with an appropriate email template. In case, there are no templates associated with a specific candidate locale, then system uses the default template to send emails to the candidates.
    - When the OTP-based email address verification is enabled:
      - The CAPTCHA will no longer be displayed while creating an account on the external career site.
      - For account creation, the existing email address verification using the ► [Admin Center](#) ► [Recruiting Email Triggers](#) ► [Career Site E-Mail Notification](#) ► email trigger is ignored.
  - Updating contact email address in the Candidate Profile – configuring [Contact Email](#) field scenarios:

| If you configure the contactEmail field                | Then                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Only in the Candidate Profile                          | An OTP is triggered for email verification with each update to contact email in the Candidate Profile. However, this email verification is not triggered for the update of contact email in the application profile during the application process.                                            |
| In both the application template and Candidate Profile | An OTP is triggered for the email verification. The contact email is updated successfully in the profile information.                                                                                                                                                                          |
| Only in the application template                       | <ul style="list-style-type: none"> <li>• For Mobile Apply, the <a href="#">Contact Email</a> field which appears under profile information, is updated in the application only.</li> <li>• For Non-Mobile Apply, OTP verification is not triggered if the contact email is updated.</li> </ul> |

## 19.12.4 Configuring Job Alerts for the Career Portal

Configure the Job Alerts feature so that candidates using the career portal can set up saved searches and receive alerts when new jobs are posted that match their criteria.

### Prerequisites

The *Enhanced Job Search UI* feature setting is enabled in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Procedure

1. Go to ► [Admin Center](#) ► [Recruiting Email Triggers](#) ► Enable and configure [Job Alert Expired Notification](#), [Job Alert Invalidated Notification](#), and [Job Alert Notification](#)
2. Go to ► [Provisioning](#) ► [Company Settings](#) ► and select [Enable Job Alerts for Candidates](#)
3. If you're changing this from disabled to enabled, complete the next option: "This feature will enable a scheduled job. You must specify a valid user to own that job:"

Enter a technical user or shared user that will never be deactivated. If you specify an actual person who later becomes inactive, the job fails.

☒ **Enable Job Alerts for Candidates ( requires Version 11 UI framework (ULTRA) ):**

This feature will enable a scheduled job. You must specify a valid user to own that job:

|                         |
|-------------------------|
| admins                  |
| adminsf admins (admins) |

#### ⓘ Note

The option to specify a user to own the Job Alerts job isn't visible after the feature is enabled. To change the user who owns the job, you need to disable the [Enable Job Alerts for Candidates](#) feature, save it the change, and then enabled it again with the new owner.

## 19.12.5 Using Career Portals

Candidates interact with the Recruiting Management product through the career portals.

Internal candidates have access to the career portal through the Careers tab in Recruiting. External candidates have access to the career portal through externally facing microsites.

- Internals can only access the Careers tab.
  - All employees who the client wishes to recognize as internal must be set up with a SAP SuccessFactors HCM suite user account
  - If you set up Single Sign-On so that the system is only accessible to employees on your network, internal candidates cannot access the internal career portal when they're off the network (at home, at a library, etc.)
- Jobs posted externally, appear on the Default microsite and on any other microsite where the requisition data matches the microsite's filters
- Placing an SAP SuccessFactors Recruiting Management career site within an iFrame is not supported and results in errors under certain conditions
- The column labels displayed on the Jobs Applied page are configurable only via 3 Tier language.
- The columns display on the *Jobs Applied* portlet can be controlled via ► [Provisioning](#) ► [Company Settings](#) ► [Internal and External Applicant Search Settings](#) ►. Some columns are selected by default, and others respect the setting of standard and customer filters in [Provisioning](#). If additional features are enabled, like Assessment Integration, some additional columns display.

## 19.12.5.1 Profile Before Application

When candidates apply for a job, the product can either take them directly to the application page or can take them first to the candidate profile page and then to the application page.

Since the Candidate Profile data is searchable, it's advisable to present the candidate with the profile page, when applying, to collect as much data as possible. It's also advisable to confirm the existing data on the profile to ensure it's accurate and up to date.

When Profile before Application is used, a Next button appears on the lower right-hand corner of the Candidate Profile page. Most fields that appear on both the Application and Candidate Profile XML have their permissions removed in the candidate view of the Application. This action ensures that the candidate has a smooth two-page data entry experience where they aren't presented with fields to complete on the second page that they have finished completing on the first page.

To configure, select ► [Provisioning](#) ► [Company Settings](#) ► [Complete Profile before Application](#) ►.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## 19.12.5.2 Draft Applications

Candidates may want to partially complete an application, leave, and return later to finish it.

When this feature is enabled, a [Save](#) button appears on the bottom of the application page.

If the candidate clicks the button, a confirmation message appears. *The draft application was saved successfully.*

When the feature is enabled, a [Saved Jobs](#) tab appears on the [Job Management](#) tab. You can find saved draft applications here. The candidate can use the [Actions](#) menu to complete or delete the draft application.

#### Note

The candidate can go back to their application in their Candidate Profile and delete the saved draft applications after a job requisition is closed.

If a candidate tries to apply to a job posting, which has been removed from the [Saved Applications](#) menu, they receive a message that the job is no longer posted and accepting applications. The candidate can navigate from the Candidate Profile to the Job listings page and click on the [Delete](#) button to delete their saved applications.

## 19.12.5.3 Attachments Post Application

Some clients wish to allow candidates to add attachments to an existing application, to collect reference letters, work samples, or other supplementary materials.

### Related Information

[Enabling the Addition of Attachments to a Previously Submitted Application \[page 1140\]](#)

## 19.12.5.4 Job Alerts in SAP SuccessFactors Recruiting

Candidates can set up saved searches so they can easily reuse search criteria. Then they can set up job alerts to inform them when new jobs are posted that match the criteria in their saved searches.

#### Note

Career Site Builder job alerts, which is configured in a Data Capture Form component you add to a landing page, supersedes this SAP SuccessFactors Recruiting job alerts functionality. If you're using Career Site Builder, for both your external and internal career site, you can disable SAP SuccessFactors Recruiting job alerts.

Additional considerations:

- Job alert emails include an unsubscribe link. Candidates must log in to confirm the unsubscribe action.
- Job alerts that rely on a particular filter or `mfie`ld fails if that field configuration is removed from the Internal and External Applicant Search Settings.
- The job alert emails for internal candidates are sent to their **user** email address and not the email address entered in the [contactEmail](#) field on the candidate profile.

## 19.12.5.5 Saved Searches/Job Alerts

Candidates who perform a job search can choose to either save the search or run a saved search.

### Save A Search

If candidates choose to save a search, they can do so by specifying a name and email frequency for the search.

Following are the options for email frequency:

- Daily
- Weekly
- Every Two Weeks
- Never

Candidates can also choose to receive emails only when new jobs are posted. If they don't select this option, they will continue to receive emails for both new and already posted jobs. Once this search is saved, it appears in the [Saved Searches/Alerts](#) page with the provided name.

### Access the Saved Searches/Alerts

Candidates can access their list of saved searches from the [Saved Searches/Alerts](#) page. They can [Edit](#), [Run](#), or [Delete](#) the saved searches from this page. Candidates can also create new job alerts by using the [Create New Job Alert](#) option available on this page.

#### ⓘ Note

- All the saved searches or job alerts expire six months after they are created or updated. Candidates can create up to 15 job alerts.
- If candidates have created job alerts with radial search and when the configured country/region ISO code changes, they must select the latest ISO country/region code and resave the job alerts. For more information, refer to *Actions to Consider When ISO Code Changes for Country/Region or State/Province*.

### Unsubscribe a Job Alert

By deleting a saved search, candidates can **unsubscribe** from the job alert.

### Related Information

[Actions to Consider When ISO Code or Label Changes for Country/Region or State/Province \[page 1628\]](#)

## 19.13 Recruiting Sites

Recruiting sites (also called microsites) enable the creation and tracking of accounts for candidates and email recipients. RCM allows the client to define multiple different search landing pages for candidates, complete with unique logos, text, and preset search filters.

Every client instance has a default site for internal candidates. Manually create the default external site by clicking on [Create Site](#). Click the checkbox inside the external site to make it the default.

When Recruiting Management is used with Recruiting Marketing, microsite functionality still works but mostly goes unused because the Recruiting Marketing sites are superior. The Internal site and Default site still must be set up and carefully considered because they still receive a fair amount of candidate traffic, even with Recruiting Marketing enabled.

- There's no way to disable or prevent external candidates from accessing the Default site. The Default site is always available to them after they create or log in to their account.
- The datetime information for **Status Date** and **Date Applied** fields on the [External Career Site > Jobs Applied](#) page is displayed in logged on user's browser timezone.
- Only one career site can exist for internal candidates; additional microsites can't be configured.
- The datetime information for **Status Date** and **Date Applied** fields on the [Internal Career Site > Jobs Applied](#) page is displayed in logged on user's preferred timezone.
- The page layout (search box on the left, configurable content on the right) can't be changed.
- The background color of the search box isn't configurable.
- If events functionality is used, posted events appear as "posters" at the bottom of the main search screen. The filters selected in the career site setup affect which events appear on the screen.

### 19.13.1 Configuring an External Career Site Home Page

Follow the steps to configure an external career site home page.

#### Prerequisites

You have access to Provisioning.

##### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Procedure

1. Go to ► [Provisioning](#) ► [Company Settings](#) ► and select [Enable External Career Site Home Page](#).
2. Go to ► [Admin Center](#) ► [Manage Recruiting Sites](#) ► [Select site](#) ► and click [Update to edit content](#).

## Next Steps

|                                             |                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Signed-in Homepage: Overall Description     | <a href="#">Update</a><br>Welcome to the Career Opportunities site, {0}! We have several tools to help you find your next new job.                                                                                                                                                                                             |
| Signed-in Homepage: Job Search description  | <a href="#">Update</a><br>Take a look at our current job openings. You can search, filter, and sort jobs to find the right one for you.                                                                                                                                                                                        |
| Signed-in Homepage: Manage Jobs description | <a href="#">Update</a><br>You can track and manage the jobs you've found. Use our organizational tools to save jobs to review later, see the status of jobs you applied to, and create job alerts so you'll be notified when relevant jobs are posted.                                                                         |
| Signed-in Homepage: My Profile description  | <a href="#">Update</a><br>Create a personal profile that saves your background experience and business information so recruiters can easily find you when new jobs come up. The more details you add, the more likely the job will match your interests. Also, your profile is automatically attached to any job you apply to. |

[Edit Content on the External Career Site Home Page](#)

Most of the text is configurable by the system administrator. The lines that have actionable links are not presently configurable.

Note the count of open jobs is based on the number of jobs posted in the default language of the instance. This is not configurable.

## 19.13.2 Configuring Manage Recruiting Sites

Follow the steps to configure Manage Recruiting Sites.

## Prerequisites

- You have the ► [Administrator Permissions](#) ► [Manage Recruiting](#) ► [Manage Recruiting Sites](#) ► permission.
- You have the ► [Administrator Permissions](#) ► [Manage Recruiting](#) ► [Internal and External Career Search Settings](#) ► permission.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Sites](#) ►.
2. Edit the Internal site and Default site by selecting ► [Take Action](#) ► [Edit](#) ►.
3. Create, duplicate, delete, or make inactive additional microsites.

4. Update the site settings as needed.
5. To configure internal and external search settings, go to ► [Admin Center](#) ► [Recruiting](#) ► [Internal and External Career Search Settings](#) ►.

## 19.13.3 Settings for Recruiting Sites

Edit the settings for the recruiting sites.

Go to ► [Admin Center](#) ► [Manage Recruiting Sites](#) ►.

The site marked as default has the instance-specific URL. Note that the Default site does not respect filter settings. All job postings can be searched on the Default site.

### ⚠ Caution

The following examples show a URL that starts with `https://careers...`. If your system shows a URL that starts with `https://performancemanager...` instead, this is due to the [Reverse Proxy URL](#) setting.

You must clear this setting for the default domain to be present in the URL. To clear, go to ► [Provisioning](#) ► [Company Settings](#) ► [Reverse Proxy URL Prefix](#) ►.

## Edit Default

**Preview your new Site by copy-and-pasting the URL below into a separate browser this session, so we recommend a secondary browser for previews.**

**Site URL: `https://careersd4.successfactors.com/career?company=ACE218`**

Instance-Specific Site URL

Each microsite has a uniquely generated URL. This URL links the candidate to a microsite with the admin-specified filters already applied and locked in place.

## Edit UK

**Preview your new Site by copy-and-pasting the URL below into a separate browser (for example, open Firefox if you're currently using this session, so we recommend a secondary browser for previews.**

**Site URL: `https://careersd4.successfactors.com/career?company=ACE218&site=VjltR2U0ZmpQVjVzUDcwUnBWUG54ZmgyZz09`**

Unique Microsite URL

The admin user can adjust the settings on each site on the [Manage Recruiting Site Edit Page](#).

Table 22 Manage Recruiting Site Edit Options

| Field | Purpose |
|-------|---------|
|-------|---------|

|                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Site URL                                    | Unique auto-generated URL linking the user to the site. This URL can't be adjusted manually. Whichever career site is designated as the Default has the shorter URL that ends in the company instance ID, such as <code>https://salesdemo4.successfactors.com/career?company=INSTANCEID</code>                                                                                                                                                                     |
| Site Status                                 | Sites can be de-activated by unchecking this box if they are in preparation or temporarily decommissioned                                                                                                                                                                                                                                                                                                                                                          |
| Default Site                                | One site at a time can be selected as the Default by selecting this checkbox. When this field is selected, it unchecks the box from the site previously designated as Default                                                                                                                                                                                                                                                                                      |
| Name of Site                                | A configurable value only used by the admin to identify sites                                                                                                                                                                                                                                                                                                                                                                                                      |
| Description                                 | A configurable value only used by the admin to identify sites                                                                                                                                                                                                                                                                                                                                                                                                      |
| Language                                    | Each career site can contain various translations of the content, which allows a candidate to select their language for viewing the site. This language drop-down is a toggle used to switch between languages and set up the various translated copies of the content.                                                                                                                                                                                            |
| Set as default                              | <p>When a candidate visits a career site, the system attempts to present the candidate with the best language pack possible.</p> <ol style="list-style-type: none"> <li>1. It first attempts to find out the language of the candidate's browser and, by default, displays the site in that language if it's enabled.</li> <li>2. If the system can't determine the candidate's language from the browser, it uses the language selected as the default</li> </ol> |
| Default Language                            | Indicates the career site's present default language                                                                                                                                                                                                                                                                                                                                                                                                               |
| Site Landing Page                           | Determines the text, html, images, and Flash content presented on the right side of the career site page. Embedded video and audio files aren't supported.                                                                                                                                                                                                                                                                                                         |
| Signed-in Homepage: Overall Description     | Determines the text, html, images, and Flash content at the top of the candidate Home tab                                                                                                                                                                                                                                                                                                                                                                          |
| Signed-in Homepage: Job Search description  | <p>Determines the text, html, images, and, Flash content in the left-hand Job Search grid on the candidate Home tab.</p> <p>The action links in this part of the grid aren't configurable.</p>                                                                                                                                                                                                                                                                     |
| Signed-in Homepage: Manage Jobs description | <p>Determines the text, html, images, and Flash content in the center Job Management grid on the candidate Home tab.</p> <p>The action links in this part of the grid aren't configurable.</p>                                                                                                                                                                                                                                                                     |
| Signed-in Homepage: My Profile description  | <p>Determines the text, html, images, and Flash content in the right hand My Profile grid on the candidate Home tab</p> <p>The action links in this part of the grid aren't configurable.</p>                                                                                                                                                                                                                                                                      |

## Job Filters

The filters available are based on the configuration in [Admin Center > Recruiting > Internal and External Career Search Settings](#). In multilanguage environments, the language field always appears.

The Default career site doesn't respect selected filters; all externally posted jobs are always available on the Default career site.

If filters are set up on a career site, a user accessing that site can not remove the filter; all other options in the picklist are hidden. The selected option is checked and grayed out.

There's presently no way to multiselect the filter options on the career site setup page.

## Add Logo

Each career site can have a unique logo specified. The image file used for the logo must be hosted in the same datacenter in which the client's instance is hosted. Else, there could be browser security warning pop ups for users who access the career site.

Logos must be 40x210 pixels to fit into the space provided in the upper left-hand corner of the application. Transparent GIF (RGB recommended)

## 19.13.4 Job Search, Job Management, and My Profile for External Career Site Landing Pages

To provide the candidate an easy navigation experience, it is possible to enable a landing page with three panels of text: Job Search, Job Management, and My Profile.

External Career Site Home Page

## 19.13.5 Configuring Career Site Footers

Configure a footer on the micro site so it appears on external career site screens.

To configure the footer, go to ► [Admin Center](#) ► [Manage Recruiting Sites](#) ► [Manage External Recruiting Sites](#) ► [Edit Site](#). ►

## 19.13.6 Finding the Microsite ID for a Career Site

You can find and view a microsite ID for associating a brand with an external career site.

### Procedure

1. Select ► [Admin Center](#) ► [Recruiting](#) ► [Manage Recruiting Sites](#) ►.

You see a page displaying any Recruiting Management career sites that have been created.

2. To see a site URL, select the site desired.

The site URL is displayed. In the URL, the characters following the parameter `site=` are the microsite ID.

## 19.14 Recruiting Management Career Site Search

For any Job Requisition to conclude successfully, potential candidates must find it easily. The Recruiting module allows customer to decide what search fields are appropriate for their type of jobs.

There are different ways for potential candidates to find the job openings:

- For Internal Candidates, the job search begins from the [Careers](#) link, found in the [Home](#) dropdown menu.
- For External Candidates, the job search begins at the corporate website of your company.

SAP SuccessFactors Recruiting Management offers two candidate-facing user interfaces for job searches. To use these interfaces, go to ► [Provisioning](#) ► [Company Settings](#) ► and select [Enhanced Job Search UI](#) option. Based on your requirement, you can select [Enable Multi-language Job Search](#), [Enable Radial Job Search](#), or both the options.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

Turning on the [Enhanced Job Search UI](#) switch results in the following:

- Automatically precounts jobs that match the filter criteria.
- Easily refines the filter criteria after searching using filter panel.

- More searches are performed without reloading the entire page.
- Search results display clearly in contemporary format.
- Allows the Internal Career Site landing page to display configurable rich text.

## 19.14.1 Configuring Multi-language Job Search

If you have multilanguage instances and wish to allow the candidates to use job posting language as a search filter, you can configure multilanguage job search. With this option, the job search defaults to the language that candidate has selected or the job search defaults to all the selected languages.

### Prerequisites

- Go to ► [Provisioning](#) ► [Company Settings](#) ► [Enhanced Job Search UI](#) ► option.
- Ensure the defaultLanguage and jobPostLanguage fields are defined in the Job Requisition XML.
- Ensure that the Job Requisition records are posted in multiple languages.

### Context

Following are the steps to configure multilanguage job search career portal.

#### ⓘ Note

Enabling multilanguage job search treats U.S. English (en\_US) and UK English (en\_GB) as one language. Disabling this setting decouples the two languages.

### Procedure

1. Go to ► [Provisioning](#) ► [Company Settings](#) ► and select [Enable Multi-language Job Search](#) option.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

2. Go to ► [Provisioning](#) ► [Company Settings](#) ► and select [Enable Default Search to All Languages](#) option.

## Results

Candidates can toggle between the languages in which the job was posted.

## 19.14.2 Configuring Radial Job Search

Candidates can configure the radial search option to enter a zip or postal code and a distance to view jobs that are posted only within the specified distance from the ZIP code.

### Prerequisites

- *Enhanced Job Search UI* is enabled in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- The **postal code** and **country/region** fields are defined in the Job Requisition XML.

### Context

The radial search is only available to candidates searching jobs and not to recruiters to search jobs on the Recruiting tab. The radial search switches between miles and kilometers based on the locale of the user. It isn't allowed to have miles and kilometers enabled with only English\_US configured. If the customer is only using English\_US, only miles are supported.

Ensure that the distance is always greater than 0. If you use radial search, the zip/postal code field of their job requisition can't have a type of **picklist**. The zip/postal code field must be a text type field.

### Procedure

1. Go to ► *Provisioning* ► *Company Settings* ► and select *Enable Radial Job Search* option.
2. Go to ► *Provisioning* ► *Managing Recruiting* ► *Internal and External Applicant Search Settings* ►.
3. Select *Radial Search* option and assign a *Grid Order* for both External Site and Internal Site.
4. Request for reindexing the job requisition index-type.

### → Remember

If you're an existing customer and already enabled radial job search, you still have to request reindexing for job requisition index-type. However, after the 2H 2020 Release, when the new customers decide to enable radial job search, they don't have to request for reindexing.

## Results

Candidates can provide the ZIP code and distance to filter to jobs that are posted within the specified distance.

## 19.15 Distribution to Job Boards

SAP SuccessFactors Recruiting include several ways to distribute job postings to job boards.

- Recruiting Posting (leading practice)
- Feed Management in Command Center (included with Career Site Builder)
- Third party integration with eQuest

### 19.15.1 Recruiting Posting

Enable Recruiting Posting in SAP SuccessFactors Recruiting so that recruiters can distribute postings to multiple job boards or school job boards, in multiple languages, from a job requisition.

Recruiting Posting allows you to:

- Access the job board market place. The job board market place is always growing and there are many external paid and unpaid job boards and school job boards you can post to.
- Crosspost your job and internship offers to the general and specialized job boards.
- Crosspost your jobs to the job boards and alumni associations of more than 2,000 schools and universities.
- Post jobs to multiple job or school boards in multiple languages easily from a job requisition.
- Manage your job offers easily after their publication.
- Analyze the performance of the job boards you're using.

## 19.15.1.1 Configuring Recruiting Posting

Configure the Recruiting Posting settings in Provisioning.

### Prerequisites

- You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- The Recruiting Posting administrator has permission to manage the Recruiting Posting settings.

### Context

By default, you enable Recruiting Posting in [Provisioning](#), in [Company Settings](#).

If you've mapped the environments correctly, you can skip these instructions and go to [Providing Permissions for Recruiting Posting](#):

- The tenant's production environment is mapped to the Recruiting Posting production environment.
- The tenant's preview environment is mapped to the Recruiting Posting preview environment.

Otherwise, follow the steps here to modify the mapping of the tenant and Recruiting Posting environments.

Recruiting Posting's universal enablement ensures that the following are auto-populated based on the tenant's environment:

- The [Recruiting Posting Environment](#) dropdown values
- [Recruiting Posting Base URL](#) and [Recruiting Posting API URL](#) in [► Provisioning ► Company Settings ► Recruiting Posting Settings ►](#)

In the [► Provisioning ► Service Provider Settings ► Authorized SP Assertion Consumer Service Settings ►](#) section:

- The [Assertion Consumer Service URLs](#) for Recruiting Posting are also auto-populated based on the tenant environment.
- For [Recruiting Posting API URL](#):
  - [SP Mapping Key](#) is set to RP.
  - [Application Name](#) is set to [Recruiting Posting](#).
  - [SHA-256 Certificate](#) is enabled by default.

## Procedure

1. Go to the Provisioning URL.

The Provisioning URL depends on your data center. Refer to *SAP Knowledge Base Article 2686521 - Provisioning settings for Recruiting Posting SSO implementation - Recruiting Posting* for a list of Provisioning URLs.

2. For the instances where Recruiting was never enabled, enable [Provisioning](#) > [Company Settings](#) > [Recruiting – requires “Question Object Management”](#) to enable Recruiting, and selecting [Save Feature](#).
3. Select [Save](#) in [Provisioning](#) > [Company Settings](#) > [Recruiting](#) > [Recruiting Posting Settings](#).

The following are auto-populated based on the tenant's environment:

- The values in the [Recruiting Posting Environment](#) dropdown list, in [Provisioning](#) > [Company Settings](#) > [Recruiting Posting Settings](#).
- The values in the [Recruiting Posting Environment](#) dropdown list.
- [Recruiting Posting Base URL](#) and [Recruiting Posting API URL](#) in [Provisioning](#) > [Company Settings](#) > [Recruiting Posting Settings](#).
- The [Assertion Consumer Service](#) URL for Recruiting Posting in [Provisioning](#) > [Service Provider Settings](#) > [Authorized Service Provider Assertion Consumer Services](#).

For existing Recruiting instances, the Recruiting Posting is enabled by default. The following are auto-populated based on the tenant's environment:

- The [Recruiting Posting Environment](#) dropdown values.
- Recruiting Posting URLs ([Recruiting Posting Base URL](#) and [Recruiting Posting API URL](#)).
- The [Assertion Consumer Service](#) URL for Recruiting Posting is auto-populated based on the tenant's environment.

### Note

To modify the Recruiting Posting Environment URLs, select the [Recruiting Posting Environment](#) dropdown values in [Provisioning](#) > [Company Settings](#) > [Recruiting Posting Settings](#), and click [Save](#).

The following are auto-populated based on the value you select in [Recruiting Posting Environment](#):

- [Recruiting Posting Base URL](#) and [Recruiting Posting API Base URL](#) in [Provisioning](#) > [Company Settings](#) > [Recruiting Posting Settings](#).
- The [Assertion Consumer Service](#) URL values in [Provisioning](#) > [Service Provider Settings](#) > [Authorized Service Provider Assertion Consumer Services](#).

For example, selecting [Production](#) populates the [Production](#) URL in the Recruiting Posting URLs and the corresponding [Assertion Consumer Service](#) URL.

The following table lists the [Recruiting Posting Environment](#) values that are displayed in the Recruiting Posting dropdown based on the Provisioning environment:

| Provisioning Environment | Recruiting Posting Environment Drop-down Values | Notes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Production               | Production and Preview                          | <p>If you had mapped the Recruiting Posting environment URLs to a different environment, such as <a href="#">Sales</a>, then <a href="#">Recruiting Posting Environment</a> displays the <a href="#">Sales</a> option, in addition to the <a href="#">Production</a> and the <a href="#">Preview</a> options.</p> <p>If you explicitly modify the <a href="#">Recruiting Posting Environment</a> dropdown list to <a href="#">Production</a> or <a href="#">Preview</a> and save the configuration, then the <a href="#">Production</a> and <a href="#">Preview</a> options are the only options available in the <a href="#">Recruiting Posting Environment</a> dropdown list.</p> |
| Preview                  | Preview                                         | <p>If you had mapped the Recruiting Posting environment URLs to a different environment, such as <a href="#">Sales</a>, then <a href="#">Recruiting Posting Environment</a> displays the <a href="#">Sales</a> option, in addition to the <a href="#">Preview</a> option.</p> <p>If you explicitly modify the <a href="#">Recruiting Posting Environment</a> dropdown list to <a href="#">Preview</a> and save the configuration, then the <a href="#">Preview</a> is the only option available in the <a href="#">Recruiting Posting Environment</a> dropdown list.</p>                                                                                                            |
| Sales                    | Sales                                           | <p>If you had mapped the Recruiting Posting environment URLs to a different environment, such as <a href="#">Preview</a>, then <a href="#">Recruiting Posting Environment</a> displays the <a href="#">Preview</a> option, in addition to the <a href="#">Sales</a> option.</p> <p>If you explicitly modify the <a href="#">Recruiting Posting Environment</a> dropdown list to <a href="#">Preview</a> and save the configuration, then <a href="#">Preview</a> is the only option available in the <a href="#">Recruiting Posting Environment</a> dropdown list.</p>                                                                                                              |

#### Note

If you disable the Recruiting feature in your instance, the configured URLs remain the same on enabling the Recruiting option later. To change the Recruiting Posting URLs, manually select the [Recruiting Posting Environment](#) dropdown values. For example, If your Recruiting posting URLs are mapped to the

Preview instance and you prefer to configure the Production URLs, manually select the [Recruiting Posting Environment](#) values from the dropdown.

[SAP Note 2686521](#) 

### 19.15.1.2 Setting Up Permissions for Recruiting Posting

Recruiting Posting Admins have permission to manage all Recruiting Posting settings such as Recruiting user association, Posting Profiles, job boards, and field mappings. Recruiting Posting users have permission to access Recruiting Posting to post jobs.

## Context

See the Related Information section for more information, including *SAP Note 2686521 - Provisioning settings for Recruiting Posting SSO implementation - Recruiting Posting*.

## Procedure

1. Go to role-based permissions and grant [Administrator Permissions](#) > [Manage Recruiting](#) > [Manage Recruiting Posting](#) permission to the Recruiting Posting administrator role.

Users granted this permission can manage posting profiles, school boards, and all the other Admin Center settings required for Recruiting Posting.

2. Go to role-based permissions and grant [User Permissions](#) > [Recruiting Permissions](#) > [Recruiting Posting Permission](#) permission to Recruiter roles using Recruiting Posting.

Users granted this permission can create a job posting from a job requisition, enter job posting details, and post to job boards.

### Note

When Recruiting users have permission to post jobs in Recruiting Posting, the daily user synchronization (5:00 a.m. GMT) updates the list of Recruiting users in the Recruiting Posting Back Office and updates any changes to permissions. Users can also initiate the synchronization manually by selecting [Synchronize Users](#) on the [Posting Profiles and Groups](#) page. The first manual synchronization isn't possible, as users still can't access [Manage Recruiting Posting](#).

### 19.15.1.3 Anonymize Recruiting Posting Information

Data anonymization is information sanitization with the intent of privacy protection. It is a process of either encrypting or removing personally identifiable information so that the data is anonymized.

Administrators and recruiters can provide generic information to avoid sharing user's personal information. Alternatively, you can use the user synchronization option to anonymize the user data.

A recruiter can provide generic information for all the job posting fields. As an administrator, you can provide generic information in the following scenarios to avoid sharing personally identifiable information:

- Creating a *Posting profile*.
- Creating *Job Posting Report*.
- Adding and configuring job boards and school job boards from the *Job Board MarketPlace*. Configuration requires the job board credentials, including a set of values such as client ID, login and password, and email IDs.
- Defining *Field Completion Rules*.

For example, instead of first and last names, provide generic userIDs, recruitment department, or blank values for address, telephone number, and email IDs.

To anonymize user information through user synchronization, we recommend raising a Technical Support for Recruiting Posting Implementation. User synchronization updates the list of Recruiting users and any required permission changes in Recruiting. Technical Support will anonymize the user information (for example, email IDs) to a generic one.

Existing customers can consider the following for user synchronization:

- To add new users, raise a Technical Support ticket
- To anonymize the current user information, purge all the user data, and contact Technical Support to launch user synchronization to anonymize user information before you perform a new user synchronization.

New customers must request user anonymization before synchronizing their users.

#### Note

Anonymizing the user information through user synchronization does not send email notifications for automatic reposting events.

## 19.15.1.4 Administrator Tasks for Recruiting Posting

Learn about Administrator tasks for Recruiting Posting, as well as where and how to perform them.

In the Admin Center, the [Managing Recruiting Posting](#) tool lets your Recruiting Posting Administrators perform all their admin tasks in one location.

To make these settings, Admins need the following permission ► [Administrator Settings](#) ► [Manage Recruiting](#) ► [Manage Recruiting Postings](#) ►.

### Tasks in Posting Profiles

| Tasks                                               | Location in <a href="#">Manage Recruiting Posting</a>           | Additional Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## 19.15.1.4.1 Posting Profiles

A posting profile is a job posting entity that companies use to post jobs.

### Posting Profiles

Posting profiles reflect different ways that companies organize their recruiting teams. For example, some companies prefer to manage their posting profiles based on country or region, some others may base them on their product.

#### Note

Note that disabling or purging a posting profile deletes all the active job postings that are made using the posting profile.

Additionally, posting profiles are entities that have ownership over job board credentials.

## 19.15.1.4.1.1 Creating Posting Profiles

Create posting profiles so that Recruiting users can process job postings on job boards.

### Prerequisites

You have [Manage Recruiting Posting](#) permission.

### Context

Every user requires a posting profile to post jobs.

Use posting profiles to tailor your company organization by brand, location, contract type and so on.

Configured company descriptions are automatically retrieved into the job posting form. Set the company descriptions in the languages your Recruiters need in the posting profile. You can set several company descriptions — both default and optional. You can add, edit, and remove company descriptions at every level of your company organization (root, group, or posting profile level). Company descriptions are prepopulated in available languages in the job requisition to the job posting.

Groups are optional and contain posting profiles. Groups let you assign permissions to all the posting profiles in one go. To do this, you must first create the group and the posting profile at the same time.

#### Note

You must have posting profiles in a group so that the users assigned to the group can post jobs. Users assigned to groups without posting profiles will not be able to post jobs.

### Procedure

1. Choose  [Admin Center](#)  [Manage Recruiting Posting Settings](#) .

Posting profiles display on the left area of the screen.

2. At the bottom of this screen area, choose the icon with a plus sign ([Create Posting Profile or Group](#)).
3. Create a posting profile for either a group or a posting profile.

In [Name](#) and [Email](#), enter the details of the person responsible for the group. On some job boards, the profile name appears, on others only the company name is visible.

4. Complete the information for the company for each profile.
5. Set additional company description languages.

If the job requisition is available in other languages, the additional language for the posting profile are retrieved.

6. Deactivate or delete/purge posting profiles in the group.

In accordance with data privacy and compliance laws, an Admin is authorized to do this. Deactivating moves the posting profile from Active to Inactive and delete or purge removes the posting profile for good.

Posting profiles that don't have a job board configuration or an assigned contract can be moved from one group to another.

## Related Information

### 19.15.1.4.1.2 Applying Associations of Recruiting Users with Posting Profiles

Associate Recruiting users with a posting profile so that they can post jobs, modify job board configurations, and manage contracts.

## Prerequisites

You have the [Manage Recruiting Posting](#) permission.

You've created the required posting profiles as described in [Creating Posting Profiles](#).

## Context

A Recruiting user who is only associated with one posting profile can't access the [Posting Profile selection](#) step during the job posting workflow.

A default posting profile is automatically generated and associated with the job boards that are part of the Day One Posting Pack as soon as a customer instance is created. The default posting profile is associated to the Recruiting user if no association is made through the [Users to Posting Profiles Association](#) menu.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Posting Settings](#) ► [Associate Users to Posting Profiles](#) ►.

You see a list of available users for Recruiting Posting. The users with the permission [Recruiting Posting](#) or [Manage Recruiting Posting](#) are synchronized during the daily system synchronization, and are visible in [Associate Users to Posting Profiles](#).

2. Select [Edit set of posting profiles](#) and choose the profiles to associate with the user.
3. To copy an existing set of associations from one user to another, select the users from the list, then select [Copy set of posting profiles](#).
4. Check the boxes next to the destination users and click [Apply to selected users](#).
5. Cancel the selection copy when you have finished using the mass copy feature.

### 19.15.1.4.1.3 Configure Display Settings for the Posted Jobs on the Job Posting Table

You can view the posted job in the job posting table based on the [Job Posting Visibility](#) option set in Recruiting Posting.

## Context

Configure the view permission in Recruiting Posting to let the Recruiting user view the posted job in the job posting table based on the [Job Posting Visibility](#) option set in the Recruiting Posting. The [Job Posting Visibility](#) option in the [Manage Recruiting Posting](#) under [Settings, Edit Settings](#) option controls if a Recruiter user associated with the posting profile or unassociated with a posting profile can view and post the jobs from the [Job Posting Table](#). By default, you can view only the posted jobs associated with your Posting Profile used for posting the jobs.

In the [Job posting Table](#), the [Post and Manage Jobs](#) button has the following behavior:

- If you are associated with posting profile A and opening a job requisition that is associated with posting profile B:
  - If the job is active, you are not authorized to view the job requisition details.
  - If the job posting has expired, you are redirected to Step 1 of the [Post a job](#) page in Recruiting Posting to post the job as a new job posting.
- If you are associated with posting profile A and opening an inactive job requisitions associated with posting profile A:
  - If the posting profile used to post the job is active, you are directed to the job requisition details page.
  - If the posting profile used to post the job is inactive or purged, you are redirected to Step 1 of the [Post a job](#) page in Recruiting Posting to post the job as a new job.

### Note

You can select a different profile in Step 1 of the [Post a job](#) page if you are associated with multiple profiles.

## Procedure

1. Go to [Manage Recruiting Posting, Settings, Edit Settings, Job Posting Visibility](#).  
By default, a Recruiting user associated with one posting profile can view and post jobs in the job posting table. By default, the job posting visibility option is enabled in REcruiting posting.
2. To ensure all the users have permission to view the posted jobs, Disable the Job Posting Visibility option. You can view all the posted jobs in the Job posting table irrespective of whether you are associated with the posting profile used for posting the job requisition or not. You can now repost the expired or deactivated job associated with a posting profile using another posting profile.

## 19.15.1.4.2 Job Boards

A job board is a platform for posting jobs.

Publicly available job boards are accessible online for everyone. They can be free of charge or payable. Customers pay using either credits or slots. An example of a publicly available job board is Steptone or Monster. Some job boards however, require contracts to be set up between customers before they can be configured.

Add and configure job boards from the [Job Board Market Place](#).

### Note

The implementation duration could be extended because of delays in job board answers, notably when providing credentials.

You can also add and configure school job boards from the [Job Board Market Place](#).

If the job board or school job board you're looking for isn't yet integrated with Recruiting Posting, you can request an integration. These third-party job boards should be willing to cooperate with SAP SuccessFactors. The stability and reliability of the integration also depend on these third parties.

If job boards are unavailable, the administrator is notified in the job board selection and also in [Manage Recruiting Posting, My Job Boards](#) section. The job board is unavailable because of the following reasons:

- The job board is temporarily unavailable because it requires some technical maintenance. Once the integration update is finalized, the job board will be available for posting the jobs.
- It's unavailable because it will be removed from Recruiting Posting catalog. In this case, the indication of unavailability will be visible for one month. Afterward, the job board will disappear from the interface.

## Related Information

### 19.15.1.4.2.1 Adding and Configuring Job Boards from the Job Board Market Place

After creating Posting Profiles and associating users with the profiles, a recruiter can use the *Job Board Market Place* to use targeted job boards to find candidates.

## Context

Activation is the process of providing the required credentials that allow a customers to post jobs to a job board. If a job board is free and does not require credentials, then the job board is already activated.

The owner of the Job Board Configuration plays a pivotal role in job board activation. Take a look at the following options to determine how your job board activation will be implemented:

- **Client Owner:** In this case, customers own the job board configuration and enter the required credentials to activate it.
- **Job Board Owner:** In this case, the job board provides Recruiting Posting with credentials required to identify the customer job posting. This action is triggered by the customer creating a configuration in Manage My Job Boards/Configuration.
- **Client and Job Board Owner:** In this case, the configuration requires authentication information on the customer and job board side.

#### Note

Customers must first provide information to the job board to make this configuration possible.

## Procedure

- In the *Admin Center*, search *Manage Recruiting Posting Settings* and choose ► *Job Board Market Place* ► *Add job boards and school job boards* .
- Select a job board from the *Job Board Market Place* and select the plus symbol. This would directly open the credentials tab.

A job board credential is a value or a set of values such as client ID, login and password, email and so on that lets Recruiting posting authenticate the customer to the job board. If a job board is free, credentials are not usually required. However, in other cases the job board must be configured with these credentials. If this configuration is missing, it will not be possible to activate the job board.

- Fill in the credential name and the required fields that connect your company with the given job board.
- Select the posting profiles or groups that have permission to post on the job board with these credentials. The credentials requested for configuration can vary from one job board to another. Some require a login and password. Others require a token generated on the job board web site. Under [Credentials](#), you can also view the status of the job board in the Status column.
- Select a credential using the arrow on the right. Select [Edit](#) to change the credentials or the posting profiles of persons allowed to post on the job board.

A job board configuration is a set of credentials that can be a value or a set of values such as client ID, login and password, email and so on that lets Recruiting posting authenticate the customer to the job board. If a job board is free, credentials are not usually required. However, in other cases the job board must be configured with these credentials. If this configuration is missing, it will not be possible to activate the job board.

Job board market place displays all job boards available within Recruiting Posting that a customer can add to Recruiting Posting interfaces to post jobs. The new job boards (integrated within less than 6 months), then biggest job boards are listed in the [Job Board Market Place](#) to find the ones that work best for an organization and to add them in priority. The Job Board Market Place displays the biggest job boards based on the reliability index. You can use multiple filters to find the targeted job boards and schools job boards or universities.

The job board description shows whether it supports the text formatting with HTML tags. For example, text formatting may include bold, italic, line break, paragraph, unordered Bulleted list, ordered list, unordered list, and divisions.

The filter by location ([Countries/Regions](#) field) is enhanced with a new criteria: [Worldwide](#). This filter refers to job boards and schools job boards that are available based on the country or region of the company.

#### Note

If the school job board you are looking for is not in the Recruiting Posting school job board catalog, refer to the KBA 2663347 – New School Board Integration – Recruiting Posting in the Related Information section.

The job board market place remains the most accurate and up-to-date with the list of available job boards and these lists are updated after each release.

While activating job boards from the Job board market place, consider the following:

- You won't be able to post jobs immediately after adding the job board — activation can take a few days. Have any credentials for the job board ready before adding it.
- When you add a job board, fill in the credential name and the required fields first to connect your company with the board. Select the posting profiles or groups that have permission to post on the job board.

## 19.15.1.4.2.2 Using My Job Boards and My Job Credits

Describes how to make a job board operational by adding or modifying posting profiles, credentials, and packs to job boards.

### Context

- Navigate to ► [Admin Center](#) ► [Manage Recruiting Posting Setting](#) ► [Manage My Job Boards](#) ►.
- View available job boards using [My Job Boards](#)  
A tooltip is displayed next to any job board that contains a configuration error. You can find information on how to fix the error in the Configurations tab. The unavailable job boards are disabled in the Job Board Market Place and Select Job Boards sections and a warning sign appears next to the job board's name to define the reason why it's unavailable.  
The job board description shows whether it supports the text formatting with HTML tags. For example, text formatting may include bold, italic, line break, paragraph, unordered Bulleted list, ordered list, unordered list, and divisions.
- Go to the Credentials tab. Select [Credentials](#).  
A job board configuration is a set of credentials that can be a value or a set of values such as client ID, login/password, email, and so on, that lets Recruiting posting authenticate the customer to the job board. If a job board is free, credentials aren't usually required. However, in other cases the job board must be configured with these credentials. If this configuration is missing, it won't be possible to activate the job board.
- Fill in the credential name and the required fields that connect your company with the given job board.
- Select the posting profiles or groups that have permission to post on the job board with these credentials.  
The credentials requested for configuration can vary from one job board to another. Some require a login and password. Others require a token generated on the job board web site. Under Credentials, you can also view the status of the job board in the Status column.  
Select a configuration using the arrow on the right. Click [Edit](#) to change the credentials or the posting profiles of persons allowed to post on the job board.
- Under [Posting Profiles & Groups](#), choose the availability of job board in the Job board availability column.
  - Select Default to make a job board available by default.
  - Select Mandatory to make a job board mandatory for all job postings.
  - Select Preselected to allow recruiters to deselect the job board.
- Remove a job board by selecting [Delete a Job Board](#) and confirm.

### Job Board Credits

You can additionally manage the job board credits you have for a paid job board provider.

These credits are purchased directly from the job board provider. Each time you post a job to a payable job board, one job board credit is consumed.

#### ⓘ Note

Credits must be purchased in advance of the posting.

Starting Point: ► [Admin Center](#) ► [Manage Recruiting Posting Setting](#) ► [Manage My Job Boards](#) ►.

1. Select a paid job board from [My Job Boards](#) displayed on the left.
2. Choose ► [Packs](#) ► [New Pack](#) ► [Pack Details](#) ►  
In [Type](#), choose [Credits](#) or [Slots](#).  
To allocate an unlimited amount of credits, check [Credits](#). Otherwise, enter the actual amount of credits purchased from the job board.

#### ⓘ Note

Be sure to enter the actual amount and not an approximate amount.

[Define the credit cost](#), choose the type of credits you have with the job board. If you have purchased a predefined number of credits, choose [For a pack](#) or [Per Unit](#)

| 3. Credit Type               | Instructions                                                                             | Good2Know                                                                                                                                                                |
|------------------------------|------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pack of credits              | Choose <a href="#">For a pack</a>                                                        | When this pack is consumed, edit the contract with the newly purchased pack information and save the contract.<br><br>→ Recommendation<br>Set a fixed value for credits. |
| Purchase credits as required | Choose <a href="#">Per Unit</a> and enter the unitary cost and currency as per agreement | → Recommendation<br>In <a href="#">Credits</a> , check the box. You are charged on what you consume and checking this box gives you unlimited credits.                   |

Use the [Comments](#) section to add helpful notes and contract details. Note that the comments box has a text limit of 400 characters.

Save your entries. When you save your entries, the tab [Posting Profiles & Groups](#) appears.

4. Choose ► [Posting Profiles & Groups](#) ► ► [Edit Set of Posting Profiles](#) ►

#### ⓘ Note

Credits are assigned to a posting profile not to a user.

5. Select the posting profile and assign the credits as required. Save your entries.

## 19.15.1.4.2.3 Adding and Configuring School Job Boards from the Job Board Market Place

An outline of notable differences in the posting process to school job boards.

### Prerequisites

- The desired school job board is already integrated with Recruiting Posting
- As a Recruiting Posting customer, you have an account with the desired school job board and any valid credentials required

### Procedure

- In the *Admin Center*, search *Manage Recruiting Posting Settings* and choose ► *Job Board Market Place* ► *Add job boards and school job boards* ➤.
- Switch to the *Schools* tab on the top right corner of the page.
- Select the plus sign on the school job board you want to add.
- Fill in the credential name and the required fields that connect your company with the given job board.
- Select the posting profiles or groups that have permission to post on the job board with these credentials. The credentials requested for configuration can vary from one job board to another. Some require a login and password. Others require a token generated on the job board web site. Under *Credentials*, you can also view the status of the job board in the Status column.
- Select a configuration using the arrow on the right. Click Edit to change the credentials or the posting profiles of persons allowed to post on the job board.

### Posting to School Job Boards

The main reason posting to school job board differs from regular posting activity has to do with the fact that schools tend to receive fewer postings than job boards. Consequently, schools tend to have a less developed platform, and therefore need specialized integration.

There are three different cases when posting on school job boards:

- There is a technical integration with the school's career site provider. These jobs are posted directly through this provider.
- There is not a technical integration with the school's career site provider. These jobs are posted directly on the school's form on the customers' behalf.
- The school does not have career site. These jobs are sent to the school via email.

### 📘 Note

Posting to a school job board is usually free. However, some boards may incur charges. Additionally, some schools may require manual validation before posting.

A school may have a separate posting interface dedicated to internships or permanent jobs for alumni and recent graduates. In this case, one school will have several job boards which will require several different configurations.

The SAP SuccessFactors Product team is available to evaluate the feasibility of any direct integration that a school or provider wishes to build.

### 19.15.1.4.2.4 Test Job Posting on Job Board's Sandbox from Preview Environment

Some job boards provide a sandbox to test your job postings before you post the job on the job board and make it external. You can test the job posting on a sandbox in the preview environment. Note that only a few job boards support the testing option.

Consider the following configuration requirements:

- The job board should have a sandbox available.
- You must have the job board test credentials from your job board.

The **Sandbox Available** label in the **Job Board Market Place** will indicate the job boards that let you test your job postings on a job board before you post the job on the job board and make it external.

In the posting process, during the review posting step, confirm the message that your jobs will be sent to the job board's sandbox.

### 📘 Note

- You require job board test credentials that the job boards shared with you to test your job posting on a job board. For more information, refer to *SAP Note 3245771 – List of Job boards with Preview Posting enabled – Recruiting Posting*.
- If a job board has a sandbox environment and wants to connect it to the SAP preview environment, it should follow the instructions described in the *SAP Note 3245767 – Process to Integrate Job boards in Preview – Recruiting Posting*.

## Related Information

[SAP Note 3245767](#) 

### 19.15.1.4.2.5 Choosing Job Boards to Suggest for Recruiting Posting

The Job Board Market Place contains over 3,000 sources. Learn here how to suggest an integration with Recruiting Posting.

## Prerequisites

#### Note

SAP does not charge the job board or its customers for job board integrations. On the job board side, it varies a lot. Some job boards might charge the customer for costs related to creating the integration, its maintenance, or when the customer wants to activate the job board. SAP does not take part in these negotiations that occur between the job board and the customer.

- You've checked the Job Board Market Place and the Excel Catalogue on Customers Community, and the desired job board isn't listed.
- You have a valid contract with the job board, if the job board requires a subscription or fee.
- You commit to regularly posting job adverts to the requested job board through SAP SuccessFactors Recruiting Posting.
- The contacts indicated in the suggestion form are aware that the Recruiting Posting Product team contacts them.
- You haven't exceeded 10 job boards suggestions in the calendar year.
- The user suggesting the integration has the permission [Manage Recruiting Posting](#).

## Context

A job board is a platform for posting jobs. Publicly available job boards are accessible online and available to everyone. They can be free of charge or payable. Customers pay using either credits or slots. An example of a publicly available job board is Steptone or Monster.

A job board integration creates a technical bridge between a job board and SAP SuccessFactors Recruiting Posting, so that organizations can post jobs on this job board, as well as to the 3-000-plus Job Board Market Place sources.

A job board integration isn't a service, but a product enhancement that falls within the Recruiting Posting roadmap. Therefore, each integration is unique and requires Product Managers and Engineering team to specify technical development with the job board. An integration suggestion contributes to improving the job posting tool as a whole.

It's important to note that roadmaps are current states of planning. They can be changed anytime without notice. They don't serve as commitment for feasibility or deadline.

If the job board you're looking for isn't in the Recruiting Posting job board catalog, you can suggest it through the Job Board Market Place. Once a job board is integrated, it's available to all customers.

If the school job board you're looking for isn't in the Recruiting Posting school job board catalog, refer to the *KBA 2663347 – New School Board Integration – Recruiting Posting*.

You can suggest a job board integration from the Job Board Market Place as described in the Job Board Market Place Update.

If you don't have access to the Job Board Market Place, you can display all available job boards and school job boards in the Customer Community of the Job Board Catalog.

## Procedure

1. To submit an integration, select the [Suggest a new job board](#) button in *Job Board Market Place*.

Your suggestion is transmitted to the Recruiting Posting product team and is stored until three different customers request the same job board. Note that the request for the job board must be from the production instance and not from the preview instance.

### Note

Your integration request may be delayed or canceled if the job board experiences technical difficulties, refuses integration attempts, or doesn't meet SAP strategies or other customer requests.

2. After the job board is integrated, you receive an email notifying you that the new job board is available in Job Board Market Place; you can now set up the new job board on your interface.

Each customer account has five aggregators or job boards added automatically, and they are ready to use on the first day of Go-Live production.

## 19.15.1.4.2.6 Configuring Templates Using a Template ID

Configure a template that receives a template ID from a job board.

### Prerequisites

- A contract is in place with the job board that supports template management.
- You have the latest version of Recruiting Posting.
- You've configured one template per Posting Profile.

### Context

Recruiting Posting allows you to post jobs externally from SAP SuccessFactors. Corporate branding on external jobs is managed by the job board itself. When using a template ID for template management, the job board creates, builds, and stores job templates defined by a template ID. Recruiting Posting sends a corresponding template ID to the job board so that the job board displays the correct template.

### Procedure

1. Provide the job board with template elements.  
The job board then stores the elements and defines a template ID per template.
2. Add the job board to the Job Board Market Place at [Job Board Market Place](#) > [Add Job Boards and School Job Boards](#) .
3. The customer begins job board configuration by selecting the job board. [Manage Recruiting Posting](#) > [My Job Boards](#) .
4. The customer selects the posting profile to associate to the job board at [Edit Set of Posting Profiles](#).
5. In the [Configurations](#) tab, the customer sets credentials for accessing the job board. Use the magnifying glass icon to display the [Credentials](#) tab.
6. The job board supplies the template ID to Recruiting Posting.
7. The customer creates a job posting.
8. Recruiting Posting submits job posting with the corresponding template ID.
9. The job board publishes the job posting with the corresponding template.

## 19.15.1.4.3 Setting Up Automatic Reposting of Jobs on Job Boards

Ensure that open job requisitions will be automatically reposted to the relevant job boards so that you can continue to attract candidates.

### Context

Under normal circumstances, job requisitions are removed from job boards after 30 days even if they're still online on the external career site. By setting up automatic reposting, you can specify that the job requisition will be reposted after the 30 days are up.

### Procedure

1. Post the job requisition on your external career site
2. Choose [Post job](#).
3. Select the job boards on which you want to post and repost your job.
4. In the [Automatic Reposting of Jobs](#) section, select the job boards on which you want to automatically repost your job. You can either specify that the job should be reposted until the job requisition is removed from the external career site, or choose a specific number of reposts.
5. Continue with the usual process to post a job.

#### Note

- Reposting jobs might incur additional costs (through job board credits) from job boards.
- It's not possible to edit or stop automatic reposting for a job that has already been posted. As such, please be careful when configuring this feature during the posting workflow in Recruiting Posting.
- To deactivate automatic reposting entirely, go to ► [Manage Recruiting Posting](#) ► [Settings](#) ► and deselect [Automatic Reposting](#).

### Results

The job requisition will be reposted as many times as you specified. The recruiter will be notified by mail every time an automatic repost occurs.

## 19.15.1.4.4 Creating a Job Posting to Multiple Locations

Post a job to multiple locations from Recruiting Posting at a time on job boards that support multilocation posting.

### Prerequisites

Set the job posting rule to fetch the location information from the job requisition (either with the Location Foundation Object or other job requisition fields) to auto-populate the *City*, *Postcode*, *Country/Region*, field values on the *Complete specific fields* page to facilitates the posting of a job to multiple locations.

### Context

You can simultaneously post a job to multiple locations on the job boards that support multilocation posting. For the job boards that don't support multiple locations, the job is posted only to a primary location.

When you post a job to multiple job boards, the maximum locations you can add depends on the job board supporting minimum locations. For example, if job board A supports five locations and job board B supports 10 locations, you post the jobs to five locations.

The *Location* category saves the *City*, *Postcode*, and *Country/Region* information. The *Map to location Foundation Object (Multiple locations supported)* option supports the multilocation posting and fetches the data from the foundation objects defined in the job requisition template.

The *City*, *Postcode*, *Country/Region* information is populated while posting the jobs based on the job posting rules defined in the *Field Completion Rule*. The *Standard mapping (Multiple locations not supported)* option is set by default while posting a job.

To post the jobs to multiple locations, set the field *Setting Field completion Rules* to populate the location information from the job requisition template (from Recruiting Posting values (auto-fill values), or the Foundation Object).

### Procedure

1. Go to ► *Admin Center* ► *Recruiting* ► to select a job requisition from the *Job Requisitions* page.
2. Select *JOB POSTINGS* link, and choose the ► *Post and Manage Jobs* ► option.
3. In the *Post a job* page, select job boards that support multiple locations, and choose *Next*.

#### Note

In the *Job Board Market Place*, you can view a *Multiple-location* label for the job boards that supports the simultaneous posting of a job to multiple locations. The job board description shows whether it supports the text formatting with HTML tags. For example, text formatting may include bold, italic, line break, paragraph, unordered Bulleted list, ordered list, unordered list, and divisions.

4. In the *Complete specific fields*, the *Common fields* section shows the *Location* field. You can select the *Display required and filled fields* option to view only the required and auto-populated fields to quickly review the job posting form and complete the mandatory job posting fields.

The city, country/region, and ZIP code field values are populated based on the job posting rule defined in the job posting rule. If you do not set a rule, the *City*, *Postcode*, *Country/Region* fields have no values, and you have to add the location information manually. The first location is considered the primary location.

5. Add the primary location information if there is no value.
6. Select the "+" icon to add multiple locations.
7. Select Save.  
The posted job shows the primary location.
8. Select *Show More* to view the primary location and the additional locations of the posted job.

## 19.15.1.4.5 Using Self-Service Reports

Manage self-service reports for Recruiting Posting data from *Admin Center* instead of requesting changes through Technical Support.

## Prerequisites

- Recruiting Posting is integrated with Recruiting.
- Permission to *Manage Recruiting Posting* page and access to *Manage Reports* from *Admin Center*, *Manage Recruiting Posting*.

## Context

Configure custom reports for the Recruiting Posting data such as job postings and job board credits using the *Report* tile in *Settings*.

- Job Posting Reports
- Job Status Reports
- Job Board Credit Reports

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Posting](#) ► [My Reports](#) ► [Manage My Reports](#) ►.
2. Choose the + *plus* icon to create custom reports.
3. Select a report type in the [New Reports](#) page:

| Report Name                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Job Posting Report</b>                     | <p>Displays all the posted jobs for an entity and its corresponding posting profiles during a given period that are selected for the set of job boards.</p> <div> <p><b>Note</b></p> <p>The user's preferred names are diaplyed on the <a href="#">Job Posting Report</a> page if the <a href="#">Enable adoption of General Display Name</a> option is enabled in ► <a href="#">Admin Center</a> ► <a href="#">Company System and Logo Settings</a> ►.</p> </div> |
| <b>Job Status Report</b>                      | <p>Displays a list of all jobs, their status for an entity, and its corresponding posting profiles during a given period for the job boards.</p> <div> <p><b>Note</b></p> <p>The user's preferred names are diaplyed on the <a href="#">Job Status Report</a> page if the <a href="#">Enable adoption of General Display Name</a> option is enabled in ► <a href="#">Admin Center</a> ► <a href="#">Company System and Logo Settings</a> ►.</p> </div>             |
| <b>Job Board Credits Availability Reports</b> | <p>Displays the job board credits based on the declarations in the <a href="#">My Job Boards</a> settings. The job board credits are the credits that a posting profile spends for posting a job on the respective job board. Note that the credit score is unlimited for some job boards as they don't monetize posting of jobs.</p>                                                                                                                              |
| <b>Job Board Credits Consumption Report</b>   | <p>Displays the total job board credits consumed for posting jobs to a job board.</p>                                                                                                                                                                                                                                                                                                                                                                              |

4. Provide a report name, preferred language, date format, and recipient mail IDs.
 

The [Date Format](#) displays the selected format of the date in the generated reports, email subject, and email content. The supported date formats are "yyyy-mm-dd", "mm-dd-yy", and "dd-mm-yy". The publication date, expiration date, file name of the report, email subject, and email content display the date in the selected format. If you don't provide the date format, by default the date format of the selected locale is displayed in the generated reports and emails
5. Select the [Additional Columns](#) to include the extra fields in your reports in addition to the standard report fields. This field is available only for the Job Posting Report and Job Status Report. For Job Posting Report, the available additional columns are: [Clicks](#), [Customer](#), [Job Board ID](#), [Job Posting ID](#), [Posting ID](#), [Username](#). For the Job Status Report, the available additional columns are: [Clicks](#), [Customer](#), [Job Posting ID](#), [Posting ID](#), [Days Before Expiration](#), [Username](#).
6. Choose the value-help icons for posting profiles, job boards, school boards to select the values from the available list. Note that the school boards option is available only for Job Posting Reports.
7. Provide the values to schedule the frequency and the time of report generation:

| Field Name               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Sending Frequency</b> | <p>Specify whether to schedule the frequency of the report generation on a daily, or weekly, or monthly basis. To generate weekly or monthly reports, you can select single or multiple days of the week and month. For example, select the Every Month field and set the days of the month value as 1st, 21st, and Last Day. Sending frequency can be set for <a href="#">Job Posting Reports</a>, <a href="#">Job Status Reports</a>, and <a href="#">Job Board Credit Reports</a>.</p> <p><b>Days of the week:</b> The sending frequency can be every week, on Monday and Friday at 08:00 am.</p> <p><b>Days of the month:</b> The sending frequency can be every month, on 1st, 16th and last day, at 18:15 pm</p> <ul style="list-style-type: none"> <li>• <a href="#">Time of the day</a><br/>Specify the time of the day when to generate the report based on the frequency selected for the report generation. The report is generated in the Coordinated Universal Time (UTC) time zone. For example, the sending frequency can be Every day, at 12:30 pm</li> </ul>                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Time period</b>       | <p>Specify the jobs that are posted for an entity during a given time period. The jobs are posted for the selected posting profiles and job boards. Select the from date and to date from the calendar to generate the report.</p> <ul style="list-style-type: none"> <li>• <a href="#">Snapshot</a><br/>Display the data that is available at the time of report generation.</li> <li>• <a href="#">Last</a><br/>Display the posted jobs for the specified number of days, weeks, and months. Note that the value can't exceed 365 days. For example, last x days, weeks or months.</li> <li>• <a href="#">Since</a><br/>Define the posted jobs from the specified day of a month. Note that the value can't exceed 365 days. For example, Since the fifth of the month.</li> <li>• <a href="#">From date to date</a><br/>Use the calendar date picker to generate data in reports based on the selected date range (Start date and End date). Note that the end date is an optional field. The 'From date to date' value can't exceed 365 days.</li> </ul> <div> <p><b>Note</b></p> <p>The <a href="#">Since</a> and <a href="#">Last</a> options are available for <a href="#">Job Posting Reports</a> and <a href="#">Job Status Reports</a> only. The <a href="#">Snapshot</a> option is available for <a href="#">Job Posting Reports</a>, <a href="#">Job Status Reports</a>, and <a href="#">Job Board Credit Reports</a>.</p> </div> |
| <b>Message</b>           | Provide the message to send in an email along with the report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

- For [Job Board Credits Report](#) type, select the [Display Used Credits](#) option to view how many credits the user has spent for the job boards to post jobs. Select the [Display Unlimited Contracts](#) option to view the job boards that have unlimited credits.
- Choose Save.
- To edit an existing report, open a report and update the values.

The saved reports appear in the [My Reports](#) section in the order of creation. In the generated self-service reports, worksheet name is the date of the report generation.

#### Note

In the previous release, the worksheet name was a combination of the report type name and the date of the report generation. During translation, a few junk values got added to the worksheet name due to the length of the name. The change in the worksheet name is applicable for all the existing and new self-service reports.

## 19.15.1.4.6 Setting Up Self-Service Job Board Logs

When there's an issue with a job posting, you can access the job boards logs in the [Job Posting Table](#) section of the [Job Posting](#) table.

### Prerequisites

You have Recruiting Posting permission.

### Context

Recruiters can leverage the self-service job board logs to retrieve the log information without requesting changes through Technical Support.

### Procedure

1. From the Admin Center, go to ► [Recruiting](#) ► [Job Requisitions](#) ► to select a job requisition.
2. Go to the [Job Posting](#) section and select the down arrow icon in the [Status](#) column next to a job board name.

A new page opens after your SSO authentication. The page displays the job requisition name, job requisition ID, job board name, status, and link to download a compressed ZIP file.

3. Choose [Download Logs](#) to download the .zip file of the logs.
4. Extract the <Posting ID\_Job board name> ZIP file to share it with the job boards.

#### Note

Posting logs display on the job posting table only when they're available. Posting logs can be unavailable if they can't be retrieved, or because of these reasons:

- We couldn't send the data to the job board because the customer credentials were not valid.
- Posting logs include confidential information about other customers, and could not extract your logs.

## 19.15.1.4.7 Field Completion

Field completion aims at prefilling job posting fields.

This is based on default values or on job requisition fields so that recruiters do not need to re-enter information for each posting.

### 19.15.1.4.7.1 Editing Autofill Values

Use autofill values to set a constant value for a job posting field. This value prefills the job posting field for all your recruiters and for all your Job Requisition templates containing the rule.

#### Prerequisites

- You have the [Manage Recruiting Posting](#) permission.
- For autofill to work, the job board is already assigned and available in [My Job Boards](#)

#### Note

The autofill value is completely independent of any fields in the job requisition. Any supported job posting field can be prefilled by an autofill value. The interface simply reflects the field as it is displayed during the recruiter posting experience.

#### Procedure

1. Choose [Manage Recruiting Posting](#) > [Job Posting Rules](#) >
2. Select the Job Requisition Template to which to apply the rule.
3. Choose [+ Add rule](#) to create a job posting rule.
4. Choose [Define auto-fill value](#)

Supported Field Types

| Job Posting Field type | Specific or Common? | Example                                       |
|------------------------|---------------------|-----------------------------------------------|
| Picklist               | Common              | <a href="#">Contract Type</a>                 |
| Text                   | Common              | <a href="#">Job Description</a>               |
| Multiple select        | Specific            | LinkedIn field <a href="#">Function</a>       |
| Number                 | Common              | <a href="#">10,000</a>                        |
| Checkbox               | Specific            | Monster field <a href="#">Anonymous Offer</a> |
| Currency               | Common              | <a href="#">\$USD</a>                         |

| Job Posting Field type | Specific or Common? | Example                                            |

| Radio button           | Specific            | Stepstone.de field <a href="#">Employment type</a> |

## Related Information

[Managing Field Completion Rules and Job Requisition Field Rules \[page 740\]](#)

### 19.15.1.4.7.2 Setting Salary Field Mapping

Set the Salary field mapping to map the values either to the default values or job requisition values, or a combination of both values.

## Context

You can configure the following information for the Salary field to map the values to default or job requisition values:

- Salary Currency
- Salary Period
- Maximum Salary
- Minimum Salary
- Salary Display and Sending Rule

## Procedure

1. Go to [Admin Center](#), [Job Posting Rules](#), [Field Completion](#).
2. You view the [Salary](#) field as a [Custom Mapping](#).
3. Choose [Edit rule](#) to change the [Salary](#) field with appropriate field completion rules and choose [Save](#).

## 19.15.1.4.7.3 Setting the Job Posting Rule to Fetch Location Foundation Object

Set the job posting rule to populate the location information for posting the jobs.

### Context

Fetch the location information from the foundation objects defined in the job requisition template based on the job posting rules defined in the field completion rules.

### Procedure

1. Go to ► [Admin Center](#) ► [Job Posting Rules](#) ► [Field Completion](#) ►.

You view the [Location](#) field as a [Standard Mapping](#).

2. Click [Edit rule](#) to view or change the [Country/Region](#), [Location](#), [Postcode](#) fields values individually with appropriate field completion rules.

The values in the [Country/Region](#), [Location](#), and [Postcode](#) fields are populated as per the job posting rule defined on the [Field Completion Rules](#) page. If you have not set a rule, the [Country/Region](#), [Location](#), [Postcode](#) fields have no values. By default, the [Standard mapping \(Multiple locations not supported\)](#) option is selected for the location field to map rules to the [Country/Region](#), [Location](#), and [Postcode](#) fields individually. To fetch the location information from the foundation object configured on a job requisition template, change the mapping to the [Map to location Foundation Object \(Multiple locations supported\)](#) option.

#### Note

Foundation Object and Generic Object picklist field maps to a composite or object-type field in the Admin Center > Manage Recruiting Rules > Job Posting Rules > Field Completion Rules. You can select the attributes of the composite object while mapping the FO and GO objects in the Field Completion Rules.

3. Click ► [Change job posting rule](#) ► [Change Rule](#) ►, to select the [Map to location Foundation Object \(Multiple locations supported\)](#) option.
4. Click [Save](#).

On the field completion rules page, the [Location](#) field shows [Foundation Object Mapping](#).

5. Click the [Edit rule](#) option to select either the [Standard mapping \(Multiple locations not supported\)](#) or [Map to location Foundation Object \(Multiple locations supported\)](#) option.

[Creating a Job Posting to Multiple Locations \[page 727\]](#)

## 19.15.1.4.7.4 Setting the Job Posting Rule to Fetch Job Location Generic Object

Set the job posting rule to populate the location information for posting the jobs.

### Context

Fetch the Job Location information from the generic objects specified in the job requisition template based on the job posting rules defined in the field completion rules. The Job Location generic object lets you map the location field to provide a faceted search using the Google Maps component and posting a job to multiple locations for candidates to find on the career sites.

### Procedure

1. Go to [Admin Center](#) > [Job Posting Rules](#) > [Field Completion](#).

You view the [Location](#) field as a [Standard Mapping](#).

2. Click [Edit rule](#) to view or change the [Country/Region](#), [Location](#), [Postcode](#) fields values individually with appropriate field completion rules.

The values in the [Country/Region](#), [Location](#), and [Postcode](#) fields are populated as per the job posting rule defined on the [Field Completion Rules](#) page. If you have not set a rule, the [Country/Region](#), [Location](#), [Postcode](#) fields have no values. By default, the [Standard mapping \(Multiple locations not supported\)](#) option is selected for the location field to map rules to the [Country/Region](#), [Location](#), and [Postcode](#) fields individually. To fetch the location information from the Job Location generic object configured on a job requisition template, change the mapping to the [Map to Job Location Generic Object \(Multiple locations supported\)](#) option.

#### Note

Generic Object picklist field maps to a composite or object-type field in the [Admin Center](#) > [Manage Recruiting Rules](#) > [Job Posting Rules](#) > [Field Completion Rules](#). You can select the attributes of the composite object while mapping the generic objects in the [Field Completion Rules](#).

3. Click [Change job posting rule](#) > [Change Rule](#) to select the [Map to Job Location Generic Object \(Multiple locations supported\)](#) option.
4. Click [Save](#).

On the field completion rules page, the [Location](#) field shows [Job Location Generic Object mapping](#).

5. Click the [Edit rule](#) option to select either the [Standard mapping \(Multiple locations not supported\)](#) or [Map to Job location Generic Object \(Multiple locations supported\)](#) option.

## 19.15.1.4.7.5 Job Posting Rules

Rules prefill designated fields in the job postings with values. You can define rules for the following field types in multiple languages for all free text job posting fields (description of the job, company description...).

Mandatory job board fields are marked with \* in the job posting rules main page.

### Available Job Posting Rules

You can choose between two methods to prefill the job posting fields:

- Auto fill values let you set a constant value for a job posting field. This value prefills the job posting field, for all your recruiters and for all your job requisition templates.
- Job requisition field rules let you set a value based on job requisition fields. This value prefills the job posting field.

## 19.15.1.4.7.5.1 Adding and Applying Job Posting Rules

You can use rules to save time when creating job postings.

### Prerequisites

- You have the [Manage Recruiting Posting](#) permission.

### Context

### Procedure

1. Choose ► [Manage Recruiting Posting](#) ► [Job Posting Rules](#) ►.

Job posting fields are listed in categories to the left of the screen. The option + [Add rule](#) is visible when there's no job posting rule assigned.

2. Select the language in which you would like the auto-fill values defined.
3. Choose a Job Requisition template to configure (template A).

Your job posting fields are listed in categories to the left of the screen. The option + [Add rule](#) is visible when there's no job posting rule assigned.

4. Use the arrows on the left to unwrap the posting field categories and display the job posting fields.

Each job board that's associated in My Job Boards has its own category containing its job board-specific fields. The category Common Fields contains any field that's requested by at least two of your associated job boards.

5. Choose **+** [Add rule](#) to create a job posting rule.
6. Select a rule type from the two available rule types.
7. Select another Job Requisition Template (template B) from top-right corner list.

You can either set the Job Posting Rules individually for this new template or Import the rules from another reference template (template A).

8. Choose [Import field rules](#).
9. Select the template to import and replace the current rules of the template you're configuring.
10. Choose the import method.

| Option                                                 | Description                                                                                          |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| <a href="#">Import and overwrite existing rules</a>    | The option replaces the rules that are currently set for template B with the ones set in template A. |
| <a href="#">Import and complete with missing rules</a> | The option imports only rules for field of template B that don't already have any set.               |

## 19.15.1.4.7.5.2 Job Posting Field Rules

Use job requisition field rules to define which job requisition field is mapped to a which job posting field. This value prefills the job posting field, for all your recruiters and for all your Job Requisition templates.

This method lets you define which job requisition field is mapped to which job posting field. Here you can see two tables - the first one takes the job requisition field type as the starting point and the second one the job posting field type.

Job Requisition Field Type to Job Posting Field Type

| Job requisition field type | Job posting field type                |
|----------------------------|---------------------------------------|
| Boolean                    | Checkbox                              |
|                            | Text                                  |
| Currency                   | Salary currency                       |
|                            | Text                                  |
| Date                       | Date                                  |
| jobCode                    | Text                                  |
| jobRole                    | Text                                  |
| Number                     | Text                                  |
| Object                     | Supported for display and navigation* |
| Enum                       | Text                                  |
| Picklist                   | Text                                  |
|                            | Multiple select                       |
|                            | Checkbox                              |

| Job requisition field type | Job posting field type                |
|----------------------------|---------------------------------------|
|                            | Picklist                              |
|                            | Radio Button                          |
|                            | Range                                 |
|                            | Autocomplete                          |
| Percent                    | Text                                  |
| Richtext                   | Text                                  |
| Text                       | Text                                  |
| TextArea                   | Text                                  |
| Derived (Country/Region)   | Mapped by default to "Country/Region" |

#### Job Posting Field Type to Job Requisition Field Type

| Job posting field type                      | Job requisition field type                    |
|---------------------------------------------|-----------------------------------------------|
| Text                                        | Boolean                                       |
|                                             | Currency                                      |
|                                             | Date                                          |
|                                             | jobCode                                       |
|                                             | jobRoles                                      |
|                                             | Number                                        |
|                                             | Objects supported for display and navigation* |
|                                             | Enum                                          |
|                                             | Picklist                                      |
|                                             | Percent                                       |
|                                             | RichText                                      |
|                                             | TextArea                                      |
| Picklist, Radio Button, Range, Autocomplete | Picklist                                      |
|                                             | Objects supported for display and navigation* |
|                                             | Picklist                                      |
| Date                                        | Date                                          |
| Checkbox                                    | Boolean                                       |
|                                             | Picklist                                      |
|                                             | Objects supported for display and navigation* |

\*As object fields contain other fields and not a fixed value, you cannot map a job requisition field with such a field. However, you can navigate through the folder structure of every object to find the simple field to map.

## Available Operations

| Icon                       | Action                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X                          | Delete the mapped field                                                                                                                                                                                                                                                                                                                                              |
| +                          | Add a mapped field or conjoin existing job requisition fields together. For example, you might want to map the job posting field <i>Company description</i> to the job requisition fields <i>JobDescHeader</i> and <i>JobDescFooter</i>                                                                                                                              |
| Scissors icon              | Split a Job requisition field into text extracts in multiple languages. Choose the scissors icon, select a language and define if you want to extract text before, after or between the keyword. This keyword can be any phrase. You can decide to include or exclude keyword to make a tailored text extract. You can add an additional language for every extract. |
| Arrows                     | Sorts in ascending or descending order                                                                                                                                                                                                                                                                                                                               |
| >                          | Displayed when the chosen field is a picklist and you need to input the value.                                                                                                                                                                                                                                                                                       |
| Aggregation of text splits | You can aggregate (+ button) several extracts of a same job Requisition text split or several extracts of different job Requisition text splits.                                                                                                                                                                                                                     |

### Note

By default, the job description set in Job Profile Builder is a field defined in the Job Requisition Templates as *External Job Description*. The value that will be mapped when using this field is the aggregation of all subsections of Job Profile Builder.

## 19.15.1.4.7.5.3 Adding and Mapping Job Posting Field Rules

### Context

### Procedure

1. Choose ► *Manage Recruiting Posting* ► *Job Posting Rules* . When a job requisition field rule already exists, you'll see the name of job requisition field set for the mapping.
2. Select the Job Requisition Template to which to apply the rule.
3. Choose + *Add rule* to create a job posting rule.
4. Choose *Map with job requisition field*

#### ① Note

It is not possible to map Enum and Text fields with Recruiting Posting picklist.

#### ① Note

Fields marked with an asterisk are mandatory in a job requisition.

### 19.15.1.4.7.5.4 Contact Information Fields

Recruiting Users are able to choose between certain fields when mapping their contact information. These fields include:

- User information
- Posting Profile information
- Operator role
  - Additional Managers
  - Adhoc Approvers Team
  - Hiring Manager
  - Recruiter
  - Recruiting Admin
  - Recruiting Admin Team
  - Recruiting Lead Team
  - Recruiting Team
  - Recruiting Team Lead
  - Service Center
  - Service Center Team
  - Sourcer
  - Sourcer Team

### 19.15.1.4.7.5.5 Managing Field Completion Rules and Job Requisition Field Rules

You can use rules to save time when creating job postings.

#### Job Posting Rules

Prerequisites

- You have the [Manage Recruiting Posting](#) permission.

Rules prefill designated fields in the job postings with values. You can define rules for the following field types in multiple languages for all free text job posting fields (description of the job, company description...).

Mandatory job board fields are marked with \* in the job posting rules main page.

### Available Job Posting Rules

You can choose between two methods to prefill the job posting fields:

- Auto fill values let you set a constant value for a job posting field. This value prefills the job posting field, for all your recruiters and for all your job requisition templates.
- Job requisition field rules let you set a value based on job requisition fields. This value prefills the job posting field.

For job posting field types such as text, number, date, you can map the job requisition value directly to the corresponding job posting field.

For other job posting field types such as checkbox, picklist, and multiple select, you can define rules based on the value of your job requisition picklist items or Boolean values.

### Procedure

1. Choose [Manage Recruiting Posting](#) > [Job Posting Rules](#). Job posting fields are listed in categories to the left of the screen. The option [+ Add rule](#) is visible when there's no job posting rule assigned.
2. Select the language in which you would like the auto-fill values defined.
3. Choose a Job Requisition template to configure (Template A). Your job posting fields are listed in categories to the left of the screen. The option [+ Add rule](#) is visible when there's no job posting rule assigned.
4. Use the arrows on the left to unwrap the posting field categories and display the job posting fields. Each job board that is associated in My Job Boards has its own category containing its job board specific fields. The category Common Fields contains any field that is requested by at least 2 of your associated job boards.
5. Choose [+ Add rule](#) to create a job posting rule.
6. Select a rule type from the two available rule types.
7. Select another Job Requisition Template (Template B) from top-right corner list. You can either set the Job Posting Rules individually for this new template or Import the rules from another reference template (Template A).
8. Choose [Import field rules](#).
9. Select the template to import and replace the current rules of the template you're configuring.
10. Choose the import method.
  - The option [Import and overwrite existing rules](#) replaces the rules that are currently set for template B with the ones set in template A.
  - The option [Import and complete with missing rules](#) imports only rules for field of template B that don't already have any set.

#### Note

The import function works when the Field ID from template A and template B match.

## Job Posting Field Rules

Use job requisition field rules to define which job requisition field is mapped to a which job posting field. This value prefills the job posting field, for all your recruiters and for all your Job Requisition templates.

This method lets you define which job requisition field is mapped to which job posting field. Here you can see two tables - the first one takes the job requisition field type as the starting point and the second one the job posting field type.

Job Requisition Field Type to Job Posting Field Type

| Job requisition field type | Job posting field type                    |
|----------------------------|-------------------------------------------|
| Boolean                    | Checkbox                                  |
|                            | Text                                      |
| Currency                   | Salary currency                           |
|                            | Text                                      |
| Date                       | Date                                      |
| jobCode                    | Text                                      |
| jobRole                    | Text                                      |
| Number                     | Text                                      |
| Object                     | Supported for display and navigation*     |
| Enum                       | Text                                      |
| Picklist                   | Text                                      |
|                            | Multiple select                           |
|                            | Checkbox                                  |
|                            | Picklist                                  |
|                            | Radio Button                              |
|                            | Range                                     |
|                            | Autocomplete                              |
| Percent                    | Text                                      |
| Richtext                   | Text                                      |
| Text                       | Text                                      |
| TextArea                   | Text                                      |
| Derived (Country)          | Mapped by default to "Country" in backend |

Job Posting Field Type to Job Requisition Field Type

| Job posting field type | Job requisition field type |
|------------------------|----------------------------|
| Text                   | Boolean                    |
|                        | Currency                   |
|                        | Date                       |

| Job posting field type                      | Job requisition field type                    |
|---------------------------------------------|-----------------------------------------------|
|                                             | jobCode                                       |
|                                             | jobRoles                                      |
|                                             | Number                                        |
|                                             | Objects supported for display and navigation* |
|                                             | Enum                                          |
|                                             | Picklist                                      |
|                                             | Percent                                       |
|                                             | RichText                                      |
|                                             | TextArea                                      |
| Picklist, Radio Button, Range, Autocomplete | Picklist                                      |
|                                             | Objects supported for display and navigation* |
|                                             | Picklist                                      |
| Date                                        | Date                                          |
| Checkbox                                    | Boolean                                       |
|                                             | Picklist                                      |
|                                             | Objects supported for display and navigation* |

\*As object fields contain other fields and not a fixed value, you cannot map a job requisition field with such a field. However, you can navigate through the folder structure of every object to find the simple field to map.

#### Available Operations

| Icon                       | Action                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X                          | Delete the mapped field                                                                                                                                                                                                                                                                                                                                              |
| +                          | Add a mapped field or conjoin existing job requisition fields together. For example, you might want to map the job posting field <i>Company description</i> to the job requisition fields <i>JobDescHeader</i> and <i>JobDescFooter</i>                                                                                                                              |
| Scissors icon              | Split a Job requisition field into text extracts in multiple languages. Choose the scissors icon, select a language and define if you want to extract text before, after or between the keyword. This keyword can be any phrase. You can decide to include or exclude keyword to make a tailored text extract. You can add an additional language for every extract. |
| Arrows                     | Sorts in ascending or descending order                                                                                                                                                                                                                                                                                                                               |
| >                          | Displayed when the chosen field is a picklist and you need to input the value.                                                                                                                                                                                                                                                                                       |
| Aggregation of text splits | You can aggregate (+ button) several extracts of a same job Requisition text split or several extracts of different job Requisition text splits.                                                                                                                                                                                                                     |

### Note

By default, the job description set in Job Profile Builder is a field defined in the Job Requisition Templates as [External Job Description](#). The value that will be mapped when using this field is the aggregation of all subsections of Job Profile Builder.

## Procedure

1. Choose ► [Manage Recruiting Posting](#) ► [Job Posting Rules](#) ►.  
When a job requisition field rule already exists, you'll see the name of job requisition field set for the mapping.
2. Select the Job Requisition Template to which to apply the rule.
3. Choose + [Add rule](#) to create a job posting rule.
4. Choose [Map with job requisition field](#)

### Note

It is not possible to map Enum and Text fields with Recruiting Posting picklist.

### Note

Fields marked with an asterisk are mandatory in a job requisition.

## Managing Contact Information Field Rules

Recruiting Users are able to choose between certain fields when mapping their contact information. These fields include:

- User information
- Posting Profile information
- Operator role
  - Additional Managers
  - Adhoc Approvers Team
  - Hiring Manager
  - Recruiter
  - Recruiting Admin
  - Recruiting Admin Team
  - Recruiting Lead Team
  - Recruiting Team
  - Recruiting Team Lead
  - Service Center
  - Service Center Team
  - Sourcer
  - Sourcer Team

### 19.15.1.4.8 Posting Rules

Posting Profiles enable Recruiters to have speedy posting processes.

Posting Rules aim at accelerating posting process for recruiters based on job requisition fields. These rules allow customers to automate the selection of posting profiles, job boards, and prepopulate job posting fields.

Posting rules are a prerequisite for automated job posting.

[Creating and Editing Posting Profile Preselection Rules \[page 745\]](#)

Create, edit and use rules to preselect posting profiles based on your job requisition fields.

[Creating Job Board Preselection Rules \[page 747\]](#)

Describes how to configure and use rules to preselect job boards based on your job requisition fields.

#### 19.15.1.4.8.1 Creating and Editing Posting Profile Preselection Rules

Create, edit and use rules to preselect posting profiles based on your job requisition fields.

### Prerequisites

- You have the OData API Job Requisition Export permission
- You have permission to manage Recruiting Posting
- Your posting profiles have been created
- The posting profile to which the rule applies hasn't been associated to a posting profile selection rule yet.

### Context

Posting Profile Preselection rules help you save time when posting jobs. You can configure and use them to preselect the posting profile with which the job is posted based on your job requisition fields. The type of fields of your job requisitions that you can use to create specific rules are:

- Text fields
- Number fields
- Select fields

### Note

As you can select only one posting profile for a given job posting, a priority order must be set when creating a Posting Profile Preselection rule.

## Procedure

1. Create a rule.
2. Select ► [Manage Recruiting Posting](#) ► [Job Posting Rules](#) ► [Posting Profile Preselection Rules](#) ►. View your rules listed in a table with the posting profile for which each rule applies. A summary of the rule is included.
3. Click [Create Rule](#) at the top right of the table.
4. Select criteria for your rules as follows:
  - Select a job requisition field, the operation (for example, "is" or "isn't"), and the value of the field for each criteria.
  - Click the + icon to add criteria and operation at the same level.
  - Click [Add Group](#) to add a user group of criterion at a lower level.
  - Use "And" and "Or" to the left of the page to define the articulation of the rule.
  - Use string mode preview to read the rule that you've created.
5. Click [Next](#).
6. Select a posting profile that isn't associated to a posting profile selection rule and save your selection.

### Note

By default your posting profile rule is set as the last priority, that is the rule is applied only if the other posting profiles preselection rules can't be applied.

7. To change the priority of your rule, click [Set Priority](#) at the top right of the table.
8. Click the arrow to change the number or enter the number to select the priority of your rule. The auto correct feature ensures that you provide the correct number.
9. Click [Apply](#) to save your changes.

## 19.15.1.4.8.2 Creating Job Board Preselection Rules

Describes how to configure and use rules to preselect job boards based on your job requisition fields.

### Prerequisites

- You have the Odata API Job Requisition Export permission
- You have permission to manage Recruiting Posting
- The job boards are already assigned and available in My Job Boards
- The job board to which the rule applies is assigned and correctly configured with a valid posting profile.

### Context

Job Board Preselection rules help you save time when posting jobs. You can configure and use them to preselect job boards based on your job requisition fields and a selected posting profile.

You can create 2 types of rules:

- A rule that preselects the job board for all your job requisitions.
- A rule that preselects the job board for specific job requisitions based on the content of your job requisitions.

The fields of your job requisitions that you can use to create specific rules are:

- Text fields
- Number fields
- Select fields

### Procedure

1. Create a general rule
  - a. Choose [Manage Recruiting Posting](#) > [Job Posting Rules](#) > [Job board Preselection Rules](#)
  - b. View your rules listed in a table form with the job board(s) for which each rule applies. A summary of the rule is included.
  - c. Click on [Create Rule](#) at the top right of the table to assign a name to a new rule. You can then create a rule that preselects one or more job boards for all your job requisitions. Select [Preselect for all](#) and choose [Next](#).
  - d. Choose which job boards you want to preselect for all your job requisitions. Save your selection with [Save](#).
2. Create a specific rule
  - a. Choose [Manage Recruiting Posting](#) > [Job Posting Rules](#) > [Job board Preselection Rules](#)
  - b. View your rules listed in a table form with the job board(s) for which each rule applies. A summary of the rule is included.
  - c. Click on [Create Rule](#) at the top right of the table to assign a name to a new rule. You can then create a rule that preselects one or more job boards for all your job requisitions. Select [Use specific](#) and choose [Next](#).

- d. Select criteria for your rules.
- For each criteria, select a job requisition field, the operation (“is” / “is not”), and the value of the field.
  - Click on **+** to add criteria and operation at the same level
  - Click on **Add Group** to add a group of criterion at a lower level
  - Use “And” and “Or” to the left of the page define the articulation of the rule.
  - Use string mode preview to read the rule that you have created.
- e. Choose which job boards you want to preselect for all your job requisitions. Save your selection with **Save**.

**Task overview:** [Posting Rules \[page 745\]](#)

### 19.15.1.4.9 Jobs Statuses of the Posted Jobs

View the different statuses of the jobs that you post on the job boards on the job postings table.

After you post a job on the job boards, the job postings table displays the job status that you posted to a job board. You can make appropriate corrections using the **Remove Error** **Remove error and send jobs** option and resend the jobs to the job boards.

The statuses and the self-service removal of errors eliminate your dependency on the SAP SuccessFactors Cloud Support team to identify the reasons for the error. Additionally, the statuses provide detailed status information about the posted job and gives control to remove the error from the UI.

#### Job Statuses

| Job Status        | Description                                                                                                                                                                        |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Active            | The job posting is published on the job board, and the publication URL is available.                                                                                               |
| Credentials error | The job board sends the feedback that your credentials are no longer valid. Provide valid credentials before removing the error.                                                   |
| Credits error     | The job board sends the feedback that you've consumed all your job board credits. Contact your job board to subscribe to a new contract, or purchase additional job board credits. |
| Expired           | The job is deleted or removed from the job board.                                                                                                                                  |
| Error             | The job posting was sent to the job board, but the system returned an error. For more information about the error, contact the job board.                                          |

| Job Status      | Description                                                                                                                                                                                                                                                                               |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Invalid Fields  | <p>The job board's system returns error messages because the job posting has one or more incorrect field values.</p> <div> <p><b>Note</b></p> <p>The job board sends the messages that you see on the UI. To further understand these details, contact the job board directly.</p> </div> |
| Processing      | In the next publishing run, the job posting will be processed and sent to the job board.                                                                                                                                                                                                  |
| Sent            | The job posting is sent to the job board, and the publication URL isn't available because the Job board's technical limitations.                                                                                                                                                          |
| Technical error | The job board sends an unknown error message. The product and engineering team will work with the job board to resolve the issue.                                                                                                                                                         |

## 19.15.1.4.10 Automated Posting of Jobs on Job Boards (MVP)

Jobs posted to the external career site no longer need to be manually published to the job boards.

In Recruiting, you can automate posting of jobs across job boards through Recruiting Posting. Once posted on the external career site, the jobs are automatically posted to job boards based on the job board preselection, posting profile preselection, and field completion rules already set up in [Job Posting Rules](#).

Recruiting leverages the [Intelligent Services Center](#) (ISC) framework to trigger the automated posting of jobs. Using ISC, you can publish events from any SAP SuccessFactors application, and subscribe to these events. An event is a change that occurs in the SAP SuccessFactors HCM suite, such as posting the jobs on an external career site. Subscriber is aware of the change that happens within another application and automatically responds with a configured activity.

### Here's How the Automated Posting Works

When a job requisition is posted to an external career site, an event is published in SAP SuccessFactors. A subscriber available in Recruiting receives the event email notifications and acts on it based on the activity that you've configured for the event in Intelligent Services Center. The activities are referred to as flows in Intelligent Services Center. Configure a flow to set your business rules and time when to automatically post jobs on job boards. Note that if the start date is set to future-dated posting in Recruiting, then trigger automatically posts the job based on the delay set in days or weeks from the future date.

#### **Note**

The Automated Posting of jobs is released as a Minimum Viable Product (MVP). That is, it presents a certain number of limitations.

Consider the following MVP limitations:

- Automated posting works only on the first external posting of the job requisition. If the job is removed from the career site and posted again on the career site, then the job isn't automatically posted.

- Automated job posting isn't automatically reposted on job boards even though the job requisition is still open. For example, if a job requisition is open for 60 days and the duration of the posting on a job board is 30 days, then Recruiter have to manually repost the job on the job board. Use the Repost option in the [Job Posting Status](#) table of the job requisition to repost the jobs to job boards.

#### ⓘ Note

If the start date of the job posting on the external career site is changed, automated posting considers this change. Other modifications on the job requisition, such as a change in the description isn't considered.

## 19.15.1.4.10.1 Setting Up Automated Posting of Jobs on Job Boards

Trigger the automated posting of jobs on job boards from Recruiting Posting.

### Prerequisites

- Post job requisitions on the external career site.
- Set up posting profile preselection rules to preselect a posting profile.
- Set up the job boards preselection rules to preselect at least one job board.
- Complete the field completion rules to prepopulate all the required posting fields
- Enable Intelligent Services Center framework.

### Procedure

1. In the [Admin Center](#), search [Intelligent Services Center](#) to view the list of available events.
2. Select [Initiate Job Posting Event](#). This event stores all the events that are raised for any change in job activities. Note that posting changes that happen in an internal career site or Agencies aren't stored in the [Initiate Job Posting Event](#).
3. In the [Recruiting: Initiate Job Posting](#) page, select the [+New](#) option to create a new flow. You can use the default flow named [Flow1](#). Here, you define business rules for job requisition entity from the Recruiting side.
4. To define a rule on a job requisition entity from requisition, select job requisition in the If condition. Note that all the job requisition templates are supported to let you configure business rules on any field in the job requisition.
5. Select the predefined [Automated Job Posting Subscriber](#) in the [Activities](#) section to add the activity. The activities act on the event that is raised from the external career site when a job is posted there.
6. Select the [Timing](#) options to set the time when to trigger the auto posting events:

| Option                            | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>On Effective Date</b>          | The date when a user who has posting permission posts jobs to the external career site from Recruiting or the date user selects as posting start date. By default, the auto posting time is set to <a href="#">On Effective Date</a> .                                                                                                                                                          |
| <b>After</b>                      | Set up delay in days or weeks in triggering the automated posting of jobs. For example, if the effective date of posting is on 10 January. You can set the trigger to auto post the jobs after 5 days or after one week. If the start date is set to future-dated posting in Recruiting, then trigger automatically posts the job based on the delay set in days or weeks from the future date. |
| <b>When an event is published</b> | Auto post jobs as soon as an event is raised.                                                                                                                                                                                                                                                                                                                                                   |

#### Note

The [Before](#) option isn't supported for automated posting of jobs. Intelligent Services Center provides this option along with the other options and you can't disable it.

- To add a rule at the activity level, select next to the [Timing](#) field to view the [Configuration Options](#) icon, and select the [add rule](#) option. Note that you can set a rule for an activity only once.
- Choose [+Copy of existing rule](#) from the [Configuration Options](#) to copy an existing rule to the activity. An activity is added to configure the auto posting. You can configure multiple activities in a flow based on the business requirements. The jobs are auto posted on job boards from Recruiting Posting.

The change history of the job requisition now audits the change as [Posting Failed](#) or [Posted Automatically](#) for the auto posting task. The source value is displayed as an [event](#) that indicates the automated posting is triggered through the event mechanism.

#### Note

When the job is automatically posted, the self-service reports display "Autoposted" as the user's first name and last name for the automatically posted jobs. First name and last name of the user who has posted the job, for the jobs posted manually.

## 19.15.1.4.10.2 Monitor Automated Posting of Jobs

Monitor the status of automated job posting events that are raised for any change in job activities.

### Context

Monitor the status of the job posting automation to ensure that the automated posting of jobs on job boards has been completed successfully.

## Procedure

1. Navigate to [Admin center](#). Search [Intelligent Services Center](#) and click [Initiate Job Posting Event](#).
2. Select [Event Monitoring](#) to view the events and their status as a complete success, partial success, or failure. An email notification is sent to the user who posts the job to the external career site. If the [Single Recipient Email](#) setting is configured in ► [Provisioning](#) ► [Mail Preference](#) ], the email notification is sent to the configured mail address. The following table lists the different status and the possible reasons:

| Status          | Reason                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Success         | The automated job posting has succeeded for a job requisition on job boards.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Partial Success | <p>The automated job posting has succeeded for a job requisition on some job boards. The automated job posting has failed for the job on a few job boards due to one of the following possible reasons:</p> <ul style="list-style-type: none"><li>• The job board has an invalid configuration.</li><li>• There were no credits left for the job board.</li><li>• There were no slots available for the job board.</li><li>• The job board is unavailable due to maintenance.</li><li>• The job requisition language doesn't match the job board language.</li><li>• The field &lt;field_name&gt; isn't prepopulated according to the defined field constraints.</li></ul>                                                                                                                                                                              |
| Failure         | <p>The automated job posting has failed for the job requisition due to the following reasons:</p> <ul style="list-style-type: none"><li>• Unable to assign your job to a posting profile: couldn't find the posting profile preselection rule matching your job requisition.</li><li>• Unable to select a valid job board for a job posting: couldn't find job board preselection rule matching your job requisition.</li><li>• The job boards have invalid configurations.</li><li>• There were no credits left for the job boards.</li><li>• There were no slots available for the job boards.</li><li>• The job board is unavailable due to maintenance.</li><li>• The job requisition language doesn't match the job board language.</li><li>• The field &lt;field_name&gt; isn't prepopulated according to the defined field constraints</li></ul> |

3. To view the flow of the events that are triggered for an event, navigate to [Admin Center, Executive Manager](#). In the [Executive Manager](#) dashboard, click [Middleware Integrations](#).
4. Click an event to see all the activities that are triggered for an event. The event status is displayed "Triggered" when the event can contact Recruiting Posting. Based on whether the job was posted or not on job boards form Recruiting posting, the status is audited as "success" or "failure". A scheduled email notification report is sent upon the failure of the automated posting of jobs.

#### 📌 Note

If the automated job posting fails, the user who posted the job on the external career site receives an email explaining the reason why it failed.

## 19.15.2 Job Delivery and Feed Management with Command Center

Job distribution should be wide enough to attract enough qualified candidates, and is vital to ensuring proper candidate workflow and source analytics.

SAP SuccessFactors Recruiting offers different solutions for how organizations can deliver jobs to job boards:

| Job Delivery Method | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| XML Feeds           | <p>Enabled after moving the Career Site Builder site to Production, when active jobs are posted, XML feeds are managed through the Feed Management section of Recruiting Command Center. Feeds are automated to push job content to job boards and aggregators, and are primarily designed to allow recruiters to post many jobs to a job board in a scheduled and automated process.</p> <p>XML feeds consist of standard feeds, which are available to all organizations, as well as custom feeds, which designed to meet specific, niche needs.</p> |
| Recruiting Posting  | <p>Configured through SAP SuccessFactors Recruiting, Recruiting Posting enables recruiters to pick specific jobs and distribute postings about a job to multiple job boards or school job boards, in multiple languages, from a job requisition.</p>                                                                                                                                                                                                                                                                                                   |

A solution isn't just to choose one or the other, since the goal is to make sure organizations can utilize tracking and analytics in a comprehensive way, so that they can make informed decisions about job placements.

An implementation partner is responsible for conducting a job delivery intake meeting and developing the organization's job distribution strategy, but Professional Services can assist or perform any of the tasks.

For instructions on configuring and managing Recruiting Posting, refer to *Recruiting Posting*.

The topics in this section describe creating and running an XML feed using Command Center.

#### → Recommendation

Implementation partners should consider engaging Professional Services for support in determining the optimal distribution strategy for an organization. Professional Services work with the organization on advanced job distribution and source tracking enablement, as well as consult on Recruiting Advanced Analytics reporting needs.

[Adding a New Feed \[page 754\]](#)

[Running a Feed in Command Center \[page 756\]](#)

### 19.15.2.1 Adding a New Feed

The Feed List page allows you to create a new custom feed.

## Prerequisites

The rules you add for your feed are written using the same search syntax used to create category rules. Make sure you have a solid understanding of how to use the syntax.

Feeds require Career Site Builder; you can't add a new feed until the organization has a Career Site Builder implementation.

## Context

### Note

As a customer, you don't have access to Command Center. To complete tasks in Command Center, contact your implementation partner or your Account Executive. For any non-implementation tasks, contact Technical Support.

After you add a new feed, configure it in its Feed Details page. Refer to *Command Center Feed Details Page* for information on all the sections and fields you can configure for your feed.

## Procedure

1. Log in to the Command Center and go to ► [Feed Management](#) ► [Feeds](#) ► [Feed List](#) ►.
2. Select + [Add](#) from the far right of the search filters row.

An empty Feed Details page appears.

3. Complete the following required fields:

| Option | Description |
|--------|-------------|
|--------|-------------|

|                        |                                                                                                                                       |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Name</a>   | Enter a unique name for the feed. After you save this feed, <a href="#">Feed Title</a> changes to this name.                          |
| <a href="#">Source</a> | Select a source from the dropdown list to specify the source of the feed. The options are the sources listed in the Source List page. |
| <a href="#">Site</a>   | The dropdown list of all the sites that you have permission to access.                                                                |

By filling the required fields, the system now allows you to save the feed as is. If you choose this option, just return later to complete the rest of the settings.

4. Complete the rest of the basic fields:

| Option                        | Description                                                                                                     |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <a href="#">Activate Feed</a> | This field is read-only unless the source you select is active.                                                 |
| <a href="#">Internal Feed</a> | This field is only visible if an internal career site (powered by Career Site Builder) is enabled for the site. |

5. **Tokens** – If the source you select has been configured to include header or feed tokens, they appear in the TOKENS section of the Feed Details page.

The names of the header and feed tokens appear as field names in this section. Similar to the override text options in Career Site Builder, these blank fields allow you to replace the token names with custom text you provide. You can't, however, change what tokens are associated with a source.

6. **Rules** – Add a rule using search syntax to associate with this feed in the [RULES](#) section.

This window also displays the feeds rules list, which shows all configured rules for the feed. Individual rules can be active or inactive. The order of the rules indicates the order the rules run, and is adjusted using the ^ (up) and v (down) arrows next to the  (delete) icon. Rules are limited to 4,000 characters. The rule field expands to show larger rules. It's better to have a longer rule, rather than multiple rules.

Select [Validate Rule](#) to check the syntax.

Syntax for creating exclusion rules can be difficult. Exclusion rules can be entered as NOT {field\_name}:{ "string to exclude" }. For example: NOT title:"RN" AND NOT title:"LPN" AND title:"Nurse".

The NOT (upper-case required) only applies to the field immediately following. Don't attempt to apply NOT to grouped clauses. For example: title:"Nurse" AND NOT (title:"RN" AND title:"LPN").

When you debug your rules, the debug display page shows the modified query. The page also shows how the NOT clauses have been parsed and how siteid has been added.

7. **FTP settings** – Configure the FTP settings for the feed in the [FTP SETTINGS](#) section, including the schedule.

Feeds can be automatically distributed to job boards through FTP on a scheduled basis.

8. **Optional:** To cancel out of the Feed Details page without saving anything, select [Return to Feed List](#).
9. When you've confirmed that your settings are valid, select [Save](#) to save the feed.
10. **Optional:** To undo all the new changes you made since the last save and return to the previously saved settings, select [Reset](#).

## Results

You've created a new custom feed.

## Next Steps

You can now use [Run Feed](#) to perform various options, including performing a manual upload, debugging the feed, and so on.

## 19.15.2.2 Running a Feed in Command Center

You can run a feed from anywhere within the Feed Management section of Command Center.

## Prerequisites

You've set up and added your feed.

## Context

[Run Feed](#) is available from the Feed List and Feed Details pages in Command Center.

## Procedure

1. Choose **»»** [Run Feed](#).  
The Run Feed dialog appears.
2. If the feed you selected includes all sites, the Run Feed dialog includes [Select a site](#). Select a site from the dropdown list.
3. Choose one of the following options, then select [OK](#):

| Option               | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Debug Feed</b>    | Runs one job per rule. Use <a href="#">Debug Feed</a> to check and test whether all the settings in the feed are OK, so that it works as expected. When you debug a feed, a new browser window opens with the output for you to view, and the result returns one job as a result of the feed rule.                                                                                                                                |
| <b>Debug Rules</b>   | Debugs the query syntax on your rules. Allows you to verify that your feed rule is identifying the jobs you expect the rule to return or revise it if it's not set up correctly. This option checks one rule at a time, allowing you to refine each rule individually. When you select <a href="#">Debug Rules</a> , a new browser window opens with the output for you to view.                                                  |
| <b>Run Full Feed</b> | Runs your full feed. When you select <a href="#">Run Full Feed</a> , a new browser window opens with the output for you to view.                                                                                                                                                                                                                                                                                                  |
| <b>FTP Full Feed</b> | To perform a manual upload, select <a href="#">Run Feed</a> > <a href="#">FTP Full Feed</a> . This option generates the feed XML file, and uploads it to the FTP site. A new browser tab opens and shows the name of the generated feed file, and lists the contents of the FTP directory. You can then confirm that the file upload was successful. The FTP Full Feed option only appears if FTP active is enabled for the feed. |

## 19.15.2.2.1 Run Feed Output Examples

These are output samples of what you see when you use the Run Feed option in Command Center.

[Run Feed](#) in the Feed Management section lets you choose the following:

- Debug Feed – runs one job per rule, so you can make sure you've set up your feed settings correctly.
- Debug Rules – debugs the query syntax on your rules.
- Run Full Feed – runs your full feed.
- FTP Full Feed – lets you perform a manual upload.

The following examples show what the output for the first three options look like.

### Debug Feed Sample

#### Sample Code

```
<jobs>
<job>
<title>QA % / \ ? < > ; | [ ] * : Tester636040034044825654</title>
<company>My Sample Company</company>
<city>{job.city}</city>
<state>{job.state}</state>
<country>{job.country}</country>
<postalcode>{job.zip}</postalcode>
<location>{job.location}</location>
<alt30date>{job.alt30date}</alt30date>
<department>{job.department}</department>

</jobs>
```

## 19.16 Recruiting Agencies

The Agency solution acts as an intermediary between the recruiters of a company that's looking to hire someone and a job seeker who is looking for employment.

Enabling the agency feature provides a separate portal for External Recruiting Agencies. This feature allows external agencies and recruiters to create and view their candidates, see job requisitions open for an agency access and forward candidates to those job requisitions.

### → Remember

- There is one agency portal URL for each data center. This agency portal is shared across customers and cannot be branded for a specific customer. Examples:
  - `https://<hostname>login`
  - `https://<hostname>forgotPassword`
  - `https://<hostname>resetPassword`
- Agency users can only view jobs that have been posted to their agency.

The workflow for implementing and setting up Agency is as follows:

### 19.16.1 Setting Up Recruiting Agencies

There are a number of steps to perform before you can post a job to an agency.

1. [Configuring Job Requisition XML for Agency Posting \[page 760\]](#)  
Add the *agencyPosting* field to the Job Requisition XML is required so that admins can set up and manage recruiting agencies and users.
2. [Enabling Recruiting Agency Access from Admin Center \[page 762\]](#)  
Enable the Agency option in *Admin Center* for Agency Users to log in to the Agency portal.
3. [Enabling Recruiting Agency Access in Provisioning \[page 763\]](#)  
Enable the agency option in Provisioning for users to log in to the Agency portal.
4. [Permission to Manage Agencies \[page 764\]](#)  
Learn about the role-based permission that enables access to the *Set Up Agency Access* page.
5. [Setting Up Multi-Factor Authentication \(MFA\) using Identity Authentication Service \(IAS\) for Agency Users \[page 765\]](#)  
Setting up Multi-Factor Authentication (MFA) using Identity Authentication Service (IAS) for agency users requires an application to be configured in the IAS console along with its necessary configurations. These procedures are required to be completed before you enable *Identity Authentication Service (IAS) for Agency Users* from ► *Admin Center* ► *Manage Recruiting Settings* ► *Agency Portal* ►.
6. [Enabling Multi-Factor Authentication for Agency Users \[page 766\]](#)  
Learn how to enable Multi-Factor Authentication using Identity Authentication Services (IAS) for agency users to strengthen your security framework. This adds an extra layer of protection when they access the agency portal, going beyond just username and passwords.

## 19.16.1.1 Configuring Job Requisition XML for Agency Posting

Add the *agencyPosting* field to the Job Requisition XML is required so that admins can set up and manage recruiting agencies and users.

### Prerequisites

You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

Before modifying an XML template, ensure that you export the current XML version first. Always export two copies of the XML file. Mark one copy as original and archive it. Then work with the second copy.

This process of exporting two copies and archiving is especially important when more than one person is working with the file.

## Procedure

1. Go to ► [Provisioning](#) ► [Managing Recruiting](#) ► [Import/Update/Export Job Requisition Template](#) ►.
2. Click [Export](#) for a Job Requisition type that you want to modify.
3. Make two copies of the XML code and save them. For example, you can name them as **Archived Copy** and **Working Copy** and use Working Copy to make the changes.
4. Add the following field to the Job Requisition XML.

### Sample Code

```
<field-definition id="agencyPosting" type="bool" required="false"
custom="false">
  <field-label mime-type="text-plain"><![CDATA[Agency Posting]]>
  </field-label>
</field-definition>
```

5. Add the **agencyPosting** reference to all roles you want to have permission to post to the agency site.

### Note

You cannot define this permission as `field-permission type="read"`. Grant write permissions for this field.

### Sample Code

```
<field-permission type="write"><description>
  <![CDATA[For recruiter, sourcer and sourcer can write these fields in
approved reqs]]>
</description> <field refid="intranetPosting"/>
  <field refid="corporatePosting"/>
  <field refid="agencyPosting"/>
</field-permission>
```

## Next Steps

Upload the modified XML in ► [Provisioning](#) ► [Manage Recruiting](#) ► [Import/Update/Export Job Requisition Template](#) ►.

**Task overview:** [Setting Up Recruiting Agencies \[page 759\]](#)

**Next task:** [Enabling Recruiting Agency Access from Admin Center \[page 762\]](#)

## 19.16.1.2 Enabling Recruiting Agency Access from Admin Center

Enable the Agency option in [Admin Center](#) for Agency Users to log in to the Agency portal.

### Context

To enable the new Agency interface, and to provide access to the Agency Users, configure the Agency settings in [Admin Center](#).

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Settings](#) ►.
2. Enable [Recruiting Agency Access](#) to set up and manage Agency access.
3. Enable [Configure label for candidate status displayed to agency users](#) to display candidate status to the Agency users.
4. Enable [Posting to Specific Agencies \(Warning: Once you enable this feature, you cannot disable it\)](#) to post jobs to any of the configured agencies separately.

If not enabled, jobs are posted to all the configured agencies.

#### Note

You can't disable [Enable Posting to specific agencies](#) options once it's enabled. We recommend that you consult the customer and take a formal sign-off before enabling.

**Task overview:** [Setting Up Recruiting Agencies \[page 759\]](#)

**Previous task:** [Configuring Job Requisition XML for Agency Posting \[page 760\]](#)

**Next task:** [Enabling Recruiting Agency Access in Provisioning \[page 763\]](#)

## 19.16.1.3 Enabling Recruiting Agency Access in Provisioning

Enable the agency option in Provisioning for users to log in to the Agency portal.

### Prerequisites

You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Procedure

1. Go to ► *Provisioning* ► *Company Settings* ► and select *Enable Recruitment Agency Access*.
2. For *Agency advanced ownership setting*, you can select either of the options.
  - *Ownership for requisition*: If ownership is set at the requisition level, the same candidate can be submitted to unique requisitions by unique agencies.
  - *Ownership for duration*: If ownership is defined as duration, the user can define a time period (for example, 30 days). Only the agency that owns a candidate can submit that candidate to requisitions for that time period.

#### 📘 Note

You can change the value in *Provisioning* after it has been selected. The new rules carry from that point forward.

If you try to submit an existing candidate to a requisition, then the candidate dropdown shows all candidates added to the requisition by the agency in the last 24 hours. The candidates are shown only if you have done the following:

- The *Agency advanced ownership setting* option isn't selected and there's no ownership.
- The *Ownership for requisition* option is selected.

3. The *Enable Posting to specific agencies* setting in *Provisioning* is optional. If this option is enabled, a user can choose to post to any of the configured agencies, separately. If not enabled, jobs are posted to all configured agencies.

#### 📘 Note

It is not possible to disable *Enable Posting to specific agencies* options once it's enabled. We recommend that you consult the customer and take a formal sign-off before enabling.

Users can view all configured agencies when posting jobs. You can't restrict viewing of agencies using permissions. The available agencies all display, and can't be filtered, ordered, or sorted. You can only post

to all users within an agency, not only one user within an agency. You can't have different start dates and end dates for a job for different agency users.

**Task overview:** [Setting Up Recruiting Agencies \[page 759\]](#)

**Previous task:** [Enabling Recruiting Agency Access from Admin Center \[page 762\]](#)

**Next task:** [Permission to Manage Agencies \[page 764\]](#)

## 19.16.1.4 Permission to Manage Agencies

Learn about the role-based permission that enables access to the [Set Up Agency Access](#) page.

### Prerequisites

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

Administrators can use the [Set Up Agency Access](#) page to set up new agencies and grant permission to roles. Agency users can then log in using the Agency portal.

After you've enabled the Agency Access feature, in either Admin Center or Provisioning, give administrators the following permission:

- [User Permissions](#) > [Manage Recruiting](#) > [Set Up Agency Access](#) >

**Task overview:** [Setting Up Recruiting Agencies \[page 759\]](#)

**Previous task:** [Enabling Recruiting Agency Access in Provisioning \[page 763\]](#)

**Next:** [Setting Up Multi-Factor Authentication \(MFA\) using Identity Authentication Service \(IAS\) for Agency Users \[page 765\]](#)

## Related Information

[Using Role-Based Permissions](#)

### 19.16.1.5 Setting Up Multi-Factor Authentication (MFA) using Identity Authentication Service (IAS) for Agency Users

Setting up Multi-Factor Authentication (MFA) using Identity Authentication Service (IAS) for agency users requires an application to be configured in the IAS console along with its necessary configurations. These procedures are required to be completed before you enable [Identity Authentication Service \(IAS\) for Agency Users](#) from ► [Admin Center](#) ► [Manage Recruiting Settings](#) ► [Agency Portal](#) ►.

#### Manual IAS Setup for Controlled-Access Customers

1. Upgrade SAP SuccessFactors Instance: Ensure your SAP SuccessFactors instance is upgraded to include Identity Authentication Service.
2. Create an Application for the Agency: Submit a request to the Technical Support team to create an application for the agency in the IAS Console.
3. Configure the Application: Set up the application based on your organization's specific business requirements. This involves:
  - Enabling and Setting Up Multi-Factor Authentication (MFA): Enhance the authentication mechanism by enabling and configuring MFA. Once set up, the [Agency Access](#) login screen will integrate multi-factor authentication. This configuration applies to all agencies. For detailed guidance, refer to the *Multi-Factor Authentication* section in the **Related Information**.
  - Configuring Password Policy and Email Templates: Customize the Password Policy and Email Templates (such as welcome emails, password reset emails, etc.) based on your needs in the IAS console. Note that these configurations can only be made in the IAS console, not in the [Manage External Password Policy](#) page in [Admin Center](#). For details, refer **Configuring Password Policies** and **Configuring Email Templates** in the **Related Information** section.
4. Set Up Identity Provisioning Service (IPS) Job: If an IPS job is not already configured in your environment, you must set one up to enable secure and automated user data synchronization between your SAP SuccessFactors tenant and IAS. This setup includes:
  - Generate Certificate in IAS: Create a certificate within the IAS system for secure communications and authentication.
  - Register Certificate in your tenant.: Apply the generated certificate in your tenant to establish a trusted link between both systems.
  - Define Data Flow Mapping: Establish the mappings for user data to ensure correct synchronizing of user information between your tenant and IAS.
  - Schedule IPS Job Frequency: Set the frequency for the syncing process (e.g., every 30 minutes) to ensure timely user data updates from your tenant to IAS by navigating to ► [Identity Provisioning](#) ► [Source system](#) ► [Select agency source system](#) ► [Jobs](#) ► [Schedule](#) ► [Turn on scheduler](#) ► [Set scheduler time](#) ►.

## For Existing Customers:

For existing customers, the above procedures are executed automatically and their SAP SuccessFactors instance will be provisioned in IAS. You will need to set up MFA from the IAS console. For details, refer to *Multi-Factor Authentication* in **Related Information**. The default settings for Password Policy and Email Templates will be applied, but you have the option to modify these configurations based on your requirements. You must set the frequency for the syncing process (e.g., every 30 minutes) to ensure timely user data updates from your tenant to IAS by navigating to [Identity Provisioning](#) > [Source system](#) > [Select agency source system](#) > [Jobs](#) > [Schedule](#) > [Turn on scheduler](#) > [Set scheduler time](#).

**Parent topic:** [Setting Up Recruiting Agencies](#) [page 759]

**Previous task:** [Permission to Manage Agencies](#) [page 764]

**Next task:** [Enabling Multi-Factor Authentication for Agency Users](#) [page 766]

## Related Information

[Step-by-Step Upgrade of SAP SuccessFactors to Identity Authentication \(Video\)](#)

[Create a New Application](#)

[Configuring Application](#)

[Multi-Factor Authentication](#)

[Configuring Password Policies](#)

[Configuring Email Templates](#)

[Configuring Provisioning Systems](#)

## 19.16.1.6 Enabling Multi-Factor Authentication for Agency Users

Learn how to enable Multi-Factor Authentication using Identity Authentication Services (IAS) for agency users to strengthen your security framework. This adds an extra layer of protection when they access the agency portal, going beyond just username and passwords.

## Prerequisites

- Enable [Recruiting Agency Access](#) from [Admin Center](#) > [Manage Recruiting Settings](#).
- Ensure that your SAP SuccessFactors instance has been provisioned in IAS.

- Please confirm with your SCl Admin that the agency application has been provisioned in IAS. If you don't find an application configured in IAS, submit a request to the Technical Support team to create an application for the agency in the IAS Console.
- Ensure that other required configurations such as Multi-factor Authentication (MFA), Password Policy and Email Templates are set up based on your requirements. For details, refer to **Related Information**.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiter Settings](#) ► [Agency Portal](#) ►.
2. Under [Identity Authentication Service \(IAS\) for Agency Users](#), choose *Enable*.

## Results

- With IAS enabled, MFA is now active for your agency. The [Agency Access](#) login screen will automatically change to include multi-factor authentication. Existing users will receive an email prompting them to set a new password in order to access the system.
- To set up agency access and add a new agency user, refer to **Setting Up Agency Access** in the **Related Information** section.

### Note

Agency users are synced to IAS based on the Identity Provisioning job schedule.

When IAS is enabled for agency users:

- The [Manage External Password Policy](#) page in the legacy system is no longer applicable for managing password policies.
  - Password policies and email templates must now be managed exclusively through the IAS console.
  - This change is part of the prerequisite configuration steps when setting up IAS for external users.
- When IAS is disabled:
    - The user flow follows a two-step process. In the first step, users are required to enter their company ID. In the second step, the user is redirected to the standard legacy login screen where they need to provide their agency and login details. This is typical where IAS is not part of the authentication flow, leveraging the built-in legacy credentials.
    - After successful login, the user accesses the agency portal, allowing them to perform tasks associated with their role.

**Task overview:** [Setting Up Recruiting Agencies \[page 759\]](#)

## 19.16.2 Setting Up Agency Access

Set up multiple agencies so that the Agency User can log in and manage candidates and job postings. Note that each agency can contain multiple users.

### Prerequisites

Enable the [Recruiting Agency Access](#) option on the [Manage Recruiting Settings](#) page.

### Context

You can switch between various agencies to manage and modify them by clicking the [Agency ID](#) dropdown. The agencies appear alphabetically within the dropdown list.

To add a new agency, perform the following steps:

### Procedure

1. Go to [Admin Center](#), in the tools search field enter [Set Up Agency Access](#).
2. Click the [Add new agency](#) link to edit the settings for the already existing recruiting agency or create agency.

The following table describes the agency access settings you can configure for an existing agency or a new agency:

| Field                                        | Function                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Agency ID                                    | Enter the Unique ID for the Agency; the Agency Users can use the Agency ID as part of their logon credentials. You can't change the Agent ID once it's created. You can't include spaces or special characters. You can only use the alphabets, digits, and underscore to create Agency ID.                                                                                                                                                        |
| Agency name                                  | Enter the Agency Name. This name appears in several places in the user interface. You can create Agency name with a space. Avoid special characters in the Agency Name.                                                                                                                                                                                                                                                                            |
| Agency Country/Region                        | <p>(Optional) Select the country/region from the dropdown list that lets you select the agency relevant to the recruiter's country.</p> <p>The valid values for this field come from the MDF Country Picklist. You can select multiple countries/regions from the list.</p>                                                                                                                                                                        |
| Address and Phone                            | Enter the information of the agency company headquarters or the relevant branch.                                                                                                                                                                                                                                                                                                                                                                   |
| Email Address                                | Enter the contact information of the company.                                                                                                                                                                                                                                                                                                                                                                                                      |
| Access                                       | Select the option to enable the agency in the instance. If the option is unchecked, the agency is disabled in the instance and no Agency Users can log in to Agency.                                                                                                                                                                                                                                                                               |
| Candidate ownership                          | <p>The option is available when <a href="#">Provisioning &gt; Company Settings &gt; Agency advanced ownership setting &gt; Ownership for duration</a> is selected.</p> <p>The agency is listed as owning the candidate in the database for the time specified in this setting. After the period has elapsed, the agency's ownership over the candidate will show as expired.</p>                                                                   |
| Reset ownership clock with newest submission | <p>Appears when <a href="#">Provisioning &gt; Company Settings &gt; Agency advanced ownership setting &gt; Ownership for duration is selected</a>.</p> <p>If disabled, the agency ownership is tracked from the earliest date when the candidate is submitted by the agency into the database.</p> <p>If selected, the agency ownership is tracked from the latest date that the candidate has been submitted by the agency into the database.</p> |

| Field                                    | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <i>Agreement Text</i> | <p>The message that is presented to the agency when they attempt to submit a candidate. The agency must click to indicate their agreement to these terms.</p> <p>Limit: Maximum of 512 characters. Does store the entire agency contract.</p> <p>(Optional) The client can provide a link to a hosted copy of the agency contract.</p> |
| <i>Notes</i>          | Notes that an Admin can access and the Agency User can't view.                                                                                                                                                                                                                                                                         |

3. Select *Save*.

## Results

You've created and configured a new Agency.

## Next Steps

Set up the Agency user to post a job to an agency.

### 19.16.2.1 Agency Access Settings

Configure Agency access settings for an existing agency or a new agency.

The following table describes the agency access settings you can configure for an existing agency or a new agency:

| <i>Field</i>       | <i>Function</i>                                                                                                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Agency ID</i>   | Enter the Unique ID for the Agency; the Agency Users can use the Agency ID as part of their logon credentials. You can't change the Agent ID once it's created. You can't include spaces or special characters. |
| <i>Agency name</i> | Enter the Agency Name. This name appears in several places in the user interface. You can create Agency name with a space. Avoid special characters in the Agency Name.                                         |

| Field                                                        | Function                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (Optional) <a href="#">Agency Country</a>                    | <p>Select the country from the available list that lets you select the agency relevant to the recruiter's country.</p> <p>The valid values for this field come from a job requisition. It's possible to select multiple countries from the list.</p>                                                                                                                                                                                               |
| <a href="#">Address and Phone</a>                            | Enter the information of the agency company headquarters or the relevant branch.                                                                                                                                                                                                                                                                                                                                                                   |
| <a href="#">Email Address</a>                                | Enter the contact information of the company.                                                                                                                                                                                                                                                                                                                                                                                                      |
| <a href="#">Access</a>                                       | <p>Select the option to enable the agency in the instance. If the option is unchecked, the agency is disabled in the instance and no Agency Users can log in to Agency.</p> <div> <p><b>Note</b></p> <p>SAP recommends you to remove job postings for an Agency before you disable the Agency. This avoids inconsistencies between the Job Requisition Summary page and Job posting page with respect to the defined Agency.</p> </div>            |
| <a href="#">Candidate ownership</a>                          | <p>The option is available when <a href="#">Provisioning &gt; Company Settings &gt; Agency advanced ownership setting &gt; Ownership for duration</a> is selected.</p> <p>The agency is listed as owning the candidate in the database for the time specified in this setting. After the period has elapsed, the agency's ownership over the candidate will show as expired.</p>                                                                   |
| <a href="#">Reset ownership clock with newest submission</a> | <p>Appears when <a href="#">Provisioning &gt; Company Settings &gt; Agency advanced ownership setting &gt; Ownership for duration is selected</a>.</p> <p>If disabled, the agency ownership is tracked from the earliest date when the candidate is submitted by the agency into the database.</p> <p>If selected, the agency ownership is tracked from the latest date that the candidate has been submitted by the agency into the database.</p> |

| Field                                    | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Candidate self-ownership</a> | <p>Appears when <a href="#">Provisioning</a> &gt; <a href="#">Company Settings</a> &gt; <a href="#">Agency advanced ownership setting</a> &gt; <a href="#">Ownership for duration</a> is selected.</p> <p>The candidate is listed as owning themselves in the database for time specified in this setting, and the agencies can't submit this candidate. After this period of time has elapsed, the candidate's ownership over the candidate profile will expire and agencies will be able to submit the candidate.</p> |
| <a href="#">Recruiter Details</a>        | Lets the hiring manager or the primary recruiter view the recruiter information.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <a href="#">Users</a>                    | Lists all the Agency Users.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <a href="#">Change Language</a>          | Used to switch between languages so the admin can provide translated contents for text presented to the agencies.                                                                                                                                                                                                                                                                                                                                                                                                       |
| <a href="#">Translations</a>             | Displays the locale already saved for the fields.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <a href="#">Duplication Message</a>      | The message displayed to the agency when they attempt to submit a candidate that is noneligible for submission. Because the candidate is already available on the requisition or in the database, and currently owned.                                                                                                                                                                                                                                                                                                  |
| <a href="#">Agreement Text</a>           | <p>The message that is presented to the agency when they attempt to submit a candidate. The agency must click to indicate their agreement to these terms.</p> <p>Limit: Maximum of 512 characters. Does store the entire agency contract.</p> <p>(Optional) The client can provide hyperlinks to a hosted copy of the agency contract in text format. Hyperlinks aren't supported in the Agreement text.</p>                                                                                                            |
| <a href="#">Notes</a>                    | Notes that an Admin can access and the Agency User can't view.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### Note

SAP SuccessFactors recommends maintaining the number of configured Agencies to less than two hundred for optimum performance and searchability.

## 19.16.3 Setting Up an Agency User

Set new agency users who can log in to the Agency portal to manage candidates and job postings.

### Procedure

1. Go to ► [Admin Center](#) ► [Set Up Agency Access](#) ►.
2. Click [Add new user](#) link next to the [Users](#) field.

The [Add new user](#) dialog is displayed.

3. Provide the required details on the [Add new user](#) pop-up window:

| Field                         | Function                                                                                                                                                             |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Email Address</a> | The e-mail address to which the Agency User receives mail communications. <div><div> ⓘ Note</div><div>E-mail address is part of their logon credentials.</div></div> |
| <a href="#">Name</a>          | The Agency User's name.                                                                                                                                              |
| <a href="#">Active</a>        | Use to log in to the Agency portal.                                                                                                                                  |
| <a href="#">Notes</a>         | The Admin-facing notes about the Agency User. <div><div> ⓘ Note</div><div>The Agency User can't view the notes.</div></div>                                          |

4. Click [Save](#).

### Results

The Agency User is created.

### Next Steps

The Agency User receives an e-mail notification with the [Agency User ID](#), [Company ID](#), and a [URL](#) to reset the password to log on to the Agency portal. The existing Agency ID has been reworked. Previously, the Agency ID was constructed in this format (company ID: Agency ID). The Company ID is before the colon, and the Agency ID is after. For example, if your Agency ID is MyCompanyPRD: TheAgency, the Company ID is MyCompanyPRD, and the Agency ID is TheAgency.

If Identity Authentication Services (IAS) is enabled, admins cannot reset the password for a user in the [Set Up Agency Access](#) page, using the [Take Action](#) dropdown. Password reset should be done by the user using the **Forgot Password** option in the login screen.

The URL, opens the [AGENCY ACCESS](#) password creation page from where the Agency User can reset the password.

#### → Remember

- This agency portal is shared across customers and can't be branded for a specific customer.
- Agency Users can only view jobs that have been posted to their agency.

## 19.16.4 Posting a Job to an Agency

Post an existing job to an agency or create a job and then post this job to an Agency from the SAP SuccessFactors Recruiting.

### Context

The jobs that you post to an Agency appear in the [Job Listings](#) tab on the Agency portal.

#### 📘 Note

If [Enable Posting to specific agencies](#) option is disabled in Provisioning, the main Job Postings table lists an [Agency](#) option. Recruiting Users can post jobs to an Agency the same way they would post jobs to an internal career site. The job is either posted to all agencies or none. Similarly, if the [Enable Posting to specific agencies](#) is enabled the [Agency](#) option is unavailable from the main [Job Postings](#) table and a new Agency Listings table appears. The Recruiting User can click [Add Agencies](#) and select the agencies they want to post the jobs, and can set the start and end dates for the agency postings.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Procedure

1. Go to [Admin Center](#) [Recruiting](#).

By default, the [Job Requisition](#) page is displayed.

2. Hover the cursor over that job that you want to post to an Agency. Select [Job Postings](#) from the pop-up window.
3. Enter the [Posting Start Date](#) for External Posting and click [Post Job](#).

4. Click [Add Agencies](#) under [Agency Listings](#).

The [Add Agency Listings](#) dialog is displayed.

5. Select an agency to post the Job in the [Add Agency Listings](#) window .
6. Enter the date range for this posting and click [Post Jobs](#).
7. Click [Add Comment](#) in the [Agency comments](#) section, and enter your comments for this job requisition.

Agency comments are visible to any agency user who has access to this job requisition, but aren't visible to job candidates. Limit: 1024 characters.

#### Note

If you select [Enable Posting to specific agencies](#) option after jobs have been generically posted to all agencies, all the previous job postings are removed and recruiters have to post jobs specifically for each agency.

## Results

You've successfully posted a job to an Agency.

## 19.16.5 Working with Agency

View candidates, view and submit the job postings, view candidates list, configure display status of candidates, and view recruiter information.

In Agency Portal, you can:

- Select the locale of the page content.

#### Note

The content of the logon, forgot password, and reset password pages is shown based on the browser locale. If browser locale isn't part of the supported application locales, then the default language configured in Provisioning is displayed. After you log in to Agency Portal, the content is displayed based on the default locale set in the [Manage Recruiting Languages](#) page.

- Choose the  icon to enable the [Send me email alerts for new Jobs Posted](#) to receive mail notifications when new jobs are posted to the Agency.
- Configure the [Personal Accessibility Settings](#), and reset your password from the [Options](#) page.
- Choose the  icon to log out from the Agency Access portal.
- The following items in Agency portal are cached:
  - Agency agreement
  - Agency company logo
  - Phone code
  - Agency Locale
  - Country/region list

Any changes done in the Admin settings are delayed in reflecting on Agency pages.

## 19.16.5.1 Logging into the Agency Portal

As a new user, reset your password to log in to the Agency portal for the first time.

### Prerequisites

- Ensure you've enabled [Recruiting Agency Access](#) option from ► [Recruiting](#) ► [Manage Recruiting Settings](#) ► [Agency Portal](#) .
- You've configured password and login policy settings from ► [Admin Center](#) ► [Manage External Password Policy](#) .

### Context

Agency Users with the Agency URL can log in to Agency portal once the account is activated. The password policy that you have set in [Manage External Password Policy](#) page gets displayed on the [AGENCY ACCESS](#) login page.

As of 2H 2025, the login flow for existing users follows a two-step process. In the first step, users are required to enter their company ID. In the second step, the user is redirected to the standard legacy login screen where they need to provide their agency and login details.

If [Identity Authentication Service \(IAS\) for Agency Users](#) option has been enabled from ► [Recruiting](#) ► [Manage Recruiting Settings](#) ► [Agency Portal](#) , then Multi-factor Authentication will be applicable for your login flows via IAS.

- Based on the authentication method selected in the IAS console, the login prompts the respective authentication method like MFA.
- The **Password and Login Policy Settings** page is displayed based on SAP Customer Data Cloud and IAS being enabled, disabled or both.
- Admins cannot reset the password for a user in the **Set Up Agency Access** page, using the **Take Action** dropdown. Password reset is done by the user using the **Forgot Password** option in the login screen.

### Procedure

1. Enter a new password and then confirm the password on the [AGENCY ACCESS](#) login page.
2. Choose [Submit](#).

Ensure that the password you enter adhere to the Password Policy. If you enter a password that doesn't meet password policy requirement, an invalid password error message is displayed.

If your password and confirmation password don't match, then you're prompted to enter the same password in both the [New Password](#) and [Retype New Password](#) fields. After you reset the password, you can now log on with the new password.

3. Enter the [Company ID](#) and choose [Continue](#).

#### Note

When you access the logon page from a saved URL, the link will directly take you to **Step 4** where the Company ID is already considered. However, if you choose [a different company](#) option, you will be redirected to the logon page that prompts you to enter the Company ID of your choice.

4. Enter the [Agency ID](#), [User Email](#), and [Password](#) values on the [AGENCY ACCESS](#) logon page.
5. Click [Login](#).

## Results

You're logged into the [AGENCY ACCESS](#) portal.

#### Note

By default, the [Job Listings](#) tab is selected.

### 19.16.5.2 View Candidates on Agency Portal

View the list of candidates that has been forwarded to a job requisition.

The [Candidates](#) tab on the [Agency Access](#) page displays all the candidates that have been forwarded to a job requisition. On the right, you can see the details of the selected candidate. A grid displays a list of jobs associated to that candidate with [Requisition ID](#), [Job Title](#), and [Status](#).

#### Note

The [Created On](#) information displays the date when Agency User created the first record of a candidate submission for a job. Additionally, a [Forwarded On](#) column has been added to the table, which displays to the Agency User the date when the candidate for the requisition was forwarded.

From the [Candidates](#) page, you can:

- Search for a specific candidate by providing the [Candidate Name](#) in the [Search](#) field. Alternatively, you can use the scroll bar to view all the candidates that are forwarded to a job requisition. Ensure to search for a candidate with either the first name or the last name. Searching with both first name and last name isn't supported.

#### Note

- Enter minimum two characters to search for any text string that matches the candidate name, or the job title.
- When you search for a candidate, the dropdown doesn't populate anonymized candidates.

- Sort the candidates based on the [Candidate Name](#) and candidate [Created On](#) date by clicking the  icon. You can sort the result in [Ascending](#) or [Descending](#) order by selecting the radio button.

#### Note

From the [Agency Access](#) bar on top of the page, you can enable the [Send me email alerts for new Jobs Posted](#) option. Set the locale of the page content.

## 19.16.5.3 View Jobs Listings on Agency Portal

View the list of open job requisitions from [Agency Access](#), and forward candidates to those job requisitions.

The [Job Listings](#) tab on the [Agency Access](#) page displays all the jobs that are posted to an agency on the left pane. The details of the selected job along with the [Requisition ID](#), the [Posting Start Date](#) and, the [Posting End Date](#) of the job are displayed on the right pane.

From the [Job Listings](#) page, you can perform the following:

- Enter the [Job Title](#) in the [Search](#) field and search for a specific job requisition. Alternatively, use the scroll bar to view all the jobs that are posted to the Agency.
- Sort the jobs based on [Job Title](#), [Requisition ID](#), [Posting Start Date](#), and [Posting End Date](#) by clicking the  icon. Select the radio button to view the sort result in Ascending or Descending order.
- Submit a new candidate or an existing candidate to a job posted on this page by clicking the  icon.
- View the comments added by the recruiting user for a job posting by clicking the  icon.

## 19.16.5.4 Submitting a New Candidate to a Job Requisition

Submit a new candidate for the jobs that are listed in the [Job Postings](#) tab.

### Context

Agency Users can submit a candidate to a job requisition posted to Agencies.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Procedure

1. Log on to the Agency portal, and select the [Job Listings](#) tab.

2. Select [Submit New Candidate](#) by clicking the verticle ellipsis icon on the job details pane.

The [Add Candidate](#) dialog opens.

3. Enter the contact information of the candidate on the [Add Candidate](#) dialog.

If [Check country/region code and phone number](#) option is enabled in [Admin Center > Manage Duplicate Candidates](#), and a duplication message is added in the [Duplication Message:](#) field in [Admin Center > Set Up Agency Access](#), a validation message appears if the phone number of the candidate being submitted already exist.

4. Set the candidate profile visibility to the recruiter as per the requirement. Select an option available in [Make Candidate Profile Visible to:](#) Example, if you want the candidate profile to be made visible to the recruiters worldwide, select [Any company recruiter worldwide](#) option.
5. Select [Next](#).
6. Choose [Browse](#) to select the resume and upload it.

#### Note

The dependency on the [Allow agency users to submit updated resume with new job application](#) option in [Admin Center > Set Up Agency Access](#) has been removed.

The [Allow agency users to submit updated resume with new job requisitions \(not applicable for Agency 2.0\)](#) option is removed from Provisioning. You can now upload the latest resume of the candidate while submitting a candidate.

7. Confirm that the candidate is qualified to submit for an open job requisition. Confirm the candidate submission based on the terms of my candidate source agreement with the company.
8. Select [Add Candidate](#).

## Results

The candidate is successfully added to the Job Posting. You can verify by navigating to the [Candidates](#) tab on the [Agency Access](#) page and check the status of the candidate. The status shows that the candidate has been forwarded to a job requisition. Additionally, you can also check whether this candidate has been added under the [Candidates](#) tab on the SAP SuccessFactors Recruiting.

## 19.16.5.5 Submitting an Existing Candidate to a Job Requisition

Submit an existing candidate for the jobs that are listed in the [Job Postings](#) tab.

### Procedure

1. You can follow the steps in *Submitting a New Candidate to a Job Requisition* section, to add a new candidate for a job requisition in Agency. The candidate is available for selection in the [Submit Existing Candidate](#) dropdown for next 24 hours after being added to the Agency.
2. Log in to the Agency portal and open [Job Listings](#). Identify the job listed on the [Job Postings](#) tab to add the candidate.
3. Select [Submit Existing Candidate](#) by clicking the verticle ellipsis icon on the job details pane.

The [Submit Existing Candidate](#) dialog opens.

#### Note

An agency can submit a previously forwarded candidate again, even if the candidate was submitted by another agency. The ownership settings for the agency still apply.

4. Select the candidate name from the dropdown and submit to the job posting.

#### Note

Agency users can't submit anonymized candidates to a job posting.

5. Click [Browse](#) to select the resume and upload it.

#### Note

The dependency on the [Allow agency users to submit updated resume with new job application](#) option in [Admin Center](#) > [Set Up Agency Access](#) has been removed. You can now upload the latest resume of the candidate while submitting a candidate.

6. Click [Submit Existing Candidate](#).

### Results

When you navigate to the [Candidates](#) tab, the status column lists all the jobs that are associated with this candidate.

## 19.16.5.6 Configuring the Display Status of a Candidate

The applicant status of a candidate is displayed to an Agency user, absence of which leads to offline communication among the recruiter, recruiting team and the agency.

### Prerequisites

- Enable *Recruiting Agency Access* option in the ► *Admin Center* ► *Manage Recruiting Settings* ►.
- Go to ► *Admin Center* ► *Manage Recruiting Settings* ► and select the *Configure label for candidate status displayed to agency users* option.

### Context

In a recruiting application workflow, the status of the candidate profile changes. Create a generic description for the candidate to show the internal status to the candidate. The standard candidate statuses are *In progress*, *Forwarded*, *Invite to Apply*.

### Procedure

1. Go to ► *Admin Center* ► *Edit Application Status Configuration* ► and select a status in *Status set ID*.  
The *Applicant Status Configuration* page opens.
2. Select a status and *Edit Status Settings* page opens.
3. Set the value for *Candidate Label* that determines what status appears to candidate viewing the progress in the *Jobs Applied* section of the career site.

### Results

The Agency User can now see the status label that you've added in the *Agency User Status Label* field. Example: if the candidate profile status is In Progress, you can show different labels such as *Interview* to internal users and *In progress* to candidates. Candidates can view the status from their *Job Management page*.

#### ❗ Note

If *Configure label for candidate status displayed to agency users* field is disabled, the Agency User can see only the standard applicant status of the candidate.

## 19.16.5.7 Viewing Recruiter Information on Job Listings Page

You can view the Recruiter information, for example, name, phone number, and e-mail, next to the job [Posting End Date](#) column on the [Job Listings](#) page.

### Procedure

1. Click  icon next to the [Recruiter](#) column for the recruiter information.
2. To view the Recruiter information column, enable [Allow agency users to view recruiter contact details](#) option in [Admin Center](#) > [Set Up Agency Access](#) .

#### Note

If there's a single recruiter, the details are directly fetched and displayed in the **quickcard**. If a Recruiting team is added to the job requisition, the details of the primary recruiter are displayed. Also, when the recruiter details are unavailable, the  icon isn't displayed. If any of the details, for example, e-mail or the phone number is unavailable, then a - is displayed in the respective fields.

## 19.17 Enabling and Configuring Employee Referral

Enable the Employee Referral function and specify the related configuration settings for your company. By doing this, you can configure [Employee Referral Program Settings](#) that are used whenever employees refer candidates.

### Prerequisites

Ensure that you have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Procedure

1. Enable the feature under [Provisioning](#) > [Company Settings](#) > [Enable Employee Referral Program](#) .
2. Add the Employee Referral Payout amount to the Job Requisition XML.
  - Employee Referral Payout is a currency field. If currency is not configured on the job requisition, you must add it.

- If it's declared, then you only have to add the `erpAmount`. Add the necessary permission for this field, and include it in the XML as follows:

#### Sample Code

```
<field-definition id="erpAmount" type="currency" required="false"
custom="false">
<field-label><![CDATA[ERP Amount]]></field-label>
<field-description><![CDATA[Employee Referral Bonus Amount]]></field-
description>
</field-definition>
```

3. Grant *Employee Referral Program Setup* permission to set up the Employee Referral Program.
4. Go to **Admin Center** > *Recruiting Email Triggers* and enable these notifications:
  - *Employee Referral Program Candidate added to General pool notification*
  - *Employee Referral Program Candidate referred to a job requisition (new candidate)*
  - *Employee Referral Program Candidate referred to a job requisition (existing candidate)*
5. Configure Referrer (employee) settings for the Applicant Status Trail. Referrer settings can be applied to all applicant statuses.

| Option                                    | Description                                                                                                                              |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Visible to Referrer (employee)</b>     | Whether the stat is visible to the Referrer.                                                                                             |
| <b>Referrer (employee) Label</b>          | The label the Referrer (employee) sees when their Referral is in the corresponding status.                                               |
| <b>Referrer (employee) Next Step Text</b> | The text the Referrer (employee) sees when their Referral is in the corresponding status.                                                |
| <b>Referrer (employee) Email</b>          | Select an email template that is automatically sent to the Referrer (employee) when their Referral is moved to the corresponding status. |

6. Go to **Admin Center** > *Edit Applicant Status Configuration*.
7. Find the applicant status set for job requisitions. Select **Take Action** > *Edit* and update the *Employee Referral Program Settings*.

The *Applicant Status Configuration* for the selected *Status Set Name* is displayed.

8. Select the *Status Name* (or choose **Take Action** > *Edit*) and update the *Employee Referral Program Settings* in the *Edit Status Settings* dialog.

| Option                         | Description                                                                    |
|--------------------------------|--------------------------------------------------------------------------------|
| <b>Visible to Referrer</b>     | Enabling this setting shows the status to the user who initiated the referral. |
| <b>Referrer Label</b>          | The label the referrer sees for the status.                                    |
| <b>Referrer Next Step Text</b> | The text that displays to the referrer describing next steps.                  |
| <b>Referrer Email</b>          | Select the email template associated with the status from the dropdown menu.   |

9. Choose *Save*, then *I'm Done*.

## Results

Whenever an employee refers a candidate, the configured *Employee Referral Program Settings* are used.

## Related Information

[Setting Up the Employee Referral Program \[page 785\]](#)

[Using Role-Based Permissions](#)

### 19.17.1 Setting Up the Employee Referral Program

Set up the Employee Referral Program so that employees can recommend candidates for available jobs at their company.

## Context

Employees can submit candidates for jobs directly, or by emailing the candidate. The employee can then track the current status of their referrals throughout the hiring process.

#### ⓘ Note

- Any referrer e-mail with the status *Invited to Apply* will not be sent.
- Do not use the *Onboard* status with Employee Referral because it will not work.

## Procedure

1. Go to ► [Admin Center](#) ► [Set Up Employee Referral Program](#) ►.
2. Choose the ownership option you want to use for the program:

| Option                                                        | Description                                                                                                                                                                                        |
|---------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Ownership by Requisition for Employee Referral Program</i> |                                                                                                                                                                                                    |
| <i>Ownership by Duration for Employee Referral Program</i>    | When you choose this option, the <i>Employee shall maintain ownership over a referral for &lt;number&gt; days</i> field becomes active. Limit the duration to no more than 1875 days (five years). |
| In addition, choose which ownership start date to use:        |                                                                                                                                                                                                    |

| Option | Description                                                                                                    |
|--------|----------------------------------------------------------------------------------------------------------------|
|        | <ul style="list-style-type: none"> <li>Initial submission date</li> <li>Most recent submission date</li> </ul> |

- Complete the [Employee Referral Program - Program Information](#) section.

| Option                 | Description                                                                                                                                                        |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Change Language</b> | Choose your desired language from the dropdown list in the field then provide a description in the text field.                                                     |
| <b>Text Field</b>      | Provide a description of the program that appears at the top of the <a href="#">Referral Tracking</a> page.<br>You can use up to 300 characters in the text field. |

- Selection additional settings in the [General Options](#) section:
  - Hide Resume for Employee Referrals
  - Require Resume for Employee Referrals
  - Disable "Other jobs applied section" on referral tracking page
  - Disable the "Add a Referral: button
  - Disable Referral Amount on referral
  - Check for employee referral permissions for adding candidate (pool and job specific)
- Choose [Save](#) to save the settings.

## Related Information

[Enabling and Configuring Employee Referral \[page 783\]](#)

## 19.17.2 Working with Employee Referral

### 19.17.2.1 Employee Referral Candidate Search Page

Employee Referral icons in both Power and Conceptual Candidate Search indicate candidates active in the Employee Referral process.

Active Employee Referral candidates are in a forwarded, invite-to-apply, or in-progress status on a job requisition. If ownership by duration is selected, [Active](#) indicates a currently owned referral.

On Candidate Power Search only, a recruiting user can filter by [Active](#) or [All](#) referrals under the [Employee Referral](#) dropdown.

## 19.17.2.2 Employee Referral Candidate Summary Page

Information on the candidate summary page.

Employee Referral Candidates on the summary list page have an employee referral icon displayed next to them. The Candidate Summary also displays two source columns, [Source](#) and [Candidate Source](#). For all employee referrals, the Source column contains "Forwarded."

### Note

When a candidate is referred to a job requisition, the identity of the referrer appears on the [Candidate Summary](#) page. This helps you to understand who forwarded a candidate to a requisition and enables you to contact the referrer, if necessary. Recruiting User can click an application, and hover over the employee referral icon to display the name of the referrer. The employee referral icon is next to the referral name at the top of the page.

The Post Apply and Pre Apply scenarios are applicable only to candidates who are forwarded or Invited to Apply (employee referrals). The [Source](#) and [Candidate Source](#) values in these scenarios are tracked as follows:

Source and Candidate source in Pre Apply and Post Apply

| Pre Apply |                   | Post Apply           |                   |
|-----------|-------------------|----------------------|-------------------|
| Source    | Candidate Source  | Source               | Candidate Source  |
| Forwarded | Agency 1          | Corporate: Site Name | Agency 1          |
| Forwarded | Agency 2          | Corporate: Site Name | Agency 2          |
| Forwarded | Recruiter Sourced | Corporate: Site Name | Recruiter Sourced |
| Forwarded | Employee Referral | Corporate: Site Name | Employee Referral |
| Forwarded | Recruiter Sourced | Internal Site        | Recruiter Sourced |

In this table, the Pre apply section indicates that the candidate is still waiting to apply for a job requisition, but there was a specific source for them. For example, the [Candidate Source](#) is Employee Referral and the [Source](#) of the candidate is Forwarded in the Pre apply section. After the candidate applies (Post apply), the [Source](#) column displays the Corporate Site Name. This means that the candidate has visited the Corporate site, through which they've applied for the job requisition. When the [Source](#) is Internal site in the Post Apply section, it means that the candidate was an internal.

After a candidate applies and a Recruiter forwards the candidate application to a requisition, the [Source](#) value is tracked as follows:

Track Candidate Source

| Forward Scenario                                                                                                                                                                | Source                  | Candidate Source        |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|-------------------------|
| Candidate applies to a job requisition 1.                                                                                                                                       | Corporate Site: Default | Corporate Site: Default |
| Candidate is forwarded from job requisition 1 to job requisition 2 in forwarded state.                                                                                          | Forwarded               | Recruiter Sourced       |
| Candidate is forwarded from job requisition 1 to job requisition 2 in Default state.<br>Or the candidate is forwarded as applicant from job requisition 1 to job requisition 2. | Corporate Site: Default | Recruiter Sourced       |

### Note

When a candidate application is forwarded from employee referral or Agency, the information is tracked based on the ownership type (Ownership By Duration and Ownership By Requisition)

## 19.17.2.3 Employee Referral Information on the Application

Click on an applicant's name from the candidate page to view their application in more detail.

The bottom of the screen shows the *Jobs Applied* portlet. This includes information about their job application status and further details about the candidate's profile.

Hover over the employee referral icon next to the referral name at the top of the *Job Applicant Profile* page to display the name of the referrer.

In the application, the *Employee Referral Information* portlet shows the referrer and the date of referral for only the specified job.

## 19.17.2.4 Refer Candidates to Jobs from the Job Search Page

To view the Job Search page, select *Careers* from main navigation menu.

To view the tab, choose the *View Jobs* button at the bottom of the page, and then select any job title. Jobs posted internally and externally have an employee referral icon next to the job title.

To make a referral to a job, use the *Select Action* dropdown menu next to the job title.

Another way to refer a friend is to click into the job and click [Refer Friend to Job](#) on the job description page.

Next, the referrer must enter the first name, last name, e-mail, country, and resume of the person referred. Attaching a resume can be made required in the Employee Referral settings in Admin Tools. The number field's required status could also be changed here.

A screenshot of the 'Refer Friend to Job' form. The form has a title bar 'Refer Friend to Job'. Below the title bar, it says 'Please provide the information below:'. There are five required fields: '\* First Name', '\* Last Name', '\* Email', 'Phone', and '\* Country'. The 'Country' field is a dropdown menu currently showing 'No Selection'. Below these fields, there is a section 'Add resume' with the text 'Accepted file types are: DOCX, PDF, HTML, PPT, XLS, CSV and text'. There is a file upload field with a 'Browse...' button. At the bottom of the form, there are two buttons: 'Cancel' and 'Send'.

If a potential candidate's **e-mail does not exist** in the system, an external candidate account is created and they are added to the forwarded status of the job requisition. The employee receives a success message, and this starts the ownership period between the employee and candidate for that particular job requisition. This relationship is permanent for that specific job referral. However, other employees may refer the candidate to other jobs.

The candidate also receives an e-mail informing them that they were referred for that job and who referred them. This e-mail contains a username and URL where the potential candidate can set their password. After setting their password, they will automatically be logged in and land on the job description page to apply to the job.

If a potential candidate's **e-mail already exists** in the system, ownership rules are checked to determine if the referring employee or another employee owns the referral. The employee sees an error message informing them that they cannot add this candidate because the candidacy already exists on this job, or another employee owns this referral.

#### Note

If you use referral by time period in a client instance, and a candidate is forwarded to a job after the period of ownership has expired, then the candidate is not displayed as being referred.

## 19.17.2.5 Employee Referral Tracking

Track referrals in SAP SuccessFactors HCM suite by navigating to ► [Careers](#) ► [Referral Tracking](#) ►.

The following table describes the various parts of [Referral Tracking](#).

| Section                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Your Referrals</a>             | Contains a configurable message added in the Employee Referral settings in <a href="#">Admin Tools</a> . Any URL added automatically opens a new window.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <a href="#">Total Referrals by Percent</a> | Shows how far referrals have progressed in the application process with a bar graph. The percentages are calculated based on the number of applicant statuses visible to employees. Job requisitions may have different status sets, so these percentages track them all uniformly regardless of the number of statuses for each requisition. <div> Note<br/>Applicants are classified into percentages based on the leading number. For instance, all percentage completions beginning with <b>1</b> appear in the 10% section of the bar graph. The percentages displayed on the bar graph aren't configurable and can't be hidden from users.</div> |
| <a href="#">Earning Potential</a>          | Shows the Employee Referral amount sum of all referrals a user has made. If an employee makes referrals to jobs with different currencies, the sum for each currency is displayed separately. For example, if a referral was made in both dollars and euros, two separate entries for each currency appear. Up to five separate currencies can be displayed. This isn't configurable.                                                                                                                                                                                                                                                                                                                                                     |

| Section                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Referral Timeline</a>         | Summarizes the selected referral. If no referral is selected, a summary of the referral with the highest percentage of completion displays. The summary shows the referral's first and last name, corresponding requisition ID and title, current status, date of referral, apply date, status of the Data Privacy Consent Statement acceptance, referral amount, and the next step text configured for the referral's current status.                                                  |
| <a href="#">Other Position Applied</a>    | Shows other jobs where the applicant applied. The user can choose to disable the <a href="#">Other Positions Applied</a> portlet.                                                                                                                                                                                                                                                                                                                                                       |
| <a href="#">Overall Referral Progress</a> | <p>Displays all your referrals. The circle displays the percentage of the referral's progress in the application status pipeline. The titles show the referral's first and last name, the requisition and requisition ID, the current status and the referral amount where applicable.</p> <div> <p><b>Note</b></p> <p>Colors corresponding to the percentage progress from gray to bright green as the percentage approaches 100. Red indicates 0% or an inactive referral.</p> </div> |
| <a href="#">All   Active</a>              | <p><a href="#">All</a> referrals include disqualified and already hired candidates, as well as referrals currently in the pipeline.</p> <p><a href="#">Active</a> referrals include those who have not yet applied, generic referrals, and those in-progress on a requisition.</p>                                                                                                                                                                                                      |

## Important Points to Remember

- You can track up to 1500 records in the employee Referral Tracking page.

### → Recommendation

Use Reporting or other methods to view the Referrals when there are more than 1500 referrals.

- The [Total Referrals by Percent](#) or [Earning Potential](#) is considered only for the records within the 1500 referrals.
- All referrals are sorted systematically based on the groups [In Progress](#), [Yet to Apply](#), and [Disqualified](#).
- If the referral ownership type is configured as [Ownership by Duration for Employee Referral Program](#), the referrals continue to display as [Active](#) referrals on the referral tracking page even after the ownership duration expires. Inactive referrals include only disqualified and hired candidates; ownership duration expiration isn't considered.

### Note

The [Active](#) filter displays fewer than the hard limit of 1500 records when referrals include inactive or expired records, which the [Active](#) filter doesn't show.

- The statuses considered for percentage calculation are not configurable. As mentioned earlier, the Onboard status doesn't work with Employee Referral, if it would be used, the calculated percentage will not be at 100% in the Hired status.

## 20 Searching for Talent with SAP SuccessFactors

Finding and engaging talent candidates is critical to a successful recruiting practice. SAP SuccessFactors Recruiting includes a range of Candidate Search and Candidate Relationship Management capabilities.

### Know Before You Start

- Enabling Career Site Builder is a prerequisite to enabling Candidate Relationship Management.
- When testing email campaigns in a staging environment, you need to have an SAP domain to receive campaign emails.
- If you're using more than one language or brand, ensure that it's configured before setting up Candidate Relationship Management or using email campaigns.
- Candidates can complete a candidate profile without applying to a job, so that they can join a Talent Community.

### Leading Practices

- In Candidate Relationship Management, reuse statuses across multiple status sets when possible, instead of creating duplicate statuses with the same meaning.
- Configure display and search options in the candidate profile template for a better Candidate Search experience.
- Enable data protection and privacy features so that candidates have more control of their data, in accordance with the customer's requirements.
- Limit access to mass import features for Candidate Relationship Management, so that a candidate's data isn't stored without their consent and is in accordance with the customer's requirements.

## 20.1 Candidate Relationship Management

Recruiters working on systems that have Recruiting Management integrated with Career Site Builder can use SAP SuccessFactors Candidate Relationship Management features for greater versatility in managing candidate relationships.

With Candidate Relationship Management features, SAP SuccessFactors Recruiting evolves from an **Application Tracking System** into a full-cycle **Candidate Engagement System**, provides workflows for candidates, from applying through onboarding.

Candidate Relationship Management features are available to all SAP SuccessFactors customers running systems that have Recruiting Management integrated with Career Site Builder.

### 📘 Note

Candidate Relationship Management features require systems that have Career Site Builder integrated with Recruiting Management.

### 20.1.1 Enabling Candidate Relationship Management

Enable Candidate Relationship Management from Upgrade Center after you have an integrated SAP SuccessFactors Recruiting and Career Site Builder SAP SuccessFactors system.

#### Prerequisites

- Integrated and set up Career Site Builder to work with Recruiting Management.
- Configured Career Site Builder features, including landing pages and the data capture form.
- Enabled [Candidate Integration](#) using [Candidate Account Simplification](#).
- If you're using Data Privacy Consent Statements (DPCS) functionality, you have a valid country/region value in the [Country/Region](#) field of the UDF file for Candidate Relationship Management users.
- You have access to Command Center.

### 📘 Note

As a customer, you don't have access to Command Center. To complete tasks in Command Center, contact your implementation partner or your Account Executive. For any non-implementation tasks, contact Technical Support.

## Procedure

1. Go to ► [Admin Center](#) ► [Upgrade Center](#) ► [Optional Upgrades](#) ► and select the following upgrades:
  - Candidate Relationship Management [Talent Pools](#).
  - Candidate Relationship Management [Email Campaigns](#)
2. Select [Upgrade Now](#).
3. Go to Command Center and select ► [Site](#) ► [Site Setup](#) ► [Settings](#) ► [Use Career Site Builder](#) ►.
4. Go to ► [Career Site Builder](#) ► [Settings](#) ► [Site Configuration](#) ► [Site Information](#) ►, and select the [Use CRM](#) checkbox.
5. Select [Save](#) to finish.

The left-side pane in Career Site Builder displays ► [Tools](#) ► [Data Capture Forms](#) ► and ► [Layouts](#) ► [Email](#) ►.

## Next Steps

Set role-based permissions for Candidate Relationship Management.

## Related Information

[Using Role-Based Permissions](#)

### 20.1.2 Candidate Profile Details with Candidate Relationship Management

With Candidate Relationship Management features enabled, the [Candidate Profile](#) displays extra portlets containing information about a candidate.

With the Candidate Relationship Management enhancement to the [Candidate Profile](#), you can do the following:

- Send emails to the candidate through the [Candidate Profile](#).
- View the talent pools of which the candidate is a member, in the [Talent Pools](#) portlet.
- View the history of emails that were sent from the [Candidate Profile](#), in the [Correspondence](#) portlet. The system displays email records in descending order by date sent.
- Add candidates to talent pools through the [Talent Pools](#) portlet with the [+Add](#) link.
- View the [Email Campaign](#) that were sent to the candidate, in the [Email Campaigns](#) portlet.
- Add candidates to a draft [Email Campaign](#).

## 20.1.2.1 Candidate Search with Candidate Relationship Management

Candidate Search is more versatile with Candidate Relationship Management features.

With the Candidate Relationship Management enhancements, you can search all candidate profiles using the following capabilities:

- Search with simple keyword and location criteria or with Boolean operators.
- Search for candidates by the talent pools to which they belong.
- Search for candidates by the type of consent they've given for receiving marketing emails.
- For candidate resumes uploaded in batches, search for candidates by *Batch Name*.
- Save searches for future use.
- Add results from Candidate Search to talent pools.
- Add results from Candidate Search to email campaigns.

### Related Information

[Finding Candidates by Multiple Criteria and Saved Searches \[page 867\]](#)

## 20.1.2.2 Candidate Profile Print Preview and Send to Printer

Candidate profiles support *Print Preview* and *Send to Printer* features.

- You can print from the inline resume viewer as accessed from the Candidate Search results.
- You can't print multiple candidate profiles at once from Candidate Search results.
- Even when you collapse some sections of *Candidate Profile*, you can't hide certain sections from the print view. You also can't set the print view to hide or display different sections.

### Working with Candidate Profile Printing

When viewing a candidate profile, you can select  *Print Preview* to bring up a printer-friendly view of the candidate profile.

#### Note

On systems with Candidate Relationship Management enabled, you can preview and print information in the *Talent Pools* and *Email Campaigns* portlets, along with the other information in the candidate profile.

### 20.1.2.3 Choosing to Print Candidate Profiles

Mass print candidates' application information, resume, cover letter, and additional documents.

#### Prerequisites

- Ensure that you've enabled the [Enable Inline Viewing of Resumes \(Inline Resume Viewer\)](#) option in [Provisioning > Company Settings](#).

##### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- Define read permission in the job application XML template to view the [Candidate-Uploaded Attachments](#) and [Internally-Uploaded Attachments](#) options on the [Mass Print](#) window.
- To print the document in [All Attachments](#), define the data types of the files as `multiattachmentselection` and `multiattachment` with `custom="true"` in the job application XML template.

#### Context

You can mass print application information, resume, cover letter, and the additional documents that a candidate or a Recruiter or the Hiring team uploads. Mass printing reduces the tedious manual effort of opening each applicant's profile to print the documents. The supported file types for mass printing are as follows:

- .CSV
- .DOC
- .DOCX
- .GIF
- .JPG
- .JPEG
- .PDF
- .PNG
- .TXT

## Note

You can only access attachments of deleted candidates for mass printing in [Candidate Information](#) and [Candidate Application](#) pages.

## Procedure

1. Go to [Recruiting](#) > [Job Requisitions](#), and select a job requisition to open the [Candidate Summary](#) page.
2. Select multiple candidates, click [Action](#), and select [Print or Save](#) option.

The [Mass Print](#) window opens and displays all the applicants selected for a print.

3. Select any of the following options to select elements of the application to include in the PDF document to print or save:

| Option                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Candidate-entered application info</a> | Mass print the cover letter, resume, and application that candidate provides.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <a href="#">All Attachments</a>                    | <p>Print <a href="#">Cover Letter</a>, <a href="#">Resume</a>, and additional uploaded documents in a job application:</p> <ul style="list-style-type: none"><li>• <a href="#">Candidate-Uploaded Attachments</a> – prints additional attachments that candidate uploads.</li><li>• <a href="#">Internally-Uploaded Attachments</a> – prints additional attachments that Recruiters or Hiring team uploads.</li></ul> <p>Select any one or all the options in the <a href="#">All Attachments</a> section to print. The maximum print file size is 50 MB.</p> |
| <a href="#">All application info</a>               | Mass print the cover letter, resume, and information saved in an application.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

4. Select [Print Preview](#) or [Save to File](#) when you select the [Candidate-entered application info](#) or [All application info](#) option in the [Mass Print](#) window.
5. Select [Print/Download](#) when you select the [All attachments](#) option.

A loading screen displays, and [Print Preview](#) or [Print/Download](#) creates a single PDF that contains the data based on the selected candidates and the options. In the PDF, the pages are arranged candidate wise with cover letter, resume, candidate uploaded attachments, internally uploaded attachments.

- In Google Chrome browser, the file opens in an additional tab to print or download the file.
- In Microsoft Edge browser, a popup opens and prompts you to [Open](#), [Save As](#), or [Cancel](#). You need PDF reader software in your machine to view the file.
- In Firefox and Safari browsers, you can view the document in the Downloads folder.

[Save to File](#) creates a compressed ZIP file containing data for each selected applicant, a PDF copy of the application, resume, and cover letter. A loading screen displays while the compressed file is created.

## 20.1.3 Creating Candidate Relationship Management Generic Objects

You can create custom Generic Objects for Candidate Relationship Management to associate with [Talent Pool](#), [Email Campaigns](#), [Candidate Profile](#), and [Activity Tracking](#) Extensions.

### Prerequisites

You have permission to access [Metadata Framework](#) and [Configure Object Definitions](#).

### Procedure

1. Go to ► [Admin Center](#) ► [Configure Object Definitions](#) ►.
2. Choose ► [Create New](#) ► [Object Definition](#) ►.

The [Configure Object Definitions](#) form opens.

3. Enter or select the following values for your custom object in these required fields:

| Field                                                                                                                                                                                                                                                     | Action                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| <a href="#">Code</a>                                                                                                                                                                                                                                      | Enter a unique code for your custom Generic Object.                                                    |
| <a href="#">Effective Dating</a>                                                                                                                                                                                                                          | Select <a href="#">None</a> .                                                                          |
| <a href="#">API Visibility</a>                                                                                                                                                                                                                            | Select <a href="#">Editable</a> .                                                                      |
| <a href="#">Status</a>                                                                                                                                                                                                                                    | Select <a href="#">Active</a> .                                                                        |
| <a href="#">MDF Version History</a>                                                                                                                                                                                                                       | Select <a href="#">No</a> .                                                                            |
| <div><div> ⓘ Note</div><div>Candidate Relationship Management Generic Objects doesn't support <a href="#">MDF Version History</a>. If you select <a href="#">No</a> here, change logging and any existing audit data are no longer available.</div></div> |                                                                                                        |
| <a href="#">Label</a>                                                                                                                                                                                                                                     | Enter the label name you want to use for your Candidate Relationship Management custom generic object. |

4. Add all the string text fields in the [Fields](#) for your Candidate Relationship Management custom Generic Object.
5. Save your entries.

### Related Information

[Configuring Attributes to Generic Objects for Talent Pool \[page 806\]](#)

## 20.1.3.1 Applying Associations to Custom Generic Object Attributes

You can associate a Generic Object as an associate with [Candidate Profile Extension](#), and [Talent Pool Extension](#).

### Prerequisites

- Role-based permission for Metadata Framework and Configure Object Definition enabled.
- You've created the generic object.
- You've set [MDF Version History](#) to [No](#) within your generic object

#### ⚠ Restriction

Candidate Relationship Management generic objects don't support [MDF Version History](#).

### Procedure

1. Select [Admin Center](#) > [Configure Object Definition](#).
2. Choose Candidate Relationship Management Pool Extension, then select [Take Action](#) > [Make Correction](#).
3. Set the attributes as follows:

| Attribute          | Value                                      |
|--------------------|--------------------------------------------|
| Associations       | The code for the custom GO field you want. |
| Multiplicity       | One-to-Many.                               |
| Destination Object | Your custom GO.                            |
| Type               | Valid When.                                |

4. Select [Save](#).
5. Refresh the cache manually if the additional details aren't visible in the talent pool add/edit page after a short time, to pull in the attributes:
  - a. Go to the [Admin Center](#) and search for [OData API Metadata Refresh and Export](#).
  - b. Select [Refresh](#) next to [Cache](#).

The refresh takes between one to two minutes to complete.
  - c. Log out and log back in.

## 20.1.3.2 Creating Data for a Custom Generic Object

Through Admin Center, you can create data that you want to use in a custom generic object.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Data](#) ► [Create New](#) ►.
2. Enter a name for the data field.
3. Select [Save](#).

## 20.1.4 Career Sites with Candidate Relationship Management

Job seekers go to career sites that offer jobs of interest to them.

You can add features and functionalities to career sites with Candidate Relationship Management features.

### 20.1.4.1 Candidates Returning to the Career Site

When candidates with an established profile in the career site try to complete a data capture form without logging into the career site first, they see an error message.

The error message is similar to the following:

There's already a profile associated with the email address you provided, so we can't create a new profile.

You can customize the wording for this message in the Career Site Builder translation editor, located at ► [Tools](#) ► [Translations](#) ►. Filter for **Data Capture Forms**, then look for the resource key labeled `DataCaptureFormExisti...`

The system displays this message because the e-mail address they entered already exists. For security purposes, the system authenticates a candidate before updating any information that appears on the candidate profile. To allow candidates to complete the form, send them the data capture form links through e-mail within the system.

## 20.1.5 Candidate Relationship Management Talent Pools

A talent pool is a group of contacts. Talent pools make it easy to group and find candidates.

Recruiting users can create, edit, or delete any number of talent pools. Talent pools are groupings of candidate profiles. You can:

- Add candidates to talent pools from search results, the candidate profile, the legacy Candidate Workbench, the redesigned Applicant Management tool, and Inline Resume Viewer.
- Associate an individual candidate or a group of candidates with one or more talent pools.
- Add both internal and external candidates to talent pools.
- Make talent pools private or public, share private pools with selected users, or share public pools with your whole organization.

### ❖ Example

You can create a talent pool based on any attribute that candidates can have in common, such as attendance at a particular job fair or a job skill. Here are some examples of possible talent pools:

- San Francisco Career Fair
- Silver Medalists
- Sales, Chicago
- Java Developers
- PhDs

You can determine which columns appear in the table of talent pools. Select the  [Settings](#) icon, check the names of columns you want to make visible, and click [OK](#).

The [Talent Pools](#) table shows localized data in the following order of availability:

1. Locale of logged-in user
2. English US (en\_US)
3. Default value – usually the first value saved

### ⚠ Restriction

Attempting to delete this default value from the [Create New Talent Pool](#) or [Edit Talent Pool](#) dialogs doesn't work, even though the message conveys success. Deleting the description from [Manage Data](#) deletes it. However, you can't edit the description field from the dialogs until you add a new description in [Manage Data](#).

## 20.1.5.1 Permissions for Talent Pools for Candidate Relationship Management

Learn about the role-based permissions required to enable, configure, and use talent pools for Candidate Relationship Management.

| Permission                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Description                                                                                                                                                                                                                                                                                                                              |

### 20.1.5.2 Creating Statuses, Status Sets, and Status Maps for Talent Pools in Candidate Relationship Management

A talent pool associated with statuses, status sets, and status maps makes it easy to classify and find candidates by status. Create statuses, status sets, and status maps for talent pools through [Admin Center](#).

#### Prerequisites

- You have permission to manage metadata framework (MDF) objects:
  - [Administrator Permissions](#) > [Metadata Framework](#) > [Manage Data](#) >
  - [Administrator Permissions](#) > [Metadata Framework](#) > [Access to non-secured objects](#) >
- You have view and edit permission for the following objects:
  - [Administrator Permissions](#) > [Manage MDF Recruiting Objects](#) > [Candidate Relationship Management Status](#) >
  - [Administrator Permissions](#) > [Manage MDF Recruiting Objects](#) > [Candidate Relationship Management Status Map](#) >
  - [Administrator Permissions](#) > [Manage MDF Recruiting Objects](#) > [Candidate Relationship Management Status Set](#) >

#### Context

You can associate a talent pool with a single set of statuses. Each of this set can have multiple statuses.

##### Caution

You can't change the status set of the talent pool after you add candidates to it. **Don't** delete any status from the status set after it's in use by a talent pool that contains candidates.

#### Procedure

1. Go to [Admin Center](#) > [Manage Data](#) >.

2. In the [Create New](#) search box, enter the following:

| Option                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Candidate Relationship Management Status</b>     | <p>Enter the following:</p> <ul style="list-style-type: none"><li>• <a href="#">Status Code</a> – assign each status a two-digit decade number, such as 20, 30, or 40. Using two digits makes it easier later to add new statuses between the statuses in the original set. For example, a new status with an order of 21 appears between the status numbered 20 and the status numbered 30.</li><li>• <a href="#">Name</a></li></ul> <p>Select the globe icon next to the <a href="#">Name</a> field to add translated text for different localizations.</p>                                                                                                                                               |
| <b>Candidate Relationship Management Status Set</b> | <p>Enter the following:</p> <ul style="list-style-type: none"><li>• <a href="#">Status Set ID</a></li><li>• <a href="#">Status Set Name</a></li><li>• <a href="#">Status Set Description</a> (optional)</li></ul> <p>Select the globe icon next to the <a href="#">Status Set Name</a> and <a href="#">Status Set Description</a> fields to add translated text for different localizations.</p>                                                                                                                                                                                                                                                                                                            |
| <b>Candidate Relationship Management Status Map</b> | <p>Enter the following:</p> <ul style="list-style-type: none"><li>• <a href="#">Status Set</a> – select an existing status set from the dropdown list.<br/>Choose the <a href="#">plus sign Add Candidate Relationship Management Status Set</a> icon if you want to add a new status set from this page.</li><li>• <a href="#">Status of Member</a> – select an existing status from the dropdown list.<br/>Choose the <a href="#">plus sign Add Candidate Relationship Management Status</a> icon if you want to add a new status set from this page.</li><li>• <a href="#">Order</a> – enter a number to set the order in which each status appears in the list of statuses in the status set.</li></ul> |

3. Choose [Save](#) when you've filled in the form.

## 20.1.5.3 Setting Status Maps with Statuses to Status Sets for Candidate Relationship Management Talent Pools

A talent pool mapped to statuses and status sets makes it easy to classify and find candidates by status. Map statuses and status sets to talent pools through [Admin Center](#).

### Prerequisites

- You've created statuses and status sets.
- You have view and edit permission for the [Candidate Relationship Management Status](#) object.

## Context

### → Recommendation

Record the **Status Set Item IDs** information for the mappings. Keeping a list of **Status Set Item IDs** helps you locate them later for any revisions. For example, you could change the order of statuses.

### ⚠ Caution

Don't delete status sets that are in use in talent pools or that already have candidates associated with them.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Data](#) ►.
2. Find the instance of the ► [Candidate Relationship Management Status Map](#) ► object that you want to edit and choose ► [Take Action](#) ► [Make Correction](#) ►.
3. Choose a status set from the [Status Set](#) menu.
4. Choose a status from the [Status of Member](#) menu that you want to associate with the chosen status set.
5. Save.

### 20.1.5.4 Configuring Attributes to Generic Objects for Talent Pool

You can add your standard Generic Object as an association to the [Candidate Relationship Pool Extension](#) for Talent Pools.

## Prerequisites

- The metadata framework (MDF) is enabled in Provisioning.
- You have the ► [Administrator Permissions](#) ► [Metadata Framework](#) ► [Configure Object Definitions](#) ► permission.
- You've created a generic (MDF) object to configure Talent Pool attributes and [MDF Version History](#) set to [No](#) in the object.

### ⚠ Restriction

Candidate Relationship Management Generic Objects doesn't support [MDF Version History](#).

## Context

It's possible to configure the system to add a talent pool field on requisitions. When someone adds a private talent pool to a requisition, only those persons with the appropriate permission can see that private talent pool. The system displays *Private Talent Pool (name hidden)* when you don't have permission to see that private talent pool. You only see public talent pools, private talent pools you own, and private talent pools that they share with you.

You can configure attributes associated with other objects (such as the *Additional Details* section for Talent Pool). These can include additional fields that capture candidate location, division, department, and other MDF objects or fields.

## Procedure

1. Go to ► *Admin Center* ► *Configure Object Definition* ►.
2. Search for the object definition *Candidate Relationship Management Pool Extension* and choose ► *Take Action* ► *Make Correction* ►.
3. Go to *Associations* and fill out the following values:

| Option                    | Description                                    |
|---------------------------|------------------------------------------------|
| <i>Name</i>               | The name of the standard field.                |
| <i>Multiplicity</i>       | <i>One to Many</i> .                           |
| <i>Destination Object</i> | Your generic standard object such as Division. |
| <i>Type</i>               | <i>Valid When</i> .                            |

4. Refresh your object definition manually if it doesn't refresh automatically:
  - a. In *Admin Center*, search for *OData API Metadata Refresh and Export*.
  - b. Choose *Refresh* next to *Cache*.  
  
Wait for several minutes for the refresh to complete.
  - c. Log out and log back in.

The additional attributes display under the *Additional Details* heading.

## 20.1.5.5 Creating a Talent Pool with Candidate Relationship Management

A talent pool is a group of contacts. Through Candidate Relationship Management features, recruiters and hiring managers can create, edit, and search talent pools as a targeted method of candidate sourcing. Create talent pools through [Recruiting](#).

### Prerequisites

You have permission to edit the [Pool](#) entity.

### Context

#### Note

You can archive talent pools, but you can't delete them. Restoring an archived talent pool requires permission to access ► [Admin Center](#) ► [Manage Data](#) ►.

### Procedure

1. Go to [Recruiting](#) and select ► [Candidates](#) ► [Talent Pools](#) ►.
2. Choose  [Create Talent Pool](#).

The [Create New Talent Pool](#) dialog appears.

3. Enter a unique name in the [Talent Pool Name](#) field.

If the same talent pool name exists, the system suggests another name by appending your user name and numbers to the talent pool name you entered.

4. Select a status set from the dropdown list in the [Pipeline Status](#) field.
5. Select a value from the dropdown list that appears in the [Default Candidate Status](#) field.

The values you see in [Default Candidate Status](#) are associated with the status set you choose in [Pipeline Status](#).

6. Choose a setting in [Visibility](#):

| Option | Description |
|--------|-------------|
|--------|-------------|

|                                                                                                             |                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  <a href="#">Private</a> | Makes the talent pool visible only to the person who created it, and to those the person has shared with.<br><br>A private talent pool isn't visible to anyone else. You can share a talent pool only when it's saved and marked private. |
|-------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                                                                                                            |                                                                                                 |
|------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
|  <a href="#">Public</a> | Makes the talent pool visible to all users who have the <a href="#">Talent Pool</a> permission. |
|------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|

7. **Optional:** Populate the fields in the *Additional Details* section if you've configured *Additional Attributes*, from field dropdown lists or by searching from a field popups.
8. Save the new talent pool by selecting *Save*.

## Results

The system adds the talent pool you created to the table of talent pools.

## Next Steps

You can now edit your newly created talent pool to associate a saved search to it, as well as share it with other groups and individuals. Refer to *Assigning Saved Searches to Talent Pools* and *Enabling Share Settings to Let Others View Talent Pools* for details.

## Related Information

## 20.1.5.6 Assigning Saved Searches to Talent Pools

After you create and save a talent pool, you can populate it with candidates using a saved search.

## Prerequisites

- You've created and saved a talent pool, as described in *Creating a Talent Pool with Candidate Relationship Management*.
- You have a saved search you want to add to the talent pool. Refer to *Adding Candidates to Talent Pools* for more information on saving candidate searches.

## Context

After you save your talent pool, you can immediately add a saved search to it, so that the candidates in the talent pool are included as a result of the saved search.

## Procedure

1. Go to ► [Recruiting](#) ► [Candidates](#) ► [KEYWORD AND ITEM SEARCH](#) ► and note the name of the saved search you want to use for your talent pool.
2. Switch to the [TALENT POOLS](#) tab, then select the check box for the talent pool you want to apply the saved search to.

3. With the talent pool name selected, select  (Actions) and choose  [Edit](#) from the dropdown list.  
The [Edit Talent Pool](#) dialog appears.

### Note

If you don't have permission to edit the talent pool, the [View Talent Pool](#) dialog displays instead, and you see a message similar to `You do not have permission to edit this pool.`

4. Select [List of Saved Searches](#) under [Auto-populate by Saved Searches](#).

The link [List of Saved Searches](#) is active only for users with permissions for Candidate Relationship Management saved searches, and for the Candidate Relationship Management saved search audit.

The [Saved Searches](#) dialog appears.

5. Enter the names of one or more saved searches into the [Type or select a saved search](#) field.

The field provides type-ahead functionality that tries to auto-complete your search term.

6. Select  [Add](#) for each saved search you want to add to the talent pool.

The [Saved Searches](#) list adds the saved search. The candidates in all the saved searches listed in [Saved Searches](#) are added to the talent pool nightly. As candidates are added to the talent pool, the total number of candidates in the pool is reported in the field, [Details \(<> Members\)](#). Candidates already in the talent pool aren't added again. Choose [Close](#).

7. **Optional:** Remove a saved search from by selecting the  minus icon to the right of the name of the saved search.
8. Choose [Close](#) to close the [Saved Searches](#) dialog.
9. Choose [Save](#), then [Close](#) to close the [Edit Talent Pool](#) dialog.

## 20.1.5.7 Enabling Share Settings to Let Others View Talent Pools

After you create and save a talent pool, you can specify groups and individuals with whom to collaborate on candidate selection by sharing the talent pool through SAP SuccessFactors Recruiting.

### Prerequisites

- You've created and saved a talent pool, as described in *Creating a Talent Pool with Candidate Relationship Management*.
- You're the owner of the talent pool.

### Context

You can add or remove individuals and groups from an active talent pool's share list as soon as you create and save the talent pool.

#### ❗ Note

- You can share a talent pool with up to 500 users and up to 500 groups.
- Individuals and groups can see the names of the others you share that talent pool with.
- Only those individuals and groups with whom you share the talent pool can see the talent pool in their list.

### Procedure

1. Go to ► [Recruiting](#) ► [Candidates](#) ► [TALENT POOLS](#) ►.
2. Check the box for the talent pool desired in the table of talent pools.
3. With the talent pool name selected, select  ([Actions](#)) and choose  [Edit](#) or  [Share](#) from the dropdown list.  
The [Edit Talent Pool](#) dialog appears.

#### ❗ Note

If you don't have permission to edit the talent pool, the [View Talent Pool](#) dialog displays instead, and you see a message similar to `You do not have permission to edit this pool.`

4. Select the following options in the [Sharing](#) section of the dialog:

| Option | Description |
|--------|-------------|
|--------|-------------|

|               |                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------|
| <b>People</b> | Select <a href="#">Shared with 0 People</a> . The <a href="#">Share with People</a> dialog appears. |
|---------------|-----------------------------------------------------------------------------------------------------|

| Option | Description |
|--------|-------------|
|--------|-------------|

|  |                                                                                                                                                                     |
|--|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Enter the person's legal or preferred name in the <a href="#">Find People to Share Talent Pool With</a> field, then select + <a href="#">Add</a> for each addition. |
|--|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Note**

Although you can search for people by their General Display Name when adding them to the Shared list, the General Display Name isn't supported in the [Search for First Name in Shared List](#) and [Search for Last Name in Shared List](#) fields when looking for those who are already on the Shared list. Refer to [Adoption of General Display Name in Recruiting](#) for more information about the feature.

|               |                                               |
|---------------|-----------------------------------------------|
| <b>Groups</b> | Select <a href="#">Shared with 0 Groups</a> . |
|---------------|-----------------------------------------------|

In the dialog, specify groups in the [Add More Groups](#) field, then select + [Add](#) for each addition.

These fields are optional. You can choose to share just with people, just with groups, or both.

You see a success message in the dialog, and the group or person you added now appears in the Shared list.

The system gives the individuals or groups permission to view the talent pool. You see an error message if you try to add a user or group that's already added to the talent pool. The system gives a message confirming that the talent pool has been shared with the selected users or groups.

5. **Optional:** Stop sharing a talent pool with a particular user or group by choosing [Shared with <Number> People](#), or [Shared with <Number> Groups](#) in the [Edit Talent Pool](#) dialog.

Select the  **Stop Sharing** icon for the desired user or group.

6. Choose [Close](#) to close the dialog.

The dialog closes, and the Sharing section displays the number of groups or people you're sharing the talent pool with.

7. Choose [Save](#), then [Close](#) to close the [Edit Talent Pool](#) dialog.

## Related Information

[Adoption of General Display Name in Recruiting \[page 90\]](#)

[Creating a Talent Pool with Candidate Relationship Management \[page 808\]](#)

## 20.1.5.8 Enabling the Display of a Translated Talent Pool Name for a Candidate

You can provide a translation of talent pool names into a candidate's default language.

### Procedure

1. Go to the [Candidate Profile](#) and select [Options](#) > [Change Language](#) .
2. Choose the language, and select [Switch](#).
3. Log into the system for that language, and go to [Candidates](#) > [Talent Pools](#) .
4. Choose the box for the talent pool you want, then select [Actions](#) and choose [Edit](#) from the dropdown list.

The [Edit Talent Pool](#) dialog appears.

#### Note

If you don't have permission to edit the talent pool, the [View Talent Pool](#) dialog displays instead, and you see a message similar to `You do not have permission to edit this pool.`

5. Enter translations for the following:

| Option                      | Description                                              |
|-----------------------------|----------------------------------------------------------|
| <a href="#">Name</a>        | The talent pool name for the candidate's locale.         |
| <a href="#">Description</a> | The description for the locale of the user in the field. |

6. Choose [Save](#).  
The system saves this translation, and doesn't overwrite other translations.

## 20.1.5.9 Searching for a Talent Pool by Name

Find the talent pool you want by talent pool name in SAP SuccessFactors Recruiting.

### Procedure

1. Go to [Recruiting](#) > [Candidates](#) > [Talent Pools](#) .
2. Enter the name of a talent pool into the [Search Talent Pool Name](#) field.
3. Select [Enter](#) or [Go](#).
4. **Optional:** Choose one of the column headers and select [Sort Ascending](#) or [Sort Descending](#) to sort the table of talent pools.

## 20.1.5.10 Running a Search in Talent Pool Using Multiple Criteria

Find the talent pool you want with multiple criteria using search filters in SAP SuccessFactors Recruiting.

### Procedure

1. Go to **Candidates** > **Talent Pools** in **Recruiting**.
2. Select **Show Filter Bar**.
3. Select criteria from the **Last Modified** and **Visibility** dropdown list, and enter a name in the **Owner** field if needed.
4. Select **Filters** to search by extra objects.

You can search talent pools using attributes such as Business Unit, Division, Department, and Cost Center. You can also add your own custom searchable attributes to talent pools.

The **Filters** dialog opens, listing objects associated with talent pools.

5. **Optional:** Add filters to the search bar by choosing **More Filters** under the **Advanced** heading.

Select the box for any advanced attribute you want to include in the **Select Filters** dialog, and click **OK**.

6. **Optional:** Choose one of the buttons:

| Option                  | Description                                                    |
|-------------------------|----------------------------------------------------------------|
| <a href="#">Clear</a>   | Clears all advanced search criteria.                           |
| <a href="#">Restore</a> | Restores all advanced search criteria to their previous state. |
| <a href="#">Cancel</a>  | Cancels the search.                                            |

7. **Optional:** Specify criteria by entering or selecting values for the search fields and objects.
8. **Optional:** View a tooltip summary of values in a multiline field by hovering the cursor over the field.
9. Select **Go**.

You see a list of talent pools that match the search criteria.
10. **Optional:** Hide the filter bar by choosing **Hide Filter Bar**.
11. **Optional:** Sort the table of talent pools by choosing one of the column headers, and selecting either **Sort Ascending** or **Sort Descending**.

## 20.1.5.11 Editing a Talent Pool with Candidate Relationship Management

A talent pool is a group of contacts. Through Candidate Relationship Management features, recruiters and hiring managers can create, edit, and search talent pools as a targeted method of candidate sourcing. Edit talent pools through [Recruiting](#).

### Prerequisites

You have view and edit permission for the [Pool](#) object.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Data](#) ►.
2. Find the instance of the ► [Pool](#) ► object that you want to edit and choose ► [Take Action](#) ► [Make Correction](#) ►.
3. In the [Pool Feature List](#) section, add a row with context code **Candidate Relationship Management**.
4. Choose [Details](#) and select values for the list of objects, such as department, cost center, and job code.
5. In [Recruiting](#), select ► [Candidates](#) ► [Talent Pools](#) ►, and search for the talent pool desired.
6. With the talent pool name selected, select  (Actions) and choose  [Edit](#).
7. Edit the values in the fields as desired, and click [Save](#).

### Results

You've now edited and saved the talent pool. Some of the fields, including the fields under [Additional Details](#) are multiline fields that can hold multiple values. To view a summary of values in a multiline field, hover the cursor over the field.

## 20.1.5.12 Editing the Talent Pool Ownership with Candidate Relationship Management

You can update talent pool ownership by assigning a new owner.

### Prerequisites

You have view and edit permission for the [Pool](#) object.

### Context

When a talent pool is created, it's linked to the user (as the owner) who created it. There are times when a change of ownership is necessary, for example, when the talent pool owner has left the company or department. Use the Admin Center to complete the ownership update.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Data](#) ►.
2. Find the instance of the ► [Pool](#) ► object that you want to edit and choose ► [Take Action](#) ► [Make Correction](#) ►.
3. Update the pool ownership by changing the [Pool Owner ID](#) field.
4. Save.

### Related Information

[Using Role-Based Permissions](#)

## 20.1.5.13 Importing Talent Pool Data

Import batches of talent pool data in a ZIP file.

### Prerequisites

You have import/export permission for the generic (MDF) object you want to import.

## Procedure

1. Go to ► [Admin Center](#) ► [Import and Export Data](#) ► and choose the action [Import Data](#).
2. Select one of the following generic objects to import:
  - [Candidate Relationship Management Status Map](#)
  - [Candidate Relationship Management Status](#)
  - [Candidate Relationship Management Status Set](#)
  - [Pool](#)
  - [Pool Member](#)
  - [Pool Member – People Member](#)
  - [Share Pool With Group](#)
  - [Share Pool With User](#)
3. Use [Choose File](#) to choose the CSV file you want to import.
4. Set these parameters:

| Option                                                      | Setting                        |
|-------------------------------------------------------------|--------------------------------|
| <a href="#">File Encoding</a>                               | Western European (Windows/ISO) |
| <a href="#">Purge Type</a>                                  | Incremental Load               |
| <a href="#">Suppress Redundant Date – Effective Records</a> | Yes                            |
| <a href="#">Use Locale Format</a>                           | Yes                            |
| <a href="#">Locale</a>                                      | en_US                          |
| <a href="#">Key Preference</a>                              | Business Key                   |
| <a href="#">Enable Decimal Round Option</a>                 | No                             |

5. Choose [Export](#).

## 20.1.5.14 Exporting Talent Pools

Export batches of talent pool data in CSV files bundled in compressed ZIP files.

## Prerequisites

You have import/export permission for the generic (MDF) object you want to export.

## Procedure

1. Go to ► [Admin Center](#) ► [Import and Export Data](#) ► and choose the action [Export Data](#).

2. Select one of the following generic objects to export:

- [Candidate Relationship Management Status Map](#)
- [Candidate Relationship Management Status](#)
- [Candidate Relationship Management Status Set](#)
- [Pool](#)
- [Pool Member](#)
- [Pool Member – People Member](#)
- [Share Pool With Group](#)
- [Share Pool With User](#)

3. Set these parameters for the export:

| Option                                       | Setting      |
|----------------------------------------------|--------------|
| <a href="#">Include dependencies</a>         | Yes          |
| <a href="#">Include immutable</a>            | Yes          |
| <a href="#">Exclude Reference Objects</a>    | Yes          |
| <a href="#">Select All Data Records</a>      | Yes          |
| <a href="#">Key Preference</a>               | Business Key |
| <a href="#">Hide AutoNumber ExternalCode</a> | Yes          |

4. Choose [Export](#).

## Next Steps

Go to [Scheduled Job Manager](#) to find the exported file .

## 20.1.5.15 Adding Candidates to Talent Pools

There are a number of ways you can add a candidate to talent pools in Recruiting.

## Prerequisites

To add a candidate using Candidate Search, the redesigned Applicant Management or legacy Candidate Workbench, enable [CRM Saved Search](#) or [List of Saved Searches](#) for talent pools.

## Context

Whether you start with a job requisition or candidate search, once you get to your list of candidates in [Recruiting](#), you can select them and add them to the talent pool, one or more at a time. You can also add individual candidates to a talent pool through their candidate profiles, or while you're viewing their resume in the Inline Resume Viewer.

### Note

- Add no more than 10,000 candidates at a time to a talent pool.
- Keep the number of candidates in a talent pool to a maximum of 100,000.

## Procedure

1. Go to [Recruiting](#) and choose your preferred method:

| Option                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Applicant Management tool</b> | Select the applicant, then choose <a href="#">▶ Actions ▶ Add to Talent Pool ▶</a> .<br>You can add multiple applicants at once.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Search results</b>            | Choose any method: <ul style="list-style-type: none"><li>• To add one or more candidates from the search results list – select the box next to the name of each candidate desired, then choose <a href="#">▶ Actions ▶ Add to Talent Pool ▶</a>.</li><li>• To add all candidates appearing on the page of search results you're viewing – select the box for <a href="#">Candidate ID</a> in the table header, then choose <a href="#">▶ Actions ▶ Add to Talent Pool ▶</a>.</li><li>• To add all the candidates from the search results, not just the candidates appearing on one page of the search results – choose <a href="#">Add all candidates to Talent Pool</a>.</li></ul> <div><b>Note</b><br/>Results don't appear immediately. Since adding all candidates can be a large job, Candidate Relationship Management adds the job to a queue and sends an email to you once all candidates have been added.</div> |
| <b>Saved Searches</b>            | Rather than adding candidates to the talent pool from a search you just performed, you can give your saved search a name, and apply it to your talent pool later. <div><b>Note</b><br/>Results don't appear immediately. The process of adding saved search candidates to the talent pool occurs as a nightly job.</div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Inline Resume Viewer</b>      | In the Candidate Application Profile for a candidate, select <a href="#">▶ Resume</a> to view the inline resume viewer, then choose <a href="#">Add to Talent Pool</a> from the <a href="#">Actions</a> menu.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Option                   | Description                                                                                                                                                                                 |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Candidate Profile</b> | Choose a candidate, then select the candidate's profile to view the <a href="#">Candidate Profile</a> dialog, then scroll to <a href="#">Talent Pool</a> and choose <a href="#">+ Add</a> . |

The Add to Talent Pool dialog appears.

2. Select the name of the talent pool desired from the [Talent Pool Name](#) dropdown menu.
3. **Optional:** Select a status from the [Place in Status](#) dropdown menu, then choose [Submit](#).

#### ⓘ Note

If you don't select a status, Candidate Relationship Management assigns the default status for the destination talent pool to the selected candidate records.

A success message appears to indicate that your selection was added to the talent pool you specified.

## 20.1.5.16 The Talent Pools Portlet on Candidate Profiles

If you have appropriate permissions for talent pools, you can see the [Talent Pools](#) portlet on the [Candidate Profile](#). Candidates don't see the [Talent Pools](#) portlet in their own candidate profiles.

As a Recruiting user, you see the [Talent Pool](#) portlet for a candidate who's been associated with one or more public talent pools. You can see a private talent pool that you own. When you share a private talent pool with someone else, that person also sees the private [Talent Pool](#) associated with the candidate in the portlet.

If the [Talent Pool](#) portlet has more than three talent pools, you only see the first three by default. You can see the remaining talent pools by selecting [Show More](#).

## 20.1.5.17 Talent Pools Displayed on Job Requisitions

When you add the [Talent Pool](#) to the [Requisition Template](#), users can view talent pools on job requisitions and on the [Candidates](#) page.

When a Recruiting user adds a private talent pool to a requisition, only those persons with the appropriate permission can see that private talent pool. If you don't have permission to see that private talent pool, the system displays [Private talent pool \(name hidden\)](#) in the [Talent Pool Object](#) dropdown list.

#### 📘 Note

Recruiting users see only public talent pools, private talent pools they own, and private talent pools that have been shared with them.

## Related Information

[Applying Associations to Custom Generic Object Attributes \[page 800\]](#)

## 20.1.5.18 Using Filters and Sorts on the Candidate Relationship Management Talent Pool Table

To make it easier to find the right candidates, filter and sort the talent pool table with the [Filter Bar](#) in Recruiting Management.

## Context

You can determine which talent pools appear in the talent pool table, by applying one or more filters to the table.

#### → Tip

Refreshing the page after filtering or sorting returns the table to the default unfiltered and unsorted view.

Only those talent pool names translated for the locale of a user appear in the talent pool table when filtered by name.

#### 📘 Note

When you sort a talent pool by a column that's not translated in the user locale, the untranslated pool appears at the bottom of the grid in an ascending order, and at the top of the grid in a descending order.

## Procedure

1. Choose [Show Filter Bar](#) in Recruiting Management, if the [Filter Bar](#) isn't visible.
2. Enter values to set a filter for the table in one or more of the following fields:
  - [Talent Pool Name](#) – you can enter partial names. This field isn't case-sensitive.
  - [Last Modified](#)
  - [Owner](#) – auto-completes with names of pool owners.

- *Visibility*
3. **Optional:** Sort the talent pool table by selecting one of the following columns, and choosing *Sort Ascending* or *Sort Descending*:
    - *Talent Pool Name*
    - *Last Modified*
    - *Owner*
    - *Visibility* – sorts by *Public* or *Private* visibility.

## 20.1.5.19 Creating a Custom View of Candidate Relationship Management Talent Pools

You can customize your view of talent pools to make them best serve your particular needs. Customize your view of talent pools through SAP SuccessFactors Recruiting.

### Context

You can determine the columns, and the order of columns, that appear in your view of the *Talent Pools* table.

By default, the *Talent Pools* table shows localized data in the following order of availability:

1. Locale of logged-in user
2. English US (en\_US)
3. Default value - usually the first value saved

#### Caution

You can't delete this default value from the *Create New Talent Pool* or *Edit Talent Pool* dialogs, even though the message reports success. Deleting the description from *Manage Data* deletes it. However, you can't edit the description field from the dialogs until you add a new description in *Manage Data*.

### Procedure

1. Go to .
2. Select the  *Settings* icon.

The system displays the list of available columns in a dialog.

3. Check the box next to the name of any column you want to have displayed.
4. **Optional:** Change the order of a column by selecting it, then choosing either the  up-arrow icon or  down-arrow icon.

## 20.1.5.20 Editing Candidate Records in a Talent Pool with Candidate Relationship Management

You can save time by revising candidate records directly from talent pools. Edit candidate records in talent pools through [Recruiting](#).

### Procedure

1. Go to ► [Recruiting](#) ► [Candidates](#) ► [Talent Pools](#) ►.
2. Choose the name of the talent pool in the table of talent pools.
3. Check the box for each candidate record you want to revise, and select the  [Actions](#) icon.
4. Select one of the following from the dropdown list:
  - [Add to Talent Pool](#)
  - [Change Status](#)
  - [Remove from Talent Pool](#)
5. Select values for the fields in the dialog, and select [Submit](#).

## 20.1.5.21 Removing a Batch of Candidates from a Talent Pool

You can delete batches of candidates from a talent pool.

### Procedure

1. In [Recruiting](#), navigate to ► [Candidate](#) ► [Talent Pool](#) ►.
2. Select the talent pool from which you want to remove candidates, and select the names of the candidates to be removed.

#### Note

Select 100,000 or fewer candidates. You can't remove more than 100,000 candidates at a time from a talent pool.

3. Select ► [Actions](#) ► [Remove from Talent Pool](#) ►.

## 20.1.5.22 Choosing to Archive Talent Pools

Archive talent pools if you don't want to view them from the list of talent pools. Archiving is different from deleting or removing a talent pool, because if you need it the future, you can restore that talent pool.

### Context

#### → Remember

You can only archive talent pools that **you** created.

### Procedure

1. Go to ► [Admin Center](#) ► [Recruiting](#) ► [Candidates](#) ► [TALENT POOLS](#) ►.

The *Talent Pool* list page appears.

2. Choose the talent pool you want to archive.

3. Select  (*Actions*) then choose  *Archive* from the dropdown list.

The *Archive Confirmation* dialog appears.

4. To continue, choose **OK**, otherwise cancel.

#### → Tip

The selected talent pool disappears from the screen once you've confirmed the archive action.

### Next Steps

You've successfully archived your talent pool. When you want to restore that talent pool, you can use the steps in the next topic.

## 20.1.5.23 Restoring Archived Talent Pools

You can restore any archived talent pool that you created by going to that object in [Manage Data](#) tool.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Data](#) ► that opens up the [Manage Data](#) page.
2. Go to ► [Search](#) ► [Pool](#) ► and choose the archived talent pool.
3. Select ► [Take Action](#) ► [Make Correction](#) ► so you can edit the archived pool.
4. Go to [Is Active](#) field and select [Yes](#).
5. Select [Save](#) to finish.

### Results

The archived talent pool is restored. To verify your changes, go to ► [Recruiting](#) ► [Candidates](#) ► [TALENT POOLS](#) ►. Your archived talent pool appears in the [Talent Pools](#) list page.

## 20.1.6 Candidate Relationship Management Data Capture Forms

Data capture forms enable Recruiting users to request additional information from leads, candidates, and employees, to use for such things as lead generation. You can use data capture forms in landing pages on career sites or in candidate profiles.

You add a data capture form (DCF) to landing pages to capture new candidate information. New and existing candidates can submit a data capture form that's saved their candidate profile, so that when they later applies for a job, their basic information already exists.

New candidates that complete their form receive a welcome email with a link to set the password to their candidate profiles. Recruiters can add candidates to talent pools once they've successfully completed and submitted the form.

#### [Data Capture Forms for New and Existing Candidates \[page 826\]](#)

Recruiters can identify which existing candidates visited or updated data capture forms that have been assigned a data capture form code in Career Site Builder.

#### [Candidate Profile Extension \[page 828\]](#)

The [Candidate Profile Extension](#) Metadata Framework (MDF) extension object enables you to add more information to the candidate profile.

#### [Creating and Editing Data Capture Forms \[page 834\]](#)

Data capture forms enable Recruiting users to gather information from leads, candidates, and employees. After you create data capture forms, you can add it to external career site landing pages.

#### [Adding Data Capture Forms to Landing Pages \[page 836\]](#)

Data capture forms enable Recruiting users to gather information from leads, candidates, and employees. Add a data capture form to external career site landing pages, like any other page component, through the *Landing Page Editor*.

#### [Configuring E-Mail Notifications for Data Capture Forms \[page 838\]](#)

Customize the text of the Welcome and Set Password email sent automatically to candidates when they complete data capture forms.

## 20.1.6.1 Data Capture Forms for New and Existing Candidates

Recruiters can identify which existing candidates visited or updated data capture forms that have been assigned a data capture form code in Career Site Builder.

### Candidate Activity Status

There are three different candidate activity statuses, or scenarios, that allow new and existing candidates complete data capture forms: Submitted, Visited, and Updated.

| Candidate Activity Status | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Submitted</i>          | <p>Candidate status: New candidates</p> <p>Candidate submits a data capture form for the first time.</p> <ul style="list-style-type: none"><li>• Candidate profile is created in SAP SuccessFactors Recruiting.</li><li>• You can search for candidates in <i>Candidate Search</i> by <i>Data Capture Form</i> criteria with candidate activity selected as <i>Submitted</i>.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <i>Visited</i>            | <p>Candidate status: Existing candidates</p> <p>Existing candidate submits a data capture form but was unable to complete the process successfully because the link to the <i>Data Capture Form Landing Page</i> wasn't shared with candidate through <i>Email Campaign</i>.</p> <ul style="list-style-type: none"><li>• Existing candidate receives a generic message that state: <b>Thank you for submitting your information to our company, Your existing profile will be updated.</b></li><li>• Recruiter must send an <i>Email Campaign</i> that contains link to the data capture form within the email body text. #### 📘 Note

An authentication process also checks for fields already completed by existing candidates. Candidates can only view fields not already completed.

## Customizing Messages for Existing Candidates

When existing candidates receive access to the [Data Capture Form Landing Page](#) link without an [Email Campaign](#), they receive a generic message. You can customize this message in Career Site Builder from the associated Landing Page for that data capture form, which you access from ► [Pages](#) ► [Landing Page](#) ►. When you've selected the associated data capture form, you can customize the candidate from the [Existing User Message](#) field or the [Override Text](#) field.

## Adding Data Capture Form Landing Page Links in Email Campaigns for Existing Candidates

Existing candidates can complete data capture form successfully when received as a [Data Capture Form Landing Page](#) link from an [Email Campaign](#). As a recruiter, you can send out [Email Campaign](#) to selected candidates in [Visited](#) status from the [Candidate Search](#) page. When candidates are selected, you can use the [Send to Email Campaign](#) button.

#### 📘 Note

When you insert the [Data Capture Form Landing Page](#) link in the email, use the link icon in the email template, don't copy, and paste the link directly into body of that email. Copy and pasting [Data Capture Form Landing](#)

[Page](#) link directly into body of email doesn't allow candidate to authenticate. When candidate isn't able to authenticate, they also can't complete the data capture form process to update their candidate profile with submitted data.

## 20.1.6.2 Candidate Profile Extension

The [Candidate Profile Extension](#) Metadata Framework (MDF) extension object enables you to add more information to the candidate profile.

### Note

This page describes functionality for the legacy Candidate Workbench.

You can define fields in the [CandidateProfileExtension](#) object, which displays as a quickcard in the Recruiting User View of the candidate profile. Fields appear on the profile only if they've been filled out with a data capture form.

One of the following permissions is required to see details of the Candidate Profile Extension:

- [Access to Non-Secured Objects](#).
- [Upgrade](#) option to enable *Continue to Allow Users Access to Non-Secured Objects without Permissions being Assigned*.

## Candidate Profiles

You can view Candidate Profile Extension information in the legacy Candidate Workbench:

- [Application Details](#)
- [Candidate Profile](#)
- [Profile Extension](#) filter in [Candidate Search](#)

You can define fields in the [Candidate Profile Extension](#) MDF object that appear in a candidate profile only when that candidate has completed a data capture form.

## ⓘ Note

Candidate can't update the fields once the form has been submitted.

The additional fields appear under the [More Information](#) tab within candidate profile. Fields that are defined in the object are [Candidate Profile Extension](#) visible only to recruiters and not to candidates.

## OData Services

- **Candidate OData service:** A navigation attribute is added to the Candidate OData service to make it possible to navigate from it to the [Candidate Profile Extension](#) OData service.
- **CandidateLight OData service:** A navigation attribute is added to the CandidateLight OData service to make it possible to navigate from it to the [Candidate Profile Extension](#) OData service.

## Handling of Duplicate Candidates

When there's duplicate candidate profiles, you're prompted to merge them. Once merged, the discarded candidate profile is referred as a **legacy** or **secondary candidate profile**. When the merged candidate data been discarded and you perform a candidate purge, the secondary candidate profile is anonymized and is no longer visible in the UI.

[Creating Candidate Profile Extension Fields \[page 830\]](#)

You can use [Configure Object Definition](#) tool to create additional fields that appear in candidate data capture forms.

[Editing Candidate Profile Extension Records for Specific Candidate Profiles \[page 831\]](#)

You can edit [candidate profile extension](#) data for specific candidate profiles using [Manage Data](#).

## 20.1.6.2.1 Creating Candidate Profile Extension Fields

You can use [Configure Object Definition](#) tool to create additional fields that appear in candidate data capture forms.

### Prerequisites

- [Continue to Allow Users Access to Non-Secured Objects without Permissions being Assigned](#) installed in Upgrade Center.
- [Configure Object Definitions](#) permissions.
- [Access to non-secured objects](#) permissions

#### → Tip

You can locate both role-based permissions under ► [Administrator Permissions](#) ► [Metadata Framework](#) ►.

### Context

These field data types are supported for Candidate Profile Extension:

- string
- boolean
- picklist

#### ⓘ Note

Fields taken from the Candidate Profile Extension that are marked as required fields appear this way in candidate data capture forms. You can't change the field properties so they're nonrequired.

### Procedure

1. Go to ► [Admin Center](#) ► [Configure Object Definition](#) ► [Candidate Profile Extension](#) ►.
2. Go to ► [Take Action](#) ► [Make Correction](#) ►.
3. Enter the name of the field you want to add.

The `cust_` prefixed is added automatically.

4. Go to [Maximum Length](#) field and enter the maximum character limit you want to use for your new field.
5. Go to [Data Type](#) field and select the data type that you want.

#### ⓘ Note

When the data type is a picklist, you must create the picklist before adding.

6. Go to [Details](#) that opens up a dialog box and check the following choices:
  - Go to the [Required](#) field to select [Yes](#) or [No](#) if you want this to be a required field.
  - Go to the [Label](#) field to enter your field label name.
7. Select [Done](#) to save your choices in the [Details](#) dialog box.
8. Select [Done](#) to save and finish your candidate profile extension.

## Results

The new fields now appear in candidate data capture forms.

**Task overview:** [Candidate Profile Extension \[page 828\]](#)

## 20.1.6.2.2 Editing Candidate Profile Extension Records for Specific Candidate Profiles

You can edit [candidate profile extension](#) data for specific candidate profiles using [Manage Data](#).

## Prerequisites

- You know the candidate ID for the candidate profile with the extension data that you want to view, edit, or remove.
- [Manage Data](#) role-based permissions are set. This permission is located in ► [Administrator Permissions](#) ► [Metadata Framework](#) ►.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Data](#) ► and select [Candidate Profile Extension](#).  
A dropdown list appears.
2. From the new dropdown list, locate the candidate profile's candidate ID.

3. Go to ► [Take Action](#) ► [Make Correction](#) ► to view the candidate profile extension record for your candidate.
4. Make your changes in the record.
5. Save your changes.

## Results

You've successfully edited a candidate profile extension record.

## Next Steps

You can delete the candidate extension record for a candidate ID by selecting ► [Take Action](#) ► [Permanently Delete Entry](#) ►, and confirming the deletion when prompted.

### ⚠ Caution

Deleting a [candidate profile extension](#) record removes all the associated data, which can't be undone.

## 20.1.6.2.3 Reference Information on Data Privacy Consent Statements with Candidate Profile Extension

Data Privacy Consent Statements

What's Supported for Data Privacy Consent Statements

| Data Privacy                                                          | More Information                                                                       |
|-----------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| Purge with <a href="#">Data Privacy Consent Statements (DCPS) 1.0</a> | <a href="#">Candidate Profile Extension</a> data is deleted along with its audit data. |

## Data Privacy

## More Information

Purge with [Data Privacy Consent Statements \(DCPS\) 2.0](#)

- [Candidate Profile Extension](#) data becomes inactive when a candidate is marked for anonymization.
- When candidates have two accounts, the second account is merged. The merged candidate record is known as a **secondary candidate**. The merged record is deleted along with its audit data.

Hire with Employee Central Integration.

When an external candidate is hired, a new internal candidate profile is created when specific conditions are met. [Candidate Profile Extension](#) is copied from an external candidate profile to the new internal candidate profile.

## Candidate Profile Conversion

### Candidate Profile Conversion Type

### More Information

**External to Internal Candidate Profile Conversion** job is enabled:

External candidate profile is converted to being an internal candidate profile. The [Candidate Profile Extension](#) for the original external candidate profile is linked with the internal candidate profile after conversion.

New Internal Candidate Profile Created Earlier in Hiring Process with Employee Central integration

Internal candidate profile and the linked [Candidate Profile Extension](#) during its audit data as part of the conversion.

Converting Terminated Employees into an external candidate profile

The [Candidate Profile Extension](#) of the internal candidate is linked with the external candidate after conversion.

## 20.1.6.3 Creating and Editing Data Capture Forms

Data capture forms enable Recruiting users to gather information from leads, candidates, and employees. After you create data capture forms, you can add it to external career site landing pages.

### Prerequisites

- [Candidate Profile Extension](#) is enabled and added to the candidate profile.
- The Candidate Profile XML template (CPT file) contains the country/region picklist field, and the `Country_MDF_Picklist.csv` file has been imported.
- [Consent to Marketing](#) enabled in [Manage Recruiting Settings](#).
- All MDF Country/Regions picklists are uploaded and refreshed so that the country/region field on data capture form sync with the picklist.
- Country/Regions have translated country/region names in the [View Translation](#) icon next to the country/region name in [Manage Data](#) tool.
- Data Privacy Consent Statement (DPCS) enabled for specific countries/regions.
- [Recruiting Manual Candidate Creation Notification](#) enabled for all countries/regions that you want.
- Valid three-digit ISO country/region value in the Country/Region field of the user data file (UDF) for CRM users, such as recruiters.
- [Associate Email Alert with Data Capture Form](#) is enabled for job alert emails.

### Context

You can create data capture forms for lead-generation. The forms enable recruiting users to request additional information from leads, candidates, and employees. The custom forms can appear on landing pages built in Career Site Builder. When candidates submit the forms, the data is saved to the Recruiting Management database.

### Procedure

1. Select  [Admin Center](#) > [Recruiting](#) > [Manage Career Site Builder](#) > [Tools](#) > [Data Capture Forms](#) .
2. On the [Data Capture Form List](#) page, select  [Add](#).

The Create Data Capture Form dialog appears.

3. Enter the following: in the [Name](#) field, and select a language for it from the dropdown menu.
  - [Name](#) – a name for the new data capture form
  - [Locale](#) – select a locale from the dropdown menu. Your options are limited to the locales you have enabled.
4. Select [Save](#).

The Data Capture Form Builder page appears.

5. In the [Details](#) tab, choose the data capture form's field label type in the [Label Type](#) field. Options are:
  - [Label Only](#) – creates standard field labels displayed outside the fields.
  - [Ghost Text](#) – creates field labels inside the fields themselves. Ghost text labels disappear as you enter data into the field.
  - [Both](#) – creates both labels and ghost text.
6. In the [Layout](#) tab, verify or change the order of the following required fields:
  - [Primary Email](#)
  - [First Name](#)
  - [Last Name](#)

You can change the order of these fields by using the arrows on the right, but because these fields are required, you can't remove them.
7. Select [+](#) [Add](#), and choose the [Country/Region](#) field.
8. Add additional fields using [+](#) [Add](#).

The menu displays the existing fields from the [Candidate Profile](#) in the same order they have on the data capture form. If you have the [Resume](#) field, adding this in the data capture form allows your candidates to upload their resumes when completing the form you've configured on your website.

You can remove optional fields by choosing [Remove](#).
9. **Optional:** Create any additional fields using [Candidate Profile Extension](#) and add them to the data capture form.
10. Choose [Save](#).

You return to the Data Capture Form List page.

#### Note

To edit your landing page, choose the [Edit](#) (pencil) icon.

## Next Steps

You can now add your data capture form to a landing page.

**Task overview:** [Candidate Relationship Management Data Capture Forms \[page 825\]](#)

## 20.1.6.4 Adding Data Capture Forms to Landing Pages

Data capture forms enable Recruiting users to gather information from leads, candidates, and employees. Add a data capture form to external career site landing pages, like any other page component, through the [Landing Page Editor](#).

### Prerequisites

- A landing page exists.
- A data capture form exists and is **Active**.

### Procedure

1. Go to [Career Site Builder](#) > [Pages](#) > [Landing](#) > [<Locale>](#) > [<Brand>](#) and select the landing page.

If you can't find your landing page, make sure to set the status field to [Show All](#) to display both active and inactive pages.

2. Select [Edit](#).

The [Landing Page Editor](#) page appears.

3. Select [Add Component](#) in the [Column 1](#) tab (or [Column 2](#) if you enabled [Show two columns](#)), and choose [Data Capture Form](#) from the dropdown list.

The Data Capture Form component appears.

4. Select the gray box that represents the data capture form on the landing page.
5. Configure the fields that appear in the [Details](#) tab:
  - [Data Capture Form](#) – select the data capture form from the dropdown list.
  - [Data Capture Form Code](#) – enter a code for the form. This code allows you to search and retrieve candidate data in the [Candidate Search Tool](#).

#### → Recommendation

Assign a Data Capture Form Code when you create the form because it's needed when performing a search in the Candidate Search Tool. Forms completed by candidates before you assign the code don't appear in search results.

Edit the other fields as desired.

6. Configure style settings in the [Styles](#) tab as desired.
7. Customize the appearance of the Data Privacy Consent Statement by opening the [DPCS](#) tab by clicking [DPCS](#).

### Note

The DPCS tab only appears if you added the [Country/Region](#) field in your data capture form.

8. Add an automatic job alert to be sent to users joining through the landing page by selecting the [Job Alert](#) tab.
  - To define the parameters that determine which job alerts are sent to users, select [Keyword](#), [Location](#), or [Add Picklist](#) using **+** [Add](#).
  - To define how often job alerts are sent to users, select [Frequency number](#). For example, selecting seven results in one job alert email per seven days.

Refer to the *Job Alerts Tab* section of *Data Capture Form Component in Career Site Builder* for details on Job Alert fields and settings.

9. Choose one of the following:
  - [Save Draft](#) – saves the landing page with the active data capture form to work on later.
  - [Publish](#) – saves the landing page with the active data capture form and publishes it to the career site.

**Task overview:** [Candidate Relationship Management Data Capture Forms \[page 825\]](#)

## 20.1.6.5 Configuring E-Mail Notifications for Data Capture Forms

Customize the text of the Welcome and Set Password email sent automatically to candidates when they complete data capture forms.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Email Templates](#) ► [Edit Email Template](#) ►, and select the template *Data Capture Form Submitted - Welcome and Set Password Email*.
2. Edit the template content, as desired.

#### → Recommendation

Use all the following tokens to ensure that the necessary links are sent.

- [RECRUITING\_CANDIDATE\_SITE\_URL]
  - [RECRUITING\_CANDIDATE\_FULLNAME]
  - [RECRUITING\_CANDIDATE\_USERNAME]
  - [RECRUITING\_PASSWORD\_RESET\_URL]
  - [SIGNATURE]
3. Make sure that the customized email template is associated with the *Data Capture Form Submitted - Welcome and Set Password Email* trigger.
  4. Choose [Save](#).

## 20.1.7 Candidate Relationship Management Email Campaigns

Candidate Relationship Management email campaigns allow you to design, execute, and manage email communications with groups of candidates, large or small.

The Candidate Relationship Management email campaigns feature includes the following functionalities:

- Run basic reports for clicks, open, and bounce on a campaign.
- When the Content Template on an email campaign is changed, confirmation prompts appears before overwriting content.

## Works With Career Site Builder

Candidate Relationship Management integrates with Career Site Builder so you can:

- Create and manage branded HTML template library.
- Create HTML email using Candidate Relationship Management

## Works With Talent Pool

E-mail campaigns using talent pool:

- Create and manage a campaign to communicate, through email, with specific talent pools.
- Add a candidate to a talent pool from an [Add](#) button in the talent pool link popup.

## Managing Candidates and Candidate Searches

You can use email campaigns with candidate search:

- Create and manage campaigns to communicate, through email, with a large selection of candidates.
- Add up to 250,000 candidate records to an email campaign recipient list.
- Delete batches of email campaign recipients.
- Filter Candidate Search by their [Consent To Marketing](#) status.

### 20.1.7.1 Permissions to Create, Edit, or View Email Campaigns

Learn about role-based permissions that allow recruiting users to create and send email campaigns.

To give people permission to participate in email campaigns, give them view/edit/import/export for the following objects:

- [User Permissions](#) > [MDF Recruiting Permissions](#) > [Campaign](#) 
- [User Permissions](#) > [MDF Recruiting Permissions](#) > [CampaignContent](#) 
- [User Permissions](#) > [MDF Recruiting Permissions](#) > [CampaignPool](#) 
- [User Permissions](#) > [MDF Recruiting Permissions](#) > [CampaignRecipient](#) 

## 20.1.7.2 Enabling Administrator Permission for Email Campaign Content Template and OData Entities

Enable the administrator permission for email campaign content template and OData entities so that you can create email campaign content templates.

### Procedure

1. Select ► [Administrator Permissions](#) ► [Manage Recruiting](#) ► [Administrator Permission for Email Campaign Content Template and OData Entities](#) .
2. Select ► [User Permissions](#) ► [Manage Recruiting](#) ► [OData API Candidate Export](#) .

## 20.1.7.3 Configuring Email Notification Options

Configure whether candidates see the [Consent to Marketing Emails](#) option by default, and whether the consent option is set to opt-in or opt-out by default.

### Prerequisites

A system with Recruiting Management integrated with Career Site Builder and Candidate Relationship Management enabled

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Settings](#) ► [General Data Privacy Settings](#) .
2. Select [Show the "Consent to Marketing Emails" checkbox on account creation and on the candidate profile](#) if you want to display **Hear more about career opportunities** in the [Career Opportunities: Create an Account](#) dialog when a candidate starts creating a candidate account on an external career site.
3. Select [Enable selection of the "Marketing Emails" checkbox by default at account creation](#) if you want to make [Hear more about career opportunities](#) an opt-in on the [Account Creation](#) page.

You can select this option only you enable [Show the "Consent to Marketing Emails" ....](#) If you unselected the parent setting, this option becomes unselected as well.

#### ⓘ Note

You can change the label of the [Hear more about career opportunities](#) checkbox to one of your choosing. For information about changing labels on the user interface, see [Working with Manage Languages](#).

- a. Select one or more countries/regions from the dropdown menu under *When bulk creating candidates manually via Resume or .CSV file, set "Consent to Marketing Emails" to "Opt-in" for the following countries/regions.*

Candidate profiles you create manually in the selected countries/regions are set to Opt-in to receive marketing emails by default. For countries/regions other than those selected, the default is Unknown.

### 20.1.7.4 Creating and Editing Email Campaign Content Templates

Email campaign content templates contain the text to be inserted into the branded emails sent to candidates through email campaigns.

## Prerequisites

The administrator permission for email campaign content template and OData entities must be enabled.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Email Campaign Content Templates](#) ►.
2. Select  [New Content Template](#) to create a new email campaign content template.

To edit or view an existing email campaign content template, select the name of the content template from the [Content Templates](#) table.

The [Create Email Campaign Content Template](#) page appears.

3. Use the form on the page to create the content template:

| Option                       | Description                                                                                                                                                                                                            |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Locale</b>                | Select the locale from the dropdown list.                                                                                                                                                                              |
| <b>Status</b>                | The default value, <i>Enabled</i> , allows you to use this content template in email campaigns. Setting this field to <i>Disabled</i> removes this content template from the dropdown list in the email campaign form. |
| <b>Content Template Name</b> | Provide a unique name for the content template.                                                                                                                                                                        |

| Option                      | Description                                                                                                                    |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Email Subject Line</b>   | Provide text that will automatically appear in the subject field when you select this content template for the email campaign. |
| <b>Content (Email Body)</b> | Write and format the contents of the email message in this field.                                                              |

→ Tip

Reduce the need to revise the content in the email campaign form by creating a well-polished email message here. Any future changes you make in the template here will overwrite any customized revisions that are made in the email campaign form.

4. Select [Save](#) when you've completed the template.

Selecting [Cancel](#) returns you to the [Manage Email Campaign Content Templates](#) page without saving the template.

You successfully saved the content template.

## 20.1.7.5 Creating an Email Campaign

You can create email custom campaigns with custom layouts and content, in Recruiting Management and Career Site Builder.

### Prerequisites

The following are enabled:

- Recruiting Marketing
- Career Site Builder
- Candidate Account Simplification

### Context

Email campaigns, which can be sent to both external and internal candidates, support the following tokens:

| Field Label                         | Field Key (Token)                |
|-------------------------------------|----------------------------------|
| Recipient First Name                | [ [ CANDIDATE_FIRST_NAME ] ]     |
| Recipient Last Name                 | [ [ CANDIDATE_LAST NAME ] ]      |
| Recipient Full Name                 | [ [ CANDIDATE_FULL NAME ] ]      |
| Recipient Email                     | [ [ CANDIDATE_EMAIL ] ]          |
| URL for Consent to Marketing Emails | [ [ EMAIL_CONSENT_OPT_IN_URL ] ] |

## Procedure

1. Go to  [Recruiting](#) , and select  [New Email Campaign](#).

The [Create Email Campaign](#) page appears.

2. Provide the following information in the [Create Email Campaign](#) section:

| Option                      | Description                                                                                                                                                                                                                                        |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Email Campaign Name</b>  | Provide a name for your campaign that's URL compliant, that contains only letters, numbers, underscores, and dashes.                                                                                                                               |
| <b>Locale</b>               | Select the locale from the dropdown list.                                                                                                                                                                                                          |
| <b>Brand</b>                | The <a href="#">Brand</a> field is automatically populated with the default brand. Use the dropdown list if you want to choose a different brand than the default.                                                                                 |
| <b>Campaign Description</b> | Provide a description to help you remember what this campaign is for.                                                                                                                                                                              |
| <b>Email Campaign Code</b>  | The email campaign code is generated automatically from the campaign name, and is used as part of the URL. If your campaign name contains a space, the system automatically replaces the space with an underscore to create a valid campaign code. |

3. Provide the following information in the [Email Details](#) section:

| Option                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>From Display Name</b>      | Provide a name the email will be sent from.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Reply-To Display Name</b>  | Provide a name to whom a candidate replies to.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Reply-To Email Address</b> | Provide an email address to whom the candidate replies to.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Email Layout</b>           | Use the dropdown list to choose an email layout.<br><br>To preview the email layout, choose <a href="#">Preview Layout</a> . You can close the preview by selecting <a href="#">Close</a> .                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Content Template</b>       | Use the dropdown list to choose a content template.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Email Subject Line</b>     | This field is automatically populated with the text you provided in the <a href="#">Email Subject Line</a> field in the content template. You can choose to overwrite the text here.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Content (Email Body)</b>   | This field is automatically populated with the text you provided in the content template.<br><br>To add a link to the email body, select the  link icon above the <a href="#">Content</a> field. Add or select values for the fields.<br><br>To remove a link from the email body, select the linked word or phrase, and choose the  unlink icon from the <a href="#">Insert/Edit Link</a> dialog, and choose <a href="#">OK</a> . |

### Caution

While it's possible to customize the template text that appears here, any future updates you make to the content template will overwrite any edits or formatting you make specifically to this email campaign.

[Email Details](#) includes a [To](#) section, where you see the following:

- [0 Manually Added Recipients](#)
- [0 Talent Pools](#)

Refer to *Adding a Candidate to an Email Campaign* and *Adding a Talent Pool to an Email Campaign* for instructions on how to add candidates and talent pools to the campaign. After you do, you can return to this page and select the links to view the candidates and talent pools that were added.

#### Note

The General Display Name isn't supported in the [Search First Name](#) and [Search Last Name](#) fields in the [Manually Added Recipients](#) dialog for candidates. Refer to *Adoption of General Display Name in Recruiting* for more information about the feature.

4. Select [Review Email](#).
5. Review the email, and select [Save](#).

[Adding a Talent Pool to an Email Campaign \[page 846\]](#)

## 20.1.7.6 Creating an Initial Consent Opt-In Email Campaign

You can create an initial-consent opt-in email campaign to invite recipients to participate in email campaigns.

## Prerequisites

You have administrator permission to configure ► [Admin Center](#) ► [Manage Data](#) ►.

## Context

Create a separate initial-consent opt-in email campaign for each locale or segment targeted. Unlike regular email campaigns, you can send opt-in campaigns to recipients who haven't opted in or opted out of email campaigns.

The initial consent opt-in email is sent only to recipients who haven't opted in or opted out, either through Career Site Builder or through Recruiting Management.

## Procedure

1. Select ► [Recruiting](#) ► [Marketing](#) ► [New Email Campaign](#) ►.
2. Add the token [ [EMAIL\_CONSENT\_OPT\_IN\_URL] ] to the email.

This token resolves to [Click here](#). When recipients choose [Click here](#), their campaign email consent changes to **Opt-In**. Only those recipients who haven't opted in or opted out receive these initial-consent opt-in emails, either through Recruiting Management or through Career Site Builder. For example, recipients using Career Site Builder who have yet to opt in or opt out can receive the email inviting them to opt in.

3. Search for candidates fulfilling the locale or other segmentation requirements, and add them to the campaign.

### ⚠ Restriction

Limit the number of results for each search to 250,000. However, you can add the results from multiple searches, totaling more than 250,000, to an initial-consent opt-in campaign.

4. Go to ► [Admin Center](#) ► [Manage Data](#) ►, and search for and select the campaign object for the initial consent opt-in email campaign.
5. Select ► [Take Action](#) ► [Edit](#) ►.
6. From the dropdown list for [Include Recipients Who Have Neither Accepted Nor Refused Consent](#), select [Yes](#), and choose [Save](#).

Setting this field ensures that the [ [EMAIL\_CONSENT\_OPT\_IN\_URL] ] token resolves correctly.

7. Review the email on the [Email Campaigns](#) screen, and choose [Send](#).

## Results

The [Email Campaigns](#) portlet in the [Candidate Profile](#) shows that the initial consent opt-in email has been sent.

## 20.1.7.7 Adding a Candidate to an Email Campaign

You can add external and internal candidates to email campaigns through the [Candidate Profile](#). Both external and internal candidates receive an email as part of your campaign.

## Prerequisites

- The candidate has opted in.
- The recruiting user has permission to add candidates.
- The campaign is in [Draft](#) status.

## Procedure

1. On the [Candidate Profile](#), in the [Email Campaigns](#) portlet, select the email campaign you want for the candidate and select [+ Add](#).
2. Select [OK](#).

## Results

You can verify that your external or internal candidate was successfully added to the email campaign by selecting [Manually Added Recipients](#) in the [Email Details](#) section of the campaign.

### Note

Regardless of whether you specify the first or last name, you can't search manually added recipients using their display name. Their display name, does, however, appear in the search results.

## Related Information

[Permissions to Create, Edit, or View Email Campaigns \[page 839\]](#)

## 20.1.7.8 Adding a Talent Pool to an Email Campaign

To send an email campaign to all members of a talent pool, add the talent pool to the email campaign, as follows.

## Procedure

1. In [Recruiting](#), click [► Candidates ► Talent Pools ►](#).
2. Select one or more talent pools from the list.
3. Click [► Actions ► Add to Email Campaign ►](#).
4. Select an email campaign.
5. Click [Submit](#).

## Results

The talent pool is added to the email campaign and is listed among the campaign's associated talent pools.

## 20.1.7.9 Removing a Talent Pool from an Email Campaign

If an email campaign hasn't yet been sent, you can delete a talent pool from the email campaign.

### Procedure

1. Go to ► [Recruiting](#) ► [Marketing](#) ► [EMAIL\\_CAMPAIGNS](#) ►.
2. Click the name of the campaign desired.
3. Scroll down to the [Email Details](#) section, and click <> [Talent Pools](#).

The [Talent Pool Recipients](#) dialog is displayed, showing a list of talent pools associated with the email campaign.

4. Select the name of the talent pool you want to remove, and click [Remove Talent Pool](#).

A confirmation message is displayed.

5. Click ► [OK](#) ► [Close](#) ►.

### Results

The selected talent pool is removed from the email campaign.

## 20.1.7.10 Deploying an Email Campaign

You can send campaign emails to groups of recipients you've identified, either immediately or at a later date you specify. You can also send test emails to yourself or someone else to view what the email looks like.

### Procedure

1. Go to ► [Admin Center](#) ► [Recruiting](#) ► [Marketing](#) ► [EMAIL CAMPAIGNS](#) ►.
2. Locate and select the specific campaign using any of these options:
  - Enter the name of the email campaign in the search bar.
  - Use the [Filter Bar](#) button.
  - From the [Email Campaign\(s\)](#) list.

The [Edit Email Campaign](#) page displays.

3. **Optional:** Edit the E-mail Campaign form.
4. Select [Review Email](#) button and review the email.

Optionally, you can select [Save](#) to save the form without sending it

5. Choose [Send Test](#) if you want to send a test email.
  - a. Enter the email address you want to send the test email to in the [Send Test Email](#) dialog.
  - b. Select [Send](#).

Optionally, select [Cancel](#) to close the dialog without sending a test email.

6. Choose [Send Email](#) to send the email.

The [Send Email](#) dialog opens, and you see the following message:

Email Campaign can be sent immediately or be scheduled to be sent in the future. If you opt to schedule at a date & time in the future - that time will be when our email servers will begin sending out the emails.

Note: Emails will be sent only to recipients who have consented to receive marketing emails and opted to hear more about other job opportunities.

7. Choose [Send Immediately](#) if you want to send the email right away, then select [Send Email](#).

A confirmation dialog appears. Choose [Send](#) to send the email immediately, or [Cancel](#) to cancel.

8. Choose [Send at a Specific Date Time](#) if you want to schedule when to send the email.
  - a. Select the date picker icon to open the [Send Date and Time](#) widget.
  - b. Select the calendar date and time you want to schedule.
  - c. Select [OK](#) to save your date and time.
  - d. Select [Schedule Email](#) to finish.

A confirmation dialog appears. Choose [Schedule](#) to continue, or [Cancel](#) to cancel.

#### Note

You can view the status of the job in [Provisioning](#) or by navigating to [Recruiting](#) > [Marketing](#) > [Email Campaigns](#).

## 20.1.7.10.1 Canceling Scheduled Emails

You can cancel scheduled emails for your selected email campaign.

### Context

Canceling a schedule doesn't delete an email campaign.

### Procedure

1. Go to [Admin Center](#) > [Recruiting](#) > [Marketing](#) > [EMAIL CAMPAIGNS](#).
2. Select the specific email campaign you want from the campaign list.
3. Select [Take Action](#) icon.

4. Select [Cancel Scheduled Date](#) for your scheduled email for that campaign.

You see a confirmation dialog with this message:

You can only cancel scheduled date for campaign in scheduled status.  
Are you sure you want to cancel the scheduling of one selected email campaign? This will put this campaign back in Draft status.

5. Select [OK](#) to continue or [Cancel](#) to finish.

## 20.1.7.10.2 Conditions for Campaign Emails

Campaign emails are sent only to candidates who have checked the box for [Consent to Marketing Emails](#). Depending on the customer system, the value for this option could be kept in either the Career Site Builder database or the Recruiting Management database. The following table shows the values necessary in both databases for sending or not sending a campaign email to a candidate.

Conditions in Recruiting Marketing and Recruiting Management for Campaign Emails

| Send Email? | Career Site Builder Value | Recruiting Management Value |
|-------------|---------------------------|-----------------------------|
| Yes         | True                      | ACCEPTED                    |
| Yes         | False                     | ACCEPTED                    |
| No          | True                      | NOT_ACCEPTED                |
| No          | False                     | NOT_ACCEPTED                |
| Yes         | True                      | null                        |
| No          | False                     | null                        |

## 20.1.7.11 Sending and Viewing Emails to Individual Candidates

You can send or view email, one-to-one, with candidates, as well as send emails directly to candidates from the [Candidate Profile](#).

### Procedure

1. Choose either method:
  - In the [Candidate Profile](#), select the  [Email](#) icon.
  - Select one or more candidates from a Candidate Search and choose [Send Mail](#).
2. Select a template from the [Content Template](#) dropdown menu.
3. Select a template from the [Brand](#) dropdown menu, if configured.

4. Select a template from the *Email Layout* dropdown menu, if configured.
5. Compose the content of the email, and select *Next*.
6. Review the email and select *I'm Done*.

The *Correspondence* portlet in the *Candidate Profile* displays a record of the email sent.

→ Tip

Candidate Relationship Management logs communications with candidates. Team members can search the log and view the communications.

## Related Information

[Email Candidates \[page 962\]](#)

## 20.1.7.12 Viewing Email Campaign Details

You can view a panel containing details about email messages sent and one containing campaign details on the *Email Campaign Details* page.

## Procedure

1. Go to *Marketing* > *EMAIL CAMPAIGNS*.
2. Enter criteria into the search field and select the magnifying glass icon.

Choose *Show Filter Bar* for a more complex search, then select criteria from the search fields, and choose *Go*.

→ Tip

You can sort the results list by a column by selecting the column header and choose either *Sort Ascending* or *Sort Descending*.

3. Select the name of the campaign.  
The *Campaign Details* page displays.
4. **Optional:** Hover over the following charts for summary information, or double-click the graph for additional details.
  - *Views* – the number of recipients who viewed the email.
  - *Clicks* – the number of recipients who clicked on the link in the email.
  - *Unsubscribes* – the number of recipients who unsubscribed from marketing emails. These candidates now have their opt-in setting set to false.
  - *Undeliverable* – the number of emails not sent because of invalid email addresses or other technical problems.

- [Not Sent](#) – the number of emails not sent for any other reason, such as restricted permissions.

A dialog box displays that contains names and email addresses for the individuals counted in the chart you selected.

5. **Optional:** Find a particular individual, enter a name into the [Search First Name](#) field, or the [Search Last Name](#) field and select [Go](#).
6. **Optional:** View details about the talent pools to which the campaign emails are sent, in the [Email Details](#) pane by selecting [<> Talent Pools](#).

The [Talent Pool Recipients](#) dialog displays, showing the names and number of members drawn from each of the talent pools for the campaign.

7. **Optional:** View the names of individual recipients within one of the listed talent pools by selecting the arrow [>](#) to the right of the name of the talent pool.

## 20.1.7.13 Choosing to Opt In or Opt Out of Email Campaigns

Candidates can choose whether to receive announcements of job opportunities through email campaigns.

### Prerequisites

A Recruiting user has selected [Show the "Consent to Marketing Emails" checkbox on account creation](#) in [Admin Center > General Data Privacy Settings](#).

### Procedure

Choose a setting for [Hear more about career opportunities](#):

| Option                      | Description                                                   |
|-----------------------------|---------------------------------------------------------------|
| Opt in to email campaigns.  | Select <a href="#">Hear more about career opportunities</a> . |
| Opt out of email campaigns. | Clear <a href="#">Hear more about career opportunities</a> .  |

## 20.1.7.14 Candidate Relationship Management Landing Pages

External recruiting Web sites use landing pages as the starting place for applicants to find jobs.

Landing pages include the following features:

- Supports multicolumn dynamic page layouts.
- Supports data capture forms.

- Supports restriction to specific users by roles and permissions in Career Site Builder.
- Doesn't support indexing by search engines.
- Can link to the career site through the link editor.

## Related Information

[Creating and Configuring Landing Pages in Career Site Builder \[page 456\]](#)

### 20.1.8 Activity Tracking

Recruiting users can follow up to 100 external candidates and view activities completed by these candidates. The system displays these activities through the [Activity Tracking](#) feed on the [Candidate Profile](#).

Recruiting users with appropriate permissions can follow specified candidates to gain actionable insights into their activities. The [Activity Tracking](#) feed displays the following activities:

- Candidate logged into the career site.
- Candidate submitted a data capture form.
- Candidate saved a draft of a job application.
- Candidate abandoned the job application.
- Candidate applied for a job.

The system displays a candidate-specific [Activity Tracking](#) feed on the recruiter view of each external [Candidate Profile](#), whether or not a Recruiting user follows that candidate. You only see the follow icon for candidates you're following.

#### 📘 Note

Candidates can't see the [Activity Tracking](#) feed on the [Candidate Profile](#). The system doesn't display the activity feed on the candidate view of the [Candidate Profile](#).

## 20.1.8.1 Permissions for Activity Tracking

Learn about the role-based permissions required for activity tracking.

| Permission                                                                                                                                                                                                                                                                                                                                                        | Description                                                                                                            |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| View/edit/import/export permissions for the following objects: <ul style="list-style-type: none"><li>▶ <a href="#">User Permissions</a> ▶ <a href="#">MDF Recruiting Permissions</a> ▶ <a href="#">Candidate Follow</a> ▶</li><li>▶ <a href="#">User Permissions</a> ▶ <a href="#">MDF Recruiting Permissions</a> ▶ <a href="#">CandidateActivity</a> ▶</li></ul> | Allows administrators to view data about candidate activity and candidate follows, using <a href="#">Manage Data</a> . |
| ▶ <a href="#">User Permissions</a> ▶ <a href="#">Recruiting Permissions</a> ▶ <a href="#">OData API Candidate Export</a> ▶                                                                                                                                                                                                                                        | Allows Recruiting users to view candidate names in the activity tracker.                                               |
| ▶ <a href="#">User Permissions</a> ▶ <a href="#">Recruiting Permissions</a> ▶ <a href="#">Follow/Unfollow External Candidate</a> ▶                                                                                                                                                                                                                                | Allows Recruiting users to follow and unfollow external candidates.                                                    |
| ▶ <a href="#">User Permissions</a> ▶ <a href="#">Recruiting Permissions</a> ▶ <a href="#">View Candidate Activity Feed on Candidate Profile</a> ▶                                                                                                                                                                                                                 | Allows Recruiting users to view the Activity Feed on a Candidate Profile.                                              |

## 20.1.8.2 Data Privacy for Activity Tracking

These data privacy protections pertain to the activity tracking features in .

- The system doesn't notify candidates when you follow them in SAP SuccessFactors Recruiting. The candidate actions that appear within the [Activity](#) feed are aggregated into one place.
- You need permission to access and use the [Follow](#) functionality.
- When candidates restrict their visibility, the [Follow](#) feature conforms to that restriction. For example, when candidates decide that only recruiters in their countries/regions of residence can view them, then only those recruiters in their countries/regions of residence can follow the them.
- The [Follow](#) feature conforms to the existing permissions of the user. For example, a recruiter decides to follow a candidate who applies to a requisition that the recruiter doesn't have permission to view. From the [Activity](#) feed, the recruiter sees that the candidate has applied to the job, but the recruiter can't see the additional details on the requisition.
- Recruiting User A can't see who Recruiting User B follows.

## 20.1.8.3 Configuring Email Trigger for Abandoned Application

When candidate starts an application but don't complete or save it, the system can email the candidate a reminder. You can configure a trigger to send candidates emails reminding them to complete and submit their applications.

### Context

The activity tracking feature includes an automatic email trigger template called [Complete and Submit Your Job Application](#). This trigger automatically sends an email to candidates who abandon their applications, asking them to return to the system to complete their applications if the candidates haven't saved a draft of the application, and there's been no activity in the application for at least three hours since the candidate started the application.

The email trigger job runs every midnight (12:00 a.m.) and checks for all records before 9:00 p.m.. You can't change this schedule of when the job runs.

The system shows the abandoned application activity on the [Candidate Activity Feed](#). You can choose to send the email twice or not at all. You can't configure the number of emails sent.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Email Templates](#) ►, and select [Configure Triggers](#).
2. Select the email trigger template for [Complete and Submit Your Job Application](#).
3. Edit the template email text for the triggered email in the [Body](#) field.
4. Select [Save](#).

### Results

The [Admin Center](#) list of email triggers now includes the trigger for [Complete and Submit Your Job Application](#).

## 20.1.8.4 Choosing to Follow Candidates to View Their Activity

To view updates of candidate activities, recruiters can follow specified external candidates through Candidate Search, the job requisitions screen, and the candidate profile.

### Context

SAP SuccessFactors Recruiting allows you to follow up to 100 external candidates.

## Procedure

1. Go to ► [Recruiting](#) ► [Candidates](#) ► [KEYWORD AND ITEM SEARCH](#) ►, and search for and select a candidate by name.

The system opens the candidate profile and displays a candidate-specific [Activity](#) feed on each candidate profile, regardless of whether you follow that candidate.

2. Follow the candidate using one of these methods:

| Option                                        | Description                                                                                                                                                                                              |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| From <a href="#">Candidate Profile</a>        | On the <a href="#">Candidate Profile</a> , choose  <a href="#">Follow Candidate</a> , and select <a href="#">Done</a> . |
| From the <a href="#">Job Requisition page</a> | On the job requisition page, choose the contact card and select <a href="#">Follow</a> .                                                                                                                 |
| From search results                           | In the search results page, choose the contact card and select <a href="#">Follow</a> .<br><br>You can also select multiple names, and select ► <a href="#">Take Action</a> ► <a href="#">Follow</a> ►.  |

The system displays the activities of the followed candidate in the recruiter view of the [Candidate Activity Feed](#).

You can now set the frequency of email notifications when there's a change in your activity feed.

3. Go to ► [Recruiting](#) ► [Dashboard](#) ►, then go to  ► [Activity Feed Settings](#) ► [Email Notifications](#) ►.
4. Select a frequency from the [Email Notifications Frequency](#) dropdown list, and select ► [Done](#) ► [Close](#) ►.

You can't change the format and wording of the email notification.

## 20.1.8.5 Changing the Follow Settings Through the Activity Tracking Dialog

You can stop or restart viewing candidate activity by unfollowing or refollowing selected candidates through the [Activity Tracking](#) dialog.

## Procedure

1. Go to the [Candidate Activity Feed](#), and select the  [Settings](#) icon.

The system displays the [Activity Feed Settings](#) pop-up dialog.

2. Select the [Following List](#) tab.

[Activity Feed Settings](#) displays a table of candidates currently followed.

3. Enter the candidate name in the search box and selecting [Go](#).
4. Choose to unfollow or refollow a candidate:

| Option                | Description                             |
|-----------------------|-----------------------------------------|
| Unfollow a candidate. | Select the ⊗ <a href="#">Undo</a> icon. |
| Refollow a candidate. | Select the ↻ <a href="#">Redo</a> icon. |

5. Choose ► [Done](#) ► [OK](#) ► [OK](#) ►.
6. Select [Close](#) to close the pop-up dialog.

## 20.1.9 Creating Ad Hoc Reports for Talent Pools and Email Campaigns

Create and use the [Ad Hoc Reports](#) in Recruiting V2 reports to create reports on talent pools and email campaigns.

### Prerequisites

- Enabled either [Adhoc Report](#) or [Run Ad Hoc Report](#) in ► [Admin Center](#) ► [Manage Permission Roles](#) ► [Role](#) ► [Permission](#) ► [Reports Permission](#) ► [Create Ad Hoc Report and/or Run Ad Hoc Report](#) ► [Recruiting and/or Recruiting Secured](#) ►.
- Enabled [Email Campaigns](#) through [Upgrade Center](#).
- Enabled [Talent Pool](#) through [Upgrade Center](#).

### Context

SAP SuccessFactors Recruiting users can't schedule recurring reports themselves, since you set them up in Provisioning so that reports run regularly and drop to an FTP site, through the Job Scheduler.

You can instead use ad-hoc reports to build data pulls and flat file exports in Excel, PDF, or PowerPoint format. They can run in the system, and you can share them with others in the system. The [Ad Hoc Reports](#) feature lets you create a report on the following:

- Details of a talent pool.
- Candidates in a talent pool.
- Details of an email campaign.
- Candidates in an email campaign.
- List of talent pools with details including Name, Description, Sharing, Owner, and Status.

#### ⓘ Note

The reports are available only in Recruiting V2 reports and not in Recruiting V2 Secured report or SAC reports.

## Procedure

1. Go to ► [Home](#) ► [Reports](#) ► [Ad Hoc Reports](#) ►.

2. Choose [Create New Report](#) and select the [Report Type](#) and [Report Definition Type](#).

To create a sample report, select the [Report Type](#) as [Single Domain Report](#) and [Report Definition Type](#) as [Recruiting V2](#), then choose [Create](#).

3. Enter the details of your report: Report Name, Description, and Priority.

4. Select ► [Columns](#) ► [Select Columns](#) ►.

5. Select any of the following columns in [Talent Pool Reporting Tables](#):

- Talent Pool
- Talent Pool Extensions
- Talent Pool Members
- Talent Pool Shared with Group
- Talent Pool Shared with Person

6. Choose columns from the list and review your selected list, then select [Done](#).

Based on your selection, you can preview the report on [Talent Pool](#). To create a report on candidates in a talent pool, you'd select such required columns as [Candidate ID](#), [First Name](#), [Last Name](#), and [Pool Name](#).

When you define a report to include talent pools and candidates, the report includes:

- All the candidates who are associated with talent pools.
- All the candidates who aren't linked with any talent pools.
- All talent pools that aren't associated with any candidates.

You can add filter conditions. For example, to find only candidates who are associated with talent pools, you can filter for non-null [Talent Pool Name](#) or non-null [Talent Pool Id](#).

7. Select one of the following columns in [Email Campaign Reporting Tables](#):

- E-mail Campaign
- E-mail Campaign Content
- E-mail Campaign Pool
- E-mail Campaign Pool Extension
- E-mail Campaign Recipient
- E-mail Campaign Recipient Activity

The email campaign recipient view shows all the recipients a campaign sent email to. This view also shows all recipients who receive an email for draft campaigns.

8. **Optional:** Retrieve data regarding all pools associated with a campaign by querying the email campaign Campaign Pool.

You can't add attributes from the talent-pool-tagged views and e-mail-campaign-tagged views in one report, since these generate inconsistent data.

Choosing columns from email-campaign-tagged views disables the ones related to talent pools, and vice versa.

9. **Optional:** Retrieve data from all talent pools associated with a campaign by using the [DISTINCT](#) option and [POOL name not null](#).

This method removes duplicates, and allows you to get accurate results.

## 20.2 Internal Candidate Search Settings

The searching of internal candidates can be disabled entirely or limited to where a date field on the Employee Profile is X number of days from today or earlier.

For example, clients may wish to only allow internal candidates to be found in candidate search if the “ready to develop” date on their Employee Profile was 30 days from today or earlier.

Check the desired setting. Only one setting may be selected at a time, or both settings may be de-selected.

### *Candidate Search Settings*

- *Disable searching of internal candidates:* No internal candidates will return in the candidate search results
- *Find candidates where <select> is <x> days from today or earlier:* Internal candidates will only return in the candidate search results if the specified date on their Employee Profile matches the criteria specified by the administrator. Note that if no userinfo-element date fields are set up on the succession-data-model, this option will be grayed out and unavailable.

### 20.2.1 Example of a Userinfo Element Used by Recruiting

Configure at least one userinfo-element field on the succession-data-model XML with type="date".

```
<userinfo-element id="origHireDate" type="date" required="false">  
  <label>HireDate</label>  
</userinfo-element>
```

## 20.3 Candidate Search

Candidate search enables a user to search through the candidate profile database. You can choose to provide candidate search access to any user in the SAP SuccessFactors HCM suite. Users must have candidate search permissions to be able to perform candidate search.

All clients must have the maximum search capability enabled for their instance.

The candidate search feature searches candidate profile information, NOT candidate application information, or prescreen questions.

Recruiting users can search directly for a specific candidate using the candidate name or choose to put together a complex search using multiple criteria.

### Note

The candidate search feature supports accent characters in English or using an English keyboard. Common accent characters in other languages are mapped to English-language characters, so that you can search for candidates without adding accents to their name. For example, to find a candidate with the last name Kühner in Candidate Quick Search, you can search for Kuhner without adding the umlaut.

### 20.3.1 Quick Facts About Candidate Search

Learn about different aspects related to candidate search.

- The candidate search only searches through candidate profile and resume data. It doesn't search additional information, such as application data, prescreen question responses, and interview content.
- Depending on data privacy consent statement settings (DPCS), the candidate search may not return internal candidates until they accept the data privacy statement on the [Career](#) tab.
- Candidate search results can be limited by [Candidate Visibility](#) options.
- When [Advanced Relevancy](#) is enabled, toggling from [Thumb View](#) to [List View](#) and back can cause a column alignment issue because the [Match Score](#) stars are missing.
- Expected functionality includes a 'How do I use this?' link that contains instructional help text for the user. This can't be configured.
- Fields configured as sensitive (`sensitive=true`) in the candidate profile template aren't searchable.
- Special characters in the candidate name, including apostrophes, aren't properly encoded and show as ASCII code. Example: ' (Windows apostrophe) appears as '.
- Fields synced from Employee Profile aren't searchable unless they're appropriately permissioned in Employee Profile. For example, to allow read permission for the `firstName` field, set its [Permission](#) to read and [Role Type](#) to \*. The asterisk symbol (\*) specifies everyone.
- Candidate search results support displaying 10, 20, 50, or 100 candidates per page. View All isn't supported because the impact on system speed when displaying all candidate profiles on a single page.
- Candidate search using Boolean search operators AND/OR needs to be in English and can't be translated. The system doesn't consider translated operators as operators instead it takes them as simple text. For example, searching for "Fleischer AND Stuttgart" works however, "Fleischer UND Stuttgart" won't because the operator "UND" doesn't exist.
- Results from candidate searches by name can differ depending on whether you enter the first name, last name, or both as the search text in the [Search by Name](#) field. If you enter more than one keyword, the SAP SuccessFactors search engine uses the "AND" logic to search for keywords. For example, let there be two candidates with names "John Ryan" and "John Mark Ryan".
  - When you type "John" followed by "Ryan", the search returns John Ryan, but John Mark Ryan. Here, the system attempts to identify an exact match, therefore the name "John Mark Ryan" isn't included in the search.
  - When you type Ryan followed by John, the search displays both John Ryan and John Mark Ryan. In this case, the system first searches for Ryan and then uses the "AND" logic to search for John. The middle name "Mark" is considered as an optional field and therefore, the system includes John Mark Ryan in the search result.

### → Tip

To ensure accurate search results, search for candidates by their last name.

- If candidate search isn't working for specific fields, ensure that the fields are sm-mapped correctly in the candidate profile template and Succession Data Model. For example, if search is working for the phone number field, but not working for the first name, last name, and middle name fields, make sure that the sm-mapping for these fields are correct.
- If the instance has a combination of candidates who are recorded and not recorded in Employee Central, the search functionality isn't affected. Candidates who are in Employee Central don't need to visit their candidate account for them to be searchable. However, the candidates who aren't in Employee Central aren't searchable if they haven't visited the candidate account.
- Internal candidates are searchable depending on the data privacy settings, read permissions configured in the Succession Data Model, and internal candidate search settings.
- The country/region field configuration in the candidate profile template must match the corresponding configuration in Succession Data Model to ensure accurate search results.
- The default country/region value in the Country/Region picklist and the Country/Region generic object must match to ensure that candidate search using country/region field is successful.
- Candidates are added to the search index based on DPCS settings and Candidate Privacy Options (cross-border settings).
  - No DPCS: Internal candidate is searchable. The candidate is created on the fly while searching based on the visibility options. In this case, the candidate is also created when the internal user accesses the [Careers](#) tab.
  - DPCS1.0: Internal candidate is searchable. The candidate is created on the fly while searching based on the visibility options.
  - DPCS2.0: Internal or external candidates who haven't accepted DPCS 2.0 aren't searchable. The system prompts internal candidates to accept DPCS 2.0 when they click [My Candidate Profile](#) or apply for a job. The system prompts external candidates to accept DPCS 2.0 when they create their account. If the DPCS has been changed, candidates who accepted the DPCS earlier are prompted to accept the DPCS again when they log on the next time.

How is a candidate added to the search index? It's based on the DPCS settings and Candidate Privacy Options (cross border settings). [My candidate profile](#) isn't created until the internal user navigates to [My Candidate Profile](#) and accepts the DPCS statement.

## 20.3.2 Recruiting Search Methods

A user can choose which search method to use.

“Simple Search”: The Simple Search tab under the Candidate Search component of Recruiting provides the ability to search on Resumes/CV, Candidate Profiles, and Cover Letters using keywords and phrases.

“Tag Search”: The Tag Search tab under Candidate Search component of Recruiting provides the ability to search Candidate Profiles for specific tags that have been assigned to the individual.

“Advance Search”: The Advance Search tab under Candidate Search component of Recruiting provides the ability to search for specific keywords and phrases on the Resume, specific fields on the Candidate Profile, and tags assigned to the Candidate – or any combination of these.

## 20.3.3 Search Logic

**Search Logic** is based on a multidimensional search algorithm, which includes a ranking prioritization of results based on criteria occurrence, frequency, stemming, and relativities of all criteria.

The following are search characters and terms, which provide advanced capabilities in targeting searches. These can be used on both the Simple and the Advance Search tabs in Recruiting.

**Occurrence:** is the most influential aspect of search logic. For example, candidates are ranked higher if they match more or all of the search criteria.

**Frequency:** the number of times a search criterion is found on the Candidate. For example, people with the word “Engineer” in their profile/resume multiple times are ranked higher than people with fewer references to the word “Engineer”.

**Stemming:** helps to identify words similar to the search criteria. For example, when you search for the word “Engineer”, the system also looks for derivations of the word, such as “Engine”, “Engineering”, “Engineers”, and so on.

**Relevancy:** includes a variety of searching logic, which helps to find superior matches. The uniqueness of criteria matches provides a relevancy boost to the results. For example, “Microplasticology” is given more weight in ranking results than the word “project”, due to its uniqueness. The location of search criteria to one another provides a relevancy boost to the results. For example, “Engineer Vice President” is ranked higher than candidates with both words “Engineer” and “Vice President” located distantly in the resume/CV.

## Candidate Search Using "contains" and "is exactly" Search Criteria

- Candidate search using "contains" search criteria: The "contains" search criteria narrows search results based on the specified text. For example, if you use this criteria to search for address that contains “Square”, the search results include, for example, “Trafalgar **Square**” and “Center **Square**”. However, if the searched text is a substring of the address, it isn't retrieved. For example, the address containing “Big**Square**” isn't found. Similarly, if the address contains “Sq”, the addresses “Trafalgar **Square**” and “Center **Square**” aren't found. If the searched text includes spaces, the system divides each space-separated text into separate search text and uses the "OR" logic to find occurrences of each text. For example, when you use the "contains" criteria to search for candidates based on the ZIP code, “T3H 5E8”, the system considers “T3H” and “5E8” as separate

search text as there's a space between them. The search returns candidates whose data contains either "T3H" or "5E8".

- **Candidate search using "is exactly" search criteria:** The "is exactly" search criteria returns search results based on exact match. For example, when you use the "is exactly" criteria to search for candidates based on the ZIP code, for example, "T3H 5E8", only candidates whose records have data matching exactly with the ZIP code are found. The space between "T3H" and "5E8" is treated as a normal character and isn't considered as an extra space between the two texts. When you search for a user named, "Robin", user names like "Robins" and "Robinson" don't appear in the search result as they don't form an exact match. However, the symbols ampersand "&", slashes "/" and "\", and dash "-" separate one term from the other that results in two or more different words. For example, when searching for the department "IT", the search result can include departments, like IT/Sales, IT & Sales, or IT-Sales.

## 20.3.4 Wildcard Characters in Candidate Search

Wildcards, such as question marks, asterisks, and tilde, are characters that can be used as search criteria to narrow or expand alternatives in the search results.

**Question Mark Character (?)** – the question mark character (?) can be used when searching for terms where a single character isn't known, or is variable in the results desired. When the exact spelling of a name isn't known, then the question mark character can be used to identify people with any character in that location. For example, searching for "Thomps?n" returns people named Thompson and Thompsen.

**Multiple Characters (\*)** – the asterisk (\*) character can be used as a wildcard when searching for terms, where any number of the characters aren't known. Using the asterisk results in the greatest diversity of matches. When the search needs to include a wide variety of results, the asterisk is the best option. For example, to find people that have the terms, such as certificate, certification, certified, or cert. You can search for <cert\*>, which returns results with any of these terms in their profiles and resume/CV.

**Capitalization** – to search on the specific capitalization of characters, use the quotation marks ("" ) around the letters. The default behavior of a search doesn't treat capitalized letters any different than noncapitalized ones. However, if the capitalization is important for more accurate search results, then use quotation marks around the specific letter. For example, searching on the term Success"F"actors ranks the results higher, where the letter F is capitalized, than the ones where it isn't (example: Successfactors, successfactors).

**Fuzzy searches (~)** – to do a fuzzy logic search use the tilde ~ symbol at the end of a single term. Fuzzy logic provides assistive search logic to find similar spellings. For example, search for a term similar in spelling to roam use a tilde at the end of the word "roam~". This search finds terms like foam, roam, roams, room, road, roads, etc.

**Phrase searching ("" )** – to search for more than one word in a specific order, use 'quotation marks around the full phrase. A Phrase is a group of words surrounded by double quotes such as "hello world", ranks that full phrase higher in results. For example, searching for the exact phrase "Project Manager" only results in top Candidates, which have the exact phrase Project Manager.

**Mixed searches** – both wildcards and phrases can be used in combination to identify the best overall match. For example, searching for "Project \*" returns project manager, project owner, project coordinator, project sponsor, and so on.

### → Remember

The more wildcards, more diluted the search results can become. For example, results are ambiguous when searching for the term, "Pro\*Ma??ger~"

## 20.3.5 Search Terms

When searching for terms, you can add the **AND** and **OR** operators to the criteria statement.

### ❖ Example

Make sure you use uppercase letters for operators. Correct format:

```
<Search Criteria 1> AND <Search Criteria 2>
```

Incorrect format:

```
<Search Criteria 1> and <Search Criteria 2>
```

These operators act as follows on the search:

| Operator | Behavior                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OR       | <p>OR logic (default behavior) – searches using multiple words, treating each term with the "OR" expression. In other words, the engine looks for anyone who has Term A OR Term B. The result set appears with the combination of people with Term A, Term B, as well as people with both Term A and Term B in their profile/resume. For example, Sales OR Marketing results in people with Sales and Marketing, only Sales, and only Marketing in their profile/resume.</p> <div><p><b>Note</b></p><p>Using the OR term in search criteria can be used, but isn't necessary because it's the default behavior of search.</p></div> |
| AND      | <p>AND logic (specific behavior) – searches using multiple words connected by "AND" are treated as a single search criteria (for example, Sales AND Marketing). In other words, the search engine returns to the top of the result for those people who have BOTH words in their profile/resume. This results in very smaller search results, because 'both' conditions must be met. For example, Russia AND USA = only people with both words, Russia and USA in their profile/resume. The word AND must be expressed in the search field between the two words.</p>                                                               |

## 20.3.6 Matching, Stopwords, and Notes in Candidate Search

Learn about relativistic ranking of candidate matches, how searches based on stopwords are handled, and how to use different types of notes.

### Matching

When conducting a Candidate Search in Recruiting instances where Advanced Relevancy is enabled, the system can display a relativistic ranking of candidate matches based on the criteria provided.

The ranking is shown using a display of stars from 5 (perfect match) down to half a star (barely matched), in half star decrements. This method of ranking (also known as stars) provides a clear understanding of the top matches in the list, and also a relative rank between candidates in the list. For example, four-star matches are much better than two-star matches.

### Stopwords

Some words appear so frequently in a language, that their usage renders a search useless, since the uniqueness of the results are lost. As a result, most search engines contain 'stopwords', which are neither indexed nor used in any search. For example, the word 'the' appears in most books over 10,000 times. Therefore, searching for pages with the word 'the' returns almost every page in the book.

The SuccessFactors search engine ignores stopwords. The following is a partial list of stopwords, in English, which are currently ignored in searches: an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, and with.

Consider the following points while performing a search for candidates:

- Don't use quotation marks to search for stopwords. Quotation marks and asterisk (\*) must be used around a phrase or concept of two or more words. This ensures that the concept is searched for as a whole.
- Enter "Information Technology" instead of "IT" in your search filters to obtain better results.

### Notes

When using notes, a user can choose which type to use.

**Case Insensitivity:** searches don't consider the letter case, unless the letter is surrounded by quotation marks (for example, "S"uccess"F"actors).

**Security:** only fields that are marked as "read" in the data model are searchable (for example, hidden fields aren't searchable).

**Custom Fields:** custom fields on the Candidate Profile are indexed and searched.

**Character Wildcards:** can't start the search criteria. The wildcard characters of asterisk, question mark, and tilde can't start the search criteria. For example, *\*person* isn't an accepted search term.

## 20.3.7 Tag Search and Favorite Search

If the system is configured to use maximum possible search functionality in the instance and candidate tagging is enabled, the SAP SuccessFactors Recruiting user can include tags or favorite candidates in the search.

The *Tag* and *Favorite* options appear in the Candidates page in SAP SuccessFactors Recruiting

- *Tag* – allows the user to select tags from a Tag Cloud in their current locale and return candidates who have been tagged with that phrase.
- *Favorite* – allows the user to limit their search results to only candidates marked as personal Favorites. Additional configuration is required.

The interface for selecting tags is a Tag Cloud. This is a common interface on the internet that shows highest traffic tags by size and placement in the group of tags.

## 20.3.8 Configuring Candidate Privacy Options

Recruiting users can now configure candidate privacy options to control the candidate profile searchability and visibility.

### Prerequisites

- You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- To access the candidate page, you must have candidate search permissions configured in RBP.

### Context

Configuring Candidate Privacy Options for a candidate impacts the following:

- Candidate visibility to instance users.
- Candidate searchability in recruiting.
- Forwarding of candidates to requisitions and to colleague.

#### 📘 Note

To avoid getting an error while searching for candidates, make sure to use the Corporate Data Model as the picklist field to set the user's country/region.

Follow the procedure, to enable Candidate Privacy options:

## Procedure

1. Go to ► [Provisioning](#) ► [Managing Recruiting](#) ► [Edit Candidate Privacy Options](#) ►, to add, or edit the Candidate Profile Visibility Options available.
2. Select the following options to ask candidates to set their visibility settings:

| Option                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>External Candidates</b> | <ul style="list-style-type: none"><li>• Ask external candidates to set their visibility settings when creating an account or profile<ul style="list-style-type: none"><li>• Allow internal users with appropriate add candidate permissions to set external candidate visibility upon manually adding a candidate</li><li>• Allow agency users with appropriate add candidate permissions to set external candidate visibility upon manually adding a candidate</li></ul></li><li>• Default option applied to existing external candidates after the synchronization process is complete.</li></ul> |
| <b>Internal Candidates</b> | <ul style="list-style-type: none"><li>• Ask internal candidates to set their visibility settings when creating an account or profile</li><li>• Default option applied to existing internal candidates after the synchronization process is complete</li></ul>                                                                                                                                                                                                                                                                                                                                       |
| <b>Intranet Candidates</b> | <ul style="list-style-type: none"><li>• Ask intranet candidates to set their visibility settings when creating an account or profile</li><li>• Default option applied to intranet candidates after the synchronization process is complete:</li></ul>                                                                                                                                                                                                                                                                                                                                               |

For external, internal or intranet candidates, you can configure in the [Candidate Profile](#) page to ask the candidates to set the privacy options for their candidate profile. If this option is enabled, candidates can select any of the following options:

### Privacy Settings

| Option                                                  | Description                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Any company recruiter worldwide                         | (Default) Candidate can be found by any recruiter with the search permissions. This is the default setting if the Privacy feature isn't turned on.                                                                                                                                                                                                         |
| Any company recruiter in my country/region of residence | Recruiters without a country/region on their employee profile receive an error when they try to search.                                                                                                                                                                                                                                                    |
| Only recruiters managing jobs I apply to                | A Recruiter in the candidate's country/region of residence finds the candidate in a candidate search. Only visible on the requisitions they've applied to. The candidate can't be forwarded to a colleague. Attempts to forward the candidate prevent colleagues from being found in the search bar to select the colleague without explaining the reason. |

3. Click [Save Settings](#).
4. Click [Sync Visibility Options](#). Enabled only when candidates whose share profile flag isn't set. Sync Visibility Options is a onetime activity for an instance to update the candidate share profile values with default settings. The [Sync Visibility Options](#) option is disabled after you select the default search option.

## 20.3.9 Finding a Candidate by Name or ID

Recruiting users can find a specific candidate by name or the ID assigned to the candidate.

### Procedure

1. Navigate to the [Candidates](#) tab.
2. Do one of the following:
  - To find a candidate by name, click [Search by Name](#) and enter the candidate name criteria in the textbox.
  - To find a candidate by ID, click [Search by Candidate ID](#) and enter the candidate's ID in the textbox.

For search based on candidate name criteria, the autocomplete suggests names. By default, a maximum of 30 suggested names appear. To get lesser combination of names, type in the last name or the middle name.

3. Select a name from the suggested names.

### Results

The selected candidate's profile appears.

## 20.3.10 Finding Candidates by Multiple Criteria and Saved Searches

Recruiting users can select multiple criteria to build complex searches. Also, Recruiting users can save multicriteria searches.

### Procedure

1. Navigate to ► [Candidates](#) ► [KEYWORD AND ITEM SEARCH](#) ►. To expand the search bar, click the arrow next to the [Search](#) heading.
2. Choose a search method.
  - For a multicriteria search, expand the [Search](#) section and add search criteria from the following fields:
    - [Candidate type](#): Restricts search by candidate type (internal, external or both). Agency candidates are external.

#### Note

The **contains** search is a whole word search, not a partial word search.

- [Marketing Emails Consent](#) Restricts search to a selected email-consent value. The possible values are Any, Accepted, Declined, Either Accepted or Declined, and Neither Accepted Nor Declined.
- [Keyword \(Resume or cover letter contains the following:\)](#) Searches the text in the resume and cover letter only. The system doesn't search additional attachments.

#### Note

The system uses OCR to make all uploaded resumes searchable, including PDF documents. The system can't search some resumes depending on the way the content was created. For example, the system doesn't search Microsoft Word documents based on templates that store data in Content Control boxes.

The system finds partial matches, similar to wild-card search results. For example, if the user enters **Cha** as a search string, the search engine returns any word that contains **Cha**, such as Charlotte, Charles, or Charlene.

The system searches for any words entered into the search box individually, not as phrases. For example, a search for the words "sales" and "engineer" can find both "sales manager" and "project engineer."

- [Talent Pools](#)
- [Location](#)
- [Tag](#)
- [Favorite](#)
- [Employee Referral](#)
- [Job Req ID](#) accepts only the full job requisition ID.

#### Note

You can't restrict a Recruiting user from searching the entire candidate database while allowing the user to search only candidates who applied to a specific requisition.

[Job Req ID](#) is an autocomplete field. The autocomplete display shows only requisitions meeting the following criteria:

- They're in the [approved](#) state
- They have the user as an operator
- They have a job description
- They're in the user's locale
- [Basic Info](#) The user can select any field defined in the Candidate Profile XML to use in search. You can't remove, hide, or permission fields. The system displays all fields defined on the [Candidate Profile](#).
- [Background](#) The user can select any background element fields defined in the Candidate Profile XML to use in search. You can't remove, hide, or permission fields. The system displays all background elements defined on the [Candidate Profile](#).
- [Profile Extension](#)
- [Activity](#) The user can restrict search results to only candidate profiles created in a particular period of time, candidates who have applied to a job in a particular period of time, or candidates who haven't applied to a job but created their profile in a particular period of time. To search of a bulk upload of candidate profiles from a CSV file, click ► [Activity](#) ► [Created Via Bulk Upload](#) ►.
- [Any of...](#) The system deploys an [OR](#) operator between conditions instead of an [AND](#) operator.

- For a saved search, click [Saved Search List](#). Expand the dropdown menu in the [Actions](#) column for the saved search desired, and click [Search](#).
3. Do one of the following:
- To run the search, click the [Search](#) button.
  - To save the search, click [Save Search](#). Enter a name into the [Search Name](#) field, and click [OK](#).

## 20.3.11 Finding Candidates by Saved Search

Recruiting users can find candidates by running multi-criteria saved searches.

### Procedure

1. Navigate to ► [Candidates](#) ► [KEYWORD AND ITEM SEARCH](#) ►.
2. Click [Saved Search List](#). Expand the drop-down menu in the [Actions](#) column for the saved search desired, and click [Search](#).

## 20.3.12 Configuring Radial Search

Configure zip/postal code and mile/kilometer radius fields to allow recruiting users to be able to perform radial searches for candidates.

### Prerequisites

- Ensure that you have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- Configure the country picklist with only ISO values for country/region names.

### Context

- Candidate search results are returned in distance order, and results cannot be sorted by other columns.
- Candidates who do not have a country/region or zip/postal code on their candidate profile will not be returned in the Radial Candidate Search results. Configure these fields as required.

## Procedure

1. Navigate to [Provisioning](#) > [Company Settings](#) > [Recruiting](#) > [Enable Radial Candidate Search](#), and configure the field IDs in the Candidate Profile XML for the following required fields:

- Zip
- Country

2. Request a reindex.

The [Location](#) option uses the zip or postal code to perform a search for candidates within a particular distance from a central point.

### → Tip

When searching for postal codes in Canada, enter the post code in all caps in the format `<XXX><space><XXXX>` (three characters, followed by a space, followed by four characters).

## Related Information

[When to Request a Reindex of the Candidate Profile Template \[page 923\]](#)

## 20.4 Candidate Search Results

Candidate search results include a listing of all candidates matching the search criteria.

You can select the appropriate option from the items-per-page dropdown to view the number of candidates displayed per results page. The list of candidates displayed on each results page is sorted by candidate ID.

The search result page includes a quick link to the resume, default columns, and optional configurable columns. You can view search results in either [List](#) or [Thumb](#) view. The default view is [Thumb](#) view.

### ⓘ Note

Keywords used for candidate search don't appear highlighted in candidate search results.

The data displayed in the [Candidate](#) and [Contact Info](#) columns are preset. You can't configure these data.

The [Candidate](#) column contains:

- For internal candidates (from employee profile):
  - Thumbnail picture
  - First name
  - Last name
  - Quickcard
  - Department

- Division
- Location
- Tenure calculated from hire date
- For external candidates (from candidate profile):
  - Blank thumbnail picture
  - First name
  - Last name
  - External

The [Contact Info](#) column contains:

- For internal candidates (from employee profile):
  - Standard e-mail field
  - Standard home phone field
  - Standard cell phone field
  - Standard location field
- For external candidates (from candidate profile):
  - Standard email field
  - Standard home phone field
  - Standard cell phone field

The Recruiting user can click a candidate name from the search results list to open the candidate profile. This page includes the selected candidate profile, and a [Candidates Found](#) navigation bar that displays candidate search results. The items-per-page dropdown from [Candidate Search Results](#) defines the number of candidates displayed in the [Candidates Found](#) navigation bar. To change the number of items per page, return to the [Candidate Search Results](#) page.

Optional features include:

- Candidate Search OFCCP compliance warning and auditing.
- [Display Options](#) to refine data displayed in the search results table. This feature requires access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## 20.4.1 Enhanced Universal People Search

Universal People Search enables you to search and find people in your organizations. The universal people search feature is enhanced for the autocomplete and advanced search widget to provide search suggestions with multiple employment information for a user by name or user ID.

### Autocomplete Search

The autocomplete search widget has the following capabilities:

- Ability to control search results with Role-Based Permissions, which include the information to be provided on a need to know basis.

- Internal users with multiple assignments or employments are now displayed in the search results with indicators displaying the employment type.
- Users with multiple employments can set up personal preferences individually for each employment associated with the user. The individual groups of users are auto-populated in Job Requisition operatorTeam fields based on the employment profile selected for a job requisition operator.

For more information about each of the individual functionality, see the related information section.

#### 📌 Note

The autocomplete feature is no longer dependent on the following options:

- Person-Employment V1 (Smart Suite Mode)
- EC-V2
- RBP
- Concurrent Employment or Global Assignment

The multiple employment information support in the autocomplete search is enabled by default. To disable this feature, select the [Disable Universal Person Auto-Complete Search](#) option in ► [Provisioning](#) ► [Company Settings](#) ►.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Advanced Search

The advanced search widget is enhanced to identify and select a person with the preferred employment type for specific recruiting processes from the search results. The multiple employment types and additional data for a user is displayed for global assignments and concurrent employments.

The advanced search widget has the following capabilities:

- For a customer using global assignments and concurrent employments, search results show multiple employments with indicators displaying the employment type of a user in the search results
- Show relevant results when searching for names with or without accent characters.
- Display contingent workers and indicators of a person as contingent worker in the search results.
- Supports custom filters defined in Succession Data Model as the search filters.

#### 📌 Note

The search results are restricted based on Recruiting Groups and target population under RBP permissions.

### Autocomplete and Advanced Search Adoption in Recruiting pages

The following table shows the Recruiting pages supporting Autocomplete and Advanced search feature:

Recruiting Pages with Autocomplete and Advanced Search Support

| Recruiting Pages                                                                                                                                                                                                                            | Auto-Complete Search | Advanced Search |

### 20.4.1.1 Configuring Customizable Fields on Advanced Search Widget

The administrator can display customizable fields as search criteria on the search widget of Advanced Search.

## Prerequisites

- You've configured customizable fields in Succession Data Model.

### Example

If you want to display two customizable fields, add the following sample code in your data model.

#### Sample Code

```
<custom-filters>
  <filter-module id="default">
    <standard-element-ref refid="custom01"/>
    <standard-element-ref refid="custom02"/>
  </filter-module>
</custom-filters>
```

## Context

You can customize up to 15 additional search fields on the widget of Advanced Search after correct configuration.

## Procedure

1. Go to ► [Admin Center](#) ► [Tools](#) ► and search for [Manage Permission Roles](#).
2. In [Permission Role List](#) screen, create new or select existing permission roles for your users.

Provided you want to create a new permission role to grant the role-based permission, choose [Create New](#) and open [Permission Role Detail](#) screen.

### → Tip

For more details about how to create a permission role, you can refer to [Permission Roles](#).

3. In [Permission Role Detail](#) screen, choose [Permission...](#) and open [Permission settings](#) dialogue box.
4. In [Permission settings](#) screen, grant the permission ► [User Permissions](#) ► [Employee Data](#) ► [Customizable Field 1-15](#) ► to the permission role. Choose [Done](#).
5. Still in [Permission Role Detail](#) screen, choose ► [Grant this role to...](#) ► [Add...](#) ► and grant this permission role to the permission group you've configured for People Search users. Choose [Done](#).
6. Choose [Save Changes](#).

## Results

The customizable fields are now displayed on the Advanced Search widget.

## 20.4.2 Configuring Candidate Search Based on DPCS Acceptance

The candidate search functionality based on the acceptance status of the Data Privacy Consent Statement (DPCS) ensures that candidates (internal or external) are searchable only if they've accepted at least one version of the DPCS.

### Prerequisites

Ensure that the following settings are configured in Provisioning:

- Data Privacy Consent Statement 2.0 is enabled in ► [Provisioning](#) ► [Company Settings](#) ►.
- The option for the *Use DPCS Version* dropdown field in ► [Provisioning](#) ► [Managing Recruiting](#) ► [Edit Candidate Privacy Options](#) ► [Data Privacy Settings](#) ► is set to DPCS 2.
- Depending on your requirements, at least one of the following must be enabled:
  - *Enable external data privacy agreement set up, and require acceptance on external candidate registration*: If this option is enabled, only those external candidates who have accepted at least one version of DPCS are included in search results.
  - *Enable internal data privacy agreement set up*: If this option is enabled, only those internal candidates who have accepted at least one version of DPCS are included in search results.

#### Note

If both options are selected, DPCS acceptance-based search applies to both internal and external candidates.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Settings](#) ►.
2. Under the *General Data Privacy Settings* section, enable the option, *Allow Recruiting users to access candidate information if they have accepted one of the versions of the Data Privacy Consent Statement*.

Candidates who have accepted at least one version of DPCS, are accessible in the following areas:

- Advanced search
- Quick search
- Candidate tags
- Background elements

- [Talent pools](#) page
- [E-mail campaign](#) page
- [Manage Duplicate Candidates](#) page

#### ⓘ Note

- Candidates who haven't accepted DPCS at least once:
  - Don't appear in Embedded Analytics reports.
  - Aren't displayed in the existing [Talent Pools](#) and draft [Email Campaigns](#).
  - Aren't accessible via OData API GET calls.
- Applications that are created by the candidate before enabling this option continue to be available on Recruiting Management pages.  
If this functionality is disabled, all candidates are searchable irrespective of the DPCS acceptance status.

## 20.4.3 Candidate Power Search Relevancy

### 20.4.3.1 Candidate Power Search

Learn how candidate search results are ordered based on stars calculated for relevancy.

Ordering of candidate search results is based on number of criteria's matching that candidate's and their corresponding SOLR scores. Number of star calculated as part of relevancy is specific to the query specified in candidate power search and are calculated on the fly.

#### Formula to calculate total number of stars

Total number of stars displayed for that candidate =

(Number of search criteria met by that candidate / Total number of search criteria specified) \* 5

There are two different types of candidate power search criteria which need to be understood to understand relevancy calculation

1. **Full criteria match - Without any "AnyOf" search criteria**
2. **Partial criteria match - With "AnyOf" search criteria (Fixed with b1201)**

### 20.4.3.2 Full Criteria Match - Without any "AnyOf" Search Criteria

When you specify search criteria, the system tries to fetch candidates matching all the criteria specified.

All candidates displayed in the search results match all search criteria specified so they have the same stars. However, internally they are ordered based on the descending order of cumulative document scores for that

candidate provided by SOLR. Therefore, whichever candidate has the highest score is shown first and the candidate with the lowest document score is shown last.

### Example

User's candidate search criteria:

**firstName = "Mark" AND lastName = "Thompson"**

The system searches for all candidates who have firstName as "Mark" and lastName as "Thompson" in SOLR.

### Using the formula

Total number of Stars = (Number of search criteria met by that candidate / Total number of search criteria specified) \* 5

Total number of search criteria specified = 2

Number of search criteria met by candidate, "Mark Thompson" = 2

Total number of Stars for "Mark Thompson" =  $(2 / 2) * 5 = 5$  stars

After fetching candidate results that match all criteria, the system orders the results based on the descending order of the SOLR candidate-specific cumulative document scores.

## Related Information

[SOLR Score Calculation \[page 881\]](#)

## 20.4.3.3 Partial Criteria Match - With "AnyOf" Search Criteria

When "AnyOf" criteria is specified we will get candidates who are partially matching the user specified criteria.

We first order candidates who match most of the user specified search criteria first and then order all candidates with same stars based on the cumulative SOLR document scores.

### Example

User's candidate search criteria:

**firstName = "Mark" AND AnyOf( lastName = "Thompson" OR lastName = "Robinson")**

Our search solution searches for all candidates who have firstName with "Mark" and lastName as "Thompson or Robinson" in SOLR.

### Using the formula

Total number of Stars = (Number of search criteria met by that candidate / Total number of search criteria specified) \* 5

Total number of search criteria specified = 3

For "Mark Thompson", candidate number of criteria matched = 2

For "Mark Thompson", total number of stars =  $(2 / 3) * 5 = 3$  and half stars

For "Mark Robinson", candidate number of criteria matched = 2

For "Mark Robinson", total number of stars =  $(2 / 3) * 5 = 3$  and half stars

## 20.4.3.4 SOLR Score Calculation

SOLR document scores determine the order of search results when a number of criteria met by candidates are the same. The search results are arranged in the descending order of these scores.

Relevancy score is the summation and product of the score calculated based on the four factors below:

1. **Term frequency (tf)**  
Term frequency is the measure of how many times the term occurs in the document more frequent the term occurs in a document greater its score
2. **Inverse Document Frequency (idf)**  
This is a measure of how frequently a word occurs across documents  
The more frequently a term occurs across different documents, the lower its score
3. **QueryNorm (query Norm)**  
Among the terms in the query, document contains more matching query terms will have a higher score
4. **Length Norm (field Norm)**  
Term matched in fields with fewer terms have a higher score. A term in a field with fewer terms is more important than one with more.

### Formula

Final individual criteria Score = Summation of scores of each query term's product (queryWeight \* fieldWeight)

1.  $\text{queryWeight} = (\text{tf} * \text{idf} * \text{queryNorm})$
2.  $\text{fieldWeight} = (\text{tf} * \text{idf} * \text{fieldNorm})$

5. **Coordination factor**  
When multiple criteria are specified in the query with OR clause we calculate the coordination factor which is specific to that query and multiply the final score to get the relevant documents.  
Total score is the sum of all the scores of matched criteria multiplied by the coordination factor.

**Formula for overall score = (sum of individual criteria match score) \* coordination factor.**

For examples about these search terms, refer to Job Requisition search relevancy documentation.

## 20.4.4 Match Score

## 20.4.4.1 Enabling the Match Score

Recruiting users viewing candidate search results can include a column that shows a relative ranking of the candidates. This is shown as the “cool little stars” in the <Match Score> column, starting at a half star and going up to five stars, in half-star increments.

### Prerequisites

You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Procedure

To display the match score, select *Enable advanced relevancy for candidate search* in ► *Provisioning* ► *Company Settings* ► *Recruiting* ►.

## 20.4.5 Inline Resume Viewer / Resume Carousel

Resume Carousel/Inline Resume Viewer is an opt-in functionality that allows recruiting users to view resumes in the browser without downloading the resume or opening a separate application such as Word or Adobe Acrobat.

When a candidate adds a resume to their candidate profile, the system converts it to a JPG image viewable in the browser. Whenever a recruiting user accesses a resume via the inline resume viewer the system checks for that JPG file; if no image copy of the resume is found the system will convert the resume to an image on the fly.

The recruiting user can mass print and mass save candidate resumes and cover letters from the inline resume viewer.

# 21 Managing Candidates in SAP SuccessFactors

A good candidate experience is critical to any successful recruiting practice. This experience starts from the time a job is advertised until the candidate accepts the job offer and is ready to start the onboarding process.

## Know Before You Start

- Candidates create a profile. There's only one candidate profile per candidate. However, you can set permission so that different fields are visible on the profile to internal and external candidates.
- The application experience is defined by a job application template.
- A candidate's progress through the recruiting process is defined by their applicant status.
- After you configure job application templates, you have to associate it to a job requisition, by updating the Application Template Name in the job requisition template.
- After you configure applicant status sets, you have to associate it to a job requisition, by updating the Application Status Set in the job requisition template.
- A status has to be added to the base set in Provisioning before it can be selected in an applicant status set.
- When setting up applicant status sets, if you need to add translations or configure recruiting e-mail templates, you need to do it manually for each instance in your system. There's no migration tool.
- When using multistage configuration, you need to configure active statuses in the field permissions from the Application Status Set in the job requisition template.

## Leading Practices

- If a new required field is added to a job application template after a customer is live, create a new job application template. This action ensures that candidates aren't stuck in an applicant status.
- Limit the number of job application templates to help keep field labels the same and allow for better reporting.
- Configure display options to give people more flexibility when they view job application and candidate profile data.
- Create business rules to help with automating the selection process.
- Enable Mobile Apply for a better candidate experience.

## 21.1 Candidate Profile in SAP SuccessFactors

The Candidate Profile is the record of the candidate's data in the searchable candidate database. It's often described as the candidate's online resume, although the Candidate Profile usually contains more data than just the resume attachment.

Both internal and external candidates have candidate profiles. Not all employees are candidates by default. Depending on your data privacy consent statement settings, the employee may have to opt in to become an internal candidate.

Candidate profiles are used for multiple purposes. You can choose to capture candidate data for future use, even when the candidate hasn't found a job to apply for. If a candidate does apply to a posted requisition, the candidate profile data is appended to the application. Recruiting users can search candidate profile records to locate potential matches for job requisitions. If a good match is found, the candidate profile record can be forwarded to one or more applicable job requisitions.

### Note

You can extract most of the candidate profile information, including attachments, from the system using [Integration Center](#) or the OData API.

Candidate profiles are unaffiliated with requisitions; that is, they're standalone searchable records in the database. A candidate completes basic details such as name and contact information, resume, and cover letter and provides more detailed information. Examples of detailed information include work experience, education, and anything else an organization wants to include on the template. This data makes up the basis of the Candidate Search and since it's stored discretely, it's discretely searchable. You can't configure the layout, sizing, and spacing of the Candidate Profile.

### Note

- The index is created automatically when Recruiting is enabled and the Candidate Profile template is uploaded.
- You don't need to reindex the instance after making changes to the Candidate Profile template.

The Candidate Profile contains the following sections.

#### Candidate Profile Sections

| Section                                   | Description                                                                                                                          |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Header instructional text</a> | Shows a welcome message, images, and instructions to candidates, or recruiting users. Can be hidden or shown based on configuration. |

| Section                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Business card</i>               | <p>The candidate name, e-mail address, and mobile phone. The business card always shows, and you can't add or move fields that appear. Title and Company also are supported in the business card and they appear if these standard fields are configured in the template. An auto-population logic exists for the Title and Company fields. For internal candidates, if the candidate doesn't provide a value in the Title and Company fields, then the logic to auto-populate those fields is triggered. This means that the Title field is automatically populated with the value from the first field of the first background element. The Company field is populated with the value from the second field of the first background element. If values for Title and Company are provided by candidate, then this auto-populate logic isn't triggered.</p>                   |
| <i>Resume and cover letter</i>     | <p>Resume and cover letter attachment fields always are displayed regardless of configuration but should be explicitly configured anyway. Accepted file types for resume and cover letter uploads are .doc, .docx, .gif, .jpeg, .jpg, .pdf, and .txt. Files not supported are .html, .mp3, .mp4, .msg, .png, .ppt, .pptx, .xls, and .xlsx.</p> <p>You can't attach protected or secured PDFs. Attempts to attach a secured PDF produced the error message, <b>An exception was encountered while uploading the Attachment.</b></p> <p>The SAP Virus Scan Interface performs scans on attached resumes and cover letters. In addition, anti-virus scanning runs on servers performing file uploads. If any viruses are found, the documents aren't sent to the server.</p> <p>Save text documents (.txt) with Unicode Encoding Type, not ANSI, or another type of encoding.</p> |
| <i>Data Privacy and Visibility</i> | <p>Radio buttons displaying the candidate's current visibility setting and alternate options, and a link to the current version of the data privacy consent statement for the candidate's country/region. Can be hidden or shown based on configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <i>Documents</i>                   | <p>Attachments Portlet that stores attachment fields other than resume and cover letter when the client wants to collect additional attachments can't be hidden. This portlet doesn't appear on the Application page.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <i>More Information</i>            | <p>Stores single-value fields, which are often used for personal information data fields such as name, phone number, and e-mail address. Can't be hidden.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Section                                                          | Description                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Background elements</a>                              | Enables a candidate to create data sets that consist of multiple entries, for example education information where each line of data can contain multiple fields such as school name, or degree experience where each line of data can contain multiple fields like employer, title, and dates. Can be hidden or shown based on configuration.         |
| <a href="#">Comments</a> (Recruiting user view only)             | Shows that any comments previously added to the record, and allows recruiting users with appropriate permissions to add new comments.                                                                                                                                                                                                                 |
| <a href="#">Tags</a> (Recruiting user view only)                 | Shows that tags previously added to the record to increase searchability, and allows recruiting users with appropriate permissions to add new tags.                                                                                                                                                                                                   |
| <a href="#">Jobs Applied Portlet</a> (Recruiting user view only) | Displays the requisition ID, job requisition title, recruiter name, and the application date (date when the candidate applied). If an internal recruiting user has access to the requisition listed in the Jobs Applied Portlet, the job requisition title appears as a link to that job requisition. Displays to users with appropriate permissions. |
| <a href="#">Correspondence</a>                                   | Displays the history of emails sent from the system to the applicant in relation to the application (always appears). You can view information on Sender, Date, Subject, and Type up to four rows by default and a <a href="#">Send Email</a> link in the header.                                                                                     |
| <a href="#">Footer instructional text</a>                        | Often used to display compliance notification messages and instructions to candidates, or recruiting users (can be configured to display).                                                                                                                                                                                                            |

## 21.1.1 Configuring the Candidate Profile Template

Configure the Candidate Profile XML template to set up the candidate profile for your recruiting process.

### Prerequisites

- Recruiting is enabled in Provisioning.
- If you plan to use SM-mapping to sync Candidate Profile data with Employee Profile data, set up the Succession Data Model first.
- Necessary picklists for candidate profile have been created.
- You have access to Provisioning.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Procedure

1. Go to [Provisioning](#) > [Managing Recruiting](#) > [Edit Candidate Profile Template](#).
2. Copy and paste the entire code from Candidate Profile Template form to an XML editor.
3. Make two copies of the XML code and save them. Mark one copy as the original and archive it. Then work with the second copy.

**Always create two copies of the XML file.** This way, you can revert to the original code at any point if something goes wrong in your working copy.

4. Configure the following sections of the template
  - Template name
  - Instruction text for internal and external candidates
  - Instruction text for recruiting users
  - Field definitions
  - Candidate background information
  - SM-mapping
  - Field permissions
5. Save the template.
6. Go to [Provisioning](#) > [Managing Recruiting](#) > [Edit Candidate Profile Template](#).
7. Copy the modified code from your configured template and paste it into the Candidate Profile Template form.
8. Choose [Save Form](#).

## Results

### Note

The index is created automatically when Recruiting is enabled and the Candidate Profile template is uploaded.

[Candidate Profile Element: Field Permissions \[page 909\]](#)

### 21.1.1.1 Candidate Profile Element: Template Name

In the Candidate Profile template, the `<template-name>` tag defines the template name. Use a descriptive name to define the template.

You can also add the `<template-desc>` element to add a description of the template.

Both the `template-name` and `template-desc` elements must immediately follow the `candidate-profile-data-model` element. You can change the CDATA content as it doesn't appear anywhere in the instance or in Provisioning, isn't referenced by any other XML, and is invisible to the customer.

#### Sample Code

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE candidate-profile-data-model PUBLIC "-//SuccessFactors, Inc.//DTD
Candidate Profile Data Model//EN" "candidate-profile-data-model.dtd">
<candidate-profile-data-model>
<template-name><![CDATA[Candidate Profile Template]]></template-name>
<template-desc><![CDATA[This defined candidate profile fields.]]></template-desc>
```

### 21.1.1.2 Candidate Profile Element: Instruction Text for Internal and External Candidates

If you want to provide instruction text for internal or external candidates on the candidate profile, you can configure it in the Candidate Profile template. The **Instruction Header** provides guidance at the top of the page and the **Instruction Footer** at the bottom of the page.

You can configure the same instruction header or footer for both internal and external candidates or separate instructions header or footer for internal and external candidates.

You have to modify the XML to customize the header and footer. The XML element must immediately follow the `template-desc` element. The following sample codes let you set the headers and footers for internal and external candidates:

- **Setting same header for both Internal and External Candidates**

#### Sample Code

```
<instruction-header>
<label mime-type="text-html">
<![CDATA[<i>Thank you for completing your profile! This profile will help our
teams find you as we look for great candidates, and will allow us to get
to know you better during the application process. Upload your resume, fill
```

```

out the background elements, and provide your contact info to have maximum
exposure to our recruiting opportunities!<p><p><b>Want us to tell you when
cool new opportunities come up?</b>
Setup a job alert and we will email you when jobs that meet your criteria
become available. <p><b>Want to update your name, email, or cell phone?</b>
Click the edit button to the left on your contact card.</i>]]>
</label>
</instruction-header>

```

- **Setting separate headers for Internal Candidates**

#### Sample Code

```

<instruction-header-internal-candidate>
<label mime-type="text-html">
<![CDATA[<i>Thank you for completing your profile! This profile will help our
teams find you as we look for great candidates, and will allow us to get
to know you better during the application process. Upload your resume, fill
out the background elements, and provide your contact info to have maximum
exposure to our recruiting opportunities!<p><p><b>Want us to tell you when
cool new opportunities come up?</b>
Setup a job alert and we will e-mail you when jobs that meet your criteria
become available. <p><b>Want to update your name, e-mail, or cell phone?</b>
Click the edit button to the left on your contact card.</i>]]>
</label>
</instruction-header-internal-candidate>

```

- **Setting separate headers for External Candidates**

#### Sample Code

```

<instruction-header-external-candidate>
<label mime-type="text-html">
<![CDATA[<i>Thank you for completing your profile! This profile will help our
teams find you as we look for great candidates, and will allow us to get
to know you better during the application process. Upload your resume, fill
out the background elements, and provide your contact info to have maximum
exposure to our recruiting opportunities!<p><p><b>Want us to tell you when
cool new opportunities come up?</b>
Setup a job alert and we will e-mail you when jobs that meet your criteria
become available. <p><b>Want to update your name, e-mail, or cell phone?</b>
Click the edit button to the left on your contact card.</i>]]>
</label>
</instruction-header-external-candidate>

```

- **Setting same footers for both internal and external candidates**

#### Sample Code

```

<instruction-footer>
<label mime-type="text-html"><![CDATA[<font size="2" color="black">Operator
Footer Message. Computing Labs.<br><br>(C) All rights reserved </
font><p><p>]]></label>
</instruction-footer>

```

- **Setting separate footers for Internal Candidates**

#### Sample Code

```

<instruction-footer-internal-candidate>
<label mime-type="text-html"><![CDATA[<font size="2" color="black">Operator

```

```
Footer Message. Computing Labs.<br><br>(C) All rights reserved </font><p><p>]]></label>
</instruction-footer-internal-candidate>
```

- **Setting separate footers for External Candidates**

#### Sample Code

```
<instruction-footer-external-candidate>
<label mime-type="text-html"><![CDATA[<font size="2" color="black">Operator
Footer Message. Computing Labs.<br><br>(C) All rights reserved </font><p><p>]]></label>
</instruction-footer-external-candidate>
```

#### Note

HTML is supported in the instructional text as long as the `<mime-type>` attribute is set to `text-html`. In some cases, custom HTML tags in the description may interfere with the HTML code of the rest of the website.

### 21.1.1.3 Candidate Profile Element: Instruction Text for Recruiting Users

If you want to provide instruction text for recruiters on the candidate profile, you can configure it in the Candidate Profile template.

The `operator-instruction-header` provides guidance at the top (header) of the page and the `operator-instruction-footer` at the bottom (footer) of the page. This instruction text is only visible in the recruiting user view.

Follow these guidelines when you add operator instruction text at the header and footer:

- The operator header and footer are available only if you use the **Add Candidate** option in [Recruiting Candidates](#). The header and footer sections don't display if you open any existing candidate profile.
- The operator header must be added immediately above the `<field-definition>` elements in the candidate profile. Similarly, the operator footer must be added immediately after the `<field-definition>` elements.
- The fields in the header and footer accept only simple HTML tags. Instructions enclosed in unsupported HTML tags aren't displayed.

You can define multiple label elements on the `instruction-header` and `instruction-footer`, if you use multiple languages in your system. Typically these elements are defined during the translation phase of a project, after the rest of the configuration is tested and signed off.

The following sample codes let you set the instruction headers and instructions footers for recruiting user view:

- **Setting header for the Recruiting User view**

#### Sample Code

```
<operator-instruction-header>
<label mime-type="text-html">
<![CDATA[<font size="2" color="black">This text is viewed by a recruiting
user.</
```

```
font><p><p>]]>
</label>
</operator-instruction-header>
```

- **Setting footer for the Recruiting User view**

#### Sample Code

```
<operator-instruction-footer>
<label mime-type="text-html">
<![CDATA[<font size="2" color="black">Operator Footer Message. Computing
Labs.<br>(C) All rights reserved</font><p><p>]]>
</label>
</operator-instruction-footer>
```

## 21.1.1.4 Candidate Profile Element: Field Definition

The field-definition elements define the data fields on the candidate profile record that appear in the [More Information](#) section.

Field definitions for a candidate profile immediately follow the instructional header in the XML of the candidate profile template. Fields are displayed in the Candidate Profile in the order they're configured.

#### Sample Code

```
<field-definition id="firstName" type="text" required="true" custom="false"
anonymize="false">
  <field-label mime-type="text-plain"><![CDATA[First Name]]></field-label>
  <field-label mime-type="text-plain" lang="en_US"><![CDATA[First Name]]></field-label>
</field-definition>
<field-definition id="lastName" type="text" required="true" custom="false"
anonymize="false">
  <field-label mime-type="text-plain"><![CDATA[Last Name/Surname]]></field-label>
  <field-label mime-type="text-plain" lang="en_US"><![CDATA[Last Name/Surname]]></field-label>
</field-definition>
<field-definition id="cellPhone" type="text" required="false" custom="false"
anonymize="false">
  <field-label mime-type="text-plain"><![CDATA[Cell Phone]]></field-label>
  <field-label mime-type="text-plain" lang="en_US"><![CDATA[Mobile Phone]]></field-label>
</field-definition>
<field-definition id="contactEmail" type="text" required="true" custom="false"
anonymize="false">
  <field-label mime-type="text-plain"><![CDATA[Email Address]]></field-label>
  <field-label mime-type="text-plain" lang="en_US"><![CDATA[Email Address]]></field-label>
</field-definition>
<field-definition id="primaryEmail" type="text" required="true" custom="false"
anonymize="false">
  <field-label mime-type="text-plain"><![CDATA[Username]]></field-label>
  <field-label mime-type="text-plain" lang="en_US"><![CDATA[Username]]></field-label>
</field-definition>
<field-definition id="country" type="picklist" required="true" custom="false"
anonymize="false">
  <field-label mime-type="text-plain"><![CDATA[Country]]></field-label>
  <field-label mime-type="text-plain" lang="en_US"><![CDATA[Country]]></field-label>
```

```
<picklist-id>country</picklist-id>
</field-definition>
```

The XML that defines fields in the [More Information](#) section of the Candidate Profile contains many elements.

Candidate Profile XML Fields

| Field               | Description                                                                                                                                                                                                                                                                                       |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <field-definition>  | Internal identification of the field in the system. Must contain at least one field-label element.                                                                                                                                                                                                |
| <field-label>       | <p>The visible portion of the field, which appears the same to all internal and external candidates, recruiters, and all other users.</p> <p>The only reason to include multiple labels is to support multiple languages, which requires the client to purchase corresponding language packs.</p> |
| <field-description> | Description of the field is an optional element within the <b>field-definition</b> elements. In some browsers, the <b>field-description</b> element appears as hover text in the system user interface.                                                                                           |

For example, the definition of the first name field consists of the following:

#### Sample Code

```
<field-definition id="firstName" type="text" required="false" custom="false"
anonymize="false">
  <field-label mime-type="text-plain"><![CDATA[First Name]]></field-label>
  <field-description><![CDATA[First Name]]></field-description>
</field-definition>
```

### 21.1.1.4.1 Candidate Profile Field Definition: Attributes

The **field-definition** element defines a field and carries various attributes such as **id**, **type**, **required**, **custom**, **anonymize**, and **sensitive**. In addition to these required attributes, the Candidate Profile XML template can have many more fields based on the requirement.

#### Note

It isn't required to configure the field IDs in the same way as the field IDs in the Succession Data Model, even if the fields are sm-mapped to the Employee Profile.

The field-definition element uses the following sample structure:

#### Sample Code

```
<field-definition id="lastName" type="text" required="true" custom="false"
anonymize="false">
```

## id Attribute

### Sample Code

```
<field-definition id="lastName" type="text" required="true" custom="false"
anonymize="false">
```

The **id** must be unique within the Candidate Profile XML template. Certain field-definition ids are predefined in the product as standard. Some of these standard field ids have special functionalities.

### ⚠ Caution

- You can't define default values for any fields in the Candidate Profile XML.
- Do not use special characters, other than underscores, when defining the custom field IDs.
- The system views the configured **id** as a custom field if it doesn't follow the standard field list. If you change the field-id, it will be considered as a new system field even if you keep the same label. Using the same label for the field-id doesn't transfer historical data to the new field, but creates a new field with no value.

Candidate Profile Standard Fields with Special Functionality

| Standard Field ID | Field Type | Special Functionality                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| candidateId       | number     | Appears as a standard field on the Candidate Profile and Job Application Pages.                                                                                                                                                                                 |

## type Attribute

### Sample Code

```
<field-definition id="lastName" type="text" required="true" custom="false"
anonymize="false">
```

The type attribute defines the data that the system accepts in the corresponding field. The following table describes these options:

| Options  | Descriptions                                                                                                                          |
|----------|---------------------------------------------------------------------------------------------------------------------------------------|
| text     | A single line of alphanumeric text with a 100-character limit (character limit and display are nonconfigurable).                      |
| textarea | Alphanumeric text with a 256-character limit, shown as a 100-character-wide box (character limit and display are nonconfigurable).    |
| date     | A date that is manually entered or selected from a calendar. Displays mmddyyy or ddmmyyyy format according to selected language pack. |
| percent  | A percent value with one decimal place.                                                                                               |
| bool     | True or False (shown as a checkbox); if you make this attribute required because it must always be selected.                          |
| enum     | An enumerated type (shown as a pull-down list) where values are defined in the XML.                                                   |
| number   | A number value with two decimal places, formatted by locale.                                                                          |
| currency | A currency value, where currency symbol is determined by the field id <a href="#">currency</a> .                                      |
| picklist | Field options from a picklist defined in admin (shown as a dropdown list).                                                            |

| Options                  | Descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| derived                  | A dropdown or find-value field (depending on length of list) where values are automatically determined from another area of the system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| instruction              | A noneditable field that stretches left-to-right across the screen, used to display messages to users. Can't be made reportable or writable. Configuring reportability or writability results in error messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| multiattachmentselection | <p>A field that can have multiple documents uploaded and attached. Acts as a mini library where all documents uploaded are stored for later reuse without requiring to be uploaded again.</p> <p>Documents uploaded to <i>multiattachmentselection</i> fields on the candidate profile are automatically available in a field with the same field id on the application; the applicant can delete the attachment if desired. The file types supported for <i>multiattachment</i> and <i>multiattachmentselection</i> fields are .pdf, .doc, .docx, .txt, images, .ppt, .pptx, .xls, .xlsx, .htm, .html, and .csv.</p> <div> <p><b>Note</b></p> <p>For fields of the type <i>multiattachmentselection</i>, the value for the &lt;field-definition id&gt; can't contain any special characters, such as hyphens, underscores, or spaces.</p> </div> <div> <p><b>→ Recommendation</b></p> <p><i>multiattachmentselection</i> field is the only attachment field supported on the Candidate Profile.</p> <p>If the fields are configured identically, Candidate Profile content in <i>multiattachmentselection</i> fields can sync over to the Application in <i>multiattachmentselection</i> fields at the point when a recruiting user first views the Application. Changes made to Application multistageattachmentselection fields during the initial application are reflected on the Candidate Profile, but changes made to the application later during multi applications aren't synced back to the Candidate Profile.</p> </div> |
| richText                 | Alphanumeric lines with no character limit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| hyperlink                | Field that stores a URL and text to show instead of the URL                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## required Attribute

### Sample Code

```
<field-definition id="lastName" type="text" required="true" custom="false"
  anonymize="false">
```

This attribute defines whether a field is required for a candidate profile record to be completed.

The required fields are mandatory for both candidates and recruiting users when completing a Candidate Profile. Allowable values for required fields are **true** or **false**. You can't make fields conditionally required on the candidate profile; that is, a required field displayed to both internal and external candidates is required for both candidate types.

For this workflow, create two separate fields with the same label, where one is set to **required="true"**, and the other as **required="false"**. Use field-level permissions to show the required field to one audience and the optional field to the other audience. Advise the customer that this workaround has a reporting impact and they must add both fields separately to reports.

You can't make a field required for candidates and optional for a recruiting user who is entering a candidate manually using the [Add Candidate](#) functionality. The recruiting user must complete every required field a candidate has to complete. For this reason, customers can choose to configure fewer required fields, add a special value (such as N/A or Picklist) to picklists for internal recruiting users to select when adding a candidate without knowing the correct value (such as N/A or Pending), and advise recruiting users about the appropriate values to use in fields without picklists.

### Note

You can't hide, show, or make a field required, based on the answer to an earlier field. For example, you can't ask, *Have you ever been convicted of a felony?* and then show a *Please explain* field if the candidate selects yes for the first question. The suggested workarounds are:

- Make the *Please explain* field optional and name it something like *If yes, please explain*.
- Make the *Please explain* field required and name it something like *If yes, please explain (enter N/A if not applicable)*.

## custom Attribute

### Sample Code

```
<field-definition id="lastName" type="text" required="true" custom="false"
  anonymize="false">
```

Some field id attributes are reserved as standard fields. They don't necessarily required to be included in the XML configuration but if used, they must have the appropriate corresponding field type and be marked as **custom="false"**. All other field ids must be marked as **custom="true"**.

## anonymize Attribute

### Sample Code

```
<field-definition id="lastName" type="text" required="true" custom="false"
  anonymize="true" sensitive="false">
```

SAP SuccessFactors provides the ability to purge user data that you no longer need. The **anonymize** attribute identifies whether a given field needs to be purged. This attribute is used in conjunction with Data Retention Time Management (DRTM) and Legacy Data Retention Management (DRM).

### Note

For candidate profile and application profile templates, resume and cover letter behave as **anonymize=true**, even if it's set to **false** in the template. Further, if certain fields need to be anonymized in the candidate profile snapshot, ensure that those fields are configured in the job application template and the **anonymize** attribute for those fields is set to **true**.

## List of XML Fields That Do Not Support Anonymization

The following is the list of Candidate XML fields that do not support anonymization:

| Field                  | Field ID/Field Type |
|------------------------|---------------------|
| Custom                 | Date                |
|                        | Percent             |
|                        | Boolean             |
|                        | Number              |
|                        | Instruction         |
|                        | Currency            |
| Background data fields | Date                |
|                        | Int                 |
|                        | Float               |

## sensitive Attribute

SAP SuccessFactors provides a Read Audit function that helps to identify who has accessed the sensitive personal data of internal or external candidates at your company. When Read Audit is enabled, sensitive fields are included in read audit reports if the candidate or someone else accesses sensitive personal data of the candidate.

To configure a field as sensitive, ensure that both the **sensitive** and the **anonymize** attributes for the field are set to **true**.

#### Sample Code

```
<field-definition id="race" type="text" required="true" custom="false"
  anonymize="true" sensitive="true">
```

#### Sample Code

```
<field-definition id="customPersonal1" type="text" required="true" custom="true"
  anonymize="true" sensitive="true">
```

For more information about configuring fields as sensitive for Read Audit, refer to the *Setting Up and Using Data Protection and Privacy* guide.

## 21.1.1.4.2 Candidate Profile Field Definition: Field Label

The `field-label` element usually controls the appearance of a field name in the user interface.

However, this element doesn't control all UI field labels. On certain fields, the Succession Data Model controls the field label and for other fields, Provisioning settings control the label used throughout the system.

The label element isn't conditional, that is, a single field can't show one label to internal candidates and a different label to external candidates. By the same token, a single field can't show one label to candidates, and another to recruiting users.

The `field-definition` element must contain at least one `field-label` element.

#### Sample Code

```
<field-label mime-type="text-plain"><![CDATA[First Name]]></field-label>
```

## mime-type Attribute

#### Sample Code

```
<field-label mime-type="text-plain"><![CDATA[First Name]]></field-label>
```

Mime-type determines whether or not the system renders HTML tags defined in the CDATA content. The two supported mime types are:

- `text-plain`: Plain text, unformatted.
- `text-html`: HTML-formatted text.

## CDATA Content

The CDATA content can be configured to contain any customer-defined text.

### Sample Code

```
<field-label mime-type="text-plain"><![CDATA[First Name]]></field-label>
```

### 21.1.1.4.3 Candidate Profile Field Definition: Field ID and Field Type

Review the field type for the standard field ID in Candidate Profile.

| Standard Field ID | Field Type       |
|-------------------|------------------|
| contactEmail      | text             |
| primaryEmail      | text             |
| firstName         | text             |
| lastName          | text             |
| middleName        | text             |
| gender            | derived          |
| ethnicity         | text or picklist |
| race              | text or picklist |
| address           | text             |
| dateOfAvail       | date             |
| cellPhone         | text             |
| homePhone         | text             |
| faxNumber         | text             |
| city              | text or picklist |
| state             | text or picklist |
| country           | picklist         |
| zip               | text or picklist |
| dateOfBirth       | date             |
| disabilityStatus  | text or picklist |
| minAnnualSal      | number           |
| preferredLoc      | text or picklist |
| ssn               | text             |

| Standard Field ID       | Field Type                                                                                                                                                                                                 |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| veteranStatus           | text or picklist                                                                                                                                                                                           |
| currentTitle            | text                                                                                                                                                                                                       |
| currentCompany          | text                                                                                                                                                                                                       |
| source                  | text                                                                                                                                                                                                       |
| resume                  | richText                                                                                                                                                                                                   |
| coverLetter             | richText                                                                                                                                                                                                   |
| rating                  | text                                                                                                                                                                                                       |
| lastModified            | date                                                                                                                                                                                                       |
| name                    | text                                                                                                                                                                                                       |
|                         | <div>  <b>Note</b><br/> Don't configure this in the Candidate Profile Template. It doesn't populate with any data. </div> |
| status                  | text                                                                                                                                                                                                       |

| postConvExtContactEmail | text                                                                                                                                                                                                       |
| candidateId             | number                                                                                                                                                                                                     |

### 21.1.1.5 Candidate Profile Element: Background Information

Only configure background information in the Candidate Profile template if you also have background information configured in the Succession Data Model for Employee Profile.

You need access to Provisioning to configure the Candidate Profile template.

## → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

```
<background-element id="mobility" type-id="7">
```

Background information appears as a section on the Candidate Profile where multiple entries can be captured.

Configure background elements in the [Candidate Profile Template](#) identically with the background elements in the Succession Data Model. If fields between the Candidate Profile and Succession Data Model aren't identical, the sync for that row of data fails. For example, if a field is required in one place but not in the other. However, correctly configured fields with adequate data still sync. The background elements appear in the candidate profile record in the same order they have in the [Candidate Profile Data Model Template](#). The integer defined as the type attribute doesn't control the order of display for background elements.

The internal candidate profile shows the add and delete options on a background element, even though the background element fields are all read only. This is because, the Role-Based Permissions are set up as read on that background element while the Succession Data Model has write permissions for that background element.

The `background-element` tag must appear after the field-definitions (or after search or candidate summary display options, if configured).

Within [background-element](#), you must configure the label and data-field elements, and if applicable, picklists.

### Data Model Attributes of a Background Element

| Attributes            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>id</code>       | The <code>id</code> attribute can be any alphanumeric string without spaces or special characters. The value of the <code>id</code> attribute must be unique within the Candidate Profile template. If an <code>id</code> attribute on a background element isn't unique, an error is displayed.                                                                                                                                                                                                                                                                                                                                                               |
| <code>type-id</code>  | <p>The <code>type-id</code> attribute must be an integer, and the same type attribute can't appear twice in the Candidate Profile template. If a <code>type-id</code> is on a background element isn't unique within the Candidate Profile template, an error is displayed.</p> <p>Ensure the <code>id</code> and <code>type-id</code> are unique even when you take the Succession Data Model into an account as well. Don't reuse any of the <code>ids</code> or <code>type-ids</code> from that data model for nonmatching background elements on the Candidate Profile template, in case you later require to sm-map the background elements together.</p> |
| <code>required</code> | The <code>required</code> attribute must be set to either true or false. If a background element is set to true, at least one line of data must be added to that <code>background-element</code> to allow the candidate profile to be saved. Currently, it isn't possible to specify a minimum number of entries in a background element. Either no entries are required or one entry is required. More entries are optional.                                                                                                                                                                                                                                  |

| Attributes | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>data-field</b> within a Background Element | <p>Every <b>background-element</b> must contain at least one <b>data-field</b> element. Each <b>data-field</b> element appears as a field to the end user, and all the fields within a <b>background-element</b> is displayed as a record within the background-element.</p> <p>You can only configure a limited number of data-field elements for each field-name type (for example, 15 vfld fields). You must consider how much data a candidate can provide without getting frustrated and what the user experience is with many fields on UI.</p> <p>The first few data fields configured appear as the headers on the entry when the entry is collapsed. This isn't configurable and depends solely on the order of the fields.</p> <p>The <b>data-field</b> element must contain the following attributes: <b>id</b>, <b>field-name</b>, <b>required</b>, and <b>max-length</b>.</p> <ul style="list-style-type: none"> <li>• <b>id</b>: This attribute allows any alphanumeric value, without spaces or special characters, but that value must be unique within the background-element. The alphanumeric value maybe used as the id attribute for a data-field within a different background-element and/or can be used as the id attribute of a field-definition. There are no standard data-field ids.</li> </ul> <div data-bbox="565 856 1427 1012" data-label="Text"> <p><b>Note</b></p> <p>The ID <b>custom1</b> is reserved for technical purposes. Do not use this ID in <b>data-field</b> definition.</p> </div> <ul style="list-style-type: none"> <li>• <b>field-name</b>: This attribute defines the type of data the user is allowed to enter in the field. There's no <b>type</b> attribute on background element fields. The <b>field-name</b> attribute replaces the usual type attribute. <ul style="list-style-type: none"> <li>• <b>ifld</b>: This field contains integer values (no decimals). Possible to have up to 8 values (IFLD1 to IFLD8).</li> <li>• <b>ffld</b>: This field contains decimal or boolean values. Possible to have up to 8 values (FFLD1 to FFLD8).</li> <li>• <b>dfld</b>: This field contains dates values. Possible to have up to 3 values (DFLD1 to DFLD3).</li> <li>• <b>vfld</b>: This field contains alphanumeric text values. Possible to have up to 15 values (VFLD1 to VFLD15).</li> <li>• <b>startDate</b> and <b>endDate</b>: These fields contain date values validated against each other, where start date must precede end date. The <b>startDate</b> and <b>endDate</b> field-name values can only be used once per <b>background-element</b>.</li> </ul> </li> </ul> <div data-bbox="613 1507 1427 1675" data-label="List-Group"> <p><b>Note</b></p> <ol style="list-style-type: none"> <li>1. In Manage Template, though it's possible to use the Name and Desc fields, it's recommended that you don't implement Name and Desc fields.</li> <li>2. <i>lastmodified</i> isn't supported in Manage Template.ppl</li> </ol> </div> <p>The ifld, ffld, dfld, and vfld must have an integer added to the end of the attribute value, such as vfld1, ffld2, and so on. The integers need not be in an order or need not be consecutive, but they must be unique within the background element.</p> <ul style="list-style-type: none"> <li>• <b>required</b>: Allowable values for the required field are "true" or "false". Fields can't be made conditionally required. The requirement attribute applies equally to any user editing a line of data within a background element, whether they're an internal candidate, external candidate, or a recruiter.</li> </ul> |

## Attributes

## Description

- **max-length:** The max-length can't be greater than 4000 or less than 1. The max-length acts as a character limit on the field. If the max-length is 4 and you enter more than four characters in the field. The system validates this value while you try to save the content and displays an error.

### ⚠ Caution

Configure a **max-length** in combination with a picklist carefully, as doing so can result in an error.

## Data Model Sample

```

### 21.1.1.6 Candidate Profile Element: sm-mapping

Use the sm-mapping element in the Candidate Profile template to sync fields on the Candidate Profile with fields on the Employee Profile. After mapping is set up, updates made to one record automatically updates the other record through a bidirectional sync.

When you define a field or `background-element` in the Candidate Profile template, you can also correlate it to an Employee Profile `standard-element` field. This is the purpose of sm-mapping.

#### Note

The `userInfo-element` fields on the Succession Data Model aren't supported in sm-mapping.

When creating sm-mapping entries, ensure the fields that you're mapping have the same field type. For example, text to text and picklist to picklist. Ensure that both fields are defined with the same picklist id when sm-mapping picklist fields. It isn't required to match the field id between templates to map successfully, unless you're working with a `background-element`.

Background elements can be mapped. While mapping background elements, the definitions of the background elements have to match exactly. There are some exceptions for the parts that are intrinsically different in the data model layout. For example, `display-size` and `max-file-size-KB` attributes in the Employee Profile data model, that aren't supported in the Candidate Profile template.

Both Candidate Profile data-fields and background-elements can be synced to corresponding fields on the Employee Profile. The sync is effectively real time but the synced data is subject to the regular candidate indexing process. Updates to synced data using search isn't available for up to an hour.

Synchronized data is set up by defining an sm-mapping element in the Candidate Profile template after the last background-element.

#### Sample Code

```

<sm-mapping field-id="firstName" map-to="firstName"/>
<sm-mapping field-id="outsideWorkExperience" map-to="outsideWorkExperience" />

```

Any Candidate Profile field-definition or background-element can be mapped in the sm-mapping element.

Candidate Profile background-elements are synced if the Candidate Profile template and Succession Data Model background-element configuration matches. Labels can differ but all other configuration of the background-

elements must match exactly or the Candidate Profile template displays an error while saving the data model in Provisioning.

Fields with sm-mapping reflect the permissions specified in the Succession Data Model for internal candidate profiles, regardless of their permissions in the Candidate Profile template.

The sm-mapping element must contain a **field-id** attribute and a **map-to** attribute.

| Attribute | Description                                                                                                                                      |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| field-id  | This attribute must reference either an existing Candidate Profile <b>field-definition</b> id or Candidate Profile <b>background-element</b> id. |
| map-to    | This attribute must reference either an existing Employee Profile <b>standard-element</b> id or <b>background-element</b> id.                    |

#### → Recommendation

- Ensure that you always include the sm-mapping section in the candidate profile configuration. In case you fail to include, none of the fields between Employee Profile and Candidate Profile gets mapped. At least the following mapping should exist in every Candidate Profile template:

```
<sm-mapping field-id="firstName" map-to="firstName" />
<sm-mapping field-id="lastName" map-to="lastName" />
```

- When mapping fields from the Candidate Profile to the SM data model, certain **person** fields only render the userID value on the Candidate Profile, rather than a name. This is true of the Manager (M), Matrix Manager (X), HR Rep (H), and Custom Manager (C) designators. For example, let a user define a manager ID field in the Candidate Profile template and attempt to map it to the sm-mapping field, **managerID**. In this case, only the user ID of the manager is displayed, not the first name and last name of the manager.
- For sm-mapping, field-id must have a value corresponding to either the ID attribute from a field-definition element or the ID attribute of background element.

## Data Model Sample

```
<sm-mapping field-id="profMemberships" map-to="profMemberships" />
<sm-mapping field-id="middleName" map-to="mi" />
<sm-mapping field-id="lastName" map-to="lastName" />
<sm-mapping field-id="zip" map-to="zipCode" />
<sm-mapping field-id="insideWorkExperience" map-to="insideWorkExperience" />
<sm-mapping field-id="location" map-to="location" />
<sm-mapping field-id="outsideWorkExperience" map-to="outsideWorkExperience" />
<sm-mapping field-id="certifications" map-to="certifications" />
<sm-mapping field-id="address" map-to="addressLine1" />
<sm-mapping field-id="workPhone" map-to="businessPhone" />
<sm-mapping field-id="firstName" map-to="firstName" />
<sm-mapping field-id="mobility" map-to="mobility" />
```

## 21.1.1.7 Candidate Profile Element: Field Permissions

Field permissions in the Candidate Profile template control the permission to view and edit each field in the candidate profile.

You can set permissions so that field can be hidden, set to read or write for candidates, and set to read or write for recruiting users. Customers can specify whether only a candidate can write to specific fields or whether defined recruiting users who are part of a dynamic group can also write to the field. Permissions can be defined based on the type of candidate (internal or external) and on the country/region of the candidate. If field-permission tags don't exist in the Candidate Profile XML, the default behavior is write permission for all the fields to the candidate and read permission for recruiting users.

To give write permissions on one or more fields to internal recruiting users:

- Go to [Provisioning](#) and enable [Dynamic Groups V2 \(My Groups\)](#).

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

Before configuring field permissions, you must enable Dynamic Groups.

- In the customer instance, set up [Dynamic Groups](#) defining the users who have write permissions to the [Candidate Profile](#) fields.

## Example: XML Sample

```
<field-permission type="read">
  <role-name group-name="Recruiters"><![CDATA[Dynamic Group]]></role-name>
  <country><![CDATA[*]]></country>
  <source><![CDATA[*]]></source>
  <field refid="firstName"/>
  <field refid="middleName"/>
  <field refid="lastName"/>
  <field refid="homePhone"/>
  <field refid="cellPhone"/>
  <bg-element refid="insideWorkExperience" data-field-id="*" />
</field-permission>
<field-permission type="write">
  <role-name group-name="Recruiters"><![CDATA[Dynamic Group]]></role-name>
  <country><![CDATA[*]]></country>
  <source><![CDATA[*]]></source>
  <field refid="comments"/>
  <field refid="contactEmail"/>
  <bg-element refid="talentPool" data-field-id="*" />
</field-permission>
<field-permission type="write">
  <role-name><![CDATA[Candidate]]></role-name>
  <country><![CDATA[*]]></country>
  <source><![CDATA[Internal]]></source>
  <field refid="division"/>
  <field refid="department"/>
  <field refid="location"/>
  <bg-element refid="insideWorkExperience" data-field-id="*" />
</field-permission>
```

```
<field-permission type="write">
  <role-name><![CDATA[Candidate]]></role-name>
  <country><![CDATA[*]]></country>
  <source><![CDATA[External]]></source>
  <field refid="formerEmployee"/>
  <bg-element refid="outsideWorkExperience" data-field-id="*" />
</field-permission>
```

Review elements to configure the Candidate Profile field permissions.

ⓘ Note

To give write permissions on one or more fields to internal recruiting users:

- Enable [Provisioning](#) [Managing Recruiting](#) [Dynamic Groups V2 \(My Groups\)](#) .

→ Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- In the client instance, set up [Dynamic Groups](#) defining the users who have write permissions to the [Candidate Profile](#) fields.

Field Permission Codes

|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| CDATA Content | <p>The country element must contain a two-digit ISO code for the applicable country/region or an asterisk to denote all countries/regions, such as US, DE, UK or *. Refer to the the Online Browsing Platform (OBP) at the ISO website for the complete list of the two-digit country/region codes.</p> <p>The country element defines the field and background element permissions for candidates in a particular country, where the candidate's country is determined by the country field on the Candidate Profile.</p> <p>For this feature to function properly, the Candidate Profile must contain a field-definition with the id="country" type="picklist" where the picklist-id="country". The country picklist loaded into the instance must be the ISO standard country values. The system does the conversion into the two-character ISO country code, such as US, DE, or UK. Don't tie the country field to the ISO-Country picklist; this picklist is reserved for Employee Central.</p> <div> <p><b>Note</b></p> <p>To select a country in the standard country field defined on the Candidate Profile, the name of the country in the U.S. English locale should match the country name provided in the country list. If the name of the country in U.S English does not match the values in the country list, the country field will not display the country on the Candidate Profile. To view the country list, see the next section.</p> </div> | <pre>&lt;country&gt;&lt;![CDATA[*]]&gt;&lt;/country&gt;</pre> |

| Field                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Code                                                               |
|-----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|
| Source Element within Candidate Profile Field Permissions | <p>Source element determines the type of candidate who receives the permissions defined in the field-permissions element.</p> <p>Allowable CDATA values for the source element are Internal, External, and *. Capitalization matters — if the CDATA value is incorrect, the users affected don't have the permission applied to them.</p> <p>The asterisk applies the permission settings to both internal and external candidates. Internal recruiting users view all fields on the candidate profile even if the source element CDATA is set to Internal or External only.</p> | <pre>&lt;source&gt;&lt;![CDATA[Internal]]&gt;&lt;/source&gt;</pre> |

#### Field and bg-element Elements Within Candidate Profile Field Permissions

| Description                                                                                                                                                                                                                                                                    | Code                                                                                                             |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Once the field-permission, role-name, country and source elements are configured, the fields and background elements affected by the permission must be added. Fields are defined using the field element, and background elements are defined using bg-element.               | <pre>&lt;field refid="homePhone"/&gt; &lt;bg-element refid="outsideWorkExperience" data-field-id="*" /&gt;</pre> |
| Field elements contain a refid attribute that can point to any field-definition id attribute that already exists on the Candidate Profile XML template.                                                                                                                        | <pre>&lt;field refid="homePhone"/&gt;</pre>                                                                      |
| The bg-element contains both a refid attribute and a data-field-id attribute. The refid attribute can point to any background-element id attribute that already exists on the Candidate Profile XML template.                                                                  | <pre>&lt;bg-element refid="outsideWorkExperience" data-field-id="*" /&gt;</pre>                                  |
| The data-field-id attribute refers to a specific data-field within the selected background element. Typically all data-fields within a single background element are permissioned identically so the data-field-id attribute in that circumstance is set as <code>"*"</code> . | <pre>&lt;bg-element refid="outsideWorkExperience" data-field-id="*" /&gt;</pre>                                  |

#### Note

The refid attribute for both field and bg-element must point to a field-definition or background-element id attribute that exists higher up in the Candidate Profile XML template. If the refid points to an ID attribute that doesn't exist, an error displays upon validation:

A field with the identifier "fieldName" must appear in the document.

To hide a field from a candidate, don't list it underneath the field-permission element. Fields can't be hidden from recruiting users.

Bg-element fields can't be conditionally hidden or displayed or set with read/write permissions.

Creating dynamic and recruiting groups with same name can cause issues. In this case, the Find User lookup appears as a blank page and the system doesn't select the right group when applying permissions.

#### Note

The system uses a cache to ensure that the picklist values are available in Recruiting. If a country/region name is not available in the picklist even after the update, wait up to 30 minutes for the changes to be reflected.

## 21.1.1.8 Configuring the Candidate Profile Template for Candidate Summary Display Options

Configure the Candidate Profile template to control the fields available as display options on the legacy Candidate Workbench.

### Prerequisites

- For the fields to be displayed on the legacy Candidate Workbench, the fields must be declared on the Application XML.
- You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- Custom fields must be made reportable in the XML template.

## Context

### 📘 Note

This page describes functionality for the legacy Candidate Workbench.

### ⚠ Caution

The Candidate Summary Display options do **not** respect permissions outlined in the XML. Do not configure fields as a Display column if they contain secure data or data that can't be shared across roles.

## Procedure

1. Add the `candidate-summary-display-options-config` node to the Candidate Profile template after the `<button-permission>` node.

### 📘 Note

You can only have one `<candidate-summary-display-options-config>` node per template.

2. Define the required categories to group the display options on the legacy Candidate Workbench.

### 📄 Sample Code

```
<category id="candidateContactData" name="candidateContactData">
  <label xml:lang="en_US"><![CDATA[Candidate Contact and Application Data]]</
label>
</category>
```

3. Add fields to the category.

```
<column field-ref="cellPhone" select-by-default="true" gridOrder="1"/>
```

Where:

- `<column field-ref>` corresponds to the standard or custom field ID.
- `<select-by-default>` controls if the field is selected in the [Display Options](#) panel by default.
- `<gridOrder>` controls the order of the fields within the category. Each value for `<gridOrder>` must be unique for the category.

### 📘 Note

The `<select-by-default>` attribute configured in the template is no longer taken into consideration and the display option won't appear unless selected by the user. This is due to the prioritization of user preference over the configurations present in the application template. Therefore, the user selection for display options is going to be used. If the Application template configuration was used, anyone accessing the candidate workbench would see additional or less fields, and they would not be aware of the reason for this selection. To avoid confusion, the system considers the user's choice for the preference they have selected in the instance.

4. To make any custom fields reportable, go to [Provisioning](#) > [Configure Reportable Custom Fields](#).
5. Enter the field names for the custom fields in the *XML Custom Field ID* column.

#### Note

Ensure that you map the type of the custom field with the types available in [Provisioning](#). There are 100 text fields, 40 number fields, 110 picklist fields, and 30 date fields available as reportable custom fields for each XML entity. The number of available fields isn't configurable.

6. To update the reportable data, select [Synchronize Existing Data](#).
7. Upload the modified Candidate Profile XML Template.

#### Sample Code

```
<candidate-summary-display-options-config>
  <category id="candidateContactData" name="candidateContactData">
    <label xml:lang="en_US"><![CDATA[Candidate Contact and Application
Data]]></label>
    <column field-ref="cellPhone" bge-ref="none" select-by-default="true"
gridOrder="1"/>
    <column field-ref="contactEmail" bge-ref="none" select-by-default="true"
gridOrder="2"/>
    <column field-ref="country" bge-ref="none" select-by-default="false"
gridOrder="3"/>
  </category>

  <category id="referralData" name="referralInfo">
    <label xml:lang="en_US"><![CDATA[Referral Info]]></label>
    <column field-ref="referralName" bge-ref="none" select-by-default="true"
gridOrder="4"/>
  </category>
</candidate-summary-display-options-config>
```

## 21.1.1.9 When to Request a Reindex of the Candidate Profile Template

When you've performed an import of candidates using the legacy import into SAP SuccessFactors, you can request an instance reindex.

### When to Request Reindexing

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## When to Request Reindexing

| Scenario                                                                           | Required or Not Required |
|------------------------------------------------------------------------------------|--------------------------|
| Legacy Candidate Data import using .CSV file.                                      | Required                 |
| SFAP and OData imports                                                             | Not Required             |
| Using the <a href="#">Mass Import</a> feature via .CSV or <a href="#">Resume</a> . | Not Required             |
| Using the <a href="#">Add a Candidate</a> feature                                  | Not Required             |
| <a href="#">Candidate Profile Extension</a>                                        | Not Required             |
| SAP SuccessFactors Recruiting Management enabled for first time                    | Not Required             |

### ⓘ Note

When implementing SAP SuccessFactors Recruiting Management for the first time, allow 2 hours for data to populate.

### ⓘ Note

Don't change a field type in your [Candidate Profile Template](#). This action cause application error due to inconsistent data type between database and new field type in [Candidate Profile Template](#).

### ⓘ Note

When in the [Edit Candidate Profile Template](#) page in provisioning, there's now a note that reads: **You do not need to trigger the reindexing when performing changes to Candidate Profile Template. You need to trigger the reindexing of candidate data only after an import of new candidates using legacy import.** Similar message can also be found in the [Manage Templates](#) tool that's available from [Admin Center](#).

## 21.1.1.10 Candidate to Employee Conversion

When you hire an external candidate and process as a new SAP SuccessFactors user, the system spawns an employee profile. Depending on the [Careers](#) tab, permissions, and data privacy consent statement, the system could also spawn an [Internal Candidate Profile](#).

When the system spawns an [Internal Candidate Profile](#), the [External Candidate Profile](#) remains intact. The new [Internal Candidate Profile](#) duplicates the [External Candidate Profile](#). The candidate now has two candidate profile records, one external and one internal. The new [Internal Candidate Profile](#) usually contains little data.

When you have configured Candidate to Employee Conversion, the system deletes the empty new [Internal Candidate Profile](#). The system then associates the employee profile with the existing [External Candidate Profile](#). The system then classifies the profile as Internal instead of External. The sm-mapped data from the [External Candidate Profile](#) syncs into the employee profile.

## Need to Know

- A new reportable field called [Candidate Type When Hired](#) is populated when the candidate is moved into a Hired-category status so reliable historical reporting is available.
- After an external Candidate Profile is converted, the candidate can no longer log on using the external career site. If the customer is using Recruiting Marketing, the candidate can log into their Recruiting Marketing profile in the Talent Community, but can't access Recruiting Management external career site through candidate Single Sign-On (SSO).
- Conversion works for customers with DPCS 1.0, DPCS 2.0, or without DPCS. Conversion doesn't depend on the employee accepting the data privacy consent statement. The external Candidate Profile converts and sm-mapping of data works even before the internal candidate accepts the Data Privacy Consent Statement (DPCS).
- If an existing internal candidate profile has one or more applications associated to it, the conversion is designed to fail. The system doesn't convert the profile or overwrite important historical application data.
- When the candidate conversion job runs, it looks for a hidden option on hired external candidates and tries to find a matching Employee Profile for the candidate. If no Employee Profile is found, an error message is displayed. If the Employee Profile is found, the external candidate profile is converted and the option gets disabled. Only Employee Profiles created since the last run of the scheduled job attempts to convert.
- The hire date of the user on the [Employee Profile](#) must be after the external candidate hire date. If the [Employee Profile](#) hire date falls before the external candidate hire date, the conversion job can't convert the candidate. Customers must move the candidate to the [Hired](#) status before the creation of the user record.
- In ► [Recruiting](#) ► [Manage Recruiting Settings](#) ► [External to Internal Candidate Profile Conversion Settings](#) ►, the system displays the first run date of the conversion job. This allows for easier troubleshooting of the conversion job.

### 21.1.1.10.1 Configuring Candidate to Employee Conversion

Configuring Candidate to Employee Conversion can be broadly described as a three-step process. You prepare a unique ID that works with customer instance, set up the unique ID and enable email templates, and set up and run a scheduled job.

## Prerequisites

- In [Edit Applicant Status Configuration](#), select the hired status and set [Hirable Options](#) to [Hired](#).
- New hire process is set up and running successfully to manage users (creation, update, or deactivation).
- You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- Go to ► [Provisioning](#) ► [Manage Recruiting](#) ► [Edit Candidate Profile Template](#) ► and configure `postConvExtContactEmail` standard text field as read only.
1. [Preparing a Unique ID That Works with Customer's Process \[page 926\]](#)  
To associate an external Candidate Profile with a newly created Employee Profile, there must be a common piece of unique data present on both records.
  2. [Setting Up the Unique ID and Enabling Email Templates \[page 928\]](#)  
Set up the unique ID that works the customer's process in Admin Center so that the system uses this ID to convert a Candidate to an Employee. Also enable email template to notify the successful conversion of Candidate to Employee.
  3. [Managing Scheduled Jobs in Provisioning \[page 928\]](#)  
Use the Provisioning application to create, manage, and monitor all scheduled jobs, for any job type.
  4. [Setting Up and Running a Scheduled Job in Provisioning \[page 939\]](#)  
Set up and run an automatic job in [Provisioning](#) to perform External to Internal Candidate Profile Conversion.

## 21.1.1.10.1.1 Preparing a Unique ID That Works with Customer's Process

To associate an external Candidate Profile with a newly created Employee Profile, there must be a common piece of unique data present on both records.

### Prerequisites

► [E-Mail Notification Templates Settings](#) ► [Enable External To Internal Candidate Profile Conversion Success Notification](#) ► is enabled in Admin Center.

### Context

As each customer has a unique business process, SAP SuccessFactors doesn't prescribe a standard field for this data. Instead, you must discuss the customer's business process with them as part of configuration planning. Based on their process, advise them on the best way to capture a unique ID.

Consider the following important factors and best practices for selecting a unique ID:

- **Unique:** The Employee Profile attempts to look up a matching external Candidate Profile. If multiple Candidate Profile matches are found during the lookup, an error can occur or can lead to conversion of an incorrect candidate profile.
- **Well-maintained:** The Candidate to Employee Conversion is a process that relies on good data and proper timing. The customer must plan carefully to ensure that the unique ID is available in accordance with the new hire process. It's preferable to work with unique IDs managed through an automated process to eliminate possible human error.

- For customers using SAP SuccessFactors Employee Central, the system issues a unique Employee ID for the new employee when the Recruiting Management to Employee Central integration runs successfully. This ID is automatically added to the external Candidate Profile. No manual process is required.

#### → Recommendation

Although you can use any field on the Employee Profile in the lookup against any field defined on the Candidate Profile XML, the fields listed are best practices.

## Procedure

Configure the employee ID for the specifications of the system.

- With Employee Central
  - Configure the **employeeId** standard field on the Candidate Profile XML.
  - Configure the **empId** in the Succession Data Model, and populate it with the Employee ID issued by Employee Central. You can map other fields for the Recruiting Management to Employee Central integration.
- With a third-party HRIS
 

You can explicitly declare the HRIS username as the standard **primaryEmail** field. You can populate this field with either an email address or a candidate-generated alphanumeric string, depending on the customer's Provisioning settings.

#### → Recommendation

It's recommended that you include **primaryEmail** in the new hire export file. Then, capture the data in the HRIS and include the data as part of the user import from the HRIS to the SAP SuccessFactors HCM suite. This way, the **primaryEmail** is available on both the external Candidate Profile and the Employee Profile, and it's available to use for the Candidate to Employee Conversion process.

To use the HRIS-issued Employee ID, ensure that the HRIS Employee ID is added to the Candidate Profile after the new hire is processed in the HRIS. This action can be performed manually or using a custom-built web services integration.

#### ⓘ Note

Manual maintenance of data isn't recommended. Using contact email address or phone number is also not recommended, since SAP SuccessFactors doesn't verify these fields for unique values.

- With SAP HCM and prebuilt New Hire Integration
 

Configure the **employeeID** standard field on the Candidate Profile XML. Configure the **userId** field on the Success data model. This field must contain the **userSysId**.

#### ⓘ Note

You can also configure the **assignment\_id\_external** field for adding a unique ID on the Success data model. This field contains the assignment ID of the user.

When using the SAP-provided prebuilt integration pack, SAP HCM updates the Employee ID field on the external Candidate Profile when a new hire is successfully processed. No manual process is required.

**Task overview:** [Configuring Candidate to Employee Conversion \[page 925\]](#)

**Next task:** [Setting Up the Unique ID and Enabling Email Templates \[page 928\]](#)

## 21.1.1.10.1.2 Setting Up the Unique ID and Enabling Email Templates

Set up the unique ID that works the customer's process in Admin Center so that the system uses this ID to convert a Candidate to an Employee. Also enable email template to notify the successful conversion of Candidate to Employee.

### Procedure

1. Click ▾ arrow next to the  icon on the application home page and go to [Recruiting](#) > [Manage Recruiting Settings](#) > [External To Internal Candidate Profile Conversion Settings](#) .
2. Select from the drop downs to specify the appropriate fields to be used in the conversion lookup.

#### → Recommendation

After the initial job runs, this setting displays the date of the first run of the job. Candidates hired after the displayed date are eligible for conversion.

3. Click [Save](#).
4. Click ▾ arrow next to the  icon on the application home page and go to [Recruiting](#) > [E-Mail Notification Templates Settings](#) > [Enable External To Internal Candidate Profile Conversion Success Notification](#) .

**Task overview:** [Configuring Candidate to Employee Conversion \[page 925\]](#)

**Previous task:** [Preparing a Unique ID That Works with Customer's Process \[page 926\]](#)

**Next:** [Managing Scheduled Jobs in Provisioning \[page 928\]](#)

## 21.1.1.10.1.3 Managing Scheduled Jobs in Provisioning

Use the Provisioning application to create, manage, and monitor all scheduled jobs, for any job type.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## 21.1.1.10.1.3.1 Creating Job Requests

As a company provisioner, you can create job requests to schedule jobs in Job Scheduler.

### Context

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Procedure

1. Go to Provisioning and choose the company name.
2. Choose *Managing Jobs* under *Managing Job Scheduler*.
3. On the *Manage Scheduled Jobs* page, choose *Create New Job*.
4. In the *Job Definition* section, enter the following information.

| Option                | Description                                                                                                                                                                                                         |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Job Name</b>       | The name given to the job.                                                                                                                                                                                          |
| <b>Job Owner</b>      | The user by whom that the job is run. The user needs to be valid and have the permission to run the job, otherwise the job fails.                                                                                   |
| <b>Job Type</b>       | The type of the job that you want to schedule.                                                                                                                                                                      |
| <b>Job Parameters</b> | This field may be required depending on the job type that you select. For information on commonly used job types and the associated job parameters, see <i>Notes on Some Common Job Types</i> in the related links. |

5. For an FTP job, the following *Server Access* information is required.

| Option                   | Description                                                                                                                                                                                                   |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host Address             | Address of the FTP server that is used to import or export the file. If the job uses an SF-hosted FTP server, you can check the <i>SF hosted SFTP Server</i> checkbox, and the field is automatically filled. |
| FTP Login                | FTP/SFTP server account.                                                                                                                                                                                      |
| FTP Password             | Password of the FTP/SFTP server account.                                                                                                                                                                      |
| FTP Passive Mode         | Check with Operations team before you select this mode.                                                                                                                                                       |
| SFTP Protocol            | Select this field only if the job uses an SFTP server.                                                                                                                                                        |
| Test Connection          | You can test your connection to the FTP server without running the job.                                                                                                                                       |
| Test File Put Permission | You can check whether your FTP/SFTP account has the write permissions for export jobs without running the job.                                                                                                |

#### Note

We recommend you use an SFTP server for stability and security.

6. For an FTP job, the following File Access information is required.

| Option          | Description                                                                                                                                                                                                                                                |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File Path       | Location of the file to be imported or exported.                                                                                                                                                                                                           |
| File Name       | <p>Name of the file to be imported or exported.</p> <p>For an import job, ensure that the file has an extension name such as .csv or .txt, otherwise the job fails.</p> <p>For file that is encrypted using PGP, add .pgp to the end of the file name.</p> |
|                 | <div> <div>Note</div> <p>The file name cannot have any spaces or any of the following characters: \, /, :, *, ?, ", &lt;, &gt;, and  .</p> </div>                                                                                                          |
| Date Format     | Format of the date when the job request is created. The date is appended to the file name.                                                                                                                                                                 |
| File Encryption | <p>Select PGP if you use PGP to encrypt your files. For an export job, you need to provide a PGP encryption key.</p> <p>For more information on PGP file encryption, see <i>PGP Keys Used in Scheduled Jobs</i> in the related links.</p>                  |

7. In the *Job Occurrence & Notification* section, define how frequently you want the job to run and who receive email notifications besides the job owner.

| Option     | Description                                                                                                                                                  |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Occurrence | <ul style="list-style-type: none"> <li><i>One-Time</i>: The job runs only once.</li> <li><i>Recurring</i>: The job runs at a specified frequency.</li> </ul> |

| Option | Description                                                                                                                   |
|--------|-------------------------------------------------------------------------------------------------------------------------------|
|        | <ul style="list-style-type: none"> <li><i>Dependent of:</i> The job runs only when its prerequisite job completes.</li> </ul> |

The new job request shows in the list.

## Next Steps

After you create a job request, submit the job request so the job can run as scheduled.

You can choose *Run It Now* to immediately run the job without submitting the job request. This option allows you to get the job done right away and find out job error (if any) before the scheduled time.

## 21.1.1.10.1.3.2 Submitting Job Requests

After you create a job request, you need to submit the job request so that the job can run as scheduled.

## Prerequisites

You have created a job request.

## Context

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Procedure

1. Go to Provisioning and choose the company name.
2. Choose [Managing Jobs](#) under [Managing Job Scheduler](#).
3. On the [Manage Scheduled Jobs](#) page, find your job request and choose [Submit](#) from the dropdown list.
4. In the confirmation dialog, choose [Yes](#) to submit.

The status of the job request turns [Submitted](#).

## Next Steps

You can choose [Run It Now](#) to immediately run the job. This option allows you to get the job done right away and find out job error (if any) before the scheduled time.

### 21.1.1.10.1.3.3 Notes on Some Common Job Types

Learn more about some of the more common job types and what they do.

#### Note

This **isn't** a complete list of all available job types. It describes some of the more commonly-used job types, including notes with additional information or links to more documentation.

For modules, please use the conkeyrefs from the What's New Viewer referable content topics if available. WNV Modules: SuccessFactors or simply copy/paste from the following: Analytics Career Development Compensation Employee Central Employee Central Payroll Learning Onboarding Onboarding 1.0 Opportunity Marketplace Performance and Goals (Note: This conkeyref will be deprecated in b2305. Choose from among the more precise modules such as 360 Reviews, Goal Management, and so on.) Platform Recruiting Succession Planning Time Tracking If your module supports a new job type but there's no module-specific information or limitations you want to call out, you don't need to add an entry to the table. If a cell contains multiple entries that should appear individually in the dropdown list (Module and Feature columns), make it a simple list by using the <sl> in parentheses instead of <p> tag.

| Module    | Job Type                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Platform  | Refresh Synthetic Group Data     | <p>In job parameters, you can select:</p> <ul style="list-style-type: none"> <li>• <a href="#">All</a>: Refreshes all user data of all group types.</li> <li>• <a href="#">Common Data Model Content Deep-Link Access User Group (deepLinkActivationPermission)</a>: Refreshes the data of all modules that use SAP SuccessFactors Platform for user management. The job is view-only.                                                                                                                                                                                                              |
| Performance Management | Auto-Complete Inactive Users' Performance Management Forms for Configured Templates | To route inactive users' forms to completion. For more information, refer to the entry "Auto-complete inactive users' Performance Management forms if the job is scheduled" in <a href="#">Configuring Form Template Settings</a> .                                                                                                                                                                                                    |

## 21.1.1.10.1.4 Setting Up and Running a Scheduled Job in Provisioning

Set up and run an automatic job in [Provisioning](#) to perform External to Internal Candidate Profile Conversion.

### Prerequisites

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Procedure

1. Go to ► [Provisioning](#) ► [Managing Job Scheduler](#) ► [Manage Scheduled Jobs](#) ► [Create New Job](#) ►.
2. Configure the settings using the explanations from the following table.

| Field                        | Expected Data                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Job Name                     | Any descriptive text to define the job.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Job Owner                    | Select a dummy user in the customer's instance.<br><br>Selecting a live user can cause the job to fail if that user becomes inactive.<br><br>Tie this dummy user to an email address that is monitored regularly so that the confirmation and failure notifications are received by an appropriate client contact.                                                                                                                                                                                                                                                                                                                    |
| Job Type                     | External to Internal Candidate Profile Conversion                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Occurrence                   | <p>Recurring</p> <p>Set this job up to immediately follow the user import job to allow enough time for the user import job to complete. How long the job takes varies based on the number of candidates; small number of candidates can take minutes, larger number of customers can take hours.</p> <p>If clients are doing manual user creation or web services-based user creation instead of flat file imports, discuss the ideal timing with the client. Nightly conversion jobs are recommended, but more frequent scheduling can be accommodated by setting up multiple recurring jobs at different points during the day.</p> |
|                              | <div><p>→ Recommendation</p><p>Try to keep the conversion job as closely timed to user creation as possible to ensure a seamless experience for users and prevent any recruiting users from accessing the to-be-deleted internal candidate profile before conversion</p></div>                                                                                                                                                                                                                                                                                                                                                        |
| Start Date                   | Enter the date and time of when the conversion process begins running.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Additional E-mail Recipients | The Job Owner receives email notifications related to the success or failure of the conversion job. Use this field to specify additional email addresses that also receive a notification.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Send E-mail when Job Starts  | If the customer wishes to receive notification at the point when the job begins, select this option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

3. Save and run the job once.

By performing this step, no candidates convert. However, this action sets the baseline so that during the next run, this job looks to convert candidates whose Employee Profiles were created since the initial run.

## Next Steps

Customers need to base certain reports off the *Candidate Type When Hired* field. This reflects data from a point in time, rather than on any field that reflects the candidate's current external or internal status.

### 21.1.1.10.2 Frequently Asked Questions About Candidate to Employee Conversion

Learn answers to frequently asked questions about Candidate to Employee Conversion.

#### How is candidate to employee conversion triggered?

1. Verify all the necessary unique ID data is present on the Candidate Profile.
2. Move the external candidate into a status set up as "Hired" in the Hireable Options (as defined in [Admin Center > Recruiting > Edit Applicant Status Configuration](#)).
3. Allow the user import to run and create a new SAP SuccessFactors user account for the new hire.
4. Allow the candidate to employee conversion job to run.
5. The external candidate is converted to an internal candidate.

#### Why are no matches found when the scheduled job runs?

- The unique ID fields don't contain exactly matching data.
- The new SAP SuccessFactors user account was created before the most recent run of the Candidate to Employee Conversion scheduled job.

#### Does the candidate receive an email notification after the profile is converted?

Yes. The content of this email can be configured in [Admin Center > Company Settings > E-Mail Notification Templates Settings > External To Internal Candidate Profile Conversion Success Notification](#).

#### Does Candidate to Employee Conversion work if the newly hired employee doesn't have Career tab privileges?

No. By design if the employee doesn't have Career tab permissions, Candidate to Employee Conversion is unsuccessful.

### **Will Candidate Profile data populate the Employee Profile after conversion?**

Yes. If fields and/or background elements are sm-mapped between the Candidate Profile and Employee Profile, at point of conversion the data syncs from the converted internal Candidate Profile to the Employee Profile automatically.

### **Are converted candidates searchable?**

Internal candidate searchability depends on the client's DPCS settings. If internal candidate DPCS is enabled, the converted candidates aren't searchable until the DPCS is accepted.

### **How to make sure that the candidates are searchable?**

Ensure that the Candidate Profile is created along with the Candidate to Employee Conversion job for the internal candidate to be searchable.

### **When the conversion is first set up, does it convert all previous hires in the system?**

No. The conversion scheduled job runs only on new hires from the point the scheduled job is enabled; it's not retroactive to past hires. Existing duplicate external and internal Candidate Profiles aren't affected when the conversion feature is enabled.

### **If an external candidate is erroneously converted to an internal candidate on an unrelated employee, is there a way to undo the conversion?**

No. There's no way to manually split a converted internal Candidate Profile back into two separate external and internal Candidate Profiles if an erroneous conversion is performed.

### **What happens to applications made by an external candidate before conversion?**

The candidate continues to be tied to their previous applications. Any applications the external candidate made before being converted continue to show as external applications. The application status is unaffected by the conversion. These applications appear on the Jobs Applied portlet for the converted internal candidate. The internal candidate can access the applications from their Job Applications tab.

### **Is conversion logged in the audit trail?**

Yes. The conversion activity, including before and after field values, is included in the Candidate Profile audit trail if field-level auditing is enabled.

## **21.1.1.11 Candidate-to-Employee Deconversion**

When an employee user account is deactivated, their internal candidate profile is deactivated as well, and subject to any data purge rules that are set up.

Configure Employee-to-Candidate Conversion to preserve the internal candidate profile data for use in future recruiting activity. By using Employee-to-Candidate Conversion, you can convert the internal candidate profile to an external candidate profile so that it's disassociated from the deactivated employee user account.

Consider the data protection and privacy implications of employee-to-candidate conversion before you implement it. For example, review language in the Data Privacy Consent Statement and ensure that there are no legal concerns with retaining the data of former employees.

- If DRM 2.0 is enabled, the scheduled job must run before the DRM purge job runs to assure the data isn't purged before it's converted.

- When an internal candidate is converted to an external candidate, the system issues a primaryEmail value that becomes the user's login to the external career site.
- If field-level auditing is enabled, conversion activity is included in the Candidate Profile audit trail.

## 21.1.1.11.1 Configuring Candidate to Employee Deconversion

Converting an Internal Candidate Profile to an External Candidate Profile is called deconversion. To deconvert a profile, configure an automatic job.

### Prerequisites

- Set up the user information management process and ensure it's running successfully so that you can manage user creation, updates, or deactivation.
- Ensure that you have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- Go to [Provisioning](#) > [Manage Recruiting](#) > [Edit Candidate Profile Template](#) and configure the [postConvExtContactEmail](#) standard text field as read only. This field stores the external candidate e-mail address after conversion, so that it can be used in deconversion to reissue the logon username of the candidate.

### Procedure

1. Go to [Provisioning](#) > [Manage Scheduled Jobs](#) > [Create New Job](#).
2. Configure the settings using the explanations from the following table.

| Field    | Expected Data                           |
|----------|-----------------------------------------|
| Job Name | Any descriptive text to define the job. |

| Field                        | Expected Data                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Job Owner                    | <p>Select a dummy user record in the customer instance. To insure that a client contact monitors the confirmation and failure notifications, make sure that this dummy user record is tied to an active e-mail address.</p> <div>  <b>Caution</b> <p>If you select a live user record that later becomes inactive, rather than a dummy record, the job can fail.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Job Type                     | Internal to External Candidate Profile Conversion                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Occurrence                   | <p>Recurring</p> <p>Set this job up to follow the user import job immediately. Allow enough time for the user import job to complete. A small number of candidates can take minutes; a large number can take hours.</p> <p>If DRM 2.0 is enabled, ensure that the conversion job is scheduled, so that it completes before the DRM 2.0 purge job runs. If the Candidate Profile data is purged before it's converted, no subsequent conversion is possible. There's no way you can restore the purged data.</p> <p>If the customer isn't doing flat file imports, but instead is doing manual user creation or web-services-based user creation, discuss the ideal timing with the client. Nightly conversion jobs are recommended, but more frequent scheduling can be accommodated by setting up multiple recurring jobs at different points during the day.</p> <p>The primary consideration on scheduling is to try to keep the conversion job ahead of the DRM 2.0 purge job to prevent any data loss.</p> |
| Start Date                   | Enter the date and time for the conversion process to begin.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Additional E-Mail Recipients | The job owner receives e-mail notifications related to the success or failure of the conversion job. If other e-mail addresses also need to receive a notification, specify those recipients.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Send E-Mail when Job Starts  | If the customer wishes to receive a notification before the job begins, select this option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 21.1.1.11.2 Internal to External Candidate Profile Deconversion

A conversion job analyzes the predefined conditions to convert the internal Employee Candidate Profile to External Candidate Profile.

When an employee leaves the organization, the employee's user account is inactivated. The corresponding internal candidate profile is converted to external candidate profile. A deconversion process does the conversion from internal to external candidate profile.

The following table describes flow of conversion job to convert an internal candidate profile to external candidate profile.

Convert an Internal Candidate Profile to External Candidate Profile

| Pre-Condition                                                                   | Conversion Process                                                                                                    | Result                                                                 |
|---------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
| Employee's user account has been inactivated since the last conversion job ran. | Remove the association between the Employee Profile and candidate profile and converts to external candidate profile. | Internal candidate profile is converted to External candidate profile. |

If an inactive employee has an internal candidate profile, a unique primary e-mail address is required to convert it to an external candidate profile. Using the primary e-mail address, the candidate can access the account in the external career site. To set a unique primary e-mail address for a candidate, the conversion job considers the following criteria for the deconversion:

1. Restore the **candidate's primary e-mail address**. (If external to internal conversion was done for the employee)
2. Restore the **candidate's contact e-mail address**, if the **candidate's primary e-mail address** doesn't exist (external candidate profile wasn't converted to internal candidate profile).
3. Use **employee's contact e-mail** address if **Candidate's contact e-mail address** is unavailable or it exists for another user account.

If any one of the conditions is met, the internal candidate profile is converted to an external candidate profile.

If all the conditions fail, then an error occurs stating the duplicate profiles exist, or no contact e-mail address found for the employee.

If duplicate candidate profile exists, use [Manage Duplicate Candidates](#) to merge them into one profile.

After merging the duplicate profile or setting the unique e-mail address, if the conversion job doesn't pick the inactivated candidate profile for deconversion, then set date of the conversion job.

From ► [Admin Center](#) ► [Manage Recruiting Settings](#) ► [Internal To External Candidate Profile conversion settings](#). ► Set the [Employees marked as inactive in last \[\] weeks](#) field value to set the last run date of the conversion job. Candidates inactivated on or after the set date are converted to external candidate when the conversion job is run.

Lets consider an example where an employee was inactivated on 22 June, and conversion job was run on 24 June. The conversion job fails because external candidate profile exists. Now, merge the duplicates candidate profiles and run the conversion Job. The inactivated profile isn't picked for deconversion because the employee profile was inactivated before the last job run.

Set the Employee marked as inactive in last [] weeks value as 1. The field sets the last run date of the conversion job to 17 June. The conversion job converts the inactivated candidate profile to external profile.

## Configure E-Mail Notifications to Candidate

Configure e-mail notifications to send e-mails to the candidate after the profile is converted to external.

► [Admin Center](#) ► [E-Mail Notification Templates Settings](#) ► [External to Internal Candidate Profile Conversion Success Notification](#). ►

Sends an e-mail notification to the e-mail address of the candidate saved in the records. If the e-mail address of the candidate is unavailable in the records, no e-mail notification is sent.

### 21.1.1.12 Candidate Profile with HR Master Data

Candidate Profile in Recruiting provides the capability to reuse HR Master data (data defined in other modules) using Foundation Object and Generic Object. If you aren't looking for implementing Candidate Profile with HR Master data, you can skip this section.

#### [Configuring Candidate Profile Template \[page 946\]](#)

Add, modify, and remove UI fields, permissions, and picklists in the Candidate Profile template.

#### [Future-Dated Foundation Objects and Generic Objects for Candidate Profile \[page 948\]](#)

Candidates cannot save their profiles with objects that are inactive as of today, or which get activated in the future.

#### [Field Criteria Definition for Candidate Profile \[page 948\]](#)

Just like cascading picklists are used to filter or restrict values on a field based on the value selected for another related field, Field Criteria is used to filter on objects (Foundation Object and Generic Object).

#### [Permissions for Candidate Profile \[page 949\]](#)

There are three types of permissions for the Candidate Profile.

#### [Foundation Objects and Generic Objects in Candidate Profile \[page 950\]](#)

Supported areas for Foundation Objects and Generic Objects in Candidate Profile.

#### [OData Operation for Candidate Profile \[page 950\]](#)

The Foundation Object/Generic Object fields that are defined in the Candidate Profile template are available for OData API operations under the following conditions:

#### [Foundation Object and Generic Object Fields in Ad Hoc Reports for Candidate Profile \[page 951\]](#)

While generating Ad Hoc reports in SAP SuccessFactors, you can include Foundation Object and Generic Object fields defined in the Candidate Profile template.

### 21.1.1.12.1 Configuring Candidate Profile Template

Add, modify, and remove UI fields, permissions, and picklists in the Candidate Profile template.

## Prerequisites

You have access to Provisioning.

## → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Context

The XML attribute **object-type** helps to define Foundation Object and Generic Object field types in the Candidate Profile template. To enable Foundation Object and Generic Object field types in the Candidate Profile template, contact SAP Cloud Support.

### 📘 Note

- You can maintain [Candidate Profile Template](#) for Foundation Object and Generic Object field types using [Manage Templates](#).
  - Background elements and SM-Mapping aren't supported.
- The XML attribute **object-type** is the type of Foundation Object or Generic Object.
  - The attribute type is always set to **object**.

### 📘 Note

You can configure only custom fields as Foundation object or Generic Object on Candidate Profile.

For example, this snippet shows the definition for an object of type **Custom Department**.

```
<field-definition id="cust_department" type="object"
  required="false" custom="true" object-type="Department">
  <field-label><![CDATA[Custom Department]]></field-label>
  <field-label lang="de_DE"><![CDATA[Custom Department]]></field-label>
  <field-description><![CDATA[Custom Department]]></field-description>
</field-definition>
```

You can define custom fields of type Foundation Object and Generic Object. Here, the objects can be both standard and custom Generic Objects or standard Foundation Objects.

## Procedure

1. In Provisioning, choose [company name](#).
2. Choose [Edit Candidate Profile Template](#) in the [Manage Recruiting](#) area.
3. Modify the contents of the candidate profile template in the [Edit Candidate Profile Template](#) page.
4. Save your changes by choosing [Save Form](#).

## 21.1.1.12.2 Future-Dated Foundation Objects and Generic Objects for Candidate Profile

Candidates cannot save their profiles with objects that are inactive as of today, or which get activated in the future.

## 21.1.1.12.3 Field Criteria Definition for Candidate Profile

Just like cascading picklists are used to filter or restrict values on a field based on the value selected for another related field, Field Criteria is used to filter on objects (Foundation Object and Generic Object).

To apply field criteria, the objects need to be associated in the object definition in MDF on the [Configure Object Definitions](#) page.

A sample definition is as shown. Here, the child object has an association defined to the parent object. You can see only the **Business Units** (child objects) that are under the **Legal Entity** (parent object) that you selected earlier.

Employee Central maintains field criteria in the Succession Data Model (SDM). To use associations in Recruiting Management, field criteria has to be defined in the candidate profile template. Associations defined in the Succession Data Model aren't automatically copied to the candidate profile template.

Field criteria can only be defined for fields of **type="object"**.

Field criteria is applicable in the following scenarios:

- UI
- OData

### Note

- We recommend avoiding the following configuration for any operator:
  - Parent field - Editable
  - Child field - Read Only

If there's such a configuration, you can't change the child field value. The system displays an error message informing that such an action isn't possible due to configuration issues. This is applicable when the [Location](#) field is both single select and multi-select.

The XML attribute **field-criteria** is defined from the child field to the parent field to form a child to parent relationship. For example, if **Location** is the parent field and **Legal Entity** is the child field, the field criteria must be included in the Legal Entity definition.

```
<field-definition id="custom_legalentity" type="object" required="false"
custom="true" object-type="LegalEntity">
<field-label><![CDATA[Custom Legal Entity]]></field-label>
<field-label lang="de_DE"><![CDATA[Custom Legal Entity]]></field-label>
<field-description><![CDATA[Custom Legal Entity]]></field-description>
<field-criteria sourceFieldName="cust_location.externalCode"
destinationFieldValue="custom_location"/>
</field-definition>
```

There are two tags available in **field-criteria**. They are:

- **sourceFieldName**

Field Criteria Behavior for Parent and Child Field Permissions

| Parent Field Permission | Child Field Permission | Field Criteria Behavior                                                                                                                                                 |
|-------------------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| READ                    | WRITE                  | Field criteria is applied as defined in the Candidate Profile template.                                                                                                 |
| READ                    | READ                   | Since parent and child have Read only permissions, there aren't any changes to the values and the field criteria is ignored.                                            |
| No READ and WRITE       | READ                   | As the child value can't be changed, the field criteria isn't applied.                                                                                                  |
| No READ and WRITE       | WRITE                  | Even though the child field has Write permission, you don't see any values in the child field dropdown as the parent doesn't have Read and Write permissions.           |
| WRITE                   | READ                   | While it's possible to save the offer on changing the parent value, even if the child value is incorrect. It's recommended that you don't modify the template this way. |
| WRITE                   | WRITE                  | As both parent and child fields have Write permissions, the field criteria is applied as defined.                                                                       |

- **destinationFieldValue**

The field ID of the parent field as defined in the candidate profile template.

## 21.1.1.12.4 Permissions for Candidate Profile

There are three types of permissions for the Candidate Profile.

The permissions are Template role permissions, Object level permissions, and Target Population. These permissions are executed in a specific sequence. At any point in time, if one of these permissions fail, the next set of permissions are not executed. You can define permissions based on the type of candidate (internal or external) and on the country/region of the candidate.

## 21.1.1.12.5 Foundation Objects and Generic Objects in Candidate Profile

Supported areas for Foundation Objects and Generic Objects in Candidate Profile.

You can include custom fields of type Foundation Objects and Generic Objects in **Candidate Profile**, **Candidate Search**, **Candidate Application** (more info section), **Candidate** and [Application history](#), and **Tokens**. Customers can search candidate profiles based on the stored Foundation Objects and Generic Objects data on their profiles.

You can't import Candidate Profiles with Foundation Object and Generic Object fields in bulk through the candidate profile import job in Provisioning. However, you can import candidate profile with other fields in bulk.

### Note

- Legacy data migration bulk imports don't support Foundation Objects and Generic Objects on candidate profile.
- Integration Center doesn't support upserting/updating Foundation Objects and Generic Objects on candidate profile.
- Internal and External Career Sites, Mobile Apply, new Internal Career Site support Foundation Objects and Generic Objects in candidate profile.

## 21.1.1.12.6 OData Operation for Candidate Profile

The Foundation Object/Generic Object fields that are defined in the Candidate Profile template are available for OData API operations under the following conditions:

### Generic Object Fields

- The Object definition (MDF Entity) must have the API Visibility set appropriately (Editable or Read-only).
- Under Object definition, if the Generic Object field isn't marked as Secured, no permissions are considered while accessing data for the Generic Object.

For the secured Generic Object,

- If the API user has OData MDF Admin access ([Admin access to MDF OData API](#)), no RBP permissions are considered
- If the API user doesn't have the permission, apply RBP Object Level permission and Target Population permission.

### Note

#### API validations for Generic Object fields

Permission validation is performed on data retrieval and modification.

### Note

Following are the prerequisites for any operation on MDF entities:

- [Metadata Framework](#) > [Read/Write Permission on Metadata Framework](#) > )

- [Admin access to ODATA API](#) > [Manage Integration Tools](#) > )

### Foundation Object Fields

- If the API user has [Employee Central API](#) permissions, no RBP permissions are considered. The user can access all Foundation Object data on the Requisition.
- If the API user doesn't have the permission, RBP Permissions (Under Manage Foundation object types) on the entity is considered

#### Note

- **API validations for Foundation Object fields.**  
Permission validation is performed on data retrieval and modification.  
Data validation such as externalCode and field criteria validations are performed only on data modification (INSERT/UPSERT/UPDATE).
- SFAPI doesn't support Foundation Objects and Generic Objects in Candidate Profile.

## 21.1.1.12.7 Foundation Object and Generic Object Fields in Ad Hoc Reports for Candidate Profile

While generating Ad Hoc reports in SAP SuccessFactors, you can include Foundation Object and Generic Object fields defined in the Candidate Profile template.

For custom Foundation Object and Generic Object fields types on the Candidate Profile to be available in Ad Hoc reports, it must be configured in [Provisioning](#) > [Managing Recruiting](#) > [Configure reportable custom fields](#) > . These fields would then also be available for filtering and can be used to filter records in a report.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

#### Note

For the Foundation Object and Generic Object fields, the Role-Based Permissions and Target Population are not honored while viewing, generating, sharing, or downloading a report.

RBP and Target Population permissions are considered while viewing, generating, sharing, or downloading a report. If you don't have the required permissions (a minimum of Read permission on the Entity), the values aren't visible. The values are blanked out even when you try to filter based on these values when you don't have permissions.

In Ad hoc reports, you can display the effective-dated version of the Foundation Object and Generic Object - externalName.

To display the effective-dated version of externalName object, the [Allow users to select only those instances that are active as of the date in the Start Date field in the Job Requisition, Application and Offer Detail pages](#) option must be enabled in [Admin Center](#) > [Manage Recruiting Settings](#) > [Generic Object / Foundation Object \(GO/FO\) field types](#) > .

If this option is not enabled, the current system date is used as the value for the `externalName` object, in the Ad hoc report.

| Status   | Description                                                                                                                                                                                                          |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Disabled | The name is as of the current system date.                                                                                                                                                                           |
| Enabled  | RBP and Target Population permissions are considered while viewing, generating, and sharing reports. The value displayed is always from the effective-dated version (active or inactive), that is, as of 31-12-9999. |

### 21.1.1.13 Configuring Dynamic Groups to Associate Permissions

The Candidate Profile template is an XML file that contains the fields defined by the customer. The visibility of the fields can be controlled through permissions.

#### Prerequisites

Ensure that [Dynamic Groups V2 \(My Groups\)](#) is enabled in [Provisioning](#).

##### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

#### Context

You can configure editing permissions so recruiting users in a dynamic group have write access to fields and background elements on the candidate profile. Otherwise, only candidates have write permissions for fields and background elements. Fields can be hidden, read or write for candidates, and can be read or write for recruiting users.

Groups are associated only with the user who creates those groups. While creating groups, make sure that the creator proxies using a dedicated user account that is always activated. This action ensures that the group persists and can be located and managed.

#### Procedure

1. Log in as an admin user who manages this group.
2. Click the profile and select [Options](#).

3. Go to [Groups](#) and click [Create New Group](#).
4. Select your inclusion and exclusion categories per [People Pool](#) and save it.
5. Associate this dynamic group (for example, Recruiters) in the Candidate Profile XML.

#### Sample Code

```
<field-permission type="write">
  <role-name group-name="Recruiters"><![CDATA[Dynamic Group]]></role-name>
  <country><![CDATA[*]]></country>
  <source><![CDATA[*]]></source>
  <field refid="firstName"/>
  <field refid="middleName"/>
  <field refid="lastName"/>
  <field refid="homePhone"/>
  <field refid="cellPhone"/>
  <bg-element refid="insideWorkExperience" data-field-id="*" />
</field-permission>
```

## Next Steps

Upload the modified Candidate Profile XML template in [Provisioning](#).

## 21.1.2 Candidate Profile Creation

Candidate Profiles are created in different ways, depending on how the candidate is added to the Recruiting system.

Candidate profiles are typically created when a candidate applies to a job and enters their personal information into the Recruiting system.

For customers using a Recruiting Marketing and Recruiting Management integrated instance, the behavior is unique. The Recruiting Marketing system creates the candidate profile as an external candidate and passes the candidate data to Recruiting Management. If the customer is using SSO, the system passes the candidate directly to Recruiting Management without the users required to configure or enter another password.

Candidates can also be created when external candidates are loaded into the instance during data migration.

### Note

There are scenarios where candidates sometimes create more than one candidate profile. In such situations, you have to merge the profiles. Managing duplicate candidates is an administrative function.

## Related Information

[Recruiting Data Migration \[page 1395\]](#)

[Scheduling Jobs](#)

## 21.1.2.1 Configuring Fields for Candidate Profile Creation

Configure fields for use in candidate profiles.

### Context

If fields for the Candidate Profile aren't explicitly configured or configured correctly in the Candidate Profile XML, they don't work correctly when manually adding a candidate. For example, if the country/region field picklist is configured with non-ISO country/region values, those picklist items are missing from the country/region dropdown menu on the account creation screen.

#### Note

You've to ensure that the common standard fields that are configured in the Candidate Profile template are also configured in the Application template. If this configuration isn't done, when an application is purged, the data in the [More Information](#) section won't be purged.

Candidates manually added into the system receive an email notification providing information about how to reset their password and access their account to manage or delete their data.

This email template can be configured, or the email trigger can be enabled or disabled.

#### → Tip

In some countries, particularly in EMEA region, recruiters are required by law to notify candidates when their personal data is stored, and to provide them the option to edit, or delete their data. Remind customers to check with their legal department to make certain that disabling this email doesn't violate data privacy laws.

### Procedure

1. Navigate to **Admin Center** > **E-Mail Template Notifications Settings** > **Recruiting Manual Candidate Creation Notification**.
2. To enable this trigger, check the **Enable** box.  
  
By default the system enables this notification for candidate profiles in all countries.
3. To enable the automatic notification for specific countries/regions, select one or more countries/regions from the **Enable for Country/Region:** dropdown menu. Candidate profiles in the countries/regions selected receive this notification.

## 21.1.2.2 Configuring Fields on Candidate Profile Creation Page for an External Candidate

You can configure the fields in Provisioning, so that these fields are available on the [Candidate Profile Creation](#) page. The external candidates can then add all the required information while creating an account.

### Prerequisites

You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

An external candidate selects ► [Sign In](#) ► [Create an account](#) ► on a career site page. The candidate fills in the required field on the account creation page and selects [Create Account](#).

#### ⓘ Note

Linking directly to this account creation page isn't supported.

### Procedure

1. Configure username options by going to ► [Provisioning](#) ► [Company Settings](#) ► [Recruiting](#) ► [Use email as external applicant userID](#) ►.
  - Selecting this field uses the email address of the candidate as their usernames and sets the same value for both the `primaryEmail` and `contactEmail` fields.
  - Not selecting this field splits the candidate logon username and the candidate email address into two separate fields: `primaryEmail` and `contactEmail`.  
If this field isn't selected, configure the `primaryEmail` field in the Candidate Profile XML so the logon username candidate is visible to recruiting users.

#### ⚠ Caution

When this option isn't selected, there's no method for candidates who forget their username to retrieve it, unless a recruiting user looks it up on their candidate profile.

2. Configure password options in ► [Admin Center](#) ► [Manage External Password Policy](#) ► page.

When this option is selected, users with permissions for the feature can set password validation criteria.

3. Control the display of CAPTCHA verification codes. Go to ► [Provisioning](#) ► [Company Settings](#) ► [Disable CAPTCHA on the External Career Site for Account Creation](#) ►.

When this option is selected, the verification code doesn't show. When you don't select this option, the CAPTCHA code is displayed during account creation.

4. Allow candidates to choose who can view their profiles. Go to ► [Provisioning](#) ► [Managing Recruiting](#) ► [Edit Candidate Privacy Options](#) ► and select [Ask external candidates to set their visibility settings when creating an account or profile](#) option.

When this option is selected, the [Make My Profile Visible To](#) section appears on the candidate profile creation page.

- To allow recruiters to set the visibility of manually added candidates, enable [Allow internal users with appropriate add candidate permissions to set external candidate visibility upon manually adding a candidate](#).  
When this option is enabled, a recruiter can set candidate visibility options when manually creating a candidate.
- To allow agency users to set the visibility of manually added candidates, select [Allow agency users with appropriate add candidate permissions to set external candidate visibility upon manually adding a candidate](#) option.  
When this option is enabled, an agency user can set candidate visibility options when manually creating a candidate.
- For [Only Recruiters managing jobs I apply to](#), there's no search feature available. The candidate profile is visible only when coming from the application page. But the operator (or teamOperator) can't search for the same candidate in the candidate search page. With this option, we have visibility but not searchability.
- For [Only Recruiters in 'y of my country of residence](#), if the country/region of the candidate and the user match, you can view the profile and also search for the candidate. This is because no application is involved. With this option, we have both visibility and searchability.

5. Enable email validation. Go to ► [Admin Center](#) ► [Recruiting Email Triggers](#) ► and select [Career Site E-Mail Notification](#) option.

When this option is selected, the candidate is prompted to log in to their email and validate their active email account.

## Results

All the configured fields are available on the candidate profile account creation form.

### 21.1.2.3 Locale Consideration for E-Mails Sent to Manually Created Candidates

There are two scenarios in which e-mails are sent to candidates. These include automatic e-mails (using e-mail trigger) and e-mails sent to candidates by users when they manually create candidates from the [Candidate Search](#) or the [Candidate Summary](#) page.

#### Locale for E-Mails Sent to Manually Created Candidates Through an E-Mail Trigger

As soon as the candidates are created manually, an e-mail is sent to the candidate using [Recruiting Manual Candidate Creation Notification](#) e-mail trigger. The language in which the e-mail is sent depends on the locale of the logged-in user.

##### ⓘ Note

At the time of Candidate creation, the manually created candidates don't have a locale assigned to them.

A check is done to validate whether the e-mail template configured in the e-mail trigger has the same locale as the logged-in user. If both the locales are same, the e-mail content is fetched with the logged-in user's locale. If logged-in user's locale isn't found, the RCM default language is used to get the e-mail content.

##### ⓘ Note

The RCM default language is set in ► [Admin Center](#) ► [Manage Recruiting Languages](#) ►.

#### Locale for E-Mails Sent by the User to Manually Created Candidates

Whenever the e-mails are sent to the manually created candidates from [Candidate Search](#) or [Candidate Summary](#) page, the user can select the language and e-mail template for an e-mail before it's sent to the candidate.

### 21.1.2.4 Candidate Creation Scenarios

You can create both external and internal candidates so that they can enter their personal information into the Recruiting system.

#### External Candidates Creation Scenarios

- Using [Add Candidate](#) option in ► [Recruiting](#) ► [Candidates](#) ►, you can manually add candidate to the Recruiting Management system.
- Candidate can be also added to the system through OData API.
- When user creates an account in [External Career Site](#).

## Internal Candidates Creation Scenarios

- If DPCS is enabled for internal candidate profile:
  - Candidate profile is created when the internal user first accesses ► [Careers](#) ► [My Profile](#) ► and accepts the DPCS.
  - When employee clicks [Apply](#) for the first time and accepts the DPCS, the candidate profile is created.
- If DPCS isn't enabled for internal candidate profile:
  - When, a Recruiter has searched for the Recruiting candidate and clicked on the candidate profile.
  - When the employee accesses ► [Careers](#) ► [My Profile](#) ►.
  - Employee applies for a job.
  - **Synchronous creation on Add New Employee:** If Employee Central is enabled and when an employee is created using the [Add New Employee](#) option on the UI, the internal candidate profile is synchronously created. In this case, the effective start date of the new hire isn't in the future.
  - **Asynchronous creation:** Creation of internal candidate profiles can be done using [RCMDailyRuleBatch](#) job. In instances with Employee Central, the [RCMDailyRuleBatch:Processor:CANDIDATE\\_CREATION\\_EC\(job ID\)](#) job processor handles the processing. For instances without Employee Central, the [RCMDailyRuleBatch:Processor:CANDIDATE\\_CREATION\\_NON\\_EC\(job ID\)](#) processor is used instead. This ensures processing is optimized based on the setup. You can monitor the candidate profile creation using the [Recruiting Daily Rules Processing Batch Job](#) job type in the [Scheduled Job Manager](#) tool available in [Admin Center](#) and Provisioning.

### ⓘ Note

- In case the Admin user (**v4admin**) is either inactive or invalid in the Company, it's required to assign another Admin user as **Job Owner** to the [RCMDailyRuleBatch:Processor:<jobID>](#) job to ensure that the job execution is successful. To perform this action, go to ► [Provisioning](#) ► [Managing Job Scheduler](#) ► and select [Recruiting Daily Rules Processing Batch Job](#) as the *Job Type*.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### ⓘ Note

If SAP Customer Data Cloud migration has been completed in your preview environment, then it requires the email to be valid and unique. Once candidate migration begins, any newly created candidates must meet these validations for the contact email field.

## Related Information

[Scheduling Jobs](#)

## 21.1.2.5 Creating a Candidate Profile

You can create individual candidate profiles, manually.

### Procedure

1. A recruiting user who has candidate search permissions clicks [Add Candidate](#).
2. A recruiting user who has candidate search permissions and an open requisition can also click [Add Candidate](#) from the requisition. If a candidate is added by this link, the completed candidate profile is automatically associated to the requisition in the Forwarded status.
3. The recruiting user completes the required user account information and clicks Create Profile. This screen isn't configurable.
4. At this point, the candidate account is created but contains little data. The recruiting user can attach a resume and cover letter. Attachments are immediately saved to the record even if no additional required fields are filled out and saved. In this way, a recruiting user can create a searchable candidate profile with little data entry.
5. The recruiting user can also enter field and background element data into the candidate profile record. In this case, the recruiting user must enter all required fields before saving changes. If the recruiting user has no write permissions to the candidate profile, this is the only opportunity for them to enter data in the record.

## 21.1.2.6 Accessing and Managing a Candidate Profile

Candidates can edit their profile to add or modify information.

After external candidates create or log in to their account, or internal candidates access the Careers tab, the candidates can click their candidate profile and populate it with data on the [My Candidate Profile](#) sub tab.

Candidates can be prompted to complete their candidate profile when applying for a job, before they see the application page. This occurs when the [Provisioning](#) > [Company Profile](#) > [Complete Profile before Application](#) setting is checked.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

In this case, candidates see a [Next](#) button on the bottom of the candidate profile, since completing the profile is the first step in a two-step application process.

Candidates can delete the standard cover letter and resume attachments from their candidate profile. This action can be performed by clicking the delete icon  next to the resume, as long as the cover letter and resume fields aren't required.

## 21.1.2.7 Change History of Candidate Profile

Recruiting users can view a change history of changes to the candidate profile record.

You can access the change history by clicking the blue clock icon in the top corner of the candidate profile record.

The change history shows changes made on the field level.

## 21.1.2.8 Tagging a Candidate

Recruiting users can use tags and tag searches to add more information to a candidate's profile to increase the candidate's searchability.

Before you can tag a candidate, make sure indexes are created for the instance.

### Prerequisites to Using Tags

- [Candidate Profile XML is configured](#) is enabled in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- Relevant roles have the following permissions:
  - [User Permissions](#) > [Recruiting Permissions](#) > [Candidate Tagging Permission](#)
  - [User Permissions](#) > [Recruiting Permissions](#) > [Standalone Search Permission](#)

### Tag a Candidate

A recruiting user with candidate permission opens a candidate profile or application record, clicks "Add" in the Tags portlet and types in the desired tag. As the user types, the system prompts the user with possible tag matches based on tags previously entered into the system. Note that tags and type-ahead are case-sensitive, which isn't configurable.

The system suggests only tags entered in the locale of the user tagging the candidate. This is intuitive, but can be less intuitive when working with the en\_US and en\_UK language packs where users can expect tags to be available across multiple locales.

#### ⓘ Note

Candidate tags become searchable content.

There's no way to restrict users to selecting tags only from a predefined list, although it's possible for implementation consultants to load tag definitions to prebuild the type-ahead prompts.

As an alternative to restricting users to selecting from a list of predefined tags, customers can consider configuring a custom background element on the Candidate Profile XML. The custom background element can include picklists of the desired searchable options.

## Sort Candidate Profile Tags

Candidate profile tags are sorted according to the order in which they were added into the system. When a tag is added to the candidate profile, a Tag ID is assigned to it. If you remove it and add the same tag again, it's reused and sorted accordingly.

## Example

1. Go to Candidate Profile and add the tag **C#**. The system creates a new record in the database and sets the Tag ID as **1**.
2. Add another tag, **AngularJS**. The system then sets the Tag ID as **2**.
3. Go to another candidate profile and add the same two tags, but in a different order. You see that the order is set according to the Tag ID.
4. Now, let's say that in the other candidate profile, you add another new tag **JAVA**, for example. This Tag has the ID as **3**, so automatically it's the last one.

## Related Information

[Candidate Search \[page 858\]](#)

## 21.1.2.9 Enabling People to Forward Candidates to a Colleague

Enable the *Forward To Colleague* functionality so that recruiting users can share a candidate with another user.

## Prerequisites

- Recruiting is enabled in Provisioning.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- The Candidate Profile template is configured.
- Indexes are created for the instance.

## Context

Candidate forwarding to a colleague can be restricted based on the Candidate Visibility settings for that candidate profile.

The [Forward To Colleague](#) allows a recruiting user to select a single recipient and add some explanatory text. The recipient receives an e-mail notification with the candidate's name and the explanatory text. Name of the candidate is rendered as a hyperlink in the e-mail. This link allows the user to access a candidate's profile directly. Optionally, you can choose to allow the recruiting user to attach the candidate's resume and cover letter to the e-mail notification.

The default message text isn't configurable. Only the resume and cover letter documents are supported as e-mail notification attachments.

Only a single recipient can be selected and there's no CC or BCC functionality.

## Procedure

1. Go to ► [Provisioning](#) ► [Company Settings](#) ►.
2. Select [Enable Forward Candidate to Colleague for Internal Employees](#) to make the [Forward To Colleague](#) available on the search results, candidate profile record, or application record pages.
3. Select [Allow Attach Resume and Cover Letter](#).

### 21.1.3 Email Candidates

Recruiting users may initiate outgoing emails to candidates from within the product.

To email candidates, select the boxes next to several candidates in the search results and click [Email](#).

The [Send Email](#) screen allows the user to select from the recruiting email templates. The language field defaults to the recruiting user's language but the recruiting user can select an alternative language.

The tokens render and each user listed in the [Candidates](#) field and [CC](#) field receives an independent copy of the email; candidates cannot see each others' email addresses.

The e-mail sender is anonymized (like actual name and e-mail ID of the sender are masked) and a generic e-mail sender is displayed when sending mails to candidates using Java Apache Mail Enterprise Server (James server) for e-mail correspondence.

If desired, the recruiting user can attach one or more documents that will appear as attachments to the email. In case the template already has attachments they are displayed on this screen.

## 21.1.4 Enabling Email Verification for Candidate Account Simplification

Enable e-mail verification in a Candidate Account Simplification (CAS) enabled instance to send e-mail verifications to candidates when they create an account from an external career site.

The e-mail verification is done for mobile apply and nonmobile apply.

### Note

E-mail verification isn't supported for CAS enabled instances when *Quick Apply* is enabled for a job requisition application.

To enable the e-mail verification setting for an instance, enable the following options:

- Define the recruiting e-mail templates in ► [AdminCenter](#) ► [Manage Recruiting Email Templates](#) ►.
- Enable **Recruiting Email Triggers** option in **Admin Center**.
- Enable **Career Site E-Mail Notification** in ► [Admin Center](#) ► [Recruiting Email Triggers](#) ►.

### Note

- Beginning in Q4 2019, the option "Enable e-mail Verification for Career Site" is removed from [Company Settings](#) in [Provisioning](#). Instead, enable the "Career Site E-Mail Notification" option to send the verification emails in the CAS enabled instances. The "Career Site E-Mail Notification" option is available in, ► [Admin Center](#) ► [Recruiting Email Triggers](#) ►. Previously, if you've enabled the *Career Site E-Mail Notification option*, it's enabled by default in Q4 2019 CAS enabled instances.
- When the one-time password for email address verification is enabled, the setting of [Career Site E-Mail Notification](#) email trigger is ignored (if enabled).

A verification e-mail is sent to candidates when the candidates create an account from the Recruiting Marketing search pages through:

- View Profile
- Apply Now
- Subscribe
- Talent Community
- Social Apply
- Social Subscribe
- Create Alert

On creating a candidate account, the candidate gets a verification e-mail that has a link to [Thank You](#) page to act. The content of the [Thank You](#) page can be the default message or a customized one.

To customize the message on the *Thank You* page, go to ► [Admin Center](#) ► [Manage Recruiting Aettings](#) ► ["Email Verification Thank You Page" for Recruiting Marketing Career Site](#) ►, and select the *Custom Message* radio button to customize the message.

- If candidate has created an account after using the **Apply** and **Social Apply** option on Recruiting Marketing pages, the *Thank You* page has **Continue to Apply** and **Back to Job Listing**. Clicking the **Continue to Apply** option, the candidate is redirected to **Apply** page to apply for the posted jobs. If candidate hasn't signed in, *Sign In* page appears. Once signed in, that candidate is redirected to the **Recruiting** to the applied job postings. Clicking the *Back to Job listing* button redirects the candidate to *Recruiting Marketing* job search page.
- If candidate has created an account from *View Profile*, *Subscribe*, *Social Subscribe*, *Talent Community*, *Create Alerts*, the candidate can click *View Profile* or *Back to Job Listing* on the *Thank You* page. The *View Profile* button redirects the candidate to Sign In page. Once signed in, the candidate is redirected to the *Candidate Profile* page. The *Back to Job listing* button redirects the candidate to Recruiting Marketing job search page.

## 21.1.5 Configuring Resume Parsing

Set up the resume parsing function, which reads information from candidates' resumes and automatically enters it in the corresponding candidate profile fields.

### Prerequisites

- You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- You have configured background elements on the Candidate Profile template.

### Context

Resume parsing requires a third party to know exactly where data is placed. Third-party sources are mapped to standardized fields and you have to map these standardized fields to the configuration of your preferences.

#### 📘 Note

- Resume parsing is only supported in the following languages: Dutch, English, German, French, Spanish, Swedish, Danish, Polish, Romanian, Italian, Slovak, Czech, Russian, Portuguese, and Chinese.
- Resume parsing isn't always 100% accurate. This is a known limitation.
- The creation of candidates through API does not support parsing.

## Procedure

1. Enable the function under [Provisioning](#) [Company Settings](#) [Recruiting](#) [Resume Parsing](#).
2. Go to [Admin Center](#) [Recruiting](#) [Configure Standardization Mapping](#).
3. Select [Candidate Standardization](#) for any Recruiting users with the ability to add a candidate manually.

The standardized data fields of standardized background fields are displayed.

4. Select the appropriate template fields and the accompanying values for these fields.
5. Choose [Save](#).
6. Go to [Provisioning](#) and configure standardization mapping in the Candidate Profile XML template.

When using resume parsing, separate candidate profile XML permissions are required for internal and external candidates. If you don't separate these permissions, the recruiting user sees the internal candidate name update with the parsed information from the resume. This can cause problems if you're mapping to the Employee Profile.

```
<field-permission type="write">
  <role-name><![CDATA[Candidate]]></role-name>
  <country><![CDATA[*]]></country>
  <source><![CDATA[External]]></source>
  <field refid="customKnownAs"/>
  <field refid="firstName"/>
  <field refid="middleName"/>
  <field refid="lastName"/>
  <field refid="contactEmail"/>
  <field refid="cellPhone"/>
  <field refid="address"/>
  <field refid="customAddress2"/>
  <field refid="city"/>
  <field refid="country"/>
  <field refid="state"/>
  <field refid="zip"/>
  <field refid="customTravel"/>
  <field refid="resume"/>
  <field refid="coverLetter"/>
  <bg-element refid="outsideWorkExperience" data-field-id="*" />
  <bg-element refid="education" data-field-id="*" />
  <bg-element refid="certificates" data-field-id="*" />
  <bg-element refid="languages" data-field-id="*" />
</field-permission>

<field-permission type="write">
  <role-name><![CDATA[Candidate]]></role-name>
  <country><![CDATA[*]]></country>
  <source><![CDATA[Internal]]></source>
  <field refid="customTravel"/>
  <field refid="resume"/>
  <field refid="coverLetter"/>

  <bg-element refid="certificates" data-field-id="*" />
</field-permission>
```

## 21.1.6 Working with Resume Parsing

After resume parsing has been configured.

In the ► *Candidate Profile* ► *My Profile tab* ►, you're prompted to upload a resume for parsing.

After uploading a file, the system processes the resume and parses the information. The candidate sees an acceptance message when the resume is successfully parsed.

You can upload resume with **DOCX**, **PPT**, and **TXT** format. You can also upload **TIFF**, **JPG**, **BMP**, and **GIF** image types for parsing resumes.

If you wish to edit the resume, click on the edit button and upload the latest resume. You can see a confirmation screen to either keep the current profile or overwrite the profile with the information extracted from the updated resume.

SAP SuccessFactors uses the third-party software Textkernel to parse resume data. Supported languages are listed there.

## 21.1.7 Candidate Profile Frequently Asked Questions

Answers to frequently asked questions about Candidate Profile.

### **Candidate Search isn't working for the background Element 'Raise Your Hand'.**

This can be a permissioning issue. The field from the Candidate Profile Template and sm-mapping on the Candidate Profile Template creates one-to-one relationship between the Candidate Profile Template field and Succession Data Model field.

For example, `<background-element id="placeholder" type-id="94" sensitive="false">` from the Candidate Profile Template and `<sm-mapping field-id="placeholder" map-to="placeholder" />` from the sm-mapping on the Candidate Profile Template creates one-to-one relationship. In this example, the field is mapped to an Employee Profile field. So, the Candidate Search returns results only if it's permitted to read the data from the Employee Profile.

To provide permission, you have to edit the Succession data model so that the field is readable. This solution applies to any field element that is sm-mapped on the Candidate Profile.

### **Candidates aren't able to see the Job Country from External Career site.**

Even though the Job Requisition template has proper values for Job Country, it can so happen that you can't see the Job Country on the External Career site.

Ensure that field-label element used is unique and has the write permission in the Application template.

### **OnStartDateChange Job Fails in Provisioning.**

For sm-mapping, field-id must have a value corresponding with either the ID attribute from a field-definition element, or with the ID attribute of a background element, but not with `<search-display-options-config>`.

## 21.2 The Redesigned Applicant Management Tool

The redesigned Applicant Management tool is an update to the legacy Candidate Workbench, and provides an improved user experience for searching, filtering, and displaying individuals who have applied for specific jobs.

### Note

The main difference between the redesigned Applicant Management tool and legacy Candidate Workbench is in the user experience. The tool is enabled by default, and administrators need not set configurations from scratch nor do they have to reimplement Recruiting.

When new users log in to Recruiting for the first time, the legacy Candidate Workbench tool is the default version that displays. Users can switch to the redesigned Applicant Management if they want, and the system will remember this setting for the next connection. You can't completely disable the redesigned Applicant Management in your settings.

Administrators can configure and control the set of fields available as columns and filters in Applicant Management by using the *Recruiting User Personalization Object Configuration* MDF object in ► [Admin Center](#) ► [Manage Data](#) ► tool. A default set of the most used standard fields is available as a starter kit. You can add or remove fields to this selection.

When you enable the feature, Recruiting users can easily toggle back and forth between the latest and legacy versions by clicking on the link at the top right of the page.

The redesigned Applicant Management tool offers the following major features for the Recruiting user:

| Redesigned Feature      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The applicant list page | <p>The ability to see all applicants with information defined as columns (such as applicant type and country/region). Recruiting users can also perform actions on individual or multiple applicants at once, such as changing their status using the <a href="#">Move</a> button, or adding them to a talent pool from a quick actions menu.</p> <p>The list page also includes intuitive, easy-to-use search refinement capabilities through standard search, as well as filtering based on applicant status, as well as customer-configurable categories such as education and language proficiency that the user can perform.</p> <p>Filtering also allows you to perform keyword searches in resumes and cover letters.</p> |
| The detail view         | <p>The ability to select one or more persons from the list of applicants to view full details of their application. The detail view consists of organized tabs, with information separated into labeled portlet sections.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Considerations

Rather than a cosmetic update to the legacy Candidate Workbench, the Applicant Management tool provides a redesigned user experience. The following list provides some considerations as well as notable differences between

the two. Recruiting users who need to perform an action that's only available in the legacy Candidate Workbench can easily switch to it in the user interface.

- Applicants for job requisitions that were closed before January 1, 2023 don't appear in the applicant list in the redesigned Applicant Management. Switch to the legacy Candidate Workbench to view applicants for job requisitions that were closed before 2023.
- When you enable the General Display Name feature for your instance, you can see the chosen names of operators and internal applicants. This includes any updates to the chosen name.
- By default, the applicant list is sorted by Application Date (with the newest at the top), or by Forwarded Date for forwarded candidates who haven't yet applied.
- Unexpected results in the keyword search in resume and cover letter can appear if you use OpenText, a third-party product that manages data.
- Candidate and applicant data that are imported through Provisioning are available in the redesigned Applicant Management tool. Data provided by customers that the SAP SuccessFactors Operations team imports through the command prompt, however, aren't.
- Legacy imports and attachments that were added through Provisioning aren't indexed in the redesigned Applicant Management tool.
- In the redesigned Applicant Management tool, Recruiting users see dates and times based on where they are, regardless of the location specified in their profile. For example, the tool displays Eastern Time as your local time zone while you temporarily work in the New York office, even though you're based in Seattle (and the screen displays Pacific Time when you return).

#### Note

The redesigned Applicant Management tool lets Recruiting users control **all** applicant status changes through the [Move](#) button. For this reason, Applicant Management ignores any existing business rule scenario for job applications that uses a field change (OnChange) rule to update the applicant status field. Refer to *The Move Button in the Redesigned Applicant Management and Status Change Triggers in Business Rules* for more information.

## 21.2.1 Setting Up Applicant Management

This section describes how a Recruiting administrator can set some configurations for using the redesigned Applicant Management tool.

1. [Enabling Role-Based Permissions for Applicant Management \[page 969\]](#)  
Set role-base permissions for *Recruiting User Personalization Object Configuration* to allow access to the redesigned Applicant Management tool.

2. [Viewing and Editing Standard and System Fields \[page 970\]](#)  
View and edit the most commonly used standard and system fields that appear by default as filters and display columns in the redesigned Applicant Management tool.
3. [Adding a New Field as a Display or Filter Option \[page 972\]](#)  
Add fields and configure the display and filter options so they appear in the applicant list page of the redesigned Applicant Management tool.
4. [Enabling the Redesigned Applicant Management Tool \[page 976\]](#)  
Enable the redesigned Applicant Management tool if you want to have it available for Recruiting users.

### 21.2.1.1 Enabling Role-Based Permissions for Applicant Management

Set role-base permissions for [Recruiting User Personalization Object Configuration](#) to allow access to the redesigned Applicant Management tool.

#### Procedure

1. Go to [Admin Center](#) > [Manage Permission Roles](#).
2. Set permissions for [Recruiting User Personalization Object Configuration](#) by going to [Administrator](#) > [Manage MDF Recruiting Objects](#) > [Recruiting User Personalization Object Configuration](#).
  - a. Go to [Visibility](#) > [View](#).
  - b. Go to [Actions](#) to select [Edit](#) and [View](#) permissions.
3. Set permissions for [Recruiting User Personalization Field Configuration](#) by going to [Administrator](#) > [Manage MDF Recruiting Objects](#) > [Recruiting User Personalization Field Configuration](#) and selecting all of the following:
  - [View](#)
  - [Correct](#)
  - [Create](#)
  - [Adjust Order](#)
  - [Delete](#)
4. Select [Done](#) to save and exit from the [Permissions settings](#) dialog box.
5. Select [Save Changes](#) to finish.

#### Next Steps

Decide what fields you want to have appear as filters and display columns in the [Recruiting User Personalization Object Configuration](#) MDF object, as described in [Viewing and Editing the Starter Kit Fields](#).

**Task overview:** [Setting Up Applicant Management \[page 968\]](#)

**Next task:** [Viewing and Editing Standard and System Fields \[page 970\]](#)

## Related Information

[Using Role-Based Permissions](#)

### 21.2.1.2 Viewing and Editing Standard and System Fields

View and edit the most commonly used standard and system fields that appear by default as filters and display columns in the redesigned Applicant Management tool.

## Context

There are two types of fields: Standard fields, and system fields.

### System Fields

You don't need to configure system fields in the templates, as they are supported by default.

#### Note

Any changes that Recruiting administrators want to make on the filters and display options (such as adding a new field or changing the visibility of a field) need to edit the [Recruiting User Personalization Object Configuration](#) Metadata Framework (MDF) object.

Supported System Fields

| Field ID                 | Displayable | Filterable | Description                                                   |
|--------------------------|-------------|------------|---------------------------------------------------------------|
| sysApplicantType         | Yes         | Yes        | Tells you whether the applicant is internal or external.      |
| sysApplicationDate       | Yes         | Yes        | Shows the date when the application was created.              |
| sysApplicationReadStatus | Yes         | Yes        | Specifies whether or not the application has been opened yet. |
| sysAverageRating         | Yes         | No         | Shows the score related to the screening questions.           |
| sysForwardedBy           | Yes         | No         | Contains the name of the person who forwarded the candidate.  |

| Field ID            | Displayable | Filterable | Description                                                                                                                                                                                                               |
|---------------------|-------------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sysForwardedFromReq | Yes         | Yes        | Shows the requisition ID from which the applicant was forwarded.<br><br>To enable filtering on this field, set ► <a href="#">Manage Data</a> ► <a href="#">sysForwardedFromReq</a> ► <a href="#">Filterable</a> ► to Yes. |
| sysForwardedOn      | Yes         | Yes        | Shows the date when the candidate is forwarded.                                                                                                                                                                           |
| sysLastUpdated      | Yes         | Yes        | Shows the date when the application is last updated.                                                                                                                                                                      |

## Standard Fields

Standard fields are part of the [Recruiting User Personalization Object Configuration](#) Metadata Framework (MDF) object, and appear only if you've configured them in your application or profile templates. The following table lists the standard fields on the application template.

Standard Fields on the Application Template

| Field ID     | Displayable | Filterable |
|--------------|-------------|------------|
| cellPhone    | Yes         | No         |
| city         | No          | Yes        |
| contactEmail | Yes         | No         |
| country      | No          | Yes        |
| coverLetter  | No          | Yes        |
| resume       | No          | Yes        |
| statusId     | Yes         | Yes        |

### Note

You can't remove this field from the MDF object because it's needed for displaying the statuses on the list page.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Data](#) ► to control the most commonly used set of fields for columns and filters in redesigned Applicant Management tool.
2. In the first Search field, select [Recruiting User Personalization Object Configuration](#).

3. In the second Search field, select *List Page Type: JOB APPLICATION*.
4. To add a new field or to change the settings on the starter kit fields, select  *Make Correction* from the *Take Action* dropdown list on the top right.

Refer to *Supported Field Types for Applicant Management* for information on what data types are supported in the *Recruiting User Personalization Object Configuration* MDF object.

The fields and their settings become editable, so that you can change the display or filter settings, change the order in which the fields appear, or add new fields.

#### Note

System fields continue to be displayable and filterable even when you remove them. If you don't want anyone to view or filter them, keep them in the MDF object and change the configuration to either of the following:

- Filtrable: No; Displayable: Yes
- Filtrable: Yes; Displayable: No

5. Choose *Save* to save any changes you make to the MDF object.

**Task overview:** [Setting Up Applicant Management \[page 968\]](#)

**Previous task:** [Enabling Role-Based Permissions for Applicant Management \[page 969\]](#)

**Next task:** [Adding a New Field as a Display or Filter Option \[page 972\]](#)

## Related Information

[Supported Field Types as Display or Filter Option for Applicant Management \[page 974\]](#)

[Implementing the Metadata Framework \(MDF\)](#)

### 21.2.1.3 Adding a New Field as a Display or Filter Option

Add fields and configure the display and filter options so they appear in the applicant list page of the redesigned Applicant Management tool.

## Prerequisites

- In order for fields to be available to configure, the fields IDs have been defined in your application templates or the candidate profile template.
- *Recruiting User Personalization Object Configuration* and *Recruiting User Personalization Field Configuration* role-based permissions are enabled, as described in [Enabling Role-Based Permissions for Applicant Management \[page 969\]](#).

- The set of fields for columns and filters in the [Recruiting User Personalization Object Configuration](#) MDF object have been viewed and edited, as described in [Viewing and Editing Standard and System Fields \[page 970\]](#).

## Context

- You can configure fields from all active job application and candidate profile templates in the [Manage Data](#) tool, except for sensitive fields.

### Note

If you convert a field into a sensitive field, check that the field isn't already configured as a filter or display option in Applicant Management.

Using [Manage Data](#) means that the display and filter options in the template configurations are no longer necessary nor supported when using Applicant Management.

- Data types and labels defined in the candidate profile template take precedence over data types and labels defined in job application templates.
- To add these fields to the [Recruiting User Personalization Object Configuration](#) object, they need to be defined in either the job application or candidate profile template. The same field IDs can't be in multiple application templates and configured with different data types.
- The display and filter options don't respect role-based permissions or permissions outlined in the templates.
- Find the IDs of the fields that you'd like to add to the personalization object by viewing your candidate profile template and job application templates using the [Manage Templates](#) tool.

### Tip

Only one set of fields for display and filter options is allowed per instance. There's only one object in the [Recruiting User Personalization Object Configuration](#) dropdown list.

## Procedure

1. Go to [Admin Center](#) [Manage Data](#), then in the first [search](#) field, search for and select [Recruiting User Personalization Object Configuration](#).
2. Go to the next [search](#) field and select the available object.  
The [Recruiting User Personalization Object Configuration](#) page appears.
3. In the top-right corner, select [Take Action](#) [Make Correction](#) to open the [Recruiting User Personalization Object Configuration](#) page in edit mode and perform the following configurations in the [fields](#) section:

| Option   | Description                                                            |
|----------|------------------------------------------------------------------------|
| Field ID | Enter the field IDs you want to add to the display and filter options. |

| Option             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | <p>→ Recommendation</p> <p>To ensure the best user experience, avoid adding more than 30 fields.</p>                                                                                                                                                                                                                                                                                                                                                         |
| <b>Displayable</b> | <p>Set the options by selecting <a href="#">Yes</a> for every field you want to appear in a column.</p> <p>Column order is controlled by Recruiting users in <a href="#">Manage Columns</a> from the  <a href="#">Settings</a> icon in the redesigned Applicant Management tool. The <a href="#">Name</a> column, however, frozen by default and can't be unselected.</p> |
| <b>Filterable</b>  | Set the options by selecting <a href="#">Yes</a> for every field you want to appear in a column.                                                                                                                                                                                                                                                                                                                                                             |
| <b>Actions</b>     | Fields can be moved up or down in the list, or deleted.                                                                                                                                                                                                                                                                                                                                                                                                      |

4. Select [Save](#) to finish.

**Task overview:** [Setting Up Applicant Management \[page 968\]](#)

### 21.2.1.3.1 Supported Field Types as Display or Filter Option for Applicant Management

The list of supported and unsupported data types and unsupported fields in the redesigned Applicant Management tool.

#### ⓘ Note

This page describes functionality for the redesigned Applicant Management tool. If you can't see this feature, make sure you're not in the legacy Candidate Workbench by toggling back to the redesigned Applicant Management tool.

## Supported Data Types

You can configure fields in the [Recruiting User Personalization Object Configuration](#) MDF object using the following supported data types:

- text
- date
- bool – the field type is configured as bool but displays in the user interface as [Yes](#) or [No](#).
- enum
- percent
- number
- currency
- picklist
- percent
- bgElement – you can configure only background elements and not the data fields.
- textarea – supported only for filterable fields.
- richText – supported only for filterable fields.

## Unsupported Data Types

Error messages display if you configure a field with these unsupported data types:

- textarea
- richText
- hyperlink
- instruction
- multiattachment
- multiattachmentselection
- Foundation Objects
- Generic Objects
- derived

## Unsupported Fields

You see error messages on the screen when you try to configure these fields in the [Recruiting User Personalization Object Configuration](#) MDF object:

- bkgrndChkStatus
- candidateId
- candidateSource
- comments
- gender
- id
- jobsApplied
- lastModified
- onBoardingSubmissionStatus
- overdueInterviews
- questionResponse

- `referralSource`
- `reviewDate`
- `source`

## 21.2.1.4 Enabling the Redesigned Applicant Management Tool

Enable the redesigned Applicant Management tool if you want to have it available for Recruiting users.

### Procedure

1. From the Admin Center, go to [Manage Recruiting Settings](#).
2. Go to the [Candidate Summary](#) section and turn on the [Enable Latest Applicant Workbench](#) setting.
3. [Optional] If you want to hide access to the legacy workbench, choose [Hide Legacy Workbench](#).  
By enabling this setting, the [New Applicant Management Experience](#) switch in the redesigned Applicant Management tool will be hidden.
4. Select [Save](#) to save your settings.

### Results

You've now enabled the redesigned Applicant Management tool.

**Task overview:** [Setting Up Applicant Management \[page 968\]](#)

**Previous task:** [Adding a New Field as a Display or Filter Option \[page 972\]](#)

## 21.2.2 Allowing Attachment Deletions

The redesigned Applicant Management tool allows Recruiting administrators to enable the deletion of files added to fields defined as [multiattachmentsselection](#) field types.

### Prerequisites

The redesigned Applicant Management tool is enabled.

## Context

The [multiattachmentselection](#) field type is designed to allow applicants or Recruiting users to upload files into a field defined on the application template.

A [multiattachmentselection](#) field can have multiple documents uploaded and attached, acting as a mini-library where all uploaded documents are stored for later reuse without requiring they be uploaded again.

In single-stage environments, applicants are allowed to add attachments in a [multiattachmentselection](#) field as long as the field is empty. In multistage environments, applicants can add or delete documents in the [multiattachmentselection](#) field based on the permissions defined for their role.

In the legacy Candidate Workbench, the [multiattachmentselection](#) field becomes unchangeable as soon as applicants add a file. The redesigned Applicant Management tool, however, continues to allow Recruiting users to be able to delete attachments.

## Procedure

- If the Recruiting user already has write permission for the [multiattachmentselection](#) field, there's nothing for the administrator to configure.

The user can add or delete documents from the [multiattachmentselection](#) field type in the redesigned Applicant Management.

- If the Recruiting user doesn't have write permission, go to ► [Manage Templates](#) ► [Recruiting Management](#) ► [Job Application](#) ► and assign write permission to the user's role for the [multiattachmentselection](#) field.

## 21.2.3 Enabling the Ability to Edit Applicant Names

The redesigned Applicant Management tool allows Recruiting users to be able to edit applicant names, such as to fix typos or correct spelling errors.

## Prerequisites

The redesigned Applicant Management tool is enabled.

## Context

The legacy Candidate Workbench doesn't allow anyone to edit an applicant's name until after the applicant is hired and added into Employee Central.

These steps explain how Recruiting administrators can set proper permissions to allow Recruiting users to be able to edit applicant names in the [Profile Information](#) portlet in the redesigned Applicant Management tool.

### Note

Even after you give Recruiting users permission, they can't edit names long as they're in the legacy Candidate Workbench. They can, however, make edits just by switching to the redesigned Applicant Management view.

## Procedure

1. In the Admin Center, go to ► [Manage Templates](#) ► [Recruiting Management](#) ► [Job Application](#) ► and select the template you're using for Applicant Management.
2. Select the field definition link to go to the [Fields](#) dialog:
  - a. Find all of the fields related to the applicant name that's been set up in your system, such as `firstName`, `middleName`, `lastName`, and so on.
  - b. For each of these name-related fields, verify that *Is Read Only* is set to `False`.
  - c. Choose [Done](#) to save the field definition settings.
3. Select the button permissions link to go to the [Button Permissions](#) dialog:
  - a. In the [Button Permission Button](#) dropdown list, choose `EDIT_CANDIDATE_SNAPSHOT`.
  - b. In the [Button Permission Role Name](#) dropdown list, choose all of the Recruiting roles you want to give edit access to.
  - c. Choose [Done](#) to save this button permission setting.
4. Choose ☑ [Publish](#) to save and publish your settings.

## Results

Applicant names can now be edited and corrected in the redesigned Applicant Management tool in the [Profile Information](#) portlet.

## Related Information

## 21.2.4 The Applicant List Page

The applicant list page in the redesigned Applicant Management tool allows you to see all applicants that have applied to your job requisition, with information defined as columns (such as candidate type and country/region). Recruiting users can also perform quick actions, including mass actions on multiple applicants at once.

### Note

This page describes functionality for the redesigned Applicant Management tool. If you can't see this feature, make sure you're not in the legacy Candidate Workbench by toggling back to the redesigned Applicant Management tool.

| Functionality                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Search for name</a>    | Located at the top above the applicant list, the search field lets you search for individuals by name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <a href="#">Status and Filters</a> | <p>☒ <a href="#">Status</a> – Located on the left pane, <a href="#">Status</a> lets you refine your applicant list based on status. Statuses that display the &gt; (right arrow) are collapsed. Selecting the icon expands to show all of the substatuses.</p> <p>If you choose a checkbox for a collapsed status, the list displays applicants whose substatuses match.</p> <p>☒ <a href="#">Filters</a> lets you refine the applicant list based on values for various fields, such as language skills or country/region.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <a href="#">Applicants</a>         | <p>The list of applicants associated with the job requisition.</p> <p>The list displays 25 applicants at a time by default. Click on <a href="#">More</a> at the bottom of the page to load additional sets of 25 applicants.</p> <p>The list of applicants provides the following functionality:</p> <ul style="list-style-type: none"><li>• See when applicants update their applications – with the <b>Updated</b> value in the <a href="#">Unread</a> column when you enable multistage application.</li><li>• See a visual distinction (in the form of icons) that differentiates among internal, external, agency, and referred candidates in the <a href="#">Applicant Type</a> column. The icons are:<ul style="list-style-type: none"><li>•  <a href="#">Internal</a></li><li>•  <a href="#">External</a></li><li>•  <a href="#">Agency</a></li><li>•  <a href="#">Referred</a>: Employee Referral Program needs to be enabled for this applicant type.</li></ul></li></ul> <p>A new applicant type that's identified with the new symbol in the list page when the Employee Referral Program is enabled. Filter and display options for <a href="#">Applicant Type</a> now includes <a href="#">Referred</a> as an addition to</p> |

the existing *External*, *Internal*, and *Agency* types. When viewing a referred applicant in the detail view, clicking the ⓘ *Candidate Forwarded* icon shows additional information.

- See applicants who haven't been viewed at all yet appear in bold to make them easier to spot.
- View the details of an individual candidate by clicking on their name.
- With *Skills Compatibility*, you can have a high-level understanding of how the applicant's skills match with the job description.
- Drag & drop functionality allows recruiters to move candidates across the recruiting pipeline efficiently while ensuring permissions and business rules are adhered to. The drag and drop functionality supports the following features:
  - Single applicant movement.
  - Multiple applicant movement (Bulk Action): If all applicants are in the same initial status, they are moved successfully with the required action or eligibility checks as for a single applicant. If applicants are in different statuses, the system handles partial success, requiring user actions for eligibility checks.
  - Permission check and eligibility: The system checks permissions for each move action to ensure the recruiting user is authorized to perform the move. Eligibility checks are performed to ensure applicants can be moved to the desired status.
  - User feedback and error handling: If a user lacks permission or if there are eligibility issues, the system provides feedback explaining why the action cannot be completed. Dependencies on intermediate statuses are clearly communicated to the user.

The Recruiting user can control exactly which columns appear, in what order, in the list.

#### ⓘ Note

The list page doesn't display anonymized applicants.

As soon as an applicant has one of the following statuses in the redesigned Applicant Management tool — *Deleted On Demand by Candidate*, *Deleted On Demand*

| Functionality                                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Refer to <i>Quick Actions from the Applicant List Page</i> for descriptions.</p> <p>From the list of applicants, Recruiting users can perform the following actions:</p> <ul style="list-style-type: none"> <li>• <a href="#">Add Comment</a></li> <li>• <a href="#">Add to Requisition</a></li> <li>• <a href="#">Add Tags</a></li> <li>• <a href="#">Add to Talent Pool</a></li> <li>• <a href="#">Contact</a></li> <li>• <a href="#">Download Documents</a></li> <li>• <a href="#">Forward</a> &gt; <a href="#">Forward as Applicant</a></li> <li>• <a href="#">Forward</a> &gt; <a href="#">Forward to Colleague</a></li> <li>• <a href="#">Forward</a> &gt; <a href="#">Forward to Requisition</a></li> <li>• <a href="#">Initiate Background Check</a></li> <li>• <a href="#">Initiate Onboarding</a></li> <li>• <a href="#">Invite Late Stage Applicant</a></li> <li>• <a href="#">Invite to Apply</a></li> <li>• <a href="#">Re-invite to Apply</a></li> <li>• <a href="#">View Details</a></li> </ul> |
| ↓↑ <a href="#">Sort</a>                                                                                      | <p>Choose any column on the list page to sort the list of applicants. You can view the list in ascending or descending order, and choose which column to sort by. The sorted list carries over to the detail view, and stays sorted for the session. Sort up to 150 applicants in the list page.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|  <a href="#">Settings</a> | <p>Customize display options to show, hide, or move the display order of columns on the list page.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 21.2.4.1 Quick Actions from the Applicant List Page

The redesigned Applicant Management tool allows you to perform some quick actions for individual, as well as multiple applicants from the applicant list page.

### Note

This page describes functionality for the redesigned Applicant Management tool. If you can't see this feature, make sure you're not in the legacy Candidate Workbench by toggling back to the redesigned Applicant Management tool.

The following options (from left to right), located on the top right of the applicant list in the redesigned Applicant Management tool lets you perform the following actions:

- [Move](#) button: Select one or more applicants, then choose the button to open the [Move Applicants](#) dialog to move them to a different status.
- [Sort](#) icon allows you to sort the applicants for the job requisition based one of the columns visible on the list.
- [More](#) icon (described on this page): Perform some quick actions for applicants you select from the list page:
  - For multiple applicants – select their names, then choose [More](#), located next to the [Move](#) button.
  - For a single applicant – choose the [More](#) icon in the farthest right location of the column for that applicant.
- [Settings](#) icon: Customize display options to show, hide, or move the display order of columns on the list page.

### Note

- Applicant statuses were previously known as the Talent Pipeline.
- You can perform a mass action on up to 500 applicants at a time.

### Note

- Mass actions will be processed asynchronously using an event-driven architecture or the Job Scheduler.
- While a mass action is in progress, the recruiter cannot start another mass action on the same job requisition until the current one is complete.
- However, recruiters can still view and update individual applications during this time.
- As of 2H 2025,
  - Mass action for the [Add to Talent Pool](#) action is not supported.
  - The limit for mass actions on the [Contact](#) action has been raised from 50 applicants to 150 applicants.
- The available actions are based on your organization's configuration, such as if Late Stage is enabled or if you use SAP SuccessFactors Onboarding.
- Actions that are grayed out on the list mean they're not valid for your selected applicants.

| Action                      | Description                                                                                                                                |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Add Comment</a> | Opens the <a href="#">Add Comment</a> dialog, where you can enter comments about the applicants you select. Choose <a href="#">Show on</a> |

| Action                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <a href="#">Re-invite to Apply</a> | Re-invite individuals to apply for a specific job application if they've already been invited to apply but haven't completed the application process. You can continue to use the <a href="#">Re-invite to Apply</a> action until the individual completes the application.                                                                                                                                                                                                                                                          |
| <a href="#">View Details</a>       | <p>Opens the detail view for the selected applicant, just as when you choose their name from the applicant list. When you select <a href="#">View Details</a> for multiple applicants, they move to a "mini list" in the left pane, allowing you to see the detailed view of your selected applicants.</p> <p>For the selected applicants, the <a href="#">View Details</a> action lets you switch between their information. You can also download documents like resumes and cover letters from each applicant's details page.</p> |

## 21.2.4.2 The Move Button and Status Change Triggers in Business Rules

The redesigned Applicant Management tool lets Recruiting users control **all** applicant status changes through the [Move](#) button. For this reason, Applicant Management ignores any OnChange rules configured on Status.

The redesigned Applicant Management tool **ignores** the following OnChange rules:

- An onChange rule that's set to automatically modify the value of [Status](#).  
Example: If the value for Rating is < 5 = set Status to disqualify
- An onChange rule that's set on the Status field itself.  
Example: When [Status](#) is changed to "Interview" = set Interview Picklist to "To be scheduled" and raise alert "Please make sure to schedule interview"

With the exception of onChange rules on Status, all other onChange and onSave rules behave the same way between the redesigned Applicant Management tool and legacy Candidate Workbench. For this reason, if you set an onChange rule on Status with the legacy Candidate Workbench, you can convert it to an onSave rule.

Note some minor differences between onChange and onSave rules:

- You can't raise alerts with onSave rules.
- While onSave changes the value stored in the database, onChange only changes what users see on the screen. Users can modify the value presented to them from onChange before saving the information, which means onChange acts more as a suggestion.

- onSave rules are triggered when users choose [Save](#) or [Move](#), and can also be triggered through OData APIs (for example, in third-party integrations). onChange rules, on the other hand, are triggered only through the user interface when modifying a value in the portlet, and can't be triggered through OData APIs.

### 21.2.5 The Detail View

Selecting an applicant from the list view takes you to that applicant's detail page, where different tabs display various portlets in an organized way.

Which portlets are visible to Recruiting users in the detail view depends on either role-based permissions, or permissions configured with the job requisition, application, or candidate profile template.

Selecting an applicant from the list view takes you to their detail page. The list of selected applicants slides to the left side of the screen. In addition to their names, you can see their individual  [Action](#) icon to perform an action on that applicant, separate from the main applicant whose detail page you're viewing.

The following icons appear to the right of the applicant name:

- The [Move](#) button lets Recruiting users forward multiple applicants at once to a different status.

#### Note

All status changes in the redesigned Applicant Management tool are made in the [Move Applicants](#) dialog, which the [Move](#) button opens. Refer to *Changing the Status of Applicants Using Move* for details.

- The [Contact](#) button takes you to the [Contact Applicant](#) form, where you can send email to the applicant. If your system is configured for SMS text messages, the form gives you the option to send email, an SMS, or both.
- The [View Profile](#) button navigates to the Candidate Profile page for an applicant.

#### Note

As of 2H 2025, we do not support the candidate privacy option selected during profile creation. The [View Profile](#) button is displayed regardless of that selection, and the candidate's profile remains accessible.

-  [More](#) icon: Perform some quick actions for applicants you select from the list page.
- < (left arrow) icon: Navigates to the previous applicant.
- > (right arrow) icon: Navigates to the next applicant.
-  [full screen](#) icon: Expands the detail view of the applicant.

When an agency forwards a candidate to a job, you can see the details of the specific agency by choosing

 [Candidate Forwarded](#) next to the applicant's name.

Below the name of the applicant are the following:

- Email address – presented as a `mailto` link.

- Phone number – selecting the number opens the user's default phone application.
- Application URL – selecting the icon copies the applicant's detail view URL into the user's clipboard.
- Status – displays the applicant's status, such as **New**.
- Type – displays whether the applicant is internal, external, or referred by an internal employee or submitted by an agency.

### Note

The following is a list of available portlets, in the order that they appear on the screen. Not all portlets are visible to the Recruiting user depending on what functionality is enabled and configured. Administrators can also control what portlets Recruiting users can see, add to or edit, based on the permissions they've been assigned.

The detail view displays the following information:

| Detail View Tab                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

[Candidate Profile Element: Background Information \[page 902\]](#)

## 21.2.5.1 Visibility of Standard and Custom Field in Portlets

Information on which portlets standard and custom fields appear in the redesigned Applicant Management tool.

### Standard Fields

#### Note

Standard fields are displayed in the applicant detail view only if they are permissioned in the application or candidate profile template with either read or write permission

#### Standard Fields that Display in the [Profile Information](#) Portlet

In the redesigned Applicant Management tool, defining the following standard fields in both candidate profile and application templates results in their being displayed in the [Profile Information](#) portlet:

- [contactEmail](#)
- [firstName](#)
- [lastName](#)
- [middleName](#)

- *address*
- *phoneCountryCode*
- *cellPhone*
- *homePhone*
- *faxNumber*
- *city*
- *state*
- *country*
- *zip*
- *currentTitle*
- *currentCompany*
- *postConvExtContactEmail*

### **Standard Fields that Display in the *Application Information* Portlet**

In the redesigned Applicant Management, defining the following standard fields in both candidate profile and application templates results in their being displayed in the *Application Information* portlet:

- *primaryEmail*
- *gender*
- *ethnicity*
- *race*
- *dateOfAvail*
- *optInCellNumber*
- *dateOfBirth*
- *disabilityStatus*
- *minAnnualSal*
- *preferredLoc*
- *ssn*
- *veteranStatus*
- *soure*
- *forwardedBy*
- *forwardedFrom*
- *forwardedOn*
- *rating*
- *lastModified*
- *name*
- *status*
- *applicationDate*
- *bkgrndChkStatus*
- *employeeId*
- *comments*

## Custom Fields

When you configure a custom field in the legacy Candidate Workbench in both the candidate profile and application templates, the field displays under **both** [Application Information](#) and [Profile Information](#) portlets (honoring respective candidate profile and application template read and edit permissions).

However if you configure that same custom field in both candidate profile and application templates in the redesigned Applicant Management tool, the field displays **only** in [Application Information](#) (honoring only application template read and edit permissions).

For this reason, a custom field that a Recruiting user sees in the legacy Candidate Workbench might not appear in the redesigned Applicant Management tool. If this happens, you have two options:

- Grant your users read and edit permissions on the custom field in the application template so that the field is visible to them in the [Application Information](#) portlet. If you have multistage applications enabled, you also want to grant them permission in the job requisition template.
- Remove the custom field from the application template altogether, and keep it only in the candidate profile template. That way, the custom field only shows up in the [Profile Information](#) portlet..

## 21.2.6 Using the Redesigned Applicant Management Tool

You can use the redesigned Applicant Management tool to search, and filter for applicants. This feature includes configurable filters, personalized columns, and search options to help accelerate the screening phase of the hiring process.

### Prerequisites

**Optional:** The administrator has reviewed and updated the Field Display and Filter Options using the [Manage Data](#) tool. Refer to [Adding a New Field as a Display or Filter Option \[page 972\]](#) for details.

### Context

#### 📘 Note

This page describes functionality for the redesigned Applicant Management tool. If you can't see this feature, make sure you're not in the legacy Candidate Workbench by toggling back to the redesigned Applicant Management tool.

## Procedure

1. From the Admin Center, go to ► [Recruiting](#) ► [Job Requisitions](#) ►.
2. Select a job requisition and choose the number from the [Candidates](#) column.

Choosing from the [Active Candidates](#) column, which doesn't include individuals who withdrew their applications or whose applications were rejected, simply takes you to the same list.

If you see the legacy Candidate Workbench, toggle the [New Applicant Management Experience](#) switch on the top-right of the page.

### → Tip

From the redesigned Applicant Management tool, if you want to go to other sections within a specific requisition, such as Job Postings or Job Profile, click on the job title in the breadcrumb trail.

You initially see 150 applicants listed. To see more data, you can scroll down the list page and select [More](#), to load 300, 450 and 600 applications.

The applicant list shows all individuals who applied, including applicants who are in the Forwarded and Invited to Apply statuses.

3. From your list of applicants, you can the following options:
  - Select one or more applicants. Choose the [Move](#) button to open the [Move Applicants](#) dialog to forward them to a different status.
  - Choose the [More](#) icon to perform some quick actions for those applicants you select from the list.
  - Select an applicant from the list to view the individual's detail page.

## Results

When you log back in after your session times out then go to the [Candidate Summary](#) page, the system automatically displays the latest or legacy version of the workbench based on your previous session.

### ⓘ Note

The system doesn't save your filter settings when you switch between the latest and legacy versions. For example, if you filter for a country/region in the legacy Candidate Workbench then switch to the redesigned Applicant Management tool, you see the full list of applicants from all countries/regions.

## 21.2.6.1 Choosing Column Display Options for the Applicant List

You can customize display options for the applicant list page in the redesigned Applicant Management tool, to show, hide, or move the column display order.

### Prerequisites

#### ⓘ Note

This page describes functionality for the redesigned Applicant Management tool. If you can't see this feature, make sure you're not in the legacy Candidate Workbench by toggling back to the redesigned Applicant Management tool.

- The fields are configured as displayable in [Recruiting User Personalization Object Configuration](#). Refer to [Adding a New Field as a Display or Filter Option \[page 972\]](#) for instructions.
- The redesigned Applicant Management tool is enabled in your system, and you have applicants for specific job requisitions.

### Context

The following options (from left to right), located on the top right of the applicant list in the redesigned Applicant Management lets you perform the following actions:

- [Move](#) button: Select one or more applicants then choose the button to open the [Move Applicants](#) dialog to forward them to a different status.
- [More](#) icon: Perform some quick actions for applicants you select from the list page.
- [Described on this page] [Settings](#) icon: Customize display options to show, hide, or move the display order of columns on the list page.

#### ⓘ Note

This option shows all the fields that have been defined as display columns. They might not be used on the template used for the job requisition the user is viewing at the time. In addition, field-level permissions are ignored.

The most commonly used fields are selected by default.

### Procedure

1. From the Admin Center, go to [Recruiting > Job Requisitions](#).

2. Select [Candidate Summary](#) from any job requisition.
3. Select a job requisition and choose the number from the [Candidates](#) column.

Choosing from the [Active Candidates](#) column, which doesn't include individuals who withdrew their applications or whose applications were rejected, simply takes you to the same list.

If you see the legacy Candidate Workbench, toggle the [New Applicant Management Experience](#) switch on the top-right of the page.

4. Select the  [Settings](#) icon.

The [Manage Columns](#) dialog box appears with the [Name](#) column already selected by default. You can't unselect this column.

5. Select additional columns in [Manage Columns](#) to display for you.

#### Note

You can't remove the [Name](#) column.

You can choose up to nine (9) additional columns.

You can't predefine selected columns for a user, a set of users, or for specific roles.

To access specific applicant data that's not available in [Manage Columns](#), use the [Manage Data](#) tool. Refer to [Setting Up Field Display and Filter Options to the Redesigned Applicant Management Tool](#) for instructions.

6. **Optional:** Use the ^ [up](#) and v [down](#) arrows to change the display order of the columns you selected.
7. Select [OK](#) to save your display options.

The data now appear under your selected columns for those fields that have been completed by the candidate when applying or being forwarded.

### 21.2.6.2 Using Filters to Refine the Applicant List

Use the status and filter settings to refine the view of the applicant list to help identify the most qualified applicants for a job.

## Prerequisites

#### Note

This page describes functionality for the redesigned Applicant Management tool. If you can't see this feature, make sure you're not in the legacy Candidate Workbench by toggling back to the redesigned Applicant Management tool.

The fields have been configured as filterable in [Recruiting User Personalization Object Configuration](#). Refer to [Adding a New Field as a Display or Filter Option \[page 972\]](#) for instructions.

## Context

The system doesn't save your filter settings when you switch between the redesigned Applicant Management tool and the legacy Candidate Workbench. For example, if you filter for a country/region in one then switch to the other, you see the full list of applicants from all countries/regions.

Both the filter and status settings apply to **all** applicants for the job requisition, and not just the applicants you see on the page.

The text fields in the filters allow you to enter partial words, but numbers must be an exact match.

## Procedure

1. From the Admin Center, go to ► [Recruiting](#) ► [Job Requisitions](#) ►.
2. Select a job requisition and choose the number from the [Candidates](#) column.

Choosing from the [Active Candidates](#) column, which doesn't include individuals who withdrew their applications or whose applications were rejected, simply takes you to the same list.

If you see the legacy Candidate Workbench, toggle the [New Applicant Management Experience](#) switch on the top-right of the page.

### → Tip

From the redesigned Applicant Management tool, if you want to go to other sections within a specific requisition, such as Job Postings or Job Profile, click on the job title in the breadcrumb trail.

3. **Refine by status** – select the  [Status](#) button on the left column of the page to view all of the available statuses for the job requisition, with the number of applicants listed next to each status.

- a. Select one or more statuses from the list.

A label for each selected status appears at the top of the list next to the [Search for name](#) field. The list is shortened to those applicants who match your status selection.

4. **Refine using filters.**

You can use filters to look at applicants based on different criteria. Only picklist type filters indicate the applicant count, and Recruiting users can select different combinations of filters to refine the list of applicants that appear on the page. The filter doesn't show the count when text or date fields are defined as filters. When you filter, it updates the list of applicants that contain that text.

- a. Select the  [Filters](#) button on the left column of the page to see a list of all the fields you can filter by.
- b. Select and expand a filter field, and enter the value you want to filter by.

Depending on the settings for a field, filters can appear in different formats, such as keyword text searches, checkboxes, date pickers, and so on.

### → Recommendation

For better system performance, avoid using more than 25 filters at a time.

A label for each selected filter appears at the top of the list next to the [Search for name](#) field. Some of the filter options include:

- Background information, such as their education or work experience. This information doesn't display in the columns on the applicant list.  
If an applicant has more than a single background element, the applicant count for a filter and the number of applicants displayed in the list don't match.
- Localized text search in resume and cover letter.
- Applicant counts for picklist fields, such as Country/Region.

5. To clear statuses and filters, choose one of the following methods:

- You can select x in that specific filter itself at the top of the page.
- Deselect the filter criteria under the [Status and Filters](#) column.
- Select [Reset](#) to remove all selected status and filter options. Using this option reverts your applicant list to the previous state.

## 21.2.6.3 Searching for Applicants by Name

Use the search field at the top of the applicant list to search for applicants by name.

### Prerequisites

#### 📘 Note

This page describes functionality for the redesigned Applicant Management tool. If you can't see this feature, make sure you're not in the legacy Candidate Workbench by toggling back to the redesigned Applicant Management tool.

### Procedure

1. From the Admin Center, go to ► [Recruiting](#) ► [Job Requisitions](#) ►.
2. Select a job requisition and choose the number from the [Candidates](#) column.

Choosing from the [Active Candidates](#) column, which doesn't include individuals who withdrew their applications or whose applications were rejected, simply takes you to the same list.

If you see the legacy Candidate Workbench, toggle the [New Applicant Management Experience](#) switch on the top-right of the page.

You initially see 25 applicants listed. To see more data, you can scroll down the list page and select [More](#), which then loads the next 25 applicants.

The applicant list shows everyone who applied, including individuals who are in the Forwarded and Invited to Apply statuses.

### 3. Search for applicants by name in the search field.

You can search applicants by first name, last name, or middle name if they're configured in your templates. You can also search by chosen name for internal applicants if the General Display Name feature is enabled. The search looks at all applicants, not just persons who are displayed on the screen. The search option is located at the top of the applicant list and returns relevant results by ignoring any special characters, or leading or trailing white spaces from the search criteria.

If you search for names that include accented characters (such as à, è, ì, ò, ù, À, È, Ì, Ò, Ù), the system ignores the accents. For example, if you search for Schäfer with the umlaut character ä, the search returns both Schäfer and Schafer.

#### ⓘ Note

If you can't find an applicant you know was in the system, the reason can be because of a change in status. As soon as an applicant has one of the following statuses in the redesigned Applicant Management tool — [Deleted On Demand by Candidate](#), [Deleted On Demand By Admin](#), or [Declined DPCS](#) — the applicant immediately disappears from the system because there's nothing you can do with the applicant anymore.

## 21.2.6.4 Editing Applicant Names

Use the redesigned Applicant Management tool to update an applicant name so that you can do things like make corrections on spelling errors.

### Prerequisites

- The Recruiting administrator has configured the settings for the redesigned Applicant Management tool.
- The Recruiting administrator has enabled the [EDIT\\_CANDIDATE\\_SNAPSHOT](#) button permission in the application template for you.

### Context

You can only use this functionality in the redesigned Applicant Management tool. Even if the admin has enabled appropriate permissions for you, you can't change applicant names while you're viewing applicants in the legacy Candidate Workbench. If your Recruiting system is only using the legacy version, you have to wait until applicants are hired to update their names in Employee Central.

## Procedure

1. From the Admin Center, go to ► [Recruiting](#) ► [Job Requisitions](#) ►.

2. Select a job requisition and choose the number from the [Candidates](#) column.

Choosing from the [Active Candidates](#) column, which doesn't include individuals who withdrew their applications or whose applications were rejected, simply takes you to the same list.

If you see the legacy Candidate Workbench, toggle the [New Applicant Management Experience](#) switch on the top-right of the page.

3. Select an applicant by choosing their name.

The applicant's detail view appears.

4. In the default [Applicant Information](#) tab, scroll down to the [Profile Information](#) portlet, where you see the applicant's first and last name.

5. Choose [Edit](#) for the portlet.

If you don't see the [Edit](#) button, you either don't have permission to change the information in this portlet, or your Recruiting administrator hasn't enabled Edit Candidate Snapshot functionality.

You've gone into edit mode when you see the portlet expand to show all available fields, and they become editable.

6. Edit the applicant's name, as well as any additional information in the portlet that needs to be updated.
7. Select [Save](#) at the top-right corner of the [Profile Information](#) portlet.

You've successfully changed the applicant's name.

### 21.2.6.5 Changing the Status of Applicants Using Move

Use the [Move](#) button to move applicants to different statuses.

## Prerequisites

### ⓘ Note

This page describes functionality for the redesigned Applicant Management tool. If you can't see this feature, make sure you're not in the legacy Candidate Workbench by toggling back to the redesigned Applicant Management tool.

The redesigned Applicant Management tool is enabled in your system, and you have applicants for specific job requisitions.

## Context

The following options (from left to right), located on the top right of the applicant list in the redesigned Applicant Management lets you perform the following actions:

- [Described on this page] [Move](#) button: Select one or more applicants then choose the button to open the [Move Applicants](#) dialog to forward them to a different status.  
If you want to move just a single applicant, you can choose [Move Applicant](#) from the [More](#) icon, located in the far right of applicant's name instead. Both of options open the same [Move Applicants](#) dialog.
- [More](#) icon: Perform some quick actions for applicants you select from the list page.
- [Settings](#) icon: Customize display options to show, hide, or move the display order of columns on the list page.

### Note

The [Move Applicants](#) dialog is the only way that you can change the status of applicants. Any automatic updates to statuses that the administrator set up in the legacy Candidate Workbench don't happen in the redesigned Applicant Management tool.

## Procedure

1. From the Admin Center, go to [Recruiting > Job Requisitions](#).
2. Select a job requisition and choose the number from the [Candidates](#) column.

Choosing from the [Active Candidates](#) column, which doesn't include individuals who withdrew their applications or whose applications were rejected, simply takes you to the same list.

If you see the legacy Candidate Workbench, toggle the [New Applicant Management Experience](#) switch on the top-right of the page.

### Tip

From the redesigned Applicant Management tool, if you want to go to other sections within a specific requisition, such as Job Postings or Job Profile, click on the job title in the breadcrumb trail.

You initially see 25 applicants listed. To see more data, you can scroll down the list page and select [More](#), which then loads the next 25 applicants.

The applicant list shows everyone who applied, including individuals who are in the Forwarded and Invited to Apply statuses.

3. Check the ☐ [checkbox](#) of the applicants who you want to move.
4. Select the [Move](#) button from the top right of the applicant list.

The [Move Applicants](#) dialog appears, and you see the applicant or list of applicants you selected to move.

If any of your selected applicants aren't eligible to have their status moved, you see a warning at the top of the dialog similar to the following:

5 of 6 applicants are eligible to move statuses.  
Others may need more input to be eligible.

Accompanying this message is a second tab in the dialog with the label *Not Eligible to Move*, which lists applicants who can't be moved, and why. For example, you could be prevented from extending an offer if your organization requires candidates to formally apply for the job.

The *Not Eligible to Move* tab is for your information. You can't change those applicants from this dialog, and nothing happens to them when you confirm your status move.

5. Select a status from the dropdown list in the *Update Status* field.

#### Note

You can only choose a single status in this field. If you select multiple applicants, you move all of them to the same status at the same time, except for applicants who appear in *Not Eligible to Move*. Choose *Not Eligible to Move* to view the applicants in this group, as well as why they aren't eligible to move to the status you chose.

The *Move* confirmation button in the dialog becomes selectable when you choose a status.

6. **Optional:** Provide text in the *Comments* field.

You can enter up to 1,000 characters in your comment.

7. Choose the *Move* confirmation button.

If you choose *Cancel*, the dialog closes, and you return to the applicant list without moving any applicants.

The *Move Applicants* dialog closes and you see the updated statuses for the applicants in the applicant list.

## 21.2.6.6 Choosing to Forward Applicants to Additional Job Requisitions

Use the *Forward to Requisition* option to forward applicants to additional job requisitions in the redesigned Applicant Management tool.

### Prerequisites

#### Note

This page describes functionality for the redesigned Applicant Management tool. If you can't see this feature, make sure you're not in the legacy Candidate Workbench by toggling back to the redesigned Applicant Management tool.

## Context

[Forward to Requisition](#) allows you to select single or multiple individuals to forward them to another job requisition.

### Note

[Forward to Requisition](#) isn't the same as [Add to Requisition](#). The latter is available only for individuals who are in Forwarded or Invited to Apply status, and only if your organization has enabled the Late Stage Applications feature.

## Procedure

1. From the Admin Center, go to [Recruiting > Job Requisitions](#).

2. Select a job requisition and choose the number from the [Candidates](#) column.

Choosing from the [Active Candidates](#) column, which doesn't include individuals who withdrew their applications or whose applications were rejected, simply takes you to the same list.

If you see the legacy Candidate Workbench, toggle the [New Applicant Management Experience](#) switch on the top-right of the page.

3. From the applicant list, choose the applicants whom you want to forward to another job requisition by selecting the checkboxes by their names.

You can choose one or multiple applicants at once.

4. Select [More](#) from the top right of the page, then select [Forward > Forward to Requisition](#).

The [Forward to Requisition](#) dialog appears.

The dialog displays 10 job requisitions by default. To view additional job requisitions, select [More](#) at the bottom of the list.

5. **Optional:** Refine your list of requisitions by using the search fields at the top of the dialog.

| Option                | Description                                                                               |
|-----------------------|-------------------------------------------------------------------------------------------|
| <b>Keyword</b>        | Choose to search for the keyword in the job title and description, or just the job title. |
| <b>Requisition ID</b> | The job requisition ID.                                                                   |
| <b>Recruiter</b>      | The name of a recruiter.                                                                  |
| <b>Hiring Manager</b> | The name of a hiring manager.                                                             |
| <b>Job Posting</b>    | Specify either all jobs, or only those jobs that have been posted.                        |

### Note

Unlike the legacy Candidate Workbench, these options are hard-coded in the redesigned Applicant Management tool and are not configurable.

6. Select the checkboxes for the job requisitions you want to forward the applicants to, then choose [Next](#).

A summary appears in the dialog that shows the job requisitions and applicants you chose.

7. Choose either *Forwarded* or *New* as the status for the selected applicants.
8. Choose *Allow applicants who have not yet accepted latest DPCS statement* to allow the forwarding of applicants who haven't signed their data privacy consent statements.

You don't see this option depending on the *Country/Region Specific Consent Settings* in the Admin Center, or what applicants choose for their *Make My Profile Visible To* candidate profile setting.

9. Choose *Forward*.

## 21.2.6.7 Downloading and Uploading Resumes and Cover Letters

Use the redesigned Applicant Management tool to download and upload resumes, cover letters, and other documents related to applicants.

## Prerequisites

### Note

This page describes functionality for the redesigned Applicant Management tool. If you can't see this feature, make sure you're not in the legacy Candidate Workbench by toggling back to the redesigned Applicant Management tool.

## Context

If you just want to view applicant resumes and cover letters without downloading them, go to the *Resume and Documents* tab in the applicant's detail view.

## Procedure

1. From the Admin Center, go to **Recruiting** > *Job Requisitions*.
2. Select a job requisition and choose the number from the *Candidates* column.

Choosing from the [Active Candidates](#) column, which doesn't include individuals who withdrew their applications or whose applications were rejected, simply takes you to the same list.

If you see the legacy Candidate Workbench, toggle the [New Applicant Management Experience](#) switch on the top-right of the page.

3. To download resumes or other documents, choose one of the following:

| Option                                                                                                                                                                                                                                                                                                                                                                                                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Multiple applicants at once</b>                                                                                                                                                                                                                                                                                                                                                                                            | <ol style="list-style-type: none"><li>1. From the applicant list, choose the applicants whose resumes and cover letters you want to manage by selecting the checkboxes by their names.</li><li>2. Select <b>...</b> <a href="#">More</a> from the top right of the page, then select <a href="#">Download Documents</a>.<br/>If the <a href="#">Download Documents</a> option is grayed out, none of the selected applicants have any resumes or cover letters in the system.<br/>The <a href="#">Download Documents</a> dialog appears.<br/>If you selected multiple applicants, the dialog indicates which documents are available for which applicants.</li><li>3. Select whether you want to download resumes or cover letters, then choose <a href="#">Download</a>.<br/>The files are downloaded to your machine.</li></ol> |
| <div><div> <b>Note</b></div><div>You can download documents for up to 50 applicants at once. Also, you can download up to 100 documents in a single download. Furthermore, the selected documents are zipped and downloaded in the background, allowing you to continue with other tasks while the download proceeds eventually.</div></div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>A single applicant</b>                                                                                                                                                                                                                                                                                                                                                                                                     | <ol style="list-style-type: none"><li>1. Select the individual from the applicant list to view their detail page, then go to the <a href="#">Resume and Documents</a> tab.</li><li>2. Choose <a href="#">Resume</a>, <a href="#">Cover Letter</a>, or <a href="#">Other Documents</a>.</li><li>3. Choose <a href="#">Download</a> from the top-right corner above the document.<br/>The file downloads to your machine or storage location.</li></ol>                                                                                                                                                                                                                                                                                                                                                                             |

4. To upload a resume or cover letter, go to the [Resume and Documents](#) tab for the applicant and perform the following:
  - a. Choose [Resume](#), [Cover Letter](#), or [Other Documents](#).
  - b. Choose [Upload](#) from the top-right corner above the document.

The file upload dialog appears, where you can choose which file to upload from your machine or storage location.

## 21.2.6.8 Deleting Resumes and Attachments

The redesigned Applicant Management lets you delete or update a resume, whether it was uploaded by an applicant or a recruiter.

### Prerequisites

- The Recruiting administrator has enabled the redesigned Applicant Management tool.
- The administrator has given you write permission for [multiattachmentsselection](#).
- Find out from the administrator which field is associated with the [multiattachmentsselection](#) field type.

### Context

What you can do depends on whether you're using the redesigned Applicant Management tool or the legacy Candidate Workbench.

#### Note

This page describes functionality for the redesigned Applicant Management tool. If you can't see this feature, make sure you're not in the legacy Candidate Workbench by toggling back to the redesigned Applicant Management tool.

The [multiattachmentsselection](#) field type in the Job Application template lets applicants upload their own resumes, cover letters, and additional documents. In the legacy Candidate Workbench, once an applicant uploads a file themselves, the system places a lock so that Recruiting users can't delete any files uploaded into the [multiattachmentsselection](#) field. This behavior is true even if the administrator gives users write permission for [multiattachmentsselection](#).

This lock doesn't exist in the redesigned Applicant Management tool, so that Recruiting users with Write permission can delete documents that were uploaded by applicants.

These instructions explain how you can delete files you or another Recruiting user uploaded for the applicant, as well as files uploaded by the applicant directly.

### Procedure

1. From the Admin Center, go to ► [Recruiting](#) ► [Job Requisitions](#) ►.
2. Select a job requisition and choose the number from the [Candidates](#) column.

Choosing from the [Active Candidates](#) column, which doesn't include individuals who withdrew their applications or whose applications were rejected, simply takes you to the same list.

If you see the legacy Candidate Workbench, toggle the [New Applicant Management Experience](#) switch on the top-right of the page.

3. Select an applicant by choosing their name.

The applicant's detail view appears.

While you're in the [Applicant Information](#) tab, check the [Application Information](#) portlet to verify that files have been uploaded for this application.

#### → Tip

Look for the field name you got from the admin that uses the [multiattachmentselection](#) field type. This field is what you're looking for if you want to delete a file that the applicant uploaded.

If there are no documents listed in this portlet, it means that there are no uploaded documents for you to delete.

4. Go to the ► [Resume and Documents](#) ► [Other Documents](#) ►.
5. Select the X for uploaded file you want to delete.

You've successfully deleted the file.

## 21.2.6.9 Adding Skills in a Job Application Using AI

Add and validate skills in a job application using AI capabilities.

### Prerequisites

- You've purchased the **AI units** license. For more information about **AI units** license, please contact your Account Executive.
- The setting ► [Admin Center](#) ► [AI Services Administration](#) ► [Assisted Applicant Screening](#) ► is enabled.
- The option ► [Admin Center](#) ► [Manage Recruiting Sites](#) ► [Enable Mobile Apply](#) ► is enabled.
- You have an external or internal candidate account.

### Context

On the application page of a career site, applicants can provide skills as part of their application, in the following ways:

- Uploading a resume. Then, skills are automatically derived from the resume, using AI, and shown in the [My Skills](#) section.
- Use the [Suggest Skills](#) option to get recommended skills, based on the skills they've added to their skill set. Then, applicants can choose which of the recommended skills to add to the [My Skills](#) section.
- Use the skills search bar under [Add Skills](#) and add skills manually.

## Procedure

1. Go to the application page.
2. In the [My Documents](#) section, upload a resume.

If a resume is not available for upload, go to **Step 3**.

On successful upload, skills from the resume are automatically extracted and populated in the [Skills](#) section.

3. Go to the [Skills](#) section.

If you had uploaded a resume in **Step 2**, then the extracted skills will be populated in the [My Skills](#) section.

4. In the [Add Skills](#) field, search and select skills that are suited for the application.

The [Suggest Skills](#) option generates skills suggestions that are based on the skills added in the [My Skills](#) section and that are required for the job.

### → Remember

A minimum of one skill must be added to the [My Skills](#) section to enable the [Suggest Skills](#) option. If skills were extracted from the resume as a result of **Step 2**, then this option would be enabled automatically.

- a. In the [Add Skills](#) field, enter a skill and add it to [My Skills](#).
- b. Choose [Suggest Skills](#) to receive suggestions.

Upto 10 suggestions are displayed from which you can select and add them to the [My Skills](#) section.

- c. Select skills and choose [Add to My Skills](#) to add them to [My Skills](#)

### ⓘ Note

A maximum of 100 skills can be added to the application. Retain skills that best suit the job application.

The selected skills are added to the [My Skills](#) section.

5. Choose [Save](#) to save your application as draft without submitting it.  
The skills in **My Skills** section will be saved along with the rest of the application.
6. Choose [Apply](#) to validate and submit the application.

## Results

The skills validated by the applicant are submitted for the job. Recruiters will use these skills information in the applicant screening process.

The skills validated by the applicant at this point are eventually used for applicant skills match, which uses AI capabilities that help recruiters view detailed information of the applicant skills and understand how these skills suit the job requisition.

Applicant validated skills provides:

- Candidates to have more clarity and control on the skills they provide as part of their application.
- Recruiters to have accurate skills-related information in the [Skills Compatibility](#) section in the Applicant Management workbench, as these skills have been fully managed and validated by the applicant.

## Related Information

[Notes about AI-Assisted Skills Mapping](#)

### 21.2.6.9.1 AI-Assisted Skills Validation for Applicants

AI-Assisted Skills Validation allows applicants to add and manage skills that they want to share with the recruiter, as part of their application.

In the application page of the career site, applicants have the following ways to provide skills as part of their application:

- Uploading a resume. Here, the skills are automatically derived from the resume using AI capabilities and populated in the [My Skills](#) section.
- Using the skills search bar under [Add Skills](#), the applicants can search and add skills that are suitable for the application.
- Using the [Suggest Skills](#) functionality, applicants can get recommended skills based on the skills that they've added to their skill set. Applicant's can carefully choose from these recommended skills and add them to [My Skills](#).

Applicants can manage their skills by removing and adding skills from the [My Skills](#) section. They retain skills that add value to their skills profile.

#### Note

This feature is applicable for new and existing candidates in a career site.

Skills can be managed only using:

- Mobile Apply career site Candidate Profile page.
- Mobile Apply career site Job Application page

Applicants can't manage their skills using:

- Quick Apply
- ODATA API
- Forwarded Candidates

#### Note

Once applicants have submitted a validated skill set using this feature, this skill set is used if they are forwarded to a job requisition prior to that. This applies to all the Forward Candidate scenarios (Agency forward, employee referral, forward to requisition, forward as applicant).

- Non-mobile Apply Career Sites

The skills validated by the applicant at this point are eventually used for applicant skills match, which uses AI capabilities that help recruiters view detailed information on the applicant skills and understand how these skills suit the job requisition.

With applicant skills match in the [Applicant Management](#) tool, the recruiter can view a list of applicants whose skills are computed using AI capabilities. The skills are displayed in the [Skills Compatibility](#) section in the Applicant List view and the Applicant Details view. The skills displayed are derived from:

- Skills that were validated by the applicant in their Candidate Profile or the application page.
- Or, skills that were found in the applicant's resume (without skills validation)

## Candidate Snapshot

A candidate snapshot refers to a snapshot of the applicant's skills when an applicant is reviewed by the recruiter in the Applicant Details view.

The candidate snapshot avoids

- Propagation of updated skills from the candidate profile to an applicant during an application review for a specific job requisition.
- Repetitive reviews by the recruiter every time a candidate updates their skills in the Candidate Profile.

### 21.2.6.10 Viewing Skills Compatibility for an Applicant in Applicant Management

[Skills Compatibility](#) in Application Management gives a detailed view of the applicant's skills that recruiters or hiring managers can use to make informed decisions in your hiring process.

## Prerequisites

- You've purchased the **AI units** license. For more information about **AI units** license, please contact your Account Executive.
- Enable [Assisted Applicant Screening](#) in ► [Admin Center](#) ► [AI Services Administration](#) ► [Feature Settings](#) ► [Recruiting](#) .
- Recruiting administrators have to [Configure AI-Assisted Skills Matching Eligibility for Job Requisition](#) rule scenario in the [Business Rules Admin](#) page to control which job requisition uses the AI-assisted skills matching feature. Without any rule, the functionality will be active for all job requisitions by default.

## Context

You've received applications for your Job Requisition, and you wish to understand the applicants' suitability for the job with enhanced insight into the applicant skills that are derived using AI capabilities.

## Procedure

1. Go to [Recruiting](#) > [Job Requisitions](#) .
2. Select a job requisition from the list. Hover over the job requisition for [Actions](#) and choose [Candidate Summary](#) under [Candidate Actions](#) to view the list of applicants who applied for the job on the Application Management list view.
3. From the [Settings](#) option, choose [Skills Compatibility](#) to include the [Skills Compatibility](#) column on the applicant's list page.
4. Choose an applicant's name to navigate to the [Applications](#) page.
5. On the [Applications](#) page, in the [Skills Compatibility](#) column, a selected applicant, displays the number of skills that match the total number of skills identified by a recruiter in a job requisition.
6. Choose an applicant's matched skills to view AI-driven skills information relative to the skills required in a job requisition on the [Skills Compatibility Details](#) page:
  - **Primary Skills** - Skills identified as a must for the job in a job description and are available in the applicant's skill set.
  - **Secondary Skills** - Skills that improve an applicant's ability to perform a specific job but aren't required. An applicant also has skills besides the required skills relevant to the job.
7. Choose [View Details](#) to view where the skills are matched on the job description and the applicant's resume on the [Skills Compatibility](#) tab.
8. The [Skills Compatibility](#) tab categorizes skills as [Job Skills](#) and [Other Applicant Skills](#) section to view the following skill set:
  - **Job Skills** - Skills defined in the job description as primary and secondary skills by a recruiter when a job is posted.
  - **Other Applicant Skills** - Skills derived from applicant's resume and did not match the job skills identified in the job description.
    - **Relevant Skills** - The relevant skills are additional skills of an applicant that are relevant for the job but not identified as the required skills. The relevant skills are from the applicant's resume or manually added by the applicant on the career site.
    - **Unmatched Applicant Skills** - Additional skills of an applicant that may not be relevant for the job.
9. Choose a skill to view where the applicant's skill or the job skills match in the job description or on the resume or whether skills were added by an applicant manually while applying for a job in the [Occurrences](#) window in the [Phrase](#), [Type](#), and [Occurs](#) sections.

### Note

[Skills Compatibility](#) isn't evaluated for a job requisition if it has already been receiving applications before the [Assisted Applicant Screening](#) option was enabled.

## 21.2.6.10.1 Configuring Business Rule for AI-Assisted Skills Matching for Applicant Screening

Configure the business rule that allows you to define job requisitions that will use the AI-assisted Skills Matching for Applicant Screening feature during the hiring process.

### Prerequisites

You have the *Billing And Subscription Configuration* permission and the corresponding *Actions: View, Edit* and *Import/Export* enabled under ► *Admin Center* ► *Manage Permission Roles* ► *Admisitrator Permissions* ► *Manage MDF Recruiting Objects* ►.

### Context

As a recruiting administrator, you can control which job requisitions use the AI-assisted Skills Matching feature. The rule is executed when a job requisition is created or updated (onSave). If the job requisition satisfies the criteria defined in the rule, then AI units are deducted when a candidate is hired for that job requisition.

### Procedure

1. Go to ► *Admin Center* ► *Configure Business Rules* ►.

The *Business Rules Admin* page appears.

2. Choose **+** (*Create New Rule*).
3. Expand the *Recruiting* section and choose *Configure AI-Assisted Skills Matching Eligibility for Job Requisition*.
4. Configure the required details and choose *Continue*.

You get to the *Configure Business Rules* page.

5. Create conditions in the *If* section as required.
6. Choose *Save* to save the rule.

### Next Steps

Assign this rule to the *Recruiting Billing and Subscription Configuration* object under *Manage Data*.

## Related Information

[Assigning Rule to an Object \[page 1013\]](#)

### 21.2.6.10.1.1 Assigning Rule to an Object

This section describes how to assign the business rule *Configure AI-Assisted Skills Matching Eligibility for Job Requisition* to an object in *Manage Data*.

## Prerequisites

You have created a rule.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Data](#) ►.
2. In the [Search](#) field, choose the *Recruiting Billing and Subscription Configuration* object.
3. From the [Take Action](#) dropdown, choose *Make Correction*.
4. In [External Code](#) field, choose *Default Billing and Subscription Configuration*.
5. For the *AI Skills Eligibility for Job Requisition Rule* field object, choose the rule you want to assign.
6. Choose [Save](#).

## Results

You have successfully assigned the *Configure AI-Assisted Skills Matching Eligibility for Job Requisition* rule to the *Billing and Subscription Configuration* object.

### 21.2.6.10.2 AI-Assisted Skills Matching for Assisted Applicant Screening

AI-assisted skills matching for assisted applicant screening provides visibility into the applicant's skills and how they match the skills required for the job.

The AI-Assisted Applicant Screening feature uses AI with a universal taxonomy to extract skills rather than relying on custom libraries defined in the instance (Job Profile Builder (JPB) skills/competencies). Skills matching not only identifies skills that are exact matches but also identifies additional relevant skills related to the skills in the job

description. It also suggests skills the applicant has knowledge about or could easily acquire that are relevant to the job.

*Skills Compatibility* in the applicant list view and the applicant details page is derived using AI by comparing skills in the applicant's resume with those mentioned in the job description. The applicant's skills displayed as part of *Skills Compatibility* are derived either from the skills manually added and validated by the applicant or skills automatically derived from the applicant's resume and validated in their Candidate Profile.

#### Note

Skills Compatibility is primarily computed using the skills validated by the candidate. If the candidate's validated skills are not available for computation, Skills Compatibility is instead computed using the applicant's resume.

## Important Notes

- Skills Compatibility data is not available if:
  - Job requisition-related:
    - The business rule is not active for a job requisition
    - Some applicants applied for a job before the feature was enabled. Ensure there are no active applications during feature activation to compute applicant skills.
    - The AI Skills functionality supports none of the job requisition posting languages.
    - Internal service error occurred.
  - Applicant-related
    - The AI Skills functionality does not support the language of the applicant's resume.
    - The applicant did not provide the resume.
- When a job description is updated, the applicant skills compatibility is recalculated as follows:
  - If a recruiter or hiring manager validates skills in a job description are not validated, then the skill set is updated along with the job description update. Then, the compatibility of the skills will be recalculated for all the applicants to reflect the new job skills.
  - If a recruiter or hiring manager validates the skill set in a job description, then updating the job description will neither recalculate the job's skill set nor the applicant's skills compatibility.
- When a recruiter or hiring manager manually updates the job's skill set, the applicant skills compatibility is recalculated.
- Skills compatibility is recalculated as follows when a candidate's resume is updated:
  - If the feature *Allow Applicant to Manually Add Skills* is enabled:
    - Before snapshot: The skills compatibility is not recalculated. The candidate has provided a validated skill set. In that sense, an update on the application resume will not recalculate the skills for this application. The candidate has to update skills from the candidate profile *Skills* section for updating skills.
    - After snapshot: The skills compatibility is not recalculated. Neither changes from the application resume nor from the candidate profile *Skills* section will trigger a skills compatibility recalculation. Once the candidate snapshot is taken, updates by the candidate on the application aren't considered.
  - If the feature *Allow Applicant to Manually Add Skills* is disabled:
    - Before snapshot: The skills compatibility is recalculated. As the skills are automatically derived from the resume, an application resume update will recalculate the skills compatibility.

- After snapshot: As the candidate snapshot has been taken, the newly derived skills are not recalculated and the skills compatibility is not updated.
- When a candidate manually updates the job skill set from the [My Skills](#) section, the skill compatibility is calculated as follows:
  - Before the candidate snapshot: The skills compatibility is recalculated. The candidate manually updates the skills before the candidate snapshot.
  - After the candidate snapshot: The skills compatibility is not recalculated. The candidate manually updates the skills, but the candidate snapshot does not allow for the compatibility of the skills to be recalculated

## Related Information

[Viewing Skills Compatibility for an Applicant in Applicant Management \[page 1010\]](#)

## 21.3 The Legacy Candidate Workbench

This section describes display and filter options for the legacy Candidate Workbench.

### 📌 Note

The legacy Candidate Workbench has been updated with the redesigned Applicant Management tool, which provides an improved experience for Recruiting users to search for, filter, and view individuals who have applied for specific jobs. Refer to *The Redesigned Applicant Management Tool* for details.

You can configure the display and filter options when you configure the Job Application XML, Candidate Profile XML, and [Manage Templates](#).

You can choose from configured fields to control your view of the candidate list within the legacy Candidate Workbench view. You can group the fields you want to display within categories. Categories are created by adding them to the Candidate Profile XML template itself that are within the `<search-display-options-config>` section or by editing that template using the [Manage Templates](#) tool. Fields for legacy Candidate Workbench don't respect permissions, which means anyone having access to Recruiting can view all configured fields that display for every status.

Examples of display and filter options include candidate data, and candidate application data.

### → Recommendation

Since every category requires translation, only use up to three categories. Don't exceed five.

## Related Information

[The Redesigned Applicant Management Tool \[page 967\]](#)

## 21.3.1 Field Behavior for Candidate Summary Display Options

Configure fields on the Candidate Profile and Job Application templates so that they can become visible on the legacy Candidate Workbench.

### Note

This page describes functionality for the legacy Candidate Workbench.

You can configure all standard and reportable custom fields as display option columns on the legacy Candidate Workbench as long as they meet these conditions:

- Fields are configured in either the Candidate Profile or Job Application template.
- Fields as configured to be reportable.

Fields that don't meet these conditions are invisible, nor do they get populated with data. Marking custom fields as reportable also makes them sortable on screen.

Configure fields on the template where they're already declared — application fields on the Job Application template and candidate profile fields on the candidate profile template.

Fields that pull data from the candidate profile template only show a snapshot of data, not live data from the candidate profile — except for forwarded candidates or candidates who have yet to apply. Fields that pull data from the Job Application template show live data sourced from the application.

A set of default fields always appears in the legacy Candidate Workbench. These fields appear together in the first category grouping of the workbench:

- Forwarded By
- Rating
- Source
- Candidate Source
- Phone (Cell Phone)
- Last Updated

The *Name*, *Status*, and *Actions* columns appear by default, and don't appear as options in the *Display Options* panel.

When you use Career Site Builder or Recruiting Posting, the *Candidate Source* column is automatically populated; for example, with the name of the job board the applicant used to apply. The prerequisite for this is that the candidate applies through the URL, which includes the `jobPipeline` parameter. Configure this case-sensitive parameter during the setup of Recruiting Posting or Career Site Builder. The value of this parameter in the URL is automatically stored in the Recruiting Management database and is displayed in the *Candidate Source* column. To report on candidate source in ad-hoc reports, use the schema Recruiting V2 / Referral Linked on Candidate.

Tags are handled differently because they aren't template-based. You can configure tags as one of the columns in the `<candidate-summary-display-options-config>` node in the Job Application template.

### Sample Code

```
<column name="tags" select-by-default="true" gridOrder=2/>
<label><![CDATA[default column label]]></label>
<label xml:lang="es_ES"><![CDATA[column label - English]]></label>
<label xml:lang="fr_FR_SF"><![CDATA[column label - French]]></label>
</column>
```

## Note

Tags are associated with the `name` attribute, not the `field-ref` attribute.

## More Information About Source and Candidate Source

**Source** is the medium through which the candidate is onboarded to the external career site. The source can be through Agency or employee referral, through which they've created the candidate account. For example, Jobvite is an external application through which a candidate can apply for any of the open job requisitions. The **Source** here is Jobvite as the candidate came to know about this job requisition through Jobvite.

**Candidate Source** is the method through which the candidate who was created by one of the sources has applied for a specific job requisition. That is, the method through which the candidate has received information to apply for a job requisition.

Source and Candidate Source

| Source                         | Candidate Source               |
|--------------------------------|--------------------------------|
| Jobvite                        | Jobvite                        |
| Recruiting Marketing: Source 1 | Recruiting Marketing: Source 1 |
| Recruiting Marketing: Source 2 | Recruiting Marketing: Source 2 |
| Internal Site                  | Internal Site                  |
| Internal Site                  | Recruiter Sourced              |
| Corporate: Site Name           | Recruiter Sourced              |
| Corporate: Site Name           | Corporate: Site Name           |
| Corporate: Site Name           | Employee Referral              |
| Corporate: Site Name           | Agency 1                       |
| Corporate: Site Name           | Agency 2                       |
| Job Board: Job Board 1         | Job Board: Job Board 1         |

In this table, when the **Source** is internal site and the **Candidate Source** is recruiter-sourced, the recruiter has navigated to an internal site and forwarded that candidate. Recruiter-sourced means that the candidate was forwarded by someone. When the **Source** is a corporate site and **Candidate Source** is Agency 1, the candidate could have applied through the corporate site but their actual source was Agency.

Types of Candidate Sources

| Candidate source | Definition                                                                                                                                                                                                                                                       |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Direct           | Candidate is directed to a specific page on the career site (it can be a job, content, category, or search) and there's no referring URL.                                                                                                                        |
| Social Network   | Recruit candidates using social platforms as talent databases or for advertising. Social recruiting uses social media profiles, blogs, and other Internet sites to gather information about candidates. For example, LinkedIn, Twitter, Facebook, and Instagram. |

| Candidate source              | Definition                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Career Site                   | <p>Candidates can search through the job postings in a company and apply. For example, RCM Redirect and career site.</p> <p>RCM Redirect source type refers to candidates who are re-directed from Recruiting Management to RMK. Career Site source type refers to candidates who accesses the career site directly to search for jobs.</p> |
| Search Engine                 | A web search engine searches for information on the world-wide Web. For example, Google, Bing, and Yahoo.                                                                                                                                                                                                                                   |
| Career Site Service           | A subscription-based cloud solution where career pages integrate with the employer Web site to provide a job portal for candidates. For example, Search box.                                                                                                                                                                                |
| Job Boards - Niche            | A Web site that offers easy job access to candidates. These industry-specific sites allow companies to post job openings so that the targeted candidates can find them in one location. For example, Glass Door and Job Rapido.                                                                                                             |
| Sourcing                      | A customized service solution to meet the individual needs of a recruiter. For example, Sourcing LinkedIn and Sourcing Indeed.                                                                                                                                                                                                              |
| Blogs                         | A database of candidate information, which offers data-driven pieces of useful tips for recruiters and hiring managers. Blogs include some of the best educational and actionable content available to for recruitment.                                                                                                                     |
| Email and Email Subscriptions | Recruiting emails and Talent Community email alerts. The email alerts are automatically tagged from the RMK platform with accurate tracking. For example, email subscription, online email, email Job to Friend in Recruiting Management, email signature, and Recruiting Management job alerts.                                            |

## 21.3.2 Configuring the Job Application Template for Display Options

Configure the Job Application template to control the fields available as display options on the applicant list page of the redesigned Applicant Management tool and legacy Candidate Workbench.

### Prerequisites

You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Context

### Note

These settings apply to the legacy Candidate Workbench, and also automatically apply to the redesigned Applicant Management tool.

- Before fields can be made visible for the applicant list in the redesigned Applicant Management and on the legacy Candidate Workbench, they need to be declared in the job application template.
- Custom fields must be made reportable in the template.

### Caution

The display options don't respect permissions outlined in the XML. Don't configure fields containing secure data or data that can't be shared across roles a Display column.

## Procedure

1. Add the `candidate-summary-display-options-config` node to the job application template after the `<button-permission>` node.

### Note

You can only have one `<candidate-summary-display-options-config>` node per template.

2. Define the categories you need in order to group the display options on the legacy Candidate Workbench.

```
<category id="candidateContactData" name="candidateContactData">
  <label xml:lang="en_US">
    <![CDATA[Candidate Contact and Application Data]]</label>
  </category>
```

3. Add fields to the category.

```
<column field-ref="cellPhone" select-by-default="true" gridOrder="1"/>
```

Where:

- `<column field-ref>` corresponds to the standard or custom field ID.
- `<select-by-default>` controls if the field is selected in the [Display Options](#) panel by default.
- `<gridOrder>` controls the order of the fields within the category. Each value for `<gridOrder>` must be unique for the category.

4. Enter names for the custom fields in the [XML Custom Field ID](#) in [Provisioning](#) > [Configure Reportable Custom Fields](#) to make them reportable.

### Note

Make sure to map the type of the custom field with the types available in Provisioning. There are 100 text fields, 40 number fields, 110 picklist fields, and 30 date fields available as reportable custom fields for each XML entity. The number of available fields isn't configurable.

5. Select [Synchronize Existing Data](#) to update reportable data.
6. Upload the modified job application template.

You can change the labels of Assessment fields to be displayed in the [Application Candidate Summary Display](#) options. Change the labels in the assessment vendor packages CSV file and not in the Application XML template.

The header name for the assessment fields column displayed in the [Candidate Summary Display](#) options is taken from the `SHORT_NAME` that's in the file. If you need to change the header label, change the `SHORT_NAME`.

If you want to display the name of vendor in the labels of the fields Score, Recommendation and Assessment Status simply add the `SHORT_NAME` at the beginning following the column name. The display options show the following:

- 'name of vendor' Score
- 'name of vendor' Recommendation
- 'name of vendor' Assessment Status

#### Sample Code

```
<candidate-summary-display-options-config>
  <category id="candidateContactData" name="candidateContactData">
    <label xml:lang="en_US"><![CDATA[Candidate Contact and Application
Data]]></label>
    <column field-ref="cellPhone" bge-ref="none" select-by-default="true"
      gridOrder="1"/>
    <column field-ref="contactEmail" bge-ref="none" select-by-default="true"
      gridOrder="2"/>
    <column field-ref="country" bge-ref="none" select-by-default="false"
      gridOrder="3"/>
  </category>

  <category id="referralData" name="referralInfo">
    <label xml:lang="en_US"><![CDATA[Referral Info]]></label>
    <column field-ref="referralName" bge-ref="none" select-by-default="true"
      gridOrder="4"/>
  </category>
</candidate-summary-display-options-config>
```

## 21.3.3 Configuring the Candidate Profile Template for Candidate Summary Display Options

Configure the candidate profile template to control the fields available as display options in the legacy Candidate Workbench.

### Prerequisites

- Fields are declared on the Candidate Profile Template file.
- You have access to Provisioning.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- Custom fields have been made reportable in the template.

## Context

### Note

This page describes functionality for the legacy Candidate Workbench.

### Caution

The Candidate Summary Display options don't respect permissions outlined in the template. Don't configure fields containing secure data or data that can't be shared across roles as a Display column.

## Procedure

1. Add the `candidate-summary-display-options-config` node to the candidate profile template after the `<candidate-search-display-options>` node.

### Note

You can only have one `<candidate-summary-display-options-config>` node per template.

2. Define the categories you need in order to group the display options in the legacy Candidate Workbench.

```
<category id="candidateContactData" name="candidateContactData">
  <label xml:lang="en_US"><![CDATA[Candidate Contact and Application
Data]]></label>
</category>
```

3. Add fields to the category.

```
<column field-ref="cellPhone" select-by-default="true" gridOrder="1"/>
```

Where:

- `column field-ref` corresponds to the standard or custom field ID.
  - `select-by-default` controls whether the field is selected in the *Display Options* panel by default.
  - `gridOrder` controls the order of the fields within the category. Each value for `gridOrder` must be unique for the category.
4. Make custom fields reportable at [► Provisioning ► Configure Reportable Custom Fields ►](#).
  5. Enter the field names for the custom fields in the *XML Custom Field ID* column.

## Note

Make sure to map the type of the custom field with the types available in Provisioning. There are 100 text fields, 40 number fields, 110 picklist fields, and 30 date fields available as reportable custom fields for each XML entity. You can't change the number of available fields.

6. Select [Synchronize Existing Data](#) to update reportable data.
7. Upload the modified candidate profile template:

## Sample Code

```
<candidate-summary-display-options-config>
  <category id="candidateProfile" name="Profile">
    <label xml:lang="en_US"><![CDATA[Candidate Profile Data]]></label>
    <column field-ref="homePhone" bge-ref="none" select-by-default="true"
gridOrder="1">
      </column>
    <column field-ref="cust1" bge-ref="none" select-by-default="true"
gridOrder="2">
      </column>
    <column field-ref="firstName" bge-ref="none" select-by-default="true"
gridOrder="3">
      </column>
    </category>
    <category id="geoData" name="candidateGeoData">
      <label xml:lang="en_US"><![CDATA[Candidate Geo Data]]></label>
      <column field-ref="state" bge-ref="none" select-by-default="true"
gridOrder="1">
        </column>
      <column field-ref="city" bge-ref="none" select-by-default="true"
gridOrder="2">
        </column>
      </category>
    </candidate-summary-display-options-config>
```

## 21.3.4 Configuring Extra Columns for Candidate Search Display

Recruiting users can configure extra columns of data to include in their candidate search results.

### Context

#### 📘 Note

These settings apply to the legacy Candidate Workbench, and also automatically apply to the redesigned Applicant Management tool.

Including the optional `search-display-options-config` element in the Candidate Profile XML template adds a gear icon to the Candidate Search screen. You can't remove, replace, or change the standard display options that appear on the page, such as breaking apart the name into first or last name.

You can use any standard or custom field, or background element field as a display option as long as the field is defined in the profile template. If you use a custom field, it must be made reportable in Provisioning and successfully synchronized; otherwise the display option content appears blank.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Procedure

1. Set the category element with an ID and Name attribute that consist of alphanumeric values and are unique:

```
<category id="candidateProfileData" name="candidateProfileData">
```

Define at least one category. There's no limit on the number of categories you can define. You can include fields in the categories the way the customer requires.

2. Set the label for the category:

```
<label><![CDATA[Basic Candidate Data]]></label>
```

The label appears in the user interface as the category header.

The CDATA content within the label element can be configured with any client-defined text.

3. Set at least one column element to add a field to the display options category. There's no limit to how many column elements you can set.

```
<column field-ref="cellPhone" bge-ref="none" select-by-default="false" gridOrder="1"/>
```

The column element uses the following attributes:

| Option                   | Description                                                                                                                                                                                                                                                                                                                                             |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>field-ref</b>         | The <b>field-ref</b> attribute can point to either the ID attribute from a field-definition element, or the ID attribute of a data-field element from a background element. Whatever IDs are defined as <b>field-ref</b> become selectable fields to include in the Candidate Search result Display Options.                                            |
| <b>bge-ref</b>           | This attribute stands for background element and must be filled out if the column element ID attribute is pointed to a data-field element from a background element. In that case, the <b>bge-ref</b> attribute must contain the background-element ID. If referring to a <b>field-definition</b> , this attribute must be available but set to "none". |
| <b>gridOrder</b>         | The <b>grid-order</b> attribute determines the order of the fields in the search results table.                                                                                                                                                                                                                                                         |
| <b>select-by-default</b> | This attribute can be set to true or false. If true, it isn't required to click the display options gear to add the data to their search results. The data automatically appears on the search results, but a user can hide this data.                                                                                                                  |

#### 4. **Optional:** Include candidate tags as a display option.

There's a special configuration to include candidate tags in display options, even though the tags aren't set up as a field in the Candidate Profile XML.

1. As a prerequisite, you have to set up Candidate Tags. For more information, see <Tagging a Candidate>.
2. Add the following XML, as is, to the display options:

```
<category id="tag" name="tag">
  <label><![CDATA[Tags]]></label>
  <column name="tags" select-by-default="true" gridOrder="1999">
    <label><![CDATA[tags]]></label>
  </column>
</category>
```

- **Configuration:**

Add the following XML, as is, to the display options:

```
<search-display-options-config>
  <category id="candidateProfileData"
    name="candidateProfileData">
    <label><![CDATA[Basic Candidate Data]]></label>
    <label xml:lang="en_US"><![CDATA[Basic Candidate Data]]></label>
    <column field-ref="contactEmail" bge-ref="none"
      select-by-default="false" gridOrder="1"/>
    <column field-ref="primaryEmail" bge-ref="none"
      select-by-default="false" gridOrder="3"/>
  </category>
  <category id="tag" name="tag">
    <label><![CDATA[Tags]]></label>
    <column name="tags" select-by-default="true"
      gridOrder="1999">
      <label><![CDATA[tags]]></label>
    </column>
  </category>
</search-display-options-config>
```

## 21.3.5 Supported Standard and System Fields for Filter Options

Learn about supported standard fields that can be configured for legacy Candidate Workbench display and filter settings.

### Note

These settings apply to the legacy Candidate Workbench, and also automatically apply to the redesigned Applicant Management tool.

All fields represented in this table are:

- Standard fields
- Visible
- Filterable
- Sortable

When viewing this topic in a web browser, you can filter and sort on the column, show or hide columns, or use full-text search to find what you are looking for. For example, if you want to filter your results by [Template Name](#), select the filter link for the [Template XML Name](#) column to select which template you want to view standard fields. For all other columns, if you can view by field ID name, enter **address** in the [Field ID](#) column of the table.

Supported Fields for Filter Options

| Template Type                     | Field ID or Field Label Name                | Field Data Type  | System Field? | Comments                                                                               |
|-----------------------------------|---------------------------------------------|------------------|---------------|----------------------------------------------------------------------------------------|
| Job Application                   | averageRating                               | number           | No            |                                                                                        |
| Job Application Candidate Profile | applicationDate                             | date             | Yes           |                                                                                        |
| Job Application Candidate Profile | name<br>firstName<br>middleName<br>lastName | text             | Yes           |                                                                                        |
| Job Application Candidate Profile | lastModified                                | date             | Yes           |                                                                                        |
| Job Application Candidate Profile | contactEmail                                | text             | Yes           |                                                                                        |
| Job Application Candidate Profile | address                                     | text             | No            |                                                                                        |
| Job Application Candidate Profile | city                                        | picklist<br>text | Yes           |                                                                                        |
| Job Application Candidate Profile | state                                       | picklist<br>text | Yes           | You can use as a cascading picklist with <a href="#">country/region</a> as the parent. |

| Template Type                                   | Field ID or Field Label Name | Field Data Type  | System Field? | Comments                                                                                                  |
|-------------------------------------------------|------------------------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------|
| Job Application Candidate Profile               | zip                          | text             | Yes           | There are two data types: <b>text</b> and <b>picklist</b> .<br><br><b>⚠ Restriction</b><br>Use only text. |
| Job Application Candidate Profile               | country                      | picklist         | Yes           | Always a picklist.<br><br><b>📌 Note</b><br>Field label is <i>Country/Region</i> .                         |
| Job Application Candidate Profile               | candType                     | picklist         | Yes           | Always visible when configured in display option for either XML template.                                 |
| Job Application Candidate Profile               | dateOfBirth                  |                  | No            |                                                                                                           |
| Job Application Candidate Profile               | disabilityStatus             | picklist<br>text | No            |                                                                                                           |
| Application Template Candidate Profile Template | minAnnualSal                 | number           | No            |                                                                                                           |
| Job Application Candidate Profile               | preferredLoc                 | picklist<br>text | No            |                                                                                                           |
| Job Application Candidate Profile               | veteranStatus                | picklist<br>text | No            |                                                                                                           |
| Job Application Candidate Profile               | curentTitle                  | text             | Yes           | Always visible when configured in display option for either XML template.                                 |
| Job Application Candidate Profile               | currentCompany               | text             | Yes           | Always visible when configured in display option for either XML template.                                 |

| Template Type                        | Field ID or Field Label Name        | Field Data Type | System Field? | Comments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------|-------------------------------------|-----------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Onboarding                           | <i>Onboarding Initiation Status</i> |                 | Yes           | <p>Always visible when configured in display option. <i>Onboarding Initiation Status</i> shows the submission status and can have the following values:</p> <ul style="list-style-type: none"> <li>• Success</li> <li>• Canceled</li> <li>• Success (reinitiated)</li> <li>• Failed</li> </ul> <div> <p><b>Note</b></p> <ul style="list-style-type: none"> <li>• The <b>Onboarding Initiation Status</b> only indicates if the onboarding request was successfully submitted or not. It doesn't indicate the status of the onboarding workflow.</li> <li>• <i>Onboarding Initiation Status</i> field doesn't exist in either the <i>Application</i> or <i>Candidate Profile</i> XML template.</li> </ul> </div> |
| Onboarding                           | <i>Onboarding Status</i>            |                 |               | <p>Always visible when configured in display option. | Job Application<br>Candidate Profile | <i>Viewed</i>                       | enum            | Yes           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Job Application<br>Candidate Profile | <i>Forwarded From</i>               | enum            | Yes           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

#### 📘 Note

All *System Fields* are under the *System Fields* category.

## 21.3.6 Supported Data Types of Custom Fields for Display and Filter Options

There are a number of supported data types for custom fields you can configure for the display and filter options.

#### 📘 Note

These settings apply to the legacy Candidate Workbench, and also automatically apply to the redesigned Applicant Management tool.

Supported data types of custom fields are available in both the job application and candidate profile templates. They're also:

- Visible
- Sortable
- Filterable

Supported data types for custom fields:

- Boolean
- Derived
- number
- text
- date
- picklist
- enum
- percent
- currency

## 21.3.7 Configuring Display Options Using Manage Templates

Use the *Manage Templates* tool to adjust the Display Options configuration of the legacy Candidate Workbench.

### Prerequisites

- *Manage Recruiting Templates* is enabled in Upgrade Center.
- Manage Recruiting Templates role-based permission is enabled.

- All fields are reportable.
- The <candidate-summary-display-options-config> is configured in the job application template so that the *Candidate Summary Display Option* tab appears in *Manage Templates*.

## Context

### ⓘ Note

These settings apply to the legacy Candidate Workbench, and also automatically apply to the redesigned Applicant Management tool.

## Procedure

1. Go to ► *Admin Center* ► *Manage Templates* ►.
2. Select the *Recruiting Management* tab and choose the template you want to configure:
  - *Job Application*
  - *Candidate Profile*

You're directed to your selected template's list page.

3. Select the template you want to configure:
  - *Candidate Summary Display Options*
  - *Candidate Search Display Options*

You're directed to the *General Settings* page for your template.

4. Select ► *General Settings* ► *Candidate Summary Display Option* ►

The link to *Display Options Columns defined. Click to modify* appears on the page.

5. Select the display options link.
6. Click *Add display options column*.

You see the *Display Options Columns* dialog box that contains currently available fields by category name.

7. Enter the following:

| Option                                                                                                                   | Description                                                                                        |
|--------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <i>Category Id</i>                                                                                                       | Use either a new or existing category ID.                                                          |
| <i>Category Name</i>                                                                                                     | Use either a new or existing category name.                                                        |
| <i>Category Label</i>                                                                                                    | The text that appears on the user interface. You can add localized labels for different languages. |
| <div> <div>ⓘ Note</div> <div>You can add localized labels for different languages in <i>Category Label</i>.</div> </div> |                                                                                                    |
| <i>Grid Order</i>                                                                                                        | Specify a unique grid order number.                                                                |

8. Select [Done](#) to save changes and close the dialog box.

Choose [Save as Draft](#) to save and review all changes, or [Publish](#) to publish your changes to the candidate profile template temporarily.

## 21.3.8 Customizing the Display Options View in the Legacy Candidate Workbench

You can customize to either show or hide columns in the candidate list table and whether you want to freeze the first column or the table header.

### Prerequisites

- Fields are configured in either the Candidate Profile or Application template to appear in the [Display Options](#) screen.
- All fields are reportable.

### Context

#### Note

This page describes functionality for the legacy Candidate Workbench.

### Procedure

1. Go to ► [Admin Center](#) ► [Recruiting](#) ► [Job Requisitions](#) ► that takes you to the [Job Requisition](#) list page.
2. Access the legacy Candidate Workbench:
  - a. Select the job requisition you want that take you to the [Job Requisition Detail](#) page.
  - b. Select [CANDIDATES](#) tab.

When you select the [CANDIDATES](#) tab, you're directed to that job requisition's candidate list in the legacy Candidate Workbench.

3. Customize the [First and Last Name Display](#) field:
  - a. Go to ► [Recruiting](#) ► [Preferences](#) ► [My Display Preferences](#) ►.
  - b. Select either of these two options:
    - [First Name, Last Name](#)
    - [Last Name, First Name](#)
  - c. Select [Save](#) to finish.

4. From the workbench, select  [Display Options](#).

The [Display Options](#) dialog appears.

5. Select any column header checkbox for categories you want to view fields for, then select the individual fields that you want to appear as columns in your view.
6. Choose one of the [Freeze Options](#) settings:
  - [Freeze the first column \(candidate name\)](#)
  - [Freeze the table headers](#)

#### Restriction

You can't freeze both the first column and table header at the same time.

7. Choose [Update Screen](#) to save your settings.

## Results

The legacy Candidate Workbench now displays based on your settings.

## Next Steps

When you've configured which fields you want, you can select fields to be added to Filter Options. Using Filter Options, you can view candidates that fit specific criteria that you want.

### 21.3.9 Using Legacy Candidate Workbench Display and Filter Options

Recruiters and operators can use [Filter Options](#) in the legacy Candidate Workbench to limit the number of items you want to see, or to include multiple fields at one time on the candidate list table itself. More fields include [Current company](#), [Current title](#), [Veteran status](#), and custom fields.

## Prerequisites

- The Job Application and Candidate Profile templates are configured in the [Manage Templates](#) tool with the fields you want to display.
- Custom fields are reportable.

## Context

### Note

This page describes functionality for the legacy Candidate Workbench.

*Filter Options* details:

- Special characters are allowed in the text fields.
- Partial matches are allowed when entering data.
- The country/region, state, and city fields use cascading picklists.
- The *Zip or Postal Code* field is a text field, and the system validates the value entered into the field based on the country/region selected.

## Procedure

1. Go to ► *Admin Center* ► *Recruiting* ► *Job Requisitions* ► that takes you to the *Job Requisition* list page.
2. Access the legacy Candidate Workbench:
  - a. Select the job requisition you want to take you to the *Job Requisition Detail* page.
  - b. Select *CANDIDATES* tab.

When you select the *CANDIDATES* tab, you're directed to that job requisition's list of candidates.

3. From the top left above the table, select  *Display Options*.

The *Display Options* dialog appears.
4. In the *Display Options* dialog, choose the options to show or hide the columns in the table, then choose *Update Screen* to save your settings.
5. Select  *Filter Options* to select which fields to filter.
6. Select  *Filter Options*, located to the right of *Display Options*.

The *Filter Options* dialog appears.
7. In the *Filter Options* dialog, add the values to the system fields that you want to filter your list by, then choose *Apply* to save your settings.

## Results

You now see a list of candidates based on the filters you set.

## 21.3.9.1 Deriving ZIP Code/Postal Code and Creating Application Snapshot

In general, an application snapshot is created and displayed in the legacy Candidate Workbench when the user clicks on the applicant for the first time.

### Note

This page describes functionality for the legacy Candidate Workbench.

This snapshot takes the fields specified in the candidate profile during the first click. The filter is always available on the data that is displayed in the legacy Candidate Workbench. Therefore, for all candidates who have applied to the requisition, the filter is applied on the application snapshot if it exists, or else it's applied on the data specified during application. For Forwarded candidates, the filter is applied on the Country/Region and ZIP/postal code that is provided in the candidate profile.

### Note

This filter is only available when the **Country/Region** field is configured in candidate profile template.

- External Candidate (or internal candidate if no **sm-mapping** to Employee Profile exists) – The entered ZIP/postal code in the Application page overrides the field specified in candidate profile and also updates the candidate profile with this ZIP/postal code from the Application page.  
Accessing the legacy Candidate Workbench before selecting the candidate displays the ZIP/postal code given in Application page.  
After selecting the candidate for the first time, a snapshot is created which updates the ZIP/postal code with the latest value from candidate profile. Any further changes to the profile after the first click doesn't update the snapshot.  
Before selecting the candidate for the first time, we can also view and filter on the ZIP/postal code specified in the Application page.  
Selecting the candidate once creates an application snapshot with the latest ZIP/postal code value from candidate profile (Changed from APP999 to 55667).
- Forwarded Candidates – The ZIP/postal code displayed is always from the candidate profile. On inviting the candidate to apply, the ZIP/postal code value is taken from the Application page and snapshot is created with ZIP/postal code from candidate profile.

### ZIP/Postal Code Field Configured in Application, but not in Candidate Profile.

The value entered in the Application page is stored in the RCM\_APPLICATION and RCM\_CANDIDATE table, but it isn't visible anywhere on the screen.

### ZIP/Postal Code Field Configured in Candidate Profile, but not in Application.

The value is always taken from Candidate Profile and snapshot is created like explained in Scenario 1.

### Other Example – External Candidate (Internal Candidate without **sm-mapping**):

1. A candidate maintains the candidate profile with ZIP/postal code 123.
2. The candidate applies to a requisition and during the application process, 123 gets changed to 456. When they complete the application process, 456 is then also transferred to the candidate profile.
3. The candidate then opens their candidate profile and updates the code to 789.

**Scenario 1:** In the applicant list page (legacy Candidate Workbench), the candidate's application shows up. The Recruiting user viewing at that page hasn't clicked on the candidate yet. The ZIP/postal code is derived from the application and displays 456.

This candidate shows up if the filter is looking for 456, but not if the filter is looking for 789.

**Scenario 2:** As soon as the Recruiting user clicks on the candidate, the application snapshot gets created. The ZIP/postal code is derived from Candidate Profile and is the basis for the application snapshot. The ZIP/postal code is displayed as 789.

This candidate doesn't show up if the filter is looking for 456, but does if the filter is looking for 789.

The following table shows the ZIP/postal code behavior for different candidate types before and after the first click.

| Candidate Types                                          | Candidate Profile | During Application Process                                                                             | Candidate Profile | Data Change After Application              | Legacy Candidate Workbench |                                                                         |
|----------------------------------------------------------|-------------------|--------------------------------------------------------------------------------------------------------|-------------------|--------------------------------------------|----------------------------|-------------------------------------------------------------------------|
|                                                          |                   |                                                                                                        |                   |                                            | Before First Click/View    | After First Click/View (Snapshot is Created)                            |
| External candidate                                       | APPXXX            | APP999                                                                                                 | APP999            | No data change                             | APP999                     | APP999                                                                  |
| Internal candidate <b>without sm-mapping</b>             |                   | Written to the Candidate Profile.                                                                      |                   |                                            |                            | Snapshot is created based on latest information from Candidate Profile. |
| External candidate                                       | APPXXX            | APP999                                                                                                 | APP999            | 55667                                      | APP999                     | 55667                                                                   |
| Internal candidate <b>without sm-mapping</b>             |                   | Written to the Candidate Profile.                                                                      |                   | Changes to 55667 in the Candidate Profile. |                            | Snapshot is created based on latest information from Candidate Profile. |
| Internal candidate with <b>sm-mapping</b><br>(Example 1) | APPXXX            | APP999                                                                                                 | APPXXX            | No data change                             | APP999                     | APPXXX                                                                  |
|                                                          |                   | The ZIP/postal code changes, but isn't written to the Candidate Profile because of <b>sm-mapping</b> . |                   |                                            |                            |                                                                         |

| Candidate Types                                   | Candidate Profile | During Application Process                                                                                   | Candidate Profile | Data Change After Application                           | Legacy Candidate Workbench |                                              |

## 21.4 Validations on Applicant Workbench

Validations are performed in the applicant workbench when an applicant status changes to [Hireable](#), and you see new validation messages on the applicant workbench.

### Note

These validations only apply if you're using the Manage Pending Hires tool to hire the applicants. These validation messages let you know why certain applicants won't appear in the Manage Pending Hires tool.

| Validation Scenario                                                                                                                                                                                                                                                                                                                                                                                            | Result                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Both Manage Pending Hires and Onboarding are enabled in your instance, and one of the following conditions apply: <ul style="list-style-type: none"> <li>Not set any rule in the <a href="#">Onboarding Integration Setup</a> admin tool, or;</li> <li>Selected the <a href="#">Apply Onboarding to All Job Requisitions</a> option in the <a href="#">Onboarding Integration Setup</a> admin tool.</li> </ul> | In this case, the applicant can only be hired through Onboarding. The applicant doesn't appear in the Manage Pending Hires tool. |
| An applicant is already hired through Onboarding or Manage Pending Hires, and the recruiter later moves this applicant status from <a href="#">Hired</a> to <a href="#">Hireable</a> .                                                                                                                                                                                                                         | The applicant appears available to be hired again. But, the hiring process fails because the applicant has already been hired.   |
| The <a href="#">Candidate to Employee Integration</a> template isn't configured in Provisioning or doesn't exist in your instance.                                                                                                                                                                                                                                                                             | The hiring process fails with an error.                                                                                          |
| <h3>Note</h3> <p>This scenario can only be present in a new Recruiting-enabled instance. Once this template is configured, the configuration can't be deleted or removed from this template.</p>                                                                                                                                                                                                               |                                                                                                                                  |

| Validation Scenario                                                                                           | Result                                                                                                                                                                                        |
|---------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The applicant is eligible for the Manage Pending Hires process and the applicant's offer approval is pending. | The applicant will not be listed in the Manage Pending Hires tool.                                                                                                                            |
| Multiple <i>Hireable</i> and <i>Hired</i> statuses are configured in the applicant status set.                | The hiring process fails in the Manage Pending Hires tool. Resolving the issue requires correcting the statuses using <a href="#">Admin Center &gt; Edit Applicant Status Configuration</a> . |
| The <i>Hired</i> status isn't configured in the applicant status set.                                         | The hiring process fails in the Manage Pending Hires tool. Resolving the issue requires configuring the status using <a href="#">Admin Center &gt; Edit Applicant Status Configuration</a> .  |

## 21.5 Applicant Status in SAP SuccessFactors

Applicant statuses are used to track a candidate's progress through the recruiting process. They're also used for recruiting metrics, compliance, and process control.

As part of core Recruiting configuration, you need to:

1. Set up the base status set in Provisioning, from which all other applicant status sets are created.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

2. Create applicant status sets.
3. For each set, configure the applicant statuses.

Once status sets and statuses are defined, you can use them in other configurations, like job requisition templates or integrations with Employee Central.

Then you can use applicant status to manage applicants during the recruiting process.

[Configuring an Applicant Status \[page 1040\]](#)

## 21.5.1 Configuring the Base Status Set

Configure a base set of statuses that can be used to create applicant status sets used in the recruiting process.

### Prerequisites

- Recruiting is enabled in Provisioning.
- You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

The base status set contains a set of predefined applicant statuses that are necessary for the recruiting process to run correctly. You can add more statuses to the base set, as required by your recruiting process.

#### 📘 Note

- You can't delete the base status set.
- You can't delete a status from the base status set. However, you can disable it.

### Procedure

1. Go to ► [Provisioning](#) ► [Manage Recruiting](#) ► [Applicant Status Configuration](#) 🔗.
2. Choose [Edit Base](#).
3. Choose what you want to do.
  - To add a status to the base set, choose [Add New Status](#).
  - To edit an existing status in the base set, choose ► [Take Action](#) ► [Edit](#) 🔗.

#### ⚠ Caution

The following statuses are predefined when you enable Data Privacy Consent Statement 2.0. **Don't manually add them to the base set.**

- Declined DPCS
- Deleted On Demand By Admin
- Deleted On Demand By Candidate
- Withdrawn By Candidate

4. Select a status type:

| Option       | Description                                               |
|--------------|-----------------------------------------------------------|
| In Progress  | Use when the candidate's application is being processed.  |
| Disqualified | Use when the candidate's application has been rejected.   |
| Onboard      | Use when the candidate's application has been successful. |

5. Enter then save a name and category.

#### Caution

To avoid localization issues, ensure that you provide labels for all statuses in the system.

6. Repeat these steps for all the statuses you want to add to the base set.
7. Save your changes.

## Results

Applicant statuses in the base set can now be used to create different applicant status sets.

## Next Steps

Create the applicant status sets required by your recruiting process, either in Admin Center or in Provisioning.

### 21.5.1.1 Applicant Statuses Predefined by the System

By default, the newly created status set contains certain system statuses. These system statuses are required in order to ensure that the process runs correctly.

| System Status    | Functionality                                                                                                                                                                                                                               |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Forwarded        | Status for candidates a Recruiting user has attached to a job requisition.                                                                                                                                                                  |
| Invited To Apply | Status for forwarded candidates who have been invited to apply to a requisition by a recruiter.                                                                                                                                             |
| Default          | Status for newly applied candidates, as well as for forwarded candidates who have been added by a Recruiting user through the <a href="#">Add to Requisition</a> option (available in instances with late-stage application functionality). |

| System Status                  | Functionality                                                                                                                                                                                                                                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto Disqualified              | <p>Status for candidates whose applications are automatically disqualified by the prescreen questions.</p> <div>  <b>Note</b><br/>           There is no functionality that supports status disqualification reasons.         </div> |
| Requisition Closed             | Status for applicants when they're placed in an In Progress status when the requisition is closed.                                                                                                                                                                                                                    |
| Hired on Other Requisition     | Status for applicants when they're placed into a Hired status on another requisition.                                                                                                                                                                                                                                 |
| Declined DPCS                  | <p>(Predefined when you enable Data Privacy Consent Statement 2.0)</p> <p>Status for candidates who have revoked their acceptance of the data privacy consent statement after applying to requisitions.</p>                                                                                                           |
| Deleted On Demand By Admin     | <p>(Predefined when you enable Data Privacy Consent Statement 2.0)</p> <p>Status for candidates whose candidate profile was deleted by an administrator.</p>                                                                                                                                                          |
| Deleted On Demand By Candidate | <p>(Predefined when you enable Data Privacy Consent Statement 2.0)</p> <p>Status for candidates who have deleted their candidate profile.</p>                                                                                                                                                                         |
| Withdrawn By Candidate         | <p>(Predefined when you enable Data Privacy Consent Statement 2.0)</p> <p>Status for candidates who withdraw a previously submitted application.</p>                                                                                                                                                                  |

## 21.5.2 Creating an Applicant Status Set

Combine base statuses to create a new applicant status set that is used in Recruiting.

### Prerequisites

- You've added all the required statuses in the base status set.

## Context

### ⚠ Caution

- You can't delete an applicant status set after it's created.
- You can't delete a status from an applicant status set after it's added. However, you can disable it.

## Procedure

1. Go to ► [Admin Center](#) ► [Edit Applicant Status Configuration](#) ►.
2. Choose a method of creating a new applicant status set.
  - To create one from scratch, choose [Add New](#).
  - To create one based on a similar existing one, go to ► [Take Action](#) ► [Duplicate](#) ►.

A new status set is created. By default, it contains a set of predefined applicant statuses that are necessary for the recruiting process to run correctly.

3. Enter the name of a new status set. You can also give it a description.
4. To add a status to the status set, choose [Add New Status](#) and select the statuses you want to add in the dropdown menu. Then scroll to the bottom of the menu and choose [Add](#).

The dropdown menu contains a list of the statuses in the base set configured in Provisioning.

5. To add a status group to the status set, click [Add New Status Group](#).
6. To edit the status group, enter a [Status Group Name](#) and a [Status Group Label](#). The [Status Group Label](#) appears on the Talent Pipeline. Select the statuses to include in the group from the list of statuses of the same type.

### 📌 Note

To require a status before the candidate can progress through the pipeline, select [Require candidate to be in at least one status in this group before moving to the next group](#). If you don't select this option, candidates can bypass the entire status group.

7. Save your changes.

## 21.5.3 Configuring an Applicant Status

Add a new status or edit an existing status, in an existing applicant status set.

## Prerequisites

Before you configure applicant statuses, ensure that at least one language is enabled at ► [Admin Center](#) ► [Manage Recruiting Languages](#) ►. You can't save changes to a status unless at least one language is enabled.

## Context

### 📘 Note

Although you can set a status for only internal or only external applicants, there's no conditionality (if/then logic) in the status workflow.

You can't configure a hard stop that prevents candidates from moving past a given status in the application until they complete the application.

## Procedure

1. Go to ► [Admin Center](#) ► [Edit Applicant Status Configuration](#) ►
2. Select the relevant applicant status set.
3. Open the status you want to configure:
  - To add and configure a new status, choose [Add New Status](#).
  - To edit the configuration of an existing status, find and select the status name to start editing.
4. Configure the applicant status settings as required.

For more, see: [Applicant Status Settings \[page 1041\]](#).
5. To translate labels and messages, repeat these steps for each language in the [Language to Translate](#) menu.
6. Select [Save](#).

### 21.5.3.1 Applicant Status Settings

Learn about the configuration settings for an applicant status.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

#### Applicant Status Settings

| Setting Name | Description                                                   |
|--------------|---------------------------------------------------------------|
| Status ID    | A unique ID number generated by the system. Can't be changed. |

| Setting Name    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name of Status  | <p>The unique name of the status as specified in <a href="#">Provisioning</a> &gt; <a href="#">Managing Recruiting</a> &gt; <a href="#">Applicant Status Configuration</a> &gt; <a href="#">Edit Base</a>.</p> <p>There is a limit of 100 characters for the candidate label, and 1,000 for the next steps fields, including spaces.</p> <p>The setting can't be changed while editing the applicant status set. Although the setting can be changed in Provisioning in <a href="#">Edit Base</a>, avoid changes if possible. If you must make changes, proceed with caution.</p> <p>Any changes to Name of Status must consider the following dependencies:</p> <ul style="list-style-type: none"> <li>• In ad hoc reports. It can be saved as a filter or used by third parties who are integrating with Ad Hoc flat file exports.</li> <li>• By the SFAPL.</li> <li>• By the Requisition XML feature-permission.</li> </ul>                                                                                                                                                           |
| Required        | <p>If a status is required, the expected behavior is:</p> <ul style="list-style-type: none"> <li>• On the application page in the applicant status dropdown, the status is the last visible In-Progress status until placing the applicant there. After placing the applicant into this status, the subsequent statuses become visible, up through the next status marked "Required."</li> <li>• On the application list page, applicants who aren't already in or past the Required status can't be moved to the next status by using the <a href="#">Action</a> &gt; <a href="#">Move</a> option. These applicants appear grayed out and aren't placed into the desired status.</li> </ul> <div> <p><b>Note</b></p> <p>This setting doesn't apply to the following statuses:</p> <ul style="list-style-type: none"> <li>• Forwarded</li> <li>• Invite to Apply</li> <li>• Auto Disqualified</li> <li>• Withdrawn by Candidate</li> <li>• Declined DPCS</li> <li>• Deleted on demand by Admin</li> <li>• Deleted on demand by Candidate</li> <li>• Requisition Closed</li> </ul> </div> |
| Internal Label  | How the <a href="#">Status</a> column appears to internal recruiting users in all areas of the Re-recruiting tab                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Candidate Label | How the contents of the <a href="#">Status</a> column appear to candidates viewing their progress in the requisition table of the <a href="#">Careers</a> > <a href="#">Job Management</a> or <a href="#">External career site</a> > <a href="#">Jobs Applied</a> tabs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable this status for internal candidates. | <p>This option enables a status for only internal candidates. If it's selected along with <a href="#">Enable this status for external candidates only</a>, the status is visible to both internal and external candidates. If neither option is selected, the status is disabled.</p> <p>Applicant statuses can't be deleted. Deselecting both <a href="#">Enable this status</a> options disables a status, preventing recruiting users from seeing it in the pipeline or in any status drop-downs, and from placing applicants in the status.</p> <p>Before disabling a status, advise clients to run a report on all applicants currently in the status, then move the applicants to another status. If a status is disabled while it contains applicants, the applicants become inaccessible to recruiting users in the user interface. However, the requisition count of total applicants still includes applicants in this disabled status. Such applicants also remain reportable through ad hoc reports.</p> <div> <p><b>Note</b></p> <p>This setting doesn't apply to the following statuses:</p> <ul style="list-style-type: none"> <li>Forwarded</li> <li>Invite to Apply</li> <li>Auto Disqualified</li> <li>Withdrawn by Candidate</li> <li>Declined DPCS</li> <li>Deleted on demand by Admin</li> <li>Deleted on demand by Candidate</li> </ul> </div> |
| Enable this status for external candidates. | <p>This option enables a status only for external candidates. If selected in combination with <a href="#">Enable this status for internal candidates only</a> the status becomes visible to both internal and external candidates. If neither of the option is selected, the status is disabled.</p> <p>Applicant statuses can't be deleted. Deselecting both <a href="#">Enable this status</a> options disables a status, preventing recruiting users from seeing it in the pipeline or any status drop downs, and from placing applicants in the status.</p> <div> <p><b>Note</b></p> <p>This setting doesn't apply to the following statuses:</p> <ul style="list-style-type: none"> <li>Forwarded</li> <li>Invite to Apply</li> <li>Auto Disqualified</li> <li>Withdrawn by Candidate</li> <li>Declined DPCS</li> <li>Deleted on demand by Admin</li> <li>Deleted on demand by Candidate</li> </ul> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Setting Name                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Setting Name                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal Candidate's Current Manager | Selects an email template to be sent to an internal candidate's current manager whenever the applicant enters this status.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Agency User                          | Selects an email template to be sent to the agency user whenever the applicant enters this status. The agency user is either the user who submitted the candidate to the requisition, or the user who currently owns the candidate. This email is sent only when the agency owns the candidate.                                                                                                                                                                                                                                                                                                                                                      |
| Job Req Originator Email             | Selects an email template to be sent to the user who originated the requisition whenever the applicant enters this status.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Operator Emails                      | <p>For each operator listed, select an email template to be sent to the user in this operator field whenever the applicant enters this status:</p> <ul style="list-style-type: none"> <li>• Hiring Manager Email</li> <li>• Recruiter Email</li> <li>• Sourcer Email</li> <li>• Recruiting Coordinator Email</li> <li>• Second Recruiter Email</li> <li>• VP of Staffing Email</li> <li>• Hiring Manager Team Email</li> <li>• Recruiter Team Email</li> <li>• Sourcer Team Email</li> <li>• Recruiting Coordinator Team Email</li> <li>• Second Recruiter Team Email</li> <li>• VP Of Staffing Team Email</li> <li>• Approver Team Email</li> </ul> |
| Selectable By                        | <p>Specifies that users associated with a given operator field (and, if applicable, users associated to the related team field) can move an applicant into this status.</p> <div> <p><b>Note</b></p> <p>This setting doesn't apply to the following statuses:</p> <ul style="list-style-type: none"> <li>• Forwarded</li> <li>• Invite to Apply</li> <li>• Auto Disqualified</li> <li>• Withdrawn by Candidate</li> <li>• Declined DPCS</li> <li>• Deleted on demand by Admin</li> <li>• Deleted on demand by Candidate</li> <li>• Requisition Closed</li> </ul> </div>                                                                              |

## 21.5.4 Help with Applicant Status Configuration

Find the right place to get help with configuring applicant statuses.

The [Applicant Status Configuration](#) tool is used to create applicant status sets and configure applicant statuses. Applicant statuses are used to track a candidate's progress through the recruiting process. When you make a change to your recruiting process, you sometimes need add new applicant statuses to the system or update the configuration of existing statuses.

People who use the [Applicant Status Configuration](#) page to add or edit applicant statuses sometimes run into the following common problems.

For more information about applicant statuses, see:

- [Applicant Status in SAP SuccessFactors \[page 1036\]](#)
- [Job Requisition Element: Application Status Set \[page 178\]](#)
- [Configuring Applicant Status for Employee Central Integration \[page 1285\]](#)

### Can't save changes

When you're adding or editing an applicant status, if the [Save](#) action is disabled and you can't save changes, check that at least one language is enabled at ► [Admin Center](#) ► [Manage Recruiting Languages](#) ►. You can't save changes to a status unless at least one language is enabled.

For help, see: [Configuring an Applicant Status \[page 1040\]](#).

### No languages listed in language menu

When you're adding or editing an applicant status, if no languages are listed in the [Language to Translate](#) menu, check that at least one language is enabled at ► [Admin Center](#) ► [Manage Recruiting Languages](#) ►. The menu only includes languages that are enabled for use in Recruiting.

For help, see: [Configuring an Applicant Status \[page 1040\]](#).

### Status name not translated

When viewing statuses in a status set, the [Status Name](#) column doesn't reflect translated labels you've configured in the [Internal Label](#) and [Candidate Label](#) fields. The status name is always in English, regardless of which language you choose in your user settings. It's an internal name that's only visible in administration tools.

However, during the recruiting process, Recruiting users and candidates **do** see the translated labels you've configured in the [Internal Label](#) and [Candidate Label](#) fields.

For help, see: [Applicant Status Settings \[page 1041\]](#).

## Configuring Hirable Options for an applicant status

*Hirable Options* settings are required for the integration between SAP SuccessFactors Recruiting and Employee Central. Set these options to manage the transfer of candidate data from Recruiting to Employee Central.

When applicants are moved to the status that's configured as *Hirable*, they appear in the *Manage Pending Hires* workflow in Employee Central. This status creates an intermediate step for review before the candidate moves to the *Hired* status.

When applicants are moved to the status that's configured as *Hirable*, they're scheduled for conversion to "internal candidates".

For help, see: [Applicant Status Settings \[page 1041\]](#)

## Can't initiate onboarding process

When you try to initiate onboarding for an applicant and are shown the message *"We were unable to initiate this onboarding process (2.0). An unknown error occurred."*, it may be caused by 2 or more statuses being configured as the *Hired* or *Hirable* option in the status set.

For each set, there should be only 1 status configured as the *Hired* status and 1 status configured as the *Hirable* status (under *Hirable Options* in status settings).

For help, see: [Applicant Status Settings \[page 1041\]](#)

## 21.5.5 Applicants in the Applicant Status Workflow

When a candidate completes an application or is forwarded to a requisition by a Recruiting user, the candidate is associated with an applicant status on the requisition.

Recruiting users who have appropriate permissions can move the application through the status pipeline. All status changes are tracked for reporting and compliance purposes. You can view status change history:

- [Application Audit Trail](#)
- [Application Status Audit Trail](#) folder in Recruiting and V2 Secured reporting schemas

The applicant status pipeline acts as navigation for filtering the applicant list by status. A Recruiting user can click a status and view only applicants in that status. To see all applicants, click [View all candidates](#). Select multiple statuses by holding down the **CTRL** key and selecting the desired statuses.

Grouped statuses display as a dropdown menu in the candidate pipeline. Recruiters can assign a candidate to any of the statuses in the configured group.

The following options are available for the *Forwarded* and *Withdrawn* status sets:

- Hide the status from users who don't have application status *Visible To* privilege
- Hide applicant count from the users who don't have application status *Visible To* privilege

Corresponding statuses or count are either displayed or hidden within the status pipeline and job requisition landing pages for these statuses:

- [Forwarded](#)
- [Withdrawn](#)

#### 📌 Note

Users can view applicants only in statuses to which they have [Visible To](#) access.

#### ⚠ Caution

Operator Designators roles are available for selection in the [Selectable By](#) and [Visible To](#) section of status settings. Select [All Others](#) for individuals who have the [V](#) or [Relational Operators](#) role.

Recruiting users can place applicants only into statuses for which they have [Selectable By](#) access even if they don't have [Visible To](#) access for that status. Users see an error if they try to place the applicant in a status for which they don't have [Selectable By](#) access.

Recruiting users can see a quick overview the applicant status pipeline directly from the [Requisition List](#) page. Disabled statuses don't appear in the progress pipeline overview.

## Related Information

## 21.5.5.1 Allowing Permission to Access Default Status

You can choose the [Selectable by](#) option in the default application status to provide permission to required operators to access the default application status.

## Prerequisites

You must have admin role assigned to you.

## Context

With this option, you can provide permissions only to operators who need to change application status.

## Procedure

1. Go to ► [Admin Center](#) ► [Edit Applicant Status Configuration](#) ►.
2. In the [Edit Applicant Status Configuration](#) page, select the required status from the [Status Set Name](#) column.
3. In the [<status set name>](#) page, choose [Default](#) in the [Status Name](#) column.
4. In the [Edit Status Settings](#) dialog box, select the operators that need permission to access the default application status.
5. Choose [Save](#).

### 21.5.5.2 Forward Candidates to a Requisition

You can forward candidates to a requisition from candidate search results, the Candidate Profile record, or the Application record.

The job requisition search filters contain a mix of standard filters and filters set up in ► [Provisioning](#) ► [Managing Recruiting](#) ► [Internal and External Applicant Search Settings](#) ►.

To include the [Job Language](#) field as a filter option in the [Forward to Requisitions](#) page, enable the [Enable Multi-language Job Search](#) in ► [Provisioning](#) ► [Company Settings](#) ► [Recruiting](#) ► [Enhanced Job Search UI](#) ►.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

Additionally, certain filter options can be enabled in ► [Admin Center](#) ► [Manage Recruiting Settings](#) ►:

- You can enable or disable a role filter using the [Disable "Add Role" on Forward to Requisition](#) setting. This allows the user to conduct a search using the Families and Roles library, and return requisitions matching the role selection.
- You can sort on columns in the [Forward to Requisition](#) dialog search results.
- This allows you to forward internal candidates to jobs that are posted internally or externally. For external candidates, you can also forward to jobs posted internally or externally. If this setting is disabled, you can forward internal candidates only to internally posted jobs, and external candidates only to externally posted jobs.

The system ensures that job search results are relevant only to the types of candidate you're presently forwarding, and displays a message to that effect at the top of the job search popup. For example, if you're trying to forward an external candidate, only external job postings display in the search results.

If forwarding candidate fails, the confirmation message you receive includes a detailed listing of the failure reasons. For example, attempting to forward an internal candidate to an externally posted requisition or attempting to forward a candidate to a requisition that violates the candidate's privacy settings.

When candidates are successfully forwarded to a requisition, the candidate is associated with the requisition in the Forwarded status. There's also an available column in the Applicant Status Pipeline, [Forwarded By](#), which shows the user who forwarded the candidate.

Candidates don't receive e-mail notifications when they're forwarded to requisitions. Forwarded candidates aren't considered applicants; therefore certain functionalities are limited. For instance, only candidate profile data (not

application data) is available on the application record, no data is reportable, the requisition doesn't appear in the candidate's Jobs Applied portlet, and candidates can't be dis-positioned.

A warning message appears at the top of the application record for forwarded candidates, reminding recruiting users the candidate hasn't yet completed the application.

## 21.5.5.2.1 Choosing to Forward Candidates with Application Data Intact

Forward candidate to a job requisition with application data intact.

### Prerequisites

Enable late-stage applications to forward candidates with application data intact.

### Context

If an application is a late stage application, then the **required** field validation is skipped for the following fields:

- Fields with attribute `public=true`.
- Fields of type `multiattachment` and `multiattachmentselection`.
- Profile summary fields.

#### Note

The option to enable forwarding with application data intact isn't available in the Admin Center if you don't enable late-stage applications.

When a candidate is forwarded to a job requisition with **Default** status, the field values are copied to the corresponding application based on the criteria in the following table:

Behavior of Forward Data Intact for Standard and Custom Fields

| Criteria                                                                                                                                                                  | Behavior                                                                                                                                                             |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| If field type and field ID match in both the profile and application template, and the value is present in candidate profile.                                             | Then it's copied from the profile (honoring the candidate profile template value).                                                                                   |
| If field type and field id match in both the candidate profile and application template and value isn't present in candidate profile but value is present in application. | Then it's copied from the application.                                                                                                                               |
| If the field isn't configured in candidate template.                                                                                                                      | Then field value from the application is copied from the application. This feature only supports standard fields as per the list, and doesn't support custom fields. |

| Criteria                              | Behavior                                                                                                           |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| If multistage application is enabled. | The system always forwards every field that was filled at any stage, up to the time when application is forwarded. |

## Procedure

- Go to [Admin Center](#) > [Manage Recruiting Settings](#) > [Applicant Profile Setting](#) and select the checkbox for *Enable forwarding with application data intact*.
- Add `forward-intact` attribute for fields in job application template and set it true. For example:

```
<field-definition id="comments" type="text" required="false" custom="false"
public="false"
readOnly="false" anonymize="false" forward-intact="true" sensitive="false">
```

### Note

- When a candidate is forwarded to a job requisition with **Forwarded** status, there's no job application created. In this case, the `forward-intact` configuration in the job application template isn't applicable.
- Profile data for candidates in the *Forwarded* status is populated into their application snapshot. If a candidate is later moved into the *Default* status via [Add to Requisition](#), previous application data is forwarded intact.
- If the candidate is forwarded directly to the *Default* status, any missing data on the candidate's most recent application is prepopulated from the current candidate profile.
- Forwarded candidates can move through the pipeline without completing required application fields.

## Related Information

[Enabling and Configuring Late Stage Applications \[page 1124\]](#)

## 21.5.5.2.1.1 Job Application Fields Behavior with Data Intact

Job Application Fields Behavior with Data Intact

| Fields that don't forward with data intact                                                                                                            | Fields that forward if forward-intact="true"                                                                                                                   | Fields forward from the candidate profile                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## 21.5.5.2.2 Choosing to Forward Candidates from Requisition Candidate Search Results

Forward candidates from job requisition candidate search results.

### Procedure

1. Go to ► [Recruiting](#) ► [Job Requisitions](#) ►.
2. Select the job requisition you want to find candidates for and select [Candidate Search](#).
3. Enter your search parameters and choose [Search](#).
4. If you find a candidate you'd like to recommend for the job, select the check box next to the candidate's name, then choose [Forward Selected to Requisition](#).

The candidate is forwarded to the requisition you initially selected. After you've confirmed your selection, the applicant list page for the selected requisition appears.

## 21.5.5.2.3 Choosing to Forward Candidates from General Candidate Search Results

Forward candidates from general candidate search results.

### Procedure

1. Go to ► [Recruiting](#) ► [Candidates](#) ►.
2. Enter your search parameters and choose [Search](#).
3. If you find a candidate you'd like to recommend for a job, select the check box next to the candidate's name, then choose [Forward Selected to Job Requisitions](#).
4. Search for requisitions by entering the search parameters for the requisition and choose [Search](#).

#### ⓘ Note

The forward to requisition job search produces the 10 results that best match the search criteria. If you don't see the requisition that you want in search, click [Refine Search](#), and specify additional filtering criteria.

5. Select one or more requisitions and choose [Forward to Selected](#).

#### ⓘ Note

If you would like the candidate to appear in any status other than [Forwarded](#), select the desired status from the dropdown menu at the top of the requisition search.

## 21.5.5.2.4 Choosing to Forward Candidates from the Application Record

If while viewing a candidate's application the recruiter or hiring manager would like to send the candidate to a different job requisition, they can forward the candidate from their applicant record.

### Context

Forwarding candidates from the applicant record is for candidates who have already applied for a job with a company.

### Procedure

1. Go to [Job Requisitions](#) and hover over the requisition you'd like to see applicants for, then choose [Candidate Summary](#).
2. From the list of applicants, select the applicant you wish to forward.
3. In the application record, choose ► [Take Action](#) ► [Forward](#) ► [Forward To Requisitions](#) ►.

You can also access a candidate's application record from the Interview Central pipeline.

4. Search for requisitions by entering the search parameters for the requisition and choose [Search](#).

#### ⓘ Note

The forward to requisition job search produces the 10 results that best match the search criteria. If you don't see the requisition that you want in search, choose [Refine Search](#), and specify additional filtering criteria.

5. Select one or more requisitions and choose [Forward To Selected](#).

#### ⓘ Note

If you would like the candidate to appear in any status other than [Forwarded](#), select the desired status from the dropdown list at the top of the requisition search.

## 21.5.5.2.5 How the System Handles Forwarded Candidates

The system distinguishes between forwarded candidates and actual applicants, despite the continuation of the data, so clients can follow legal best practices.

- For requisitions that are configured with override fields, a candidate sees only the fields dictated by the override. For example, if a candidate applies for a job in the United Kingdom that asks for personal information, and then the candidate is forwarded to a US requisition, they don't see the personal information fields if the US requisition doesn't require them.

- Forwarded data populates to fields, regardless of the stage where the candidate sees the fields in a multistage application environment.
- Forwarding candidates using a combination of synchronous and asynchronous processes. Data syncs immediately for new applications when a recruiting user is completing 20 actions or fewer. This can be any combination of candidates and requisitions. For example, forwarding 2 candidates to 10 requisitions, 1 candidate to 20 requisitions or 20 candidates to 1 requisition. Once the 20-action threshold is reached, a scheduled job runs to forward the data.
- The recruiting user can select which status the applicants is placed into: Forwarded or Default. To place applicants into the *Default* status, you must have late-stage applications enabled. If *Forwarded Candidate only* is enabled, all candidates are placed into the forwarded status.

## 21.5.5.2.6 Forward as Applicant

Forward a candidate as an applicant to a job requisition as though the candidate has applied to it.

### ⓘ Note

**The Forward as applicant feature isn't specific to Evergreen and can be used generally.**

Recruiters or hiring team can forward the candidates as an applicant to a job requisition in to the Default status. So, Forward as Applicant functionality creates an application for a candidate as though the candidate has applied to the job requisition.

### ⓘ Note

While forwarding a candidate as an applicant, operators can only view and select default status.

Considerations:

- (only relevant if *Make My Profile Visible to* is configured) Forward as applicant is based on the Privacy setting that a candidate sets on the *My candidate Profile, Make My Profile Visible to* option. The candidate privacy settings affect forwarding a candidate using the Forward As Applicant functionality. While forwarding the candidates as an applicant, if the candidate privacy setting has restricted view then the candidate isn't forwarded to a requisition.

### ⓘ Note

The restriction does not apply to evergreen requisition. As a recruiter, you can forward a candidate as an applicant from an evergreen requisition to its child requisition, irrespective of the candidate visibility option.

- For Forward as Applicant functionality, late-stage isn't a prerequisite. While setting the application status as new application, if single stage is enabled, application creation fails if mandatory fields aren't provided. If multistage is enabled, mandatory fields are validated for the default state.

### ⓘ Note

If the data for the mandatory fields are missing, then the application creation fails.

## 21.5.5.2.6.1 Configuring Forward as Applicant

Configure the Application XML template to add Forward as Applicant Button to forward a candidate as an applicant.

### Note

The Forward as applicant feature isn't specific to Evergreen and can be used generally.

### Sample Code

```
<button-permission>
<role-name><![CDATA[O]]></role-name>
<role-name><![CDATA[G]]></role-name>
<role-name><![CDATA[T]]></role-name>
<role-name><![CDATA[S]]></role-name>
<button-id><![CDATA[ForwardAsApplicant]]></button-id>
</button-permission>
```

## 21.5.5.2.6.2 Choosing to Forward a Candidate as an Applicant

Recruiting users with the appropriate permissions can forward the candidates as an applicant to a job requisition as Default status.

### Context

### Note

The Forward as applicant feature isn't specific to Evergreen and can be used generally.

Recruiting users can forward the candidates as an applicant to a job requisition as Default status. So, Forward as Applicant functionality creates an application for a candidate as if candidate has applied to the job requisition and saved in Recruiting.

### Procedure

1. Forward the selected candidate's application using one of the following ways:

| Option            | Description                                                                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| Candidate Summary | Go to ► <a href="#">Recruiting</a> ► <a href="#">Job Requisition</a> ► <a href="#">Candidates</a> ► to open the <a href="#">Candidate Summary</a> page. |

| Option                       | Description                                                                                                                                                                                                                                 |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                              | <p>Select one or more candidates and choose ► <a href="#">Action</a> ► <a href="#">Forward as Applicant</a> ►.</p> <p>You can also select the candidate menu (icon) next to candidate, and select <a href="#">Forward as Applicant</a>.</p> |
| <b>Candidate Application</b> | <p>To open the application, select a candidate from the candidate summary page, and choose ► <a href="#">Take Action</a> ► <a href="#">Forward</a> ► <a href="#">Forward as Applicant</a> ►.</p>                                            |
| <b>Job Applied Portlet</b>   | <p>To open candidate's application in the application profile popup, select a job title of a requisition. Choose ► <a href="#">Take Actions</a> ► <a href="#">Forward as Applicant</a> ►.</p>                                               |

- Choose the [Forward as Applicant](#) button to open a dialog.
- Select the application status as [New Application](#) before adding the candidates to the selected job requisition. The candidate application is set to default status.
- Select [Allow candidate\(s\) who have not yet accepted latest DPCS Statement](#) to forward candidate as an applicant even if the candidate hasn't selected the latest version of the Data Privacy Consent Statement.  
Note: You can forward candidates using a combination of synchronous and asynchronous processes. Data synchronizes immediately for new applications when a Recruiting user is completing up to 20 actions, in any combination of candidates and requisitions. For example, forwarding 2 candidates to 10 requisitions, 1 candidate to 20 requisitions or 20 candidates to one requisition. A scheduled job runs to forward the data when the 20-action threshold is reached.
- Search for the job requisitions, and choose [Forward to Selected](#). Candidates are forwarded to the selected requisitions.
- Choose [Refine Search](#) to create a new search criteria.
- Select the job requisitions to which the candidate was forwarded as applicant. Select a candidate link to open the candidate workbench and select a candidate that was forwarded as an applicant.

A banner displays that the candidate is forwarded as an applicant to the selected job requisitions.

In the internal and external Career portal (mobile and nonmobile apply), candidates can view the applications to which they were forwarded as an applicant in the Jobs Applied section. In Candidate Workbench, Recruiters or hiring managers can view the banner message that indicates that the application is created through Forward as Applicant.

### 21.5.5.2.6.3 Forwarding Candidate as Applicant with Application Data Intact

Forward candidate as applicant with the application data intact.

#### 📘 Note

The Forward as applicant feature isn't specific to Evergreen and can be used generally.

- Late-stage applications aren't a prerequisite to forward candidate an applicant.
- If the forward-intact attribute is set to true, the candidate application is forwarded with intact data. This is irrespective of if the [Enable Late Stage Applications](#) and the [Enable forwarding with application data intact](#) options are enabled or disabled. The Field Data Forwarding Behavior remains the same as the existing forward behavior.
- If the forward-intact attribute is set to true for the multiattachment selection field, then the data is forwarded to the new application always from the current application. The data is never forwarded from the candidate profile. The data is forwarded only when fields ID on both the applications match with the custom fields. When data is missing, the forward fails with an error.

#### Note

Data is always forwarded from the current application to new application in [Forward as Applicant](#) feature only and isn't applicable for the [Forward as Requisition](#) feature.

- When a candidate is 'Forwarded as Applicant' to a requisition and is added to the default status, the data used to populate the candidates application is taken from the current application. Information in any other application isn't considered in the Forward as Applicant action. If the data for the mandatory fields isn't available, then applicant creation fails.

## Related Information

[Choosing to Forward Candidates with Application Data Intact \[page 1052\]](#)

### 21.5.5.2.6.4 Viewing Assessment Information, Background Check Results, and Interview Results

Recruiters can view an indication on the [Jobs Applied](#) portlet to access Assessment information, background check results, interview results, and so on, on the application from which the candidate was forwarded as applicant.

## Prerequisites

Enable the [Display interview results and overall ratings on Candidate Summary page](#) option in [Admin Center](#), [Manage Recruiting Settings](#).

## Context

Once a candidate is forwarded as applicant, and a new application is created in a default state. The [Jobs Applied](#) portlet displays an indication "Forwarded as an applicant from this requisition".

## Note

Assessment information, background check results, and interview results are not carried forward to a new application. Instead, you can view the information from the new application.

Candidate was forwarded as an applicant View Interview Results

Show More (5)

## Procedure

1. The *Job Applied* portlet has an indication on the requisition from which candidate was forwarded as applicant.
2. Click on the title of the requisition to open the application popup view.
3. Access interview feedback, comments, answers to prescreening questions, assessment results, and background check results, and so on.
4. Click the *View Interview Results* link to view interview results of the application from which the candidate was forwarded.
5. The job requisition displays *Forwarded as an applicant from this requisition* indication.
6. Click the *View Interview Results* link to view interview results of the application from which the candidate was forwarded.

## Note

Since forwarded applications aren't available on the *Jobs Applied* portlet, it isn't possible to view the details of the candidates on such applications from the *Jobs Applied* portlet. Interview results link is available only if *Display interview results and overall ratings* on *Candidate Summary* page option is enabled on the instance

## 21.5.5.2.6.5 Forward as Applicant on User Interface

Identify the Forward as Applicant applications with the message banner shown on the UI.

### Note

**The Forward as applicant feature isn't specific to Evergreen and can be used generally.**

Recruiter can identify the Forward as Applicant applications with the message banner shown on the UI.

### Note

The *Forward as Applicant* button isn't available from the *Candidate Search* page. Thus, you can't forward a candidate as an applicant from *Candidate Search* page.

The pages where the banner text appears are as follows:

### Note

The applications that are forwarded to a job requisition using the forward as applicant functionality works in the same way that you work with an applicant that a candidate applied.

- Candidate view: In the internal and external career portal (mobile and nonmobile apply) candidates can now view the applications to which the candidate was forwarded as an applicant in the Recruiter view: When the recruiter views the application that was created by forward as applicant then a banner is shown that the application is created using forward as applicant functionality. *Jobs Applied* section. The candidate's application that was forwarded as an applicant by the recruiter is shown as a banner stating you've been forwarded as applicant to a job requisition.
- Job Applied Portlet: Open a candidate application from ► *Job Requisitions* ► *Candidates* ►. A banner text shows a Forward as Applicant message.

## 21.5.5.2.6.6 Forward as Applicant Trigger

New Forward as Applicant trigger to send email notifications to candidates.

### Note

**The Forward as applicant feature isn't specific to Evergreen and can be used generally.**

Enhancing the email trigger frame work to provide Forward as Applicant trigger where the *Category* is candidate with relevant tokens and with configured email template. Whenever a candidate is forwarded as applicant to a requisition, the trigger sends email notification to the candidates about being added as an applicant on a requisition.

The email trigger takes precedence over the email settings under *Edit Applicant Status Configuration*, under the default status. The email is sent to candidate based on the template that is configured in the trigger and not from the template configured in *External Candidate* or *Internal Candidate*. The email trigger configured is also sent when the asynchronous batch job runs.

If the Forward as Applicant trigger isn't configured and the email is configured in *Edit Applicant Status Configuration* settings for the external and internal candidate, then the configured email is sent to the candidates.

The supported tokens:

| Tokens           | List of Tokens                                                                |
|------------------|-------------------------------------------------------------------------------|
| Supported Tokens | Candidate Email [[CANDIDATE_EMAIL]]                                           |
|                  | Candidate First Name [[CANDIDATE_FIRST_NAME]]                                 |
|                  | Candidate Full Name [[CANDIDATE_FULL_NAME]]                                   |
|                  | Candidate ID [[CANDIDATE_ID]]                                                 |
|                  | Candidate Last Name [[CANDIDATE_LAST_NAME]]                                   |
|                  | Career Site Forgot Password URL [[CAREER_SITE_FORGOT_PASSWORD_URL]]           |
|                  | Career Site URL [[CAREER_SITE_URL]]                                           |
|                  | Company Name [[COMPANY_NAME]]                                                 |

|                  | Job Requisition Number [[JOB_REQ_ID]]                                         |
|                  | Job Title [[JOB_REQ_TITLE]]                                                   |
|                  | Login URL [[LOGIN_URL]]                                                       |
|                  | Company's Logo [[LOGO]]                                                       |
|                  | Originator Full Name [[ORIGINATOR_FULL_NAME]]                                 |
|                  | Recruiter Full Name [[RECRUITER_FULL_NAME]]                                   |
|                  | Recruiting Applicant Name [[RECRUITING_APPLICANT_NAME]]                       |
|                  | Second Recruiter Full Name [[SECOND_RECRUITER_FULL_NAME]]                     |
|                  | Sourcer Full Name [[SOURCER_FULL_NAME]]                                       |
|                  | Today's date (for example, January 31, 2009) [[TODAY]]                        |
|                  | VP Of Staffing Full Name [[VP_STAFFING_FULL_NAME]]                            |
|                  | URL of the application page [[APPLICATION_PAGE_URL]]                          |

## 21.5.5.2.6.7 Forward as Applicant on Job Requisition Summary Page

View the changes on the [Job Requisition Summary](#) page.

### ⓘ Note

The Forward as applicant feature isn't specific to Evergreen and can be used generally.

The forward as Applicant is tracked under the [Source](#) columns. You can't filter the [Source](#) field, but you can order by clicking the header.. The [Source](#) columns track the values as follows:

Forward as Applicant on Job Requisition Summary Page: Scenario 1

| Forward Scenario                                                                                   | Source                 | Candidate Source  |
|----------------------------------------------------------------------------------------------------|------------------------|-------------------|
| Candidate is forwarded in 'Forwarded' status or 'Default Status' to job requisition 1.             | Forwarded              | Recruiter Sourced |
| Candidate is forwarded as an applicant from job requisition 1 to job requisition 2 by a Recruiter. | Forwarded as applicant | Recruiter Sourced |

Forward as Applicant on Job Requisition Summary Page: Scenario 2

| Forward Scenario                                                                                   | Source                   | Candidate Source         |
|----------------------------------------------------------------------------------------------------|--------------------------|--------------------------|
| Candidate applies to job requisition 1.                                                            | Corporate Site : Default | Corporate Site : Default |
| Candidate is forwarded as an applicant from job requisition 1 to job requisition 2 by a Recruiter. | Corporate Site : Default | Recruiter Sourced        |

## 21.5.5.2.6.8 Impact of Candidate Privacy Settings While Forwarding Candidates to Job Requisitions

The candidate privacy settings affect forwarding a candidate to a job requisition.

The candidate privacy settings affect forwarding a candidate using any of the [Forward To Requisition](#), [Forward To Colleague](#), and [Forward As Applicant](#) features.

The [Forward To Requisition](#) and [Forward As Applicant](#) options are disabled for candidates where the privacy option is set to [Any company Recruiter in my country/region of residence](#) and [Only recruiters managing jobs I apply to](#) in the [Candidate Summary](#) page, and the [Forward To Colleague](#) option doesn't allow the forward. Similarly, the [Forward](#) option is disabled in the candidate application. Hovering the mouse over the [Forward](#) option displays that the forward option is disabled due to the candidate privacy option.

The following table lists the candidate privacy options that a candidate can set for a profile:

Options in the Make My Profile Visible to Field in the Candidate Profile

| Privacy Option                                  | Description                                                                                                                                                                    |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Any company recruiter worldwide</a> | Recruiter with the search permissions can search the candidate. <a href="#">Any company Recruiter worldwide</a> is the default setting if the Privacy feature isn't turned on. |

| Privacy Option                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Any company recruiter in my country/region of residence</a> | <p>A recruiter in the candidate's country/region of residence can view the candidate in a candidate search. The country/region value (option ID) of a person doing the search is matched with the candidate's country/region.</p> <p>Based on the option ID, the country/region value for a recruiter is tracked in an employee data file. If the recruiter is in the candidate's country/region of residence, but a country/region value isn't in their employee profile, this results in an error.</p> <div> <p><b>Note</b></p> <p>This option can be removed from the <a href="#">Make My Profile Visible to</a> field in the candidate profile form when the administrator chooses <a href="#">Hide "Any company recruiter in candidate's country/region of residence" candidate profile visibility</a> in <a href="#">Manage Recruiting Settings</a> &gt; <a href="#">General Data Privacy Settings</a>.</p> </div> |
| <a href="#">Only recruiters managing jobs I apply to</a>                | <p>Only visible on the job requisitions the candidate has applied to. The candidate can't be forwarded to a colleague. Attempts to forward the candidate prevent colleagues from being found in the search bar to select the colleague without explaining the reason.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

To view what privacy option a candidate has opted for in the legacy Candidate Workbench, hover the padlock next to the candidate name on the Candidate Summary page. If a candidate selects the most restrictive option "Only recruiters managing jobs I apply to", then the candidate's visibility is restricted to a specific job requisition. The candidate isn't forwarded or listed on the candidate search using any of the Forward To Requisition, Forward To Colleague, Forward As Applicant options.

## 21.5.5.2.7 Additional Information You Can Track During Forwards

Learn about the fields related to Forward functionality that is introduced for the job requisitions in [Candidate Summary](#) page.

The following fields are now available in the [Candidate Summary](#) page.

- [Forwarded From Job Requisitions ID](#): Displays the ID of the job requisition from where the candidate is forwarded. You can apply the [Display Options](#) and [Filter Options](#) on the field on the [Job Requisition Summary](#) page.
- [Date Forwarded](#): Displays the date when the candidate was forwarded to a job requisition. You can view the field in [Candidate Summary](#) page after you enable the [Date Forwarded](#) field in the display options.
- [Forwarded By](#): Displays who forwarded the candidate to the requisition.

#### 📌 Note

Also, when you forward a candidate from [Candidate Search](#) page, the *Forwarded From Job Requisition ID* isn't updated.

## 21.5.5.2.8 Additional Information You Can Track During Forwards in Reports

View the forward related fields in Ad hoc and Story reports.

The following fields are reportable and filterable in Story reports:

- Forwarded from Requisition ID
- Forwarded By
- Date Forwarded
- Forwarded As Applicant

## 21.5.5.3 Invite Forwarded Candidates to Apply

Forwarded candidates can be invited to apply to a requisition in one of two ways:

Before forwarded candidates can be invited to apply, select ► [Admin Center](#) ► [Recruiting Email Triggers](#) ► [Enable Invite Candidate to Apply](#) ►

#### → Recommendation

Don't use status triggered emails with Invite to Apply. Use only the [Enable Invite Candidate to Apply](#) email trigger.

- ► [Select candidate checkbox](#) ► [Action](#) ► [Invite Candidate to Apply](#) ►
- ► [Select candidates \(checkboxes if selecting multiple candidates\)](#) ► [drag and drop into Invited to Apply status](#) ►

You receive a confirmation prompt screen to verify.

When candidates are invited to apply they receive an e-mail notification that uses the [Invite Candidate to Apply](#) e-mail template. This e-mail informs the candidate of the invitation and includes a link to apply to the job. An invited candidate can apply to a requisition only if it's posted.

If a candidate has been invited to apply but hasn't completed the application, a recruiter can reinvite them to apply. This action can be performed by clicking [Re-Invite Candidate to Apply](#) on the application. The recruiter can continue to initiate the [Re-Invite to Apply](#) until the candidate completes the application.

No further action can be taken on the candidate by a recruiting user until the candidate applies to the requisition, unless the client has chosen to enable the Late Stage Application feature.

### 📘 Note

When a Recruiter invites a candidate to apply, the e-mail is sent to the candidate in the locale of the logged-in user. For example, if the Recruiter has logged in using **Deutsch (German)** locale, the candidate receives an e-mail in the German language. This condition also applies to the [Late State Application](#).

## 21.5.5.4 Using Manage Applicant Status

Manage applicant status.

### Prerequisites

- Manage Applicant Status requires initial configuration in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- Select ► [Application XML](#) ► [statusID field permissioned to the appropriate operators](#) ►

#### → Tip

Enable this setting even in multistage application environments. You can enable this setting even though the other field permissions are configured in the Requisition XML.

### Procedure

1. Go to ► [Candidate Summary page](#) ► [Select Applicants](#) ► [Actions](#) ► [Move Candidate](#) ► [Select Status](#) ►, and select the desired status.

#### → Tip

In Progress statuses, include only the most advanced status a candidate is eligible for. That is, you only see the In Progress statuses up until the next required status in the pipeline for the candidate who is already furthest in the pipeline.

Candidates who can't be moved into the selected status because they haven't passed through the prerequisite required statuses, appear grayed out in the candidate list.

2. Select ► [Check](#) ► [Actions](#) ► [Advance](#) ► [Automatically selects next status](#) ►.
3. Check ► [Actions](#) ► [Disqualify](#) ► [Select disqualification status](#) ► and select the desired status.

#### → Tip

You see only disqualification statuses. These statuses are useful for clients who want to have a single disqualification stage with multiple disqualification statuses.

4. Drag and drop a single applicant using the drag handles (three lines next to the applicant's name).
5. Confirm the application status change.
6. Check multiple desired applicants, then drag and drop using the three-lined drag handles.
7. Confirm the application status change.

Candidates who can't be moved into the selected status because they haven't yet passed through the prerequisite required statuses, appear grayed out in the candidate list.

8. [▶ Open record ▶ change status drop down ▶ Save ▶](#). Changing an applicant status in this way requires all required fields on the application visible to this operator in this status to be filled in.
9. Open a candidate record and click [Move Candidate](#).
10. Select the desired status.

## 21.5.5.5 Hired Statuses

Statuses in the [Hired](#) category have special characteristics.

For example, when an applicant is placed into a hired category status the **number of openings** field subtracts an opening. Every applicant status set must include at least one status in the [Hired](#) category. You designate a status in the [Hired](#) category when you create or add it to the base status set. This is a different setting than the status's Hireable options. To view a category's status, navigate to [▶ Provisioning ▶ Managing Recruiting ▶ Applicant Status Configuration ▶](#) or [▶ Admin Center ▶ Edit Applicant Status Configuration ▶](#) and choose the appropriate status set.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## 21.5.5.6 Additional Statuses

In addition to Hired status, the applicant can also be in [Default](#), [Auto-Disqualified](#), or [Withdrawn By Candidate](#) status.

### Default Status

All applicants must pass through the Default status at least once. This status is labeled New Application, Applied, or similar, according to the client's preference.

We recommend configuring a [Thank you for applying](#) e-mail that is sent to the candidate recipient upon entry to this status.

## Auto-Disqualified Status

Recruiting users can establish a set of prescreening questions on the requisition that have disqualifying questions or a passing score requirement. Applicants who fail the prescreen are automatically placed into the Auto-Disqualified status.

There's presently no way to auto-disqualify applicants based on application data, when another applicant is hired, or when the requisition is closed. Disposition those applicants manually.

## Withdrawn by Candidate Status

Applicants (internal or external) can withdraw their 'nondisqualified' applications anytime. A withdrawn application is automatically moved to the [Withdrawn By Candidate](#) status.

The applicant can resubmit a withdrawn application only until the job is posted. The withdraw and the resubmit functionalities can't be disabled.

The following conditions would hold while resubmitting a withdrawn application:

- In a single-stage application environment, the application is immediately resubmitted, without allowing changes by the applicant.
- In a multistage application environment, the applicant can modify the application and then confirm the resubmission.

In either case, the prescreen question responses are re-evaluated and the application is placed in the [Default](#) or the [Auto-Disqualified](#) status accordingly.

The following table explains the working of the withdraw application feature.

| When Job Requisition State... | When Application Status... | When Job Posting date.. | Can You withdraw an application? |
|-------------------------------|----------------------------|-------------------------|----------------------------------|
| Closed                        | Qualified                  | N/A                     | Yes                              |
| Approved (open)               | Not yet qualified          | Expired/Non Expired     | Yes                              |
| Approved (open)               | Disqualified               | Expired/Non Expired     | No                               |
| Closed                        | Disqualified               | N/A                     | No                               |

## 21.5.5.7 Status-Triggered E-Mails

A candidate entering a status can trigger e-mail notifications to various operators.

Set up these e-mail notification triggers and associated templates in ► [Admin Center](#) ► [Edit Applicant Status Configuration](#) ►.

To track status-triggered e-mails sent to candidates, use the [Application Correspondence](#) portlet. You can't track status-triggered e-mails sent to other operators in the [Correspondence](#) portlet. Status-Triggered e-mails don't work with Candidate Profile e-mail tokens. Only Job Application and Job Requisition tokens are supported in status-triggered e-mails.

### → Recommendation

Status-Triggered e-mails are sent when a status changes. You can't configure a delay in sending status-triggered e-mails, except for e-mails to disqualified candidates.

## 21.5.5.8 Enabling or Disabling Status Change Comments

You can configure a free text comment box that allows recruiting users who are performing the status change to capture additional information.

### Prerequisites

You have the ► [Administrator](#) ► [Manage Recruiting](#) ► [Manage Recruiting Settings](#) ► permission.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Settings](#) ►.
2. In the [Applicant Profile Settings](#) section, select or deselect the [Allow users to optionally provide comments on application status change](#) setting.

The comment box is optional and can't be made required. No additional fields can be added to the comments page. Spell Check, Legal Scan, and rich text editor features aren't supported in the comments box.

## 21.5.5.9 Applicant Status Frequently Asked Questions

Answers to frequently asked questions about applicant status.

**Can I require either status A or status B, and prevent applicants from progressing through the pipeline until they've passed through one of those statuses?**

This option isn't supported.

#### Can I configure a conditional applicant status workflow?

This option isn't supported, but you can set a status as external or internal only.

#### How do I configure a different status workflow for requisitions in different countries/regions, departments, and so on?

Requisitions and applications have a one-to-one relationship; set up a different requisition template for every application. The recruiting must then open the correct type of requisition based on the applicant status workflow.

#### Can I prevent an applicant from progressing in the status workflow until there's an approved offer?

Assign [Selectable By](#) privileges to the user for the status you're attempting to move the applicant to.

Configure the `statusId` field in the Application XML file (**Not** the Requisition XML file, even if you're using multistage application) for the operator you're using.

Configure all required fields for all operators for the status to which the applicant is currently assigned. Perform this action even if you can't see the fields when logged in as one user. There can be required fields that are visible to another user that need to be populated with data in that status.

#### Can I prevent an applicant from progressing in the status workflow until a forwarded applicant has completed their application?

If late-stage application is enabled, there's no support for a hard stop status. If late stage application isn't enabled, the applicant can't progress beyond [Invite to Apply](#) unless the applicant completes the application.

#### Caution

If [Multi Stage Application](#) and [Late Stage Application](#) are enabled, forwarded application required fields aren't validated when changing the status. [Late Stage Application](#) is designed to skip the validation on required fields.

## 21.5.5.10 Sending E-Mail Notifications to Disqualified Candidates

Configure your system to make sure that e-mail notifications are sent to candidates who are disqualified.

### Context

The configured delay applies to the following disqualification actions:

- Manual disqualification
- Automatic disqualification
- API-based disqualification

## Moving Between Disqualification Statuses

The system handles email notifications differently based on how candidates move between statuses:

- **Manual Disqualification:** If a candidate is moved to a disqualified status manually, the email is sent after the configured number of hours.
- **Re-qualification Before Delay Ends:** If the candidate is moved to a qualified status from a disqualified status before the delay expires, no email is sent.
- **Switching Between Disqualified Statuses Before Delay Ends:**
  - Email for the new disqualified status will be sent after the remaining delay.
  - Email for the previous disqualified status will not be sent.

### Note

The delay does not reset because the candidate remains in the Disqualified category.

- **Switching After Delay Has Expired:**
  - Email for the previous status is sent immediately (since the delay expired).
  - Delay resets for the new status, and its email will be sent after the configured delay.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Settings](#) ►.
2. Enable the [Delay Emails to Disqualified Candidates \(in hours\)](#) option and enter the delay in hours.

### Note

- If the option is enabled but no hours are provided, emails will not be sent.

3. Select a Job Owner user.

### Note

Ensure that you select an active user. If the job owner becomes inactive, the emails won't be sent.

4. Save your changes.

## Results

E-mail notifications are sent out to the disqualified candidates.

### Note

Candidates will not receive email notifications in the following scenarios:

- There is no candidate-facing email template linked to the disqualification status.
- Job Owner user is inactive.
- Overlap in delay hours with [Don't send emails older than \(in days\)](#).

## 21.6 Nudging Interviewers For Pending Feedback

Sort applicants by pending interview feedback in the new Applicant Workbench to identify candidates awaiting interviewer ratings and send timely reminders to interviewers.

### Prerequisites

Before you begin, ensure that:

- You have access to the new Applicant Workbench.
- The sysOverdueInterview system field is configured as a column in your workbench view.

### Context

Use the Interview Feedback Pending column to track which candidates are waiting for interviewer ratings. This helps prevent applicants from getting stuck in the interview process by enabling you to quickly identify and follow up with interviewers who haven't yet submitted their feedback. The *Pending* icon appears when a candidate is in an Interview status and at least one interviewer hasn't submitted feedback. The icon remains visible until all pending feedback is submitted, even if the candidate's status changes.

#### Note

The *Pending* label remains visible regardless of whether the candidate is disqualified or the To-Do items are removed.

### Procedure

1. In the new Applicant Workbench, locate the *Feedback Pending* column.  
If the column is not visible, you may need to add it to your workbench view by configuring the column settings.
2. Select the column header to sort applicants in ascending or descending order based on the presence of the "Feedback Pending" icon.  
Applicants with pending interview feedback are grouped together, making it easier to identify candidates requiring follow-up.
3. Choose the *Feedback Pending* icon for a specific applicant.  
A dialog box opens displaying the names of interviewers with pending feedback and the date each interviewer was last nudged.
4. Select one or multiple interviewers by using the checkboxes next to their names.
5. Choose *Nudge* to send reminder emails to the selected interviewers.  
The system displays a success message if all interviewers were successfully nudged, or an error message if at least one interviewer wasn't nudged.

6. If the nudge fails, choose [Retry](#) to return to the dialog box with the failed interviewers already preselected, then choose [Nudge](#) again.

## Results

You have successfully identified applicants with pending interview feedback and sent reminder emails to interviewers. The [Pending](#) icon will disappear from the column once all interviewers have submitted their feedback.

## 21.7 Job Applications in SAP SuccessFactors

Candidates submit a job application to job postings they're interested in. With SAP SuccessFactors Recruiting you can configure the job application process.

### Related Information

[Configuring the Job Application Template in Provisioning \[page 1076\]](#)

### 21.7.1 Sections Displayed on Job Applications

Recruiting users can see different sections on a job application record based on the permission they've been given.

The Recruiting user view of the Application record contains the following sections:

- [Banner](#) – Displays the candidate type (internal, external, or agency candidate with owning agency).
- [Contact Information Line](#) – Displays the contact information such as phone number, e-mail address, cover letter, resume, and profile.  
Additionally, you can copy and share Application URL that allows you to access the application profile directly. The Application URL isn't visible in **Forwarded** and **Invite to apply** status. You can also configure an e-mail token in the template to include the Application URL.

#### ⓘ Note

Ensure that you have access to Job Requisition and necessary permission for the application status to view the application profile.

### Left Side Column

- [Non Applicant Warning](#) – Indicates that the application record is forwarded and the candidate hasn't yet completed the application (appears based on applicant's activity) Cell phone number, contact e-mail address, cover letter, resume, and View Profile link.

- [Application](#) – Contains fields configured in the application XML (always appears).
- [Screening Details](#) – Contains the applicant's responses to prescreening questions (always appears; populated with data based on configuration, and recruiting user and applicant activity).
- [Background Elements](#) – Displays the data present on the candidate profile record at the time the recruiter first viewed the application (always appears).

## Right Side Column

- [Comments](#) – Allows the user to view and enter comments (appears based on configuration).
- [Jobs Applied Portlet](#) – Displays the requisition ID, job requisition title, recruiter name, and the last modified date of the candidate pipeline status. These details appear based on user permissions. Recruiting users with appropriate permissions can also view comments.
- [Correspondence](#) – Cell phone number, contact e-mail Displays the history of emails sent from the system to the applicant in relation to the application (always appears). You can view information on Sender, Date, Subject, and Type up to four rows by default and a [Send Email](#) link in the header.
- [Offer Letter](#) – Displays the history of offer letters generated in relation to the application (always appears).
- [Application Status Audit Trail](#) – Displays the history of the applicant's movement within the applicant status pipeline (always appears).
- [Tags](#) – Allows the user to view and enter tags (appears based on configuration).
- [Background Check](#) – Displays the status of the Verifications Inc background check (appears based on configuration).
- [Onboarding](#) – Displays the status of the Verifications Inc onboarding process (appears based on configuration).
- [Assessment](#) – Displays the status and results of the third-party assessment testing (appears based on configuration).
- [More Information](#) – Displays the data that was present on the candidate profile record at the time the recruiter first viewed the application (always appears).

## 21.7.2 Configure Job Application Templates Using Manage Templates Tool

You can add, and edit your job application templates using Manage Templates tool in Admin Center.

### Adding and Revising Job Application Templates

You can add multiple job application templates and revise existing templates using [Manage Templates](#) tool in [Admin Center](#). You can also specify which templates you want to make active from the list of available templates.

#### → Tip

Do not use special characters, other than underscores, when defining the custom field IDs.

### 📘 Note

Even though the **Field-format** field appears for all field types of a job application template in [Manage Templates](#) tool, it's applicable only to fields of type **number**. You can use the following field formats while configuring a field of type **number**:

#00 - integer

#.00 - number with two decimal places

'##' - prefix '#' to a number. For example, formats '123' to '#123.'

#% - convert to integer and append % to the end.

For more information on enabling [Manage Templates](#) tool, about configuring job application templates, viewing template versions and audit log, refer to the [Related Information](#) section on this page.

## 21.7.3 Configuring the Job Application Template in Provisioning

Configure the Job Application XML template to set up job applications for your recruiting process.

## Prerequisites

- Recruiting is enabled in Provisioning.
- Candidate Profile XML is configured.
- You have access to Provisioning.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Procedure

1. Go to ► [Provisioning](#) ► [Managing Recruiting](#) ► [Edit Job Requisition Application Template](#) ►.
2. Copy and paste the entire code from Job Application Template form to an XML editor.
3. Make two copies of the XML code and save them. Mark one copy as the original and archive it. Then work with the second copy.

**Always create two copies of the XML file.** This way, you can revert to the original code at any point if something goes wrong in your working copy.

4. Configure the following sections of the template
  - Template name
  - Field definitions
  - Field permissions
  - Field overrides
  - Button permissions
  - Display options
5. Save the template.
6. Go to ► [Provisioning](#) ► [Managing Recruiting](#) ► [Edit Job Requisition Application Template](#) ►.
7. Copy the modified code from your configured template and paste it into the Job ApplicationTemplate form.
8. Choose [Save Form](#).

### 21.7.3.1 Job Application Element: Template Name

In the Job Application XML, the `<template-name>` tag defines the name. Set this tag with a descriptive name to define the template.

These elements must exist right beneath the candidate-profile-data-model element. The CDATA content can be changed, if desired. The CDATA content doesn't appear anywhere in the instance, in Provisioning, isn't referenced by any other XML, and isn't visible to the client, but the Job Requisition XML Template references template-name CDATA content.

In addition to the name, you can add two more elements:

- *template-name*: The unique ID of the XML template
- *template-desc*: A template-desc element is used to provide descriptive text
- *template-lastmodified*: The last modification date of the candidate template.

#### Sample Code

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE candidate-data-model PUBLIC "-//SuccessFactors, Inc.//DTD Candidate
Data Model//EN" "candidate-data-model.dtd">
<candidate-data-model spell-check="true">
  <template-name><![CDATA[Candidate Detail Info Template]]></template-name>
  <template-desc><![CDATA[This defined candidate detail page.]]></template-desc>
  <template-lastmodified>8/16/06 12:00 AM</template-lastmodified>
```

## 21.7.3.2 Job Application Element: Field Definition

The field-definition elements in the Job Application XML template define the data fields on the job application record.

You need access to Provisioning to work with XML templates.

#### Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

#### Sample Code

```
<candidate-data-model spell-check="true">
  <template-name><![CDATA[Candidate Detail Info Template]]></template-name>
  <template-desc><![CDATA[This defined candidate detail page.]]></template-desc>
  <template-lastmodified>8/16/06 12:00 AM</template-lastmodified>
  <field-definition id="instrManageApp" type="instruction" required="false"
    custom="true" public="false" readOnly="false" anonymize="false">
    <field-label mime-type="text-html" lang="en_US"><![CDATA[<table frame="border"
      width="100%"><tr><td style="background-color:#9988FF" valign="bottom"><b>Manage
      Application</b></td></tr></table>]]></field-label>
    </field-definition>
    <field-definition id="statusId" type="picklist" required="false" custom="false"
      public="false" readOnly="false" anonymize="false">
      <field-label mime-type="text-plain" lang="en_US"><![CDATA[Candidate Status]]></
      field-label>
      <picklist-id>appStatus</picklist-id>
    </field-definition>
    <field-definition id="comments" type="text" required="false" custom="false"
      public="false" readOnly="false" anonymize="false">
      <field-label mime-type="text-plain" lang="en_US"><![CDATA[Comments]]></field-
      label>
    </field-definition>
    <field-definition id="id" type="text" required="false" custom="false"
      public="false" readOnly="true" anonymize="false">
      <field-label mime-type="text-plain" lang="en_US"><![CDATA[Applicant ID]]></
      field-label>
    </field-definition>
    <field-definition id="applicationDate" type="date" required="false"
```

```

custom="false" public="false" readOnly="false" anonymize="false">
  <field-label mime-type="text-plain" lang="en_US"><![CDATA[Application Date]]></
field-label>
</field-definition>
<field-definition id="lastModified" type="date" required="false" custom="false"
public="false" readOnly="false" anonymize="false">
  <field-label mime-type="text-plain" lang="en_US"><![CDATA[Last Modified
Date]]></field-label>
</field-definition>
<field-definition id="resume" type="richText" required="true" custom="false"
public="true" readOnly="false" anonymize="false">

```

### 21.7.3.2.1 Job Application Field Definition: Attributes

The `field-definition` element contains `<id>`, `<type>`, `<required>`, `<custom>`, `<public>`, `<readOnly>`, and `<anonymize>` attributes. The Application XML template can contain as many fields as the customer desires.

You need access to Provisioning to work with XML templates.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

You need not use all standard fields in the XML; only the standard field IDs a customer requires. If you have to sync between the records at certain point in the application process, make sure the field IDs match the field IDs in the candidate profile XML.

The `field-definition` element uses the following sample attribute structure:

#### Sample Code

```

<field-definition id="firstName" type="text" required="true"
  custom="false" public="false" readOnly="false" anonymize="true">

```

## ID Attribute

#### Sample Code

```

<field-definition id="firstName" type="text" required="true"
  custom="false" public="false" readOnly="false" anonymize="true">

```

Make sure that the `<id>` field identification is unique within the job application XML template. Some products predefine the field-definition IDs.

You can't define default values for any fields in the Job Application XML template.

Don't use special characters, other than underscores, when defining the custom field IDs.

The system views the configured **id** as a custom field if it doesn't follow the standard field list. If you change the field-id, it will be considered as a new system field even if you keep the same label. Using the same label for the field-id doesn't transfer historical data to the new field, but creates a new field with no value.

#### Application Standard Fields

| Standard Field ID | Field Type | Special Functionality                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| statusId          | picklist   | <p>Values auto-populate through the applicant status workflow set up in the Admin Center.</p> <p>If the data in this field is managed through an API, set up and associate a picklist with values exactly matching the applicant status workflow set up in the Admin Center.</p> <p>When multistage application is enabled:</p> <ul style="list-style-type: none"> <li>• Configure the field permissions in the job requisition XML for candidates to view and act upon.</li> <li>• Configure the field permissions in the job application XML for recruiting users to view and act upon.</li> </ul> |
| resume            | richText   | <p>Appears in the application record contact line even if it isn't configured in the XML.</p> <p>When multistage application is enabled:</p> <ul style="list-style-type: none"> <li>• Configure the field permissions in the job requisition XML for candidates to view and act upon.</li> <li>• Configure the field permissions in the job application XML for recruiting users to view and act upon.</li> </ul>                                                                                                                                                                                    |
| coverLetter       | richText   | <p>When multistage application is enabled:</p> <ul style="list-style-type: none"> <li>• Configure the field permissions in the job requisition XML for candidates to view and act upon.</li> <li>• Configure the field permissions in the job application XML for recruiting users to view and act upon.</li> </ul>                                                                                                                                                                                                                                                                                  |
| contactEmail      | text       | <p>All email sent from the system to the applicant is sent to this email address.</p> <p>Appears in the <a href="#">Contact Info</a> line at the top of the application instead of the normal field list or <a href="#">More Information</a> section.</p> <p>Must be configured in all instances.</p>                                                                                                                                                                                                                                                                                                |
| candidateName     | text       | <p>Must not be made as a visible or editable field.</p> <p>Automatically concatenates name information.</p> <p>If not configured, the candidate name token doesn't populate with data.</p>                                                                                                                                                                                                                                                                                                                                                                                                           |

| Standard Field ID | Field Type | Special Functionality                                                                                                                                                                                                                                                                                                         |
|-------------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| overdueInterviews | derived    | Contains the number of overdue interviews.                                                                                                                                                                                                                                                                                                                                       |
| interviewResult   | derived    | Contains the average rating of the completed interviews.                                                                                                                                                                                                                                                                                                                         |

## type Attribute

### Sample Code

```
<field-definition id="firstName" type="text" required="true" custom="false"
  public="false" readOnly="false" anonymize="true">
```

The `<type>` attribute defines the data the system accepts in the field.

### Recommendation

Don't change the field type of a field to avoid application errors on existing records storing data that don't match the new field type.

The `<type>` attribute consists of the following options:

| Option      | Description                                                                                                                                                                                                          |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| text        | A single line of alphanumeric text with a 100-character limit (character limit and display are nonconfigurable).                                                                                                     |
| textarea    | Multiple lines of alphanumeric text with a 4000-character limit.                                                                                                                                                     |
| richText    | <div> <p><b>Note</b></p> <p>Standard and custom fields in job applications do not support the type <b>richText</b>.</p> </div>                                                                                       |
| instruction | A noneditable field that stretches left-to-right across the screen, used to display messages to users. Can't be made reportable or writable. Configuring for reportability or writability results in error messages. |

| Option          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| date            | A date manually entered by user or selected from calendar pull-down. Displays mmddyy or ddmmyyy according to user's chosen language pack.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| number          | <p>A numeric value. You can configure a <b>field-format</b> in the <b>field-definition</b> of a <b>number</b> field. Some of the formats include:</p> <p>#00 – integer.</p> <p>#.00 – number with two decimal places.</p> <p>'##' – prefix # to a number. For example, formats 123 to #123.</p> <p>## – converts to integer and appends % to the end.</p> <div data-bbox="461 590 683 627"> <p>Sample Code</p> </div> <pre data-bbox="477 653 1349 810">&lt;field-definition id="cust_number_test" type="number"   required="false" custom="true" public="false"   readOnly="false"&gt;   &lt;field-label&gt;&lt;![CDATA[Number Format Test]]&gt;&lt;/field-label&gt;   &lt;field-format&gt;#00&lt;/field-format&gt; &lt;/field-definition&gt;</pre> |
| percent         | A percent value with 1 decimal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| bool            | True or False (shown as a checkbox). Don't make this required because if you do, must always be selected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| enum            | An enumerated type (shown as a dropdown list) where values are defined in the XML.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| multiattachment | Indicates a field that can have multiple documents uploaded and attached to it only by a Recruiting user. Candidates can't view or upload documents for a field of this type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Option                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| multiattachments<br>election | <p>A field that can have multiple documents uploaded and attached. Acts as a mini-library where all uploaded documents are stored for later reuse without requiring they be uploaded again. Select the additional checkbox next to all uploaded files and to attach the document to the record and can't be used in candidate facing configurations. Documents uploaded to <a href="#">multiattachmentsselection</a> fields on the candidate profile are automatically available in a field with the same field ID on the application; the applicant can delete the attachment if desired. All file types can be used for <a href="#">multiattachment</a> and <a href="#">multiattachmentsselection</a> except .mp3 and .mp4.</p> <p>What Recruiting users can do in a <a href="#">multiattachmentselection</a> field differs depending on whether the redesigned Applicant Management feature has being enabled:</p> <ul style="list-style-type: none"> <li>• <b>In the redesigned Applicant Management tool</b> – Recruiting users with the appropriate Write permission can add, edit, or delete attachments in a <a href="#">multiattachmentselection</a> at any time.</li> <li>• <b>In the Redesigned Applicant Management</b> – Recruiting users <b>cannot</b> add or edit any values to the <a href="#">multiattachmentsselection</a> field if any of the following conditions are true: <ul style="list-style-type: none"> <li>• If the job requisition is closed.</li> <li>• If candidate is rejected.</li> <li>• If candidate is hired (job application status).</li> </ul> </li> </ul> <p>These are only valid if <a href="#">Add Attachments Post Application</a> permission is selected.</p> <p>For open applications, if applicants attach at least one document, Recruiting users <b>cannot</b> delete the attachment even if with relevant Write permission. If no documents are attached and the field is left blank, Recruiting users can add attachments and save the applications as long as none of the above conditions are true.</p> <p>Applicants can add or delete documents at any time in a multistage environment. In single-stage environments, however, applicants can only add attachments while the field is empty. The field is no longer editable as soon as applicants add a file.</p> <div> <p>→ Recommendation</p> <p>If the fields are configured identically, Candidate Profile content in <a href="#">multiattachmentselection</a> fields can sync over to the application in <a href="#">multiattachmentselection</a> fields at the point when a Recruiting user first views the application. However, since the use of <a href="#">multiattachmentselection</a> fields on the application isn't recommended, this isn't a common configuration. Changes made to Application multistageattachmentsselection fields during the initial application are reflected on the Candidate Profile, but changes made to the application later during multistage applications aren't synced back to the Candidate Profile.</p> </div> |
| hyperlink                    | A field that stores a URL and text to display in place of the URL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| picklist                     | Field options come from a picklist defined in admin center (shown as a dropdown list).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| derived                      | A dropdown or "find value" field (depending on length of list) where values are automatically determined from another area of the system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Note

Standard and custom fields in job applications do not support *operator*, *operatorTeam*, *competencies*, and *questions* field types.

## required Attribute

### Sample Code

```
<field-definition id="firstName" type="text" required="true"
  custom="false" public="false" readOnly="false" anonymize="true">
```

This attribute defines whether a field is required for an application record to be completed. The field requirement is only enforced, if the user editing the application can write to the field during their edit. If the field is hidden or read only to the user at the time of the edit, the fact that the field is blank doesn't prevent the user from saving the application.

Required fields are required whether the application record is being completed by a candidate or internal recruiting user. Allowable values for the required field are `true` or `false`. Fields can't be made conditionally required on the application record. A field can't be made required for candidates and not required for an internal recruiting user editing the application record. Customers can choose to configure fewer required fields for this reason, or can plan to add a special value to picklists for internal recruiting users to select when adding a candidate without knowing the correct value (such as N/A or Pending) and train the internal recruiting users on the appropriate values to add in required nonpicklist fields.

A field can't be hidden, displayed, or made required based on the answer to an earlier field. It isn't possible to ask a question like, *Have you ever been convicted of a felony?* and then display or require a *Please explain* field, if the candidate selects *Yes*. The suggested workarounds are:

- Make the *Please explain* field unrequired and rename it something like *If yes, please explain*.
- Make the *Please explain field* required and rename it something like *If yes, please explain (enter N/A if not applicable)*.

## custom Attribute

### Sample Code

```
<field-definition id="firstName" type="text" required="true" custom="false"
  public="false" readOnly="false" anonymize="true">
```

There are some field IDs reserved as standard fields. They don't need to be included in the XML configuration, but if used, they must have the appropriate corresponding field type and be marked as `custom="false"`. All other field IDs must be marked as `custom="true"`.

## public Attribute

### Sample Code

```
<field-definition id="firstName" type="text" required="true" custom="false"
  public="false" readOnly="false" anonymize="true">
```

Candidates can't view or edit fields, regardless of permissions, unless the fields are first set as public. This setting for the attribute is most commonly adjusted using field overrides, so even a field marked `public="false"` can, under certain conditions, be made public to certain applicants.

## readOnly Attribute

### Sample Code

```
<field-definition id="firstName" type="text" required="true" custom="false"
  public="false" readOnly="false" anonymize="true">
```

The `readOnly` attribute specifies the field as a read-only field. This is generally a legacy attribute. Read/Write capability is now typically controlled through permissions and not through this attribute. In a new configuration, always set this attribute to **false**.

## anonymize Attribute

### Sample Code

```
<field-definition id="firstName" type="text" required="true" custom="false"
  public="false" readOnly="false" anonymize="true" sensitive="false">
```

SAP SuccessFactors provides the ability to purge user data that you no longer need. The `anonymize` attribute identifies whether a given field needs to be purged. This attribute is used in conjunction with Data Retention Time Management (DRTM) and Legacy Data Retention Management (DRM).

### Note

The **resume** and **cover letter** fields are purged even though you configure them as `anonymize="false"` in the job application or candidate profile templates. Further, if you need to purge certain fields in the candidate profile snapshot, ensure that you configure those fields in the job application template and set the `anonymize` attribute for those fields to `true`.

## Application XML Fields That Don't Support Anonymization

The following standard fields don't support anonymization:

- jobTitle
- applicationDate
- lastModified
- reviewDate
- statusId
- jobsApplied

The following custom fields types don't support anonymization:

- Date
- Percent
- Boolean
- Number
- Instruction
- Currency

## sensitive Attribute

SAP SuccessFactors provides a Read Audit function that helps to determine who has accessed the sensitive personal data of candidates at your company. When Read Audit is enabled, sensitive fields are included in read audit reports if the candidate or someone else accesses sensitive personal data of the candidate.

To configure a field as sensitive, ensure that both the `sensitive` and the `anonymize` attributes for the field are set to `true`.

### Sample Code

```
<field-definition id="race" type="text" required="true" custom="false"
  anonymize="true" sensitive="true">

<field-definition id="customPersonal1" type="text" required="true"
  custom="true" anonymize="true" sensitive="true">
```

For more information about configuring fields as sensitive for Read Audit, refer to the *Setting Up and Using Data Protection and Privacy* guide.

## forward-intact Attribute

### Sample Code

```
<field-definition id="firstName" type="text" required="true" custom="false"
  public="false" readOnly="false" anonymize="true" forward-intact="true">
```

When set to `"true"`, this attribute identifies if a given data for a field is preserved when a customer uses **Forwarding Candidates with Application Data Intact**.

### 21.7.3.2.2 Job Application Field Definition: Field Label

The field-label element usually controls the appearance of the field name in the user interface, but doesn't control all UI field labels. On certain fields, the Succession Data Model controls the field label and for the other fields, Provisioning settings control the label used throughout the system.

You need access to Provisioning to work with XML templates.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

The label element isn't conditional, that is, a single field can't display one label to internal candidates and a different label to external candidates. It isn't possible for one field to display one label to candidates and a different label to internal recruiting users.

The `field-definition` element must contain at least one field-label element.

#### ↗ Sample Code

```
<field-label mime-type="text-plain"><![CDATA[First Name]]></field-label>
```

## mime-type Attribute

#### ↗ Sample Code

```
<field-label mime-type="text-plain"><![CDATA[First Name]]></field-label>
```

Mime-type determines whether or not the system renders any html tags defined in the CDATA content. The two supported mime types are:

- `text-plain`: Unformatted plain text.
- `text-html`: HTML-formatted text.

## CDATA Content

The CDATA content can be configured to contain any customer-defined text.

### Sample Code

```
<field-label mime-type="text-plain"><![CDATA[First Name]]></field-label>
```

### Tip

Use the following HTML in the CDATA value to define a table with a background color to separate sections of the Job Requisition. Replace the background hex color code with the preferred brand color as per the customer requirement and replace the field label as appropriate to the field.

### Sample Code

```
<table frame="border" width="100%"> <tr><td style="background-color:#6699FF"
  valign="bottom"><b>FIELD LABEL</b></td></tr> </table>
```

## 21.7.3.3 Job Application Element: Field Permissions

For single stage applications, the recruiting operator and candidate field access are determined through the **<field-permission>** Element configured in the job application template. For multistage applications, all field permissions for recruiting operator roles except for **resume**, **coverLetter**, and **statusId** fields must be moved to the job requisition template. However, **CoverLetter** and **resume** fields are defined in the job requisition template for candidates and can also be defined by status.

You need access to Provisioning to work with XML templates.

### Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

Field permissions are read and applied top to bottom in the order they appear in the XML template. This means that the latter permissions override the former if there's a conflict. For example, you can define all read permissions for all operators first and the write permissions after all read permissions are set up. That way, if there are any conflicts between permissions, the greater permissions rule.

### Recommendation

Set up a separate permission block for each operator. Even if two operators have the same permission set, define the appropriate permissions separately. This makes it easy to make small changes later to the permission structure as per the customer request. Permission structures that group field permission together for different operators are more difficult to adjust at a later date without an Implementation Partner.

### Sample Code

```
<field-permission type="read">
  <description><![CDATA[Write Permissions]]> </description>
  <role-name><![CDATA[O]]></role-name>
  <role-name><![CDATA[G]]></role-name>
  <role-name><![CDATA[GM+]]></role-name>
  <field refid="id"/>
  <field refid="applicationDate"/>
  <field refid="lastModified"/>
</field-permission>
<field-permission type="read">
  <description><![CDATA[Write Permissions]]> </description>
  <role-name><![CDATA[R]]></role-name>
  <field refid="id"/>
  <field refid="applicationDate"/>
  <field refid="lastModified"/>
  <field refid="questionResponse"/>
  <field refid="averageRating"/>
</field-permission>
<field-permission type="write">
  <description><![CDATA[Write Permissions]]></description>
  <role-name><![CDATA[O]]></role-name>
  <role-name><![CDATA[G]]></role-name>
  <role-name><![CDATA[GM+]]></role-name>
  <field refid="statusId"/>
  <field refid="comments"/>
</field-permission>
<field-permission type="write">
  <description><![CDATA[Write Permissions]]></description>
  <role-name><![CDATA[R]]></role-name>
  <field refid="statusId"/>
  <field refid="comments"/>
  <field refid="recruiterPhoneScreenDate"/>
  <field refid="screeningNotes"/>
</field-permission>
```

## 21.7.3.3.1 Job Application Field Permission Configuration

The field-permission element defines what fields can recruiting users and candidates can access. The field-permission element carries various attributes such as type, description, role-name, field element, and refid.

You need access to Provisioning to work with XML templates.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Sample Code

```
<field-permission type="read">
  <description><![CDATA[Write Permissions]]></description>
  <role-name><![CDATA[O]]></role-name>
  <field refid="statusId"/>
  <field refid="additionalInformation"/>
  <field refid="workSamples"/>
```

```
</field-permission>
```

## type Attribute

```
<field-permission type="read">
```

The type attribute of the field permission element determines what permissions are applied in the permissions block. An unlimited number of field-permission elements can be included in the Application XML.

The type attribute must be set to one of the following types:

| Types         | Description                                                                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| read          | The field can be read by internal and external users in the specified roles. This is applicable only for the open Job Requisitions.                                                                  |
| write         | The user can both read and write the fields after the Job Requisition is open.                                                                                                                       |
| external-view | Use this field type for field <code>refid="comments"</code> . This provides users with appropriate permissions to view the comments when reviewing other applications from the Jobs Applied portlet. |

There's no "none" or "hide" type. To remove a field from view, omit it from any permissions blocks.

The only conditional control available for field permissioning is through multistage application, where applicant status can adjust field permissions. Currently, you can't change field permission based on internal versus external candidate type, or country/region.

## description Element

The description element is most useful as a brief description of what the field permission block is intended to do. This is an optional element. Only one description element can be contained within the field-permission element.

### Sample Code

```
<field-permission type="read">
  <description><![CDATA[Write Permissions]]></description>
  <role-name><![CDATA[0]]></role-name>
  <field refid="statusId"/>
  <field refid="additionalInformation"/>
  <field refid="workSamples"/>
</field-permission>
```

## role-name Element

The role-name element defines the impacted operators by the permission block. Each permission block supports multiple role elements. The role-name CDATA content must contain only valid roles and relational roles such as O, R, RM, GH, and so on.

### Sample Code

```
<field-permission type="read">
  <description><![CDATA[Write Permissions]]></description>
  <role-name><![CDATA[O]]></role-name>
  <field refid="statusId"/>
  <field refid="additionalInformation"/>
  <field refid="workSamples"/>
</field-permission>
```

## field Element and refid Attribute

Specify all field ids that must be impacted by the permission block.

### Sample Code

```
<field-permission type="read">
  <description><![CDATA[Write Permissions]]></description>
  <role-name><![CDATA[O]]></role-name>
  <field refid="statusId"/>
  <field refid="additionalInformation"/>
  <field refid="workSamples"/>
</field-permission>
```

## 21.7.3.4 Job Application Element: Field Overrides

When you want specific fields displayed for a specific candidate type and for the country/region of the job requisition, you can use the `</override>` element to change the field definition attributes for those fields.

## Field Attribute Override

You can set the field attribute override in one of two ways:

- The *Manage Templates* tool
- *Edit Job Requisition Application Template* in Provisioning.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

You can change field attribute override values either by editing the Job Application XML file itself or by using the [Manage Templates](#) tool. The field attribute override settings are located under the `field-attr-override` element.

To change your field overrides using the [Manage Templates](#) tool, the settings are located under the [General Settings](#) of the selected Job Application XML. You can add multiple field attribute override settings.

### Note

Common mistakes include declaring overrides that restate the attribute configuration in the field definition or declaring two overrides that conflict with each other.

You can set the following overrides for the following attributes.

### public

The [public](#) override attribute displays specific field only to external candidates from the United States.

### Sample Code

```
<field-attr-override>
  <override>
    <description><![CDATA[For US internal and external applicants only.]]></description>
    <country><![CDATA[US]]></country>
    <field-attr attribute="public" value="true" applicant="external"/>
  </override>
  <field refid="citizen"/>
  <field refid="visaNum"/>
  <field refid="visaCustom"/>
</field-attr-override>
```

### Note

When you want fields to display for both internal and external candidates, you can indicate by entering `applicant="both"/>`

### Required

Displays specific fields as optional for internal candidates from the United States.

### Sample Code

```
<field-attr-override>
  <override>
    <description><![CDATA[For US internal and external applicants only.]]></description>
    <country><![CDATA[US]]></country>
    <field-attr attribute="required" value="true" applicant="internal"/>
  </override>
  <field refid="citizen"/>
```

```
<field refid="visaNum"/>
<field refid="visaCustom"/>
</field-attr-override>
```

#### 📘 Note

When you want fields to display for both internal and external candidates, you can indicate by entering `applicant="both"/>`

## Field Override Behaviors with Different Application Stage Types

For multistage and late stage applications, field overrides are validated when fields are configured as `field-attr attribute="required" value="false"`. When fields are configured as `field-attr attribute="required" value="true"`, field overrides are ignored and that field's always required no matter the candidate type or the country/region of the requisition. When you want to manipulate any fields, the field attribute must be set to `field-attr attribute="required" value="false"`, and make it true by adding overrides.

For single stage application types, the overrides are always validated no matter on how the field was defined, because there isn't any status configuration in the *Job Requisition XML* template. See related links for more information about multistage and late stage application types.

## Related Information

[Different Application Stage Types \[page 1112\]](#)

### 21.7.3.4.1 Job Application Field Override Configuration

The `field-attr-override` element defines overrides. This element contains the override conditions and the list of fields impacted by the override. Multiple `field-attr-override` elements can be configured in the Job Application XML.

You need access to Provisioning to work with XML templates.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

```
<field-attr-override>
  <override>
    <description><![CDATA[]]></description>
    <country><![CDATA[US]]></country>
    <field-attr attribute="public" value="true" applicant="both"/>
  </override>
```

```

<field refid="instrSelfID"/>
<field refid="eeoInstruction"/>
<field refid="gender"/>
<field refid="ethnicity"/>
<field refid="race"/>
<field refid="veteranStatus"/>
<field refid="disabilityStatus"/>
</field-attr-override>

```

## override Element

The override element specifies under which conditions the attribute change takes effect and what needs to be changed in the attribute as a result.

The full contents of the override element can be read in natural language as "On a **US** requisition, change the **public** attribute to be **true** if the **applicant** is **external**."

### Sample Code

```

<override>
  <description><![CDATA[]]></description>
  <country><![CDATA[US]]></country>
  <field-attr attribute="public" value="true" applicant="external"/>
</override>

```

## description Element

### Sample Code

```

<description><![CDATA[]]></description>

```

The description element is most useful as a brief description of what the field override block is intended to do. This is an optional element. Only one description element can be contained within the field override element.

## country Element

The country element identifies that the override takes effect when the requisition has a particular country/region value. For this feature to function properly, the country element CDATA must be set to a valid two-digit country/region value.

Multiple country elements can be available in one override.

### Note

1. You can't use the asterisk (\*) symbol to set up an override.
2. Country element uses the country/region of the job requisition and not the candidate.

### Sample Code

```
<country><![CDATA[US]]></country>
```

## field-attr Element

The `field-attr` element declares the changes to the attribute that occur when the conditions are met.

### Sample Code

```
<field-attr attribute="public" value="true" applicant="both"/>
```

The `value` item identifies how the attribute in the field-definition is to be changed. For instance, if the `public` attribute in the field is defined as `"false"`, but the conditions in the override are met, specifying `"true"` in the value attribute of the override replaces the field-definition `public` attribute value with `"true"`.

The `applicant` attribute declares an additional condition, based on the applicant type, that must be met for the override to take effect. The override can be set to take effect for applicants who are internal, external, or both.

The following fields defined in the Job Application template are having attribute `public` as `"true"`, which means both internal and external candidates have access to these fields:

1. `cust_instrScreeningQuestion`
2. `cust_salaryExpect`
3. `cust_felony`
4. `cust_whyFelony`
5. `cust_legalAuthUS`
6. `cust_formerEmployee`
7. `cust_formerEmployee2`
8. `cust_relatedToEmployee`

If you want to display the fields only to external candidates, we recommend you to set the value of `public` attribute to `false` for the field definition. Then, create override for these fields with attribute `public` as `true` for external applicants alone.

### Sample Code

```
<field-attr-override>
  <override>
    <description><![CDATA[C]]></description>
    <country><![CDATA[US]]></country>
    <field-attr attribute="public" value="false" applicant="internal"/>
  </override>
</field-attr-override>
```

### Note

If the override applies to both internal and external candidates in the same way, don't configure two separate overrides. Instead, configure a single override and set `applicant="both"`. If the system is configured such

that two separate overrides exist, one for applicant="external" and another for applicant="internal", the override doesn't work correctly.

## field Element and refid Attributes

Specify all field ids that need to be impacted by the override.

### Sample Code

```
<field-attr-override>
  <override>
    <description><![CDATA[]]></description>
    <country><![CDATA[US]]></country>
    <field-attr attribute="public" value="true" applicant="both"/>
  </override>
  <field refid="instrSelfID"/>
  <field refid="eeoInstruction"/>
  <field refid="gender"/>
  <field refid="ethnicity"/>
  <field refid="race"/>
  <field refid="veteranStatus"/>
  <field refid="disabilityStatus"/>
</field-attr-override>
```

## 21.7.3.5 Job Application Element: Button Permissions

Button permissions specify which operators have access to use specific buttons on the application record.

You need access to Provisioning to work with XML templates.

### Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Sample Code

```
<button-permission>
  <role-name><![CDATA[O]]></role-name>
  <role-name><![CDATA[G]]></role-name>
  <role-name><![CDATA[GM+]]></role-name>
  <role-name><![CDATA[GH+]]></role-name>
  <role-name><![CDATA[R]]></role-name>
  <role-name><![CDATA[RM+]]></role-name>
  <role-name><![CDATA[S]]></role-name>
  <role-name><![CDATA[T]]></role-name>
  <role-name><![CDATA[W]]></role-name>
  <button-id><![CDATA[Save]]></button-id>
  <button-id><![CDATA[Cancel]]></button-id>
</button-permission>
<button-permission>
  <role-name><![CDATA[R]]></role-name>
  <button-id><![CDATA[EDIT_CANDIDATE_SNAPSHOT]]></button-id>
```

```
</button-permission>
```

### 21.7.3.5.1 Job Application Button Permission Configuration

The `button-permission` block allows the defined roles to access the buttons on the application record. Multiple `button-permission` elements can be declared in the Job Application XML.

You need access to Provisioning to work with XML templates.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

The `button-permission` element requires the following two inputs:

- `role-name`: This CDATA value stores the valid roles. You can list multiple `role-name` elements within the `button-permission` block.
- `button-id`: This CDATA value stores the valid buttons. You can list multiple `button-id` elements within the `button-permission` block. Valid button values are Save, Cancel, Forward, Open, Close, and Reopen.

#### Sample Code

```
<button-permission>
  <role-name><![CDATA[O]]></role-name>
  <role-name><![CDATA[G]]></role-name>
  <button-id><![CDATA[Save]]></button-id>
  <button-id><![CDATA[Cancel]]></button-id>
</button-permission>
```

### role-name Element

The `role-name` element defines which operators are impacted by the button permission block. Multiple role elements are supported within each `button-permission` block. The `role-name` CDATA content must contain only valid roles and relational roles such as O, R, RM, GH, and so on.

#### Sample Code

```
<button-permission>
  <role-name><![CDATA[O]]></role-name>
  <role-name><![CDATA[G]]></role-name>
  <button-id><![CDATA[Save]]></button-id>
  <button-id><![CDATA[Cancel]]></button-id>
</button-permission>
```

## button-id Element

Multiple `button-id` elements can be declared in one button permission block.

- **Save** Allows the user access to the Save button on the application. This permission is typically granted to most or all operators.
- **Cancel**: Allows the user access to the Cancel button on the application. This permission is typically granted to most or all operators.
- **Close**: Do not use in new configurations; this is a legacy element.

### Note

When the application is closed from consideration, the application doesn't appear as an **Active** candidate on the Job Application Summary page.

- **Reopen**: Do not use in new configurations; this is a legacy element.
- **Forward**: Allows the user to use the **Forward to Req** button on the application record to associate the candidate to another requisition.
- **EDIT\_CANDIDATE\_SNAPSHOT**: Grants a user permission to edit the contents of the candidate profile snapshot associated to the application.

### Sample Code

```
<button-permission>
  <role-name><![CDATA[0]]></role-name>
  <role-name><![CDATA[G]]></role-name>
  <button-id><![CDATA[Save]]></button-id>
  <button-id><![CDATA[Cancel]]></button-id>
</button-permission>
```

## EDIT\_CANDIDATE\_SNAPSHOT

This permission allows the user to update the name, phone number, email, CV, and cover letter fields. This permission must be used together with Candidate Profile permissions that are defined by dynamic group and if those same field IDs exist on the Job Application XML the permissions have to match the permissions of users that are part of the dynamic group.

### Note

Recruiting users can **only** change the names of candidates when the redesigned Applicant Management tool is enabled. Even if you give permission, users can't update candidate names in the legacy Candidate Workbench.

When **EDIT\_CANDIDATE\_SNAPSHOT** is **not** enabled:

- The snapshot is created the first time the Application page is opened. In that case data from the Candidate Profile are copied in the Application snapshot.
- Any later change on the Candidate Profile isn't reflected in the Application snapshot.
- The Application snapshot isn't editable because the feature isn't enabled.

At the moment that the recruiter first opens the Application page, the fields from Candidate Profile are copied over to the Application. This way the recruiter sees the latest data from the candidate and decides to move forward with the candidate or to disposition them. If the fields are later edited by the candidate on the Candidate Profile, the changes aren't considered. Also, the Application snapshot isn't editable because **EDIT\_CANDIDATE\_SNAPSHOT** isn't enabled.

When *EDIT\_CANDIDATE\_SNAPSHOT* is enabled:

- The snapshot is created the first time the Application page is opened. In that case data from the Candidate Profile are copied in the Application snapshot.
- If you're using the legacy Candidate Workbench, any change on the Candidate Profile isn't reflected in the Application snapshot, no matter which permissions are defined. The changes have only one possible direction: from Application to Candidate Profile.  
This is not the case in the redesigned Applicant Management tool, where Recruiting users can edit applicant names in the *Profile Information* portlet.
- All fields of the snapshot are editable, no matter which permissions are defined in the candidate profile template, with or without dynamic group.
- There's no way to select some fields of the Application snapshot to make them editable or not. In the Application template, this is a button permission. Permissions are defined by role and not by field.
- A user is one of the roles in the button permission has the permission to edit the snapshot. If this user is also part of a dynamic group with write permission in the Candidate Profile, then the change made in the application snapshot is also copied in the candidate profile. This action is one direction only from the snapshot to the Candidate Profile.

## 21.7.3.6 Job Application Element: Display Options

Display Options on the application allow an end user to select the columns appearing on the applicant list page.

You need access to Provisioning to work with XML templates.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### ↗ Sample Code

```
<candidate-summary-display-options-config>
  <category id="candidateContactData" name="candidateContactData">
    <label xml:lang="en_US"><![CDATA[Candidate Contact and Application Data]]></label>
    <column field-ref="cellPhone" select-by-default="true" gridOrder="1">
    </column>
    <column field-ref="contactEmail" select-by-default="true" gridOrder="2">
    </column>
    <column field-ref="country" select-by-default="false" gridOrder="3">
    </column>
    <column field-ref="applicationDate" select-by-default="false" gridOrder="12">
    </column>
    <column field-ref="lastModified" select-by-default="false" gridOrder="13">
    </column>
  </category>
  <category id="candidateSourceData" name="candidateSourceData">
    <label xml:lang="en_US"><![CDATA[Candidate Source Data]]></label>
    <column field-ref="referralSource" select-by-default="false" gridOrder="4">
    </column>
  </category>
  <category id="candidateScreeningData" name="candidateScreeningData">
    <label xml:lang="en_US"><![CDATA[Candidate Screening Data]]></label>
    <column field-ref="bkgrndChkStatus" select-by-default="false" gridOrder="7">
    </column>
  </category>
</candidate-summary-display-options-config>
```

```

        <column field-ref="drugScreenResults" select-by-default="false"
gridOrder="8">
        </column>
        <column field-ref="assessmentResults" select-by-default="false"
gridOrder="9">
        </column>
        <column field-ref="averageRating" select-by-default="false" gridOrder="11">
        </column>
    </category>
</candidate-summary-display-options-config>

```

### 21.7.3.6.1 Display Option Configurations for Job Application

The `candidate-summary-display-options-config` element defines display options on the Applicant List page. You can't disable or alter the standard columns in the applicant list table.

You need access to Provisioning to work with XML templates.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

#### 🔗 Sample Code

```

<candidate-summary-display-options-config>
  <category id="candidateScreeningData" name="candidateScreeningData">
    <label xml:lang="en_US"><![CDATA[Candidate Screening Data]]></label>
    <column field-ref="bkgrndChkStatus" select-by-default="false" gridOrder="7"/>
    <column field-ref="drugScreenResults" select-by-default="false"
gridOrder="8"/>
    <column field-ref="assessmentResults" select-by-default="false"
gridOrder="9"/>
  </category>
</candidate-summary-display-options-config>

```

## category Element

The `category` element divides the display option selections into columns on the user interface. Multiple categories are supported in the `candidate-summary-display-options-config`.

#### 🔗 Sample Code

```

<candidate-summary-display-options-config>
  <category id="candidateScreeningData" name="candidateScreeningData">
    <label xml:lang="en_US"><![CDATA[Candidate Screening Data]]></label>
    <column field-ref="bkgrndChkStatus" select-by-default="false" gridOrder="7"/>
    <column field-ref="drugScreenResults" select-by-default="false"
gridOrder="8"/>
    <column field-ref="assessmentResults" select-by-default="false"
gridOrder="9"/>
  </category>

```

```
</candidate-summary-display-options-config>
```

### id and name Attributes

The id and name specify a unique ID for the category. For simplicity, these attributes must be set to the same unique alphanumeric value.

#### Sample Code

```
<category id="candidateScreeningData" name="candidateScreeningData">
```

## label Element

This element specifies the value for the label shown at the top of each column (in the display options). It uses the text-plain or text-html mime types and content is translatable.

#### Sample Code

```
<candidate-summary-display-options-config>
  <category id="candidateScreeningData" name="candidateScreeningData">
    <label xml:lang="en_US"><![CDATA[Candidate Screening Data]]></label>
    <column field-ref="bkgrndChkStatus" select-by-default="false" gridOrder="7"/>
    <column field-ref="drugScreenResults" select-by-default="false"
      gridOrder="8"/>
    <column field-ref="assessmentResults" select-by-default="false"
      gridOrder="9"/>
    </category>
  </candidate-summary-display-options-config>
```

## column Element

The column element equates to an item available in the display options for a user to select as an additional column in the Applicant List page. Multiple columns are supported in the category element.

#### Sample Code

```
<candidate-summary-display-options-config>
  <category id="candidateScreeningData" name="candidateScreeningData">
    <label xml:lang="en_US"><![CDATA[Candidate Screening Data]]></label>
    <column field-ref="bkgrndChkStatus" select-by-default="false" gridOrder="7"/>
    <column field-ref="drugScreenResults" select-by-default="false"
      gridOrder="8"/>
    <column field-ref="assessmentResults" select-by-default="false"
      gridOrder="9"/>
    </category>
  </candidate-summary-display-options-config>
```

### field-ref Attribute

The `field-ref` attribute determines what field the new display option column is mapped to. Note that the display options don't display any data until the fields they refer to are set up as Custom Reportable Fields and synchronized successfully.

#### Sample Code

```
<column field-ref="bkgrndChkStatus" select-by-default="false" gridOrder="7"/>
```

#### **select-by-default Attribute**

The `select-by-default` attribute determines whether the display option is selected or not selected by default. Based on the setting, the recruiting user needs to select the display option, or the display option is selected by default and requires the recruiting user to clear it.

#### Sample Code

```
<column field-ref="bkgrndChkStatus" select-by-default="false" gridOrder="7"/>
```

#### **gridOrder Attribute**

The `gridOrder` attribute determines the order of display for the option column in the applicant list table from left to right. All configured display options are displayed to the left of the standard columns in the applicant list table.

#### Sample Code

```
<column field-ref="bkgrndChkStatus" select-by-default="false" gridOrder="7"/>
```

## 21.7.3.7 Configuring Permissions for the History Results Table

To view an applicant's history with their associated job requisition in the legacy Candidate Workbench, configure permissions for the Historical Results table on the job application page.

### Prerequisites

You have access to Provisioning.

#### Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Context

*FADV background check* displays for customers who use First Advantage for background checks (FADV). Customers using Verifications Inc (VI) see a corresponding menu, and customers migrating from VI to FADV see both.

Configure feature permissions for each of the available History of Results tables separately in the Job Requisition template.

Recruiting users with the necessary permission can access the History of Results tables on the job application page to see the following information:

- Applicant's previous results for assessments.
- Background checks.
- Prescreening questions and answers.

## Procedure

1. Configure permission for the *Background Check* Historical Results table by adding the `historicalBackgroundCheckResults` feature permission block to the Job Requisition template:

### ❖ Example

```
<feature-permission type="historicalBackgroundCheckResults">
  <description><![CDATA[View Background Check Results]]></description>
  <role-name><![CDATA[R]]></role-name>
  <status><![CDATA[Interview]]></status>
</feature-permission>
```

2. Configure permission for the *Assessment Integration* Historical Results table by adding the `historicalAssessmentResults` feature permission block to the Job Requisition template:

### ❖ Example

```
feature-permission type="historicalAssessmentResults">
  <description><![CDATA[View Assessment Results]]></description>
  <role-name><![CDATA[R]]></role-name>
  <status><![CDATA[Interview]]></status>
</feature-permission>
```

3. Configure permission for the *Questions & Answers* Historical Results table by adding the `historicalQuestionAnswers` feature permission block to the Job Requisition template:

### ❖ Example

```
<feature-permission type="historicalQuestionAnswers">
  <description><![CDATA[View Question & Answers]]></description>
  <role-name><![CDATA[R]]></role-name>
  <status><![CDATA[Interview]]></status>
</feature-permission>
```

## Results

After you configure the Historical Results table in Job Requisition template, you can expand the individual menus on the Job Application page to display the historical results along with their associated job requisition.

## Next Steps

Define reportable custom fields and custom tokens.

### 21.7.3.8 Job Application Template Standard Fields

Learn about standard fields in the job application template.

You need access to Provisioning to work with XML templates.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

Public fields are ones that can appear on the job application form that a candidate fills out when applying for a job, whether from the career site or internally. Only the standard fields with a Yes in the public column can be set to `public = "true"`.

| Standard Field ID | Field Type | Public | Notes                                                                                                                                                                                                                                                                                  |
|-------------------|------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id                | text       | No     | If you want to display the application ID in the application detail, define this field in the application template.<br><br>If you have enabled multistage applications, set the field as <code>public = "false"</code> and <code>readOnly="true"</code> and permissioned as read-only. |
| candidateName     | text       | No     |                                                                                                                                                                                                                                                                                        |

| currentCompany      | text             | Yes    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| interviewResult     | derived          | No     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| overdueInterviews   | derived          | No     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### 21.7.3.9 Configuring OData API for Job Application

When configured, application features are supported through OData API. These features include basic application data, application attachments, question and response, and application comments. Recruiting Management now supports a number of general and application features with an OData API.

#### Context

Recruiting permissions are incorporated into the job requisition OData API. The recruiting user can do the following: review the list of job requisitions, review the list of fields of a particular job requisition, edit the job requisition details, and communicate with SAP SuccessFactors Recruiting Management to make the changes to a job requisition in a conversational style. `JobRequisitionFieldControls` defines the permissions of the properties of OData entities with one-to-one mapping with all the fields in the `JobRequisition` entity.

For a list of role-based permissions, refer to *Using Role-Based Permissions*.

## ⓘ Note

- Recruiting users with **Operator** permission can use SAP SuccessFactors mobile app (both iOS and Android platforms). The mobile app enables Recruiting users to get the list of job applications on a particular job requisition organized by their applicant status to have pipeline overview in an external client. They can also modify a job application and its details in clients, other than the SAP SuccessFactors web and mobile applications. Nonadmin users who are operators of a particular job requisition can view only those job applications. The fields in these job applications (including multistage applications) can be now read or updated based on the permissions for the job application template. Admin users aren't impacted by this change.
- Recruiting users without **OData Export** permission may notice an increase in the queries execution time. This is an expected behavior as these users aren't considered as Recruiting admins and the system validates all their permissions against Recruiting templates to retrieve only relevant data.

For more information on job application OData API, refer to *JobApplication OData API*.

## Procedure

1. Assign the user with [Provisioning](#) > [Company Settings](#) > [Web Services](#) > [SF Web Service](#) permission to access an OData entity. By default, OData API is enabled in the [SF Web Service](#) option in the [Web Services](#) section.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

2. Go to [Admin Center](#), create an API admin user, and assign [OData API RCMAApplication Export](#) role-based permission.

## 21.7.3.10 Configuring Locale for Communication with Candidate

Locale for Communication with Candidate determines the email communication language with candidates.

### Context

The Value comes from the [Application Locale](#) and [Candidate Locale](#).

The [Application Locale](#) and [Candidate Locale](#) cannot be defined. They are database fields. The [Candidate Locale](#) comes from the [Candidate Profile](#) for external candidates and from the [User Profile](#) for internal candidates.

### Procedure

1. If the expected default locale does not appear, check the Job Requisition XML default locale.

#### Sample Code

```
<field-definition id="defaultLanguage" type="text" required="false"
custom="false">
  <field-label><![CDATA[Default Language]]></field-label>
  <field-description><![CDATA[Default Language]]></field-description>
  <default-value>en_US</default-value>
</field-definition>
```

#### Note

When applications don't appear as the correct language for your company instance's locale, it's because the requisition wasn't posted in that language. When the requisition isn't translated for the language that's selected by the candidate, job application fields won't appear for that selected language.

2. If the expected default locale still does not appear, check the default language in  [Admin Center](#)  [Recruiting](#)  [Manage Recruiting Languages](#) .
3. If the default locale is not displayed, check the default company language in  [Provisioning](#)  [Company Settings](#)  [Default Language](#) .

## 21.7.3.11 Frequently Asked Questions About Job Application Configuration

Learn answers to frequently asked questions about job application configuration.

### Changing Basic Contact, Resume, and Cover Letter Information

Contact information change isn't supported for recruiting operators. For multistage applications, you can set the fields to be editable. You can use a combination of dynamic groups, candidate profile field, and profile snapshot feature permissions to change resume and cover letter fields.

### Hiding Country/Region, and Candidate Override Fields from Recruiting Operators

You can set permissions for country/region override fields for recruiting operators and candidates in the job requisition template. The table contains information on attribute values needed in order to set the country/region override fields visible or hidden for recruiting operations or candidates.

| Role                 | Configured as an Override Field?<br>(Yes/No) | Visibility                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Recruiting Operators | Yes                                          | <p>When configured as a country/region override field and the attribute is set to public=true:</p> <ul style="list-style-type: none"><li>Country/Region fields are visible to recruiting operators when they're in the specific country/region.</li></ul> <p>When configured as a country/region override field and the attribute is set to public=false:</p> <ul style="list-style-type: none"><li>Country/Region fields aren't visible to the recruiting operator.</li></ul> |
| Recruiting Operators | No                                           | Country/Region fields are visible to recruiting operators based on read/write permissions.                                                                                                                                                                                                                                                                                                                                                                                     |

| Role       | Configured as an Override Field?<br>(Yes/No) | Visibility                                                                                                                                                                                                                                                                                                   |
|------------|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Portlet Permissions on the Application Page

You can set portlet visibility in candidate applications for recruiting operators the specified templates defined in the table. Refer to the note that follows the table for portlets that are always visible in candidate applications.

| Recruiting Feature | Template                                                                                                                                                                                                  |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interview Central  | Job requisition                                                                                                                                                                                           |
| Jobs Applied       | Job requisition                                                                                                                                                                                           |
|                    | <p><b>Note</b></p> <p>You can configure comments to be visible or hidden under this portlet. Hiding candidate data isn't supported.</p>                                                                   |
| Offer Letter       | Job requisition                                                                                                                                                                                           |
|                    | <p><b>Note</b></p> <p>Dates are displayed as the logged in user's time zone for these two fields:</p> <ul style="list-style-type: none"> <li>Offer Extended On</li> <li>Candidate Responded On</li> </ul> |
| Comments           | <p>Candidate profile</p> <p>Job application</p>                                                                                                                                                           |
|                    | <p><b>Note</b></p> <p>You can't add additional fields or configure as rich text.</p>                                                                                                                      |
| Candidate tags     | <p>Candidate profile</p> <p>Job application</p>                                                                                                                                                           |

### ⓘ Note

You can't hide the following application portlets:

- Application
- Screening Details
- Background Elements
- Correspondence
- Application Status Audit Trail

### ⓘ Note

Reordering, renaming, or adding new portlets isn't supported.

## About Rating Columns in Applications.

For the rating column and calculated values by weight and score options appear in the [Questions](#) section once the recruiter sets up the prescreening questions in the requisition, so that candidates can complete them when they apply for jobs. Rating columns appear in candidate application when you configure these fields:

| Fields                                 | Template        |
|----------------------------------------|-----------------|
| <a href="#">questionResponses</a>      | Job Application |
| <a href="#">questions</a>              | Job requisition |
| <a href="#">Prescreening questions</a> | Job requisition |

## 21.7.4 Different Application Stage Types

You can set up your instance as a single stage, multistage, or a late stage application. These settings help to accommodate when candidates complete job application data and if they can view or edit the application later.

## Application Stages Breakdown

There are three different application stage types:

## Application Stage Types

| Stage Application Type       | Definition                                                                                                                                                                                                                                                                                                                                             | Field Visibility Options                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Add/Edit Data Later? (Yes/No) | Field Permissions (template name)                                                                                                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Single Stage</a> | <p>Candidate completes the application data at the initial application point and can't change or add to their data later.</p> <div> <p><b>Note</b></p> <p>Single client can't include both single stage and multi-stage application types.</p> </div>                                                                                                  | <p>All fields are visible for all statuses:</p> <ul style="list-style-type: none"> <li>Recruiting Operator Roles</li> <li>Candidates</li> </ul> <div> <p><b>Remember</b></p> <p>Candidates can view all fields for all statuses. You can, however restrict for specific recruiting operator roles, the ability to select, or view fields by specified statuses. You can edit the <a href="#">Selectable By</a> and <a href="#">Visible To</a> using the <a href="#">Applicant Status Configuration</a> tool for specific statuses or edit the <a href="#">feature-permission</a> section of the <a href="#">Application XML</a> template by status.</p> </div>                                                                                                                                              | No                            | <a href="#">Application XML</a>                                                                                                                |
| <a href="#">Multistage</a>   | <p>Candidate completes set of application data at the initial application and can be granted permissions to either access other fields or edit their data depending on the status of their application. Recruiters operator role can view and write to different fields depending on the configuration for specified applicant status permissions.</p> | <p>You can configure the ability to select and view fields for both:</p> <ul style="list-style-type: none"> <li>Recruiting Operator Roles</li> <li>Candidates</li> </ul> <div> <p><b>Tip</b></p> <p>You can configure read/write permissions in the <a href="#">Requisition XML</a> template for both the candidate and for specified recruiting operator roles.</p> </div> <div> <p><b>Caution</b></p> <p>Recruiting operators ability to view and to select fields have restrictions based on applicant status. You can restrict visibility and the ability to select fields by applicant status for recruiting operators. You can configure permissions either by editing the <a href="#">Requisition XML</a> template or by using the <a href="#">Application Status Configuration</a> tool.</p> </div> | Yes                           | <a href="#">Requisition XML</a> <div> <p><b>Note</b></p> <p>For application data completed during initial application process only.</p> </div> |

| Stage Application Type     | Definition                                                                                                                                                           | Field Visibility Options                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Add/Edit Data Later? (Yes/No) | Field Permissions (template name) |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|-----------------------------------|
| <a href="#">Late Stage</a> | Some clients or customers allow recruiting users place a candidate in the main applicant status pipeline even when the candidate hasn't completed their application. | <p>You can configure the ability to select and view fields for both:</p> <ul style="list-style-type: none"> <li>Recruiting Operator Roles</li> <li>Candidates</li> </ul> <div> <p>→ Tip</p> <p>You can configure read/write permissions in the <a href="#">Requisition XML</a> template for both the candidate and for specified recruiting operator roles.</p> </div> <div> <p>⚠ Caution</p> <p>Recruiting operators ability to view and to select fields have restrictions based on applicant status. You can restrict visibility and the ability to select fields by applicant status for recruiting operators. You can configure permissions either by editing the <a href="#">Requisition XML</a> template or by using the <a href="#">Application Status Configuration</a> tool.</p> </div> | Yes                           | <a href="#">Requisition XML</a>   |

#### 📘 Note

An instance can be set up as a single-stage application environment or a multistage application environment. When multistage application is enabled, most of the application field permissions are read out of the [Job Requisition XML](#) instead of the [Application XML](#).

## OData Upsert Queries

For multistage applications, when you use [OData](#) upsert queries to add or edit applications within job requisitions, it's not possible to add information to random set of application fields. You can upsert information when you choose to provide information to all mandatory fields, regardless of application status for candidates.

## 21.7.5 Enabling Multistage Applications

You can turn on multistage applications in Provisioning.

### Prerequisites

- Applicant statuses are configured.
- Job requisition and job application templates are configured.
- Field permissions are configured in the job application template.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

When using the multistage application setting, all required fields for all status operators must be filled out before Recruiting users are able to change the applicant status to any *In Progress* status. That applicant can be moved to a disqualification status at any point regardless whether any required fields are completed. When configuring multistage applications, all statuses must be defined or the candidate can view all fields.

You can configure country/region-specific application fields that are visible to different operator roles other than the candidate by configuring overrides in the template file.

### Procedure

1. Log into Provisioning and select the company instance that you want.
2. Go to *Company Settings*.
3. Go to *Recruiting* section and select *Enable Multi Stage Application*.
4. Save your changes to finish.

#### → Recommendation

Rename both templates you plan to use for multistage applications. You can update the template names in the templates themselves from the `<template-name>` line using an XML editor.

1. [Configuring the Job Application Template for Multistage Applications \[page 1116\]](#)  
When you've enabled multistage applications in Provisioning, you must prepare your job application template.

2. [Configuring the Job Requisition Template for Multistage Applications \[page 1119\]](#)  
Perform these steps to configure your job requisition template so that you can run multistage applications.
3. [Enabling and Disabling Instruction Field Types for Multistage Applications \[page 1123\]](#)  
You can configure whether instruction fields appear to candidates when they view their application after a job requisition has closed.

[Job Application Element: Field Permissions \[page 1089\]](#)

## 21.7.5.1 Configuring the Job Application Template for Multistage Applications

When you've enabled multistage applications in Provisioning, you must prepare your job application template.

### Prerequisites

- Applicant statuses are configured.
- Field permissions are configured in the job application template.
- Multistage application is turned on in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

Single-stage applications, the Recruiting operator, and candidate field access are determined through the `<field-permission>` element configured in the job application template. For multistage applications, however, you need to move **all** field permissions for Recruiting operator roles except for `id`, `resume`, `coverLetter`, `statusId`, and `comments` fields to the job requisition template. The `coverLetter` and `resume` fields are defined in the job requisition template for candidates and can also be defined by status. Refer to the Related Information section

of this topic to learn more about field permission configuration and behavior for your company job application template.

## Procedure

1. Go to [Provisioning](#) > [<Company Instance>](#) > [Manage Recruiting](#) > [Edit Job Requisition Application Template](#)
2. Download your job application template.
3. Use an XML editor to update the name of your job application template, in the `<template-name>` line.

### → Recommendation

Rename your template file to reflect that it's being used for multistage applications.

4. Update `feature-permission` elements in your job application template:
  - a. Open your renamed job application template.
  - b. Copy and paste everything under these field permissions over to a text file:
    - `<field-permission type="read">`
    - `<field-permission type="write">`
  - c. Save the text file to your hard drive.

This information is copied to your job requisition template later.
  - d. Return to the job application template you plan to use for multistage applications and remove all `refid` field elements except for the following:
    - `<field refid="statusId"/>`
    - `<field refid="resume"/>`
    - `<field refid="coverLetter"/>`
    - `<field refid="comments"/>`
    - `<field refid="id"/>`

### 📌 Note

The `resume` and `coverLetter` fields are read-only, but `statusId` field is writeable.

- e. Save your job application template.

### 🔗 Example

Field permissions in the job application template appear similar to this code snippet:

```
<field-permission type="read">
  <description><![CDATA[[Grant recruiter, sourcer, hiring manager and
    admin read access to the following fields]]></description>
  <role-name><![CDATA[S]]></role-name>
  <role-name><![CDATA[R]]></role-name>
  <role-name><![CDATA[T]]></role-name>
  <role-name><![CDATA[O]]></role-name>
  <role-name><![CDATA[G]]></role-name>
  <field refid="resume"/>
  <field refid="coverLetter"/>
```

```

    <field refid="id"/>
    <field refid="comment"/>
  </field-permission>
  <field-permission type="write">
    <description><![CDATA[Grant recruiter, sourcer and hiring manager
      write access to the following fields]]></description>
    <role-name><![CDATA[S]]></role-name>
    <role-name><![CDATA[R]]></role-name>
    <role-name><![CDATA[T]]></role-name>
    <role-name><![CDATA[O]]></role-name>
    <role-name><![CDATA[G]]></role-name>
    <field refid="statusId"/>
  </field-permission>

```

5. Import your job application template in Provisioning.

## Results

You've prepared your job application template for multistage applications.

## Next Steps

You can now prepare your job requisition template.

**Task overview:** [Enabling Multistage Applications \[page 1115\]](#)

## 21.7.5.2 Configuring the Job Requisition Template for Multistage Applications

Perform these steps to configure your job requisition template so that you can run multistage applications.

### Prerequisites

- Applicant statuses are configured.
- The job application template has been prepared for multistage applications.
- Multistage application is turned on in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

In a multistage application environment, the applicant status set manages the interaction between statuses and the application field permissions. When you configure multistage applications, you have to define all statuses in the status set in the candidate permissions model in order for the candidates to be able to view all fields. To understand more about how application status sets and field permissions work for multistage applications, refer to the topics in the Related Information section.

### Procedure

1. Go to  [Provisioning](#)  [<Company Instance>](#)  [Manage Recruiting](#)  [Import/Update/Export Job Requisition Template](#) .
2. Download your job requisition template.
3. Update your job requisition template you want to use for multistage applications:

| Job Requisition Template Changes                  | Detailed Steps                                                                                                                                                                                      |
|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Update the name of your job requisition template. | You can change the name of your template as part of the <code>job-req-template</code> block, in the <code>&lt;template-name&gt;</code> element. Enter the name of the recently updated job applica- |

tion template in your job requisition template by following these steps:

1. Locate the `</application-status-config>` line in your job requisition template. Enter the name of your job application template you want to use for multi-stage applications in the *application-template-name* element.
2. Save your changes.

### Preparing field permissions for recruiting operator roles

Locate the text document where you saved the original field permission element from the job application you want to use for multistage applications.

1. Copy the original field permission for recruiting operators from your saved text file.
2. Paste the saved feature permission elements into the job requisition template between the *application-status-set name* element and before the feature permission block.
3. For all feature permissions pasted from the job application template, replace the *field refid* element with *field application-field-id*.
4. Update your field permissions.
5. Save your template.

#### → Recommendation

Suggested field permissions:

- Use read permissions for common application fields such as name and contact information that also include **resume**, and **coverLetter** fields. Same permissions for fields during system statuses such as *Auto Disqualified*, *Requisition Closed*, and all other system statuses.
- Use write permissions for interview statuses that include *phoneScreenDate*, *phoneScreenDetails*, and all other interview statuses. Same permissions apply towards all background check statuses.

### Preparing field permission block for candidates

Read permissions block for candidates for the *Default* status must be added for instruction fields and write permissions for the same statuses for fields that candidates can answer.

1. Locate *application-status-set name*.
2. Add your read permissions for instruction fields.

## Job Requisition Template Changes

## Detailed Steps

3. Add your write permissions for fields that candidates can answer.

4. Prepare and update your field permissions for recruiting operators:

## Job Requisition Template Changes

## Detailed Steps

### Recruiting operator roles

Locate the text document where you saved the original field permission element from the job application you want to use for multistage applications.

1. Copy the original field permission for recruiting operators from your saved text file.
2. Paste the saved feature permission elements into the job requisition template between the *application-status-set name* element and before the feature permission block.
3. For all feature permissions pasted from the job application template, replace the *field refid* element with *field application-field-id*.
4. Update your field permissions.
5. Save your template.

### → Recommendation

Suggested field permissions:

- Use read permissions for common application fields such as name and contact information that includes *resume*, and *coverLetter* fields. Same permissions for fields during system statuses such as *Auto Disqualified*, *Requisition Closed*, and all other system statuses.
- Use write permissions for interview statuses that include *phoneScreenDate*, *phoneScreenDetails*, and all other interview statuses. Same permissions apply towards all background check statuses.

5. Prepare and update your field permissions for candidates:

## Job Requisition Template Changes

## Detailed Steps

### Field permissions for candidates

Read permissions block for candidates for the *Default* status must be added for instruction fields and write permissions for the same statuses for fields below the status set element in the job requisition template.

1. Locate *application-status-set name*.

2. Add your read permissions for instruction fields.
3. Add your write permissions for fields that candidates can answer.

#### Note

If candidates can update their applications in other statuses, you can add permission blocks for them. If you have external candidates that are invited to complete the [Background Check](#) for remaining application fields, they can be added with write permissions.

6. Add the [candQuestions](#) feature permissions so that candidates can access and fill out prescreening questions for the default status.

#### Note

Ensure that all feature permissions are correctly set for interviews and offers for recruiting roles.

7. Save and import your job requisition template in Provisioning.

## Next Steps

You can now create emails to be sent to candidates to invite them to complete the rest of the application fields. Candidate emails can be associated with the respective status in the [Applicant Status Configuration](#). When the candidate moves to that respective status, email is sent out to the candidate automatically. To understand more about how sending out emails to candidates work, refer to that topic in the Related Information section.

## 21.7.5.3 Enabling and Disabling Instruction Field Types for Multistage Applications

You can configure whether instruction fields appear to candidates when they view their application after a job requisition has closed.

### Prerequisites

- Multistage application is turned on in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- The job application and job requisition templates have been prepared for multistage applications.
- Instruction fields configured for multistage applications

#### 📘 Note

SAP Cloud Support can't perform configuration or template changes for the multistage environment.

### Context

All instruction fields appear to candidates by default when they view their application after the job requisition is closed. Perform these steps to change this behavior.

### Procedure

1. Go to [Admin Center](#) > [Manage Recruiting Settings](#) > [Applicant Profile Setting](#).
2. Select the *Hide Instruction fields on the Job Application when the Requisition is closed (for multistage applications)* checkbox.
3. Select *Save*.

**Task overview:** [Enabling Multistage Applications \[page 1115\]](#)

**Previous task:** [Configuring the Job Requisition Template for Multistage Applications \[page 1119\]](#)

## 21.7.6 Enabling and Configuring Late Stage Applications

The late stage application feature allows recruiting users to place a candidate in the main applicant status pipeline, even if the candidate has yet to complete an application.

### Prerequisites

You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Procedure

1. Select ► [Provisioning](#) ► [Company Settings](#) ► [Enable Late Stage Applications](#) ►.
2. Select ► [Admin Tools](#) ► [Recruiting Email Triggers](#) ► [Enable Invite Candidate to Apply](#) ►.

When late stage application is enabled in Provisioning, an [Add To Requisition](#) option becomes available in the [Actions](#) menu and as a button on the applicant record of forwarded candidates.

3. Select [Add to Requisition](#) to move a candidate out of the Forwarded or Invited to Apply status and into the Default status.

If any e-mail is to be sent to candidates when they enter the Default status, an exception exists for forwarded candidates who are added to the requisition. These candidates don't receive the e-mail configured for candidates in the Default status.

At this point, certain additional functionalities like comments, status-triggered emails, and other application status features become available. However, the candidate is still not considered an applicant. The forwarded candidate warning message still appears on the application.

#### 📌 Note

Organizations must design a business process that ensures all candidates complete an application before an offer is extended. This is important for technical, functional, and compliance reasons.

4. To prompt the candidate to complete the application, the recruiting user chooses [Invite Candidate to Apply](#) on the application, or selects the checkbox next to the candidate in the applicant list and selects ► [Action](#) ► [Invite Late Stage Applicant](#) ►.

You can add [feature-permissions](#) for any status or operator role that's required.

You can use the [Invite Late Stage Applicant](#) multiple times. When [Late Stage](#) is used with multistage applications, candidates that respond to the invitation are able to view all fields for all statuses that include their current status.

## Note

When a Recruiter invites a candidate to apply, the email is sent to the candidate in the locale of the logged-in user. For example, if the Recruiter has logged in using **Deutsch (German)** locale, the candidate receives an e-mail in the German language.

Here are two **examples** of the *feature-permission* section of the *Job Requisition XML* template that defines which roles can access the *Invite to Apply* and *Invite Late Stage Applicant* by status:

```
<feature-permission type="lateStageApp">
  <role-name><![CDATA[S]]></role-name>
  <role-name><![CDATA[T]]></role-name>
  <role-name><![CDATA[R]]></role-name>
  <role-name><![CDATA[W]]></role-name>
  <status><![CDATA[Default]]></status>
</feature-permission>
<feature-permission type="lateStageApp">
  <role-name><![CDATA[S]]></role-name>
  <role-name><![CDATA[T]]></role-name>
  <role-name><![CDATA[R]]></role-name>
  <role-name><![CDATA[W]]></role-name>
  <status><![CDATA[Reviewed]]></status>
</feature-permission>
```

## 21.7.6.1 Using Late Stage Applications

Some organizations want to allow recruiting users to place a candidate in the main applicant status pipeline, even if the candidate hasn't yet completed an application. The late stage application feature supports this need.

### Prerequisites

- Late Stage Applications is enabled in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- Recruiting Email Triggers is configured.
- *Invite Candidate to Apply* recruiting email template is enabled.

### Context

You can add candidates for *Late Stage* applications that are in either one of these two statuses in the candidate list for specific job requisitions:

- [Forward to Requisitions](#)
- [Invited to Apply](#)

## Procedure

1. Go to ► [Admin Center](#) ► [Recruiting](#) ► [Job Requisitions](#) ►.

You're directed to the [Job Requisitions List](#) page.

2. Select the job requisition that you want.
3. Go to the [CANDIDATES](#) tab that directs you to the candidate list for that requisition.
4. Select the candidates you want.
5. Go to ► [Action](#) ► [Invite Late Stage Applicant](#) ►.

When you select [Add to Requisition](#) to move a candidate out of the [Forwarded](#) or [Invited to Apply](#) status, that candidate is moved to Default status. When you configure e-mails to send out to candidates in default status, candidates that originally started from forwarded status don't receive the e-mails.

6. Add the feature-permission section of the [Job Requisition XML](#) template to define which roles can access [Invite to Apply](#) and [Invite Late Stage Applicant](#) by status:

```
<feature-permission type="lateStageApp">
  <role-name><![CDATA[S]]></role-name>
  <role-name><![CDATA[T]]></role-name>
  <role-name><![CDATA[R]]></role-name>
  <role-name><![CDATA[W]]></role-name>
  <status><![CDATA[Default]]></status>
</feature-permission>
<feature-permission type="lateStageApp">
  <role-name><![CDATA[S]]></role-name>
  <role-name><![CDATA[T]]></role-name>
  <role-name><![CDATA[R]]></role-name>
  <role-name><![CDATA[W]]></role-name>
  <status><![CDATA[Reviewed]]></status>
</feature-permission>
```

### Note

You can use the [Invite Late Stage Applicant](#) action multiple times. When [Late Stage](#) is used with multistage applications, candidates that respond to the invitation are able to view all fields for all statuses that include their current status.

## Results

The candidate has been invited as a Late Stage Applicant. Once the candidate completes the application using the link provided in the [Invite Late Stage Applicant](#), that action is recorded under [Applicant Audit Trail](#).

## 21.7.7 Multistage and Late Stage Application Preview Tool

You can use the [Multistage and Late Stage Application Preview](#) to identify hidden fields to help you troubleshoot permission issues.

### Troubleshooting Field Configuration Issues

The [Multistage and Late Stage Application Preview](#) tool help you identify and troubleshoot which job application fields aren't configured correctly by specific job requisition templates. There's validation that looks at the following common permission configuration issues in the [Requisition XML](#) and [Job Application XML](#) templates:

- Country/Region Override permission for selected country/region is correctly configured.
- Permissions for applicant status for specific roles are correctly configured.
- Required permissions are configured correctly.
- Read and Write permissions are configured correctly.

### Enabling the Multistage and Late Stage Application Preview Tool

You can enable the [Manage Multistage and Late Stage Application Preview Tool](#) using role-based permissions. Once enabled, it's available from Admin Center.

### Multistage and Late Stage Application Preview Filters

You can filter permission issues for the following fields:

| Filter Name                              | More Information                                                                                                                                       |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Job Requisition Template</a> | You can filter by specific job requisition template.                                                                                                   |
| <a href="#">Operator</a> Role            | Operator role permissions you want to troubleshoot.                                                                                                    |
| <a href="#">Status</a>                   | Candidate status permissions you want to troubleshoot.                                                                                                 |
| <a href="#">Country</a>                  | Country/Region override permissions you want to troubleshoot.                                                                                          |
| <a href="#">Applicant Type</a>           | Filter one of these two applicant types: <ul style="list-style-type: none"><li>• <a href="#">INTERNAL</a></li><li>• <a href="#">EXTERNAL</a></li></ul> |

### → Tip

When you want to filter *Late Stage* applications only, select the *Late Stage* checkbox.

## Viewing Visible Fields Section

When you expand *Visible Fields* section for a specific job requisition, operator, candidate status, country/region, and Applicant Type, that there are two columns:

- *Editable*: Fields that have write permissions enabled in the *Requisition XML* and *Job Application XML* template.
- *Read Only*: Fields that have read permissions enabled in the *Requisition XML* and *Application XML* template.

## Troubleshooting Hidden Fields

Fields that have permission configuration issues show up under the *Hidden Fields* section. When you select the

icon next to the field you want to troubleshoot, a tooltip appears. This tooltip contains information about the permission configuration issue for that field.

## 21.7.7.1 Using the Multistage and Late Stage Application Preview Tool

When you've enabled the *Manage Multistage and Late Stage Application Preview*, you can view which fields weren't configured correctly based on filtered criteria.

### Prerequisites

- Multistage and Late Stage Applications enabled for your company instance.
- *Manage Multistage and Late Stage Application Preview* role-based permission enabled.

### Procedure

1. Go to ► *Admin Center* ► *Manage Multistage and Late Stage Application Preview* ► that directs you to that page.
2. Select the filters you want to use and select the *Submit* button.

When you select the *Submit* button, the list of visible and hidden fields are available to review.

## Results

You can now review hidden fields for issues.

## 21.7.8 Job Applications with HR Master Data

Job Applications in Recruiting provides the capability to reuse HR Master data (data defined in other modules) using Foundation Object and Generic Object. If you aren't looking for implementing job Applications with HR Master data, you can skip this section.

### 21.7.8.1 Configuring Job Application Template

This section describes how to configure Foundation Objects and Generic Objects within the Job Application template.

#### Prerequisites

- You have access to Provisioning.

##### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- Or, you have access to Manage Templates.

#### Context

The XML attribute *object-type* helps to define Foundation Object and Generic Object field types in the job application template. To enable Foundation Object and Generic Object field types in the Job Application template, contact SAP Cloud Support.

##### 📘 Note

You can maintain *Job Application Template* for Foundation Object and Generic Object field types using *Manage Templates*.

- The XML attribute *object-type* is the type of Foundation Object or Generic Object.
- The attribute type is always set to *object*.

### Note

- FO/GO in the application do not support multiselect configuration.
- You can configure only custom fields as Foundation object or Generic Object for Job Applications. Even standard object fields such as Division, Department and Location need to be defined as `<custom = true>`.

For example, this snippet shows the definition for an object of type **Custom Department**.

```
<field-definition id="cust_department" type="object"
                  required="false" custom="true" object-type="Department">
  <field-label><![CDATA[Custom Department]]></field-label>
  <field-label lang="de_DE"><![CDATA[Custom Department]]></
field-label>
  <field-description><![CDATA[Custom Department]]></field-
description>
</field-definition>
```

## Procedure

1. In Provisioning, choose `<company name>`.
2. Choose [Edit Job Application Template](#) in the [Manage Recruiting](#) area.
3. Download the template and modify the contents of the job application template in the [Edit Job Application Template](#) page.
4. Upload the modified template.
5. Save your changes by choosing [Save Form](#).

## 21.7.8.2 Effective-Dated Foundation Objects and Generic Objects for Job Application

A Job Application can be created with fields of type Foundation Objects and Generic Objects that have currently inactive values, that become active in future.

For example, a Hiring Manager can start the hiring process for a new Location, which will become active in a month.

The standard application field with ID [startDate](#) is used to identify the date on which to validate, if a value is active or not. It ensures that the validation is not restricted to the current system date. If [startDate](#) field is not defined in the application template then the system uses the standard requisition [jobStartDate](#) field. If the Job Requisition [jobStartDate](#) field it is not defined in the Job Requisition template, then current system date is taken as default.

To configure the Foundation Objects and Generic Objects fields on the [startDate](#), go to ► [Admin Center](#) ► [Manage Recruiting Settings](#) ► [Generic Object / Foundation Object \(GO/FO\) field types](#) ► [Allow users to select only those instances that are active as of the date in the Start Date field in the Job Requisition, Application and Offer Detail pages](#) ►.

In general, the working is similar to that of [Job Requisition Details](#) page.

## 21.7.8.3 Field Criteria Definition for Job Applications

Just like cascading picklists are used to filter or restrict values on a field based on the value selected for another related field, Field Criteria is used to filter on objects (Foundation Object and Generic Object).

To apply field criteria, the objects need to be associated in the object definition in MDF on the Configure Object Definitions page.

A sample definition is as shown. Here, the child object has an association defined to the parent object. You can see only the Business Units (child objects) that are under the Legal Entity (parent object) that you selected earlier.

Employee Central maintains field criteria in the Succession Data Model (SDM). To use associations in Recruiting Management, field criteria has to be defined in the application template. Associations defined in the Succession Data Model aren't automatically copied to the application template.

Field criteria can only be defined for fields of type="object".

Field criteria is applicable in the following scenarios:

- UI
- OData

### Note

We recommend avoiding the following configuration for any operator:

- Parent field - Editable
- Child Field - Read Only

If there's such a configuration, you can't change the child field value. The system displays an error message informing that such an action isn't possible due to configuration issues. This is applicable when the Location field is both single select and multi-select.

The XML attribute field-criteria is defined from the child field to the parent field to form a child to parent relationship. For example, if Location is the parent field and Legal Entity is the child field, the field criteria must be included in the Legal Entity definition.

```
<field-definition id="custom_legalentity" type="object" required="false"
custom="true" object-type="LegalEntity">
  <field-label><![CDATA[Custom Legal Entity]]></field-label>
  <field-label lang="de_DE"><![CDATA[Custom Legal Entity]]></
field-label>
  <field-description><![CDATA[Custom Legal Entity]]></field-
description>
  <field-criteria sourceFieldName="cust_location.externalCode"
destinationFieldValue="custom_location"/>
</field-definition>
```

There are two tags available in **field-criteria**. They are:

- **sourceFieldName**

## Field Criteria Behavior for Parent and Child Field Permissions

| Parent Field Permission | Child Field Permission | Field Criteria Behavior                                                                                                                                                 |
|-------------------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| READ                    | WRITE                  | Field criteria is applied as defined in the Job Application template.                                                                                                   |
| READ                    | READ                   | Since parent and child have Read only permissions, there aren't any changes to the values and the field criteria is ignored.                                            |
| No READ and WRITE       | READ                   | As the child value can't be changed, the field criteria isn't applied.                                                                                                  |
| No READ and WRITE       | WRITE                  | Even though the child field has Write permission, you don't see any values in the child field dropdown as the parent doesn't have Read and Write permissions.           |
| WRITE                   | READ                   | While it's possible to save the offer on changing the parent value, even if the child value is incorrect. It's recommended that you don't modify the template this way. |
| WRITE                   | WRITE                  | As both parent and child fields have Write permissions, the field criteria is applied as defined.                                                                       |

## Field Criteria Association

| Parent field type       | Child field type        | sourceFieldName value (format               | Example                                                                                                                                                             |
|-------------------------|-------------------------|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Standard Generic Object | Standard Generic Object | <name of the association in MDF>.internalId | Parent field type: Division<br>Child field type: Department<br>Name of Association in MDF: cust_to_Division<br>sourceField-Name= <b>cust_to_Division.internalId</b> |

| Parent field type                                                    | Child field type                                                       | sourceFieldName value<br>(format)                               | Example                                                                                                                                                                                                                               |
|----------------------------------------------------------------------|------------------------------------------------------------------------|-----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Standard Generic Object<br>(Effective dating= <b>Basic</b> )         | Custom Generic Object<br>(Effective dating= <b>Basic</b> )             | <name of the association in<br>MDF>.internalId                  | Parent field type: Division<br><br>Child field type: Cust_Unit<br><br>Name of Association in MDF:<br>cust_to_Division<br><br>sourceField-<br>Name= <b>cust_to_Division.in-<br/>ternalId</b>                                           |
| Standard Generic Object<br>(Effective dating= <b>Basic</b> )         | Custom Generic Object<br>(Effective dating= <b>From Pa-<br/>rent</b> ) | parent.internalId                                               | sourceFieldName= <b>parent.in-<br/>ternalId</b>                                                                                                                                                                                       |
| Custom Generic Object<br>(Effective dating= <b>Basic/<br/>None</b> ) | Custom Generic Object<br>(Effective dating= <b>From Pa-<br/>rent</b> ) | parent.mdfSystemInternal-<br>Code                               | sourceFieldName= <b>pa-<br/>rent.mdfSystemInternal-<br/>Code</b>                                                                                                                                                                      |
| Custom Generic Object<br>(Effective Dating= <b>Basic</b> )           | Custom Generic Object<br>(Effective Dating= <b>Basic</b> )             | <name of the association<br>in MDF>. mdfSystemInter-<br>nalCode | Parent field type:<br>cust_GO_Parent<br><br>Child field type:<br>cust_GO_Child<br><br>Name of Association in MDF:<br>cust_Child to_Parent<br><br>sourceField-<br>Name= <b>cust_Child to_Pa-<br/>rent. mdfSystemInter-<br/>nalCode</b> |

| Parent field type                                                                                                                                                                                                                                                                                                                                                                      | Child field type                  | sourceFieldName value (format)            | Example                                                                                                                                                                                         |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Standard Foundation Object                                                                                                                                                                                                                                                                                                                                                             | Standard or Custom Generic Object | <WrapperGOForParentFO>.externalCode       | Parent field type: Location<br><br>Child field type: cust_State_GO<br><br>Name of Association in MDF: cust_State_to_Location<br><br>sourceFieldName= <b>cust_State_to_Location.externalCode</b> |
| <div>  <b>Note</b> <ol style="list-style-type: none"> <li>1. First a wrapper Generic Object is created for the parent Foundation type.</li> <li>2. An association is then defined from the child Generic Object to the Parent type Wrapper Generic Object of the Foundation Object.</li> </ol> </div> |                                   |                                           |                                                                                                                                                                                                 |
| Standard Generic Object                                                                                                                                                                                                                                                                                                                                                                | Standard Foundation Object        | <Name of the Parent field Generic Object> | Parent field type: Department<br><br>Parent field ID: department_obj<br><br>Child field type: Location<br><br>Child field ID: location_obj<br><br>sourceFieldName: Department                   |

- **destinationFieldValue**  
The field ID of the parent field as defined in the job application template.

## 21.7.8.4 Permissions for Job Applications

There are three types of permissions for object fields in Application templates.

- Template role permissions
- Object level permissions
- Target population

These permissions are executed in a specific sequence. At any point in time, if one of these permissions fail, the next set of permissions are not executed. You can define permissions based on the type of Job Application and on the country/region of the candidate.

## 21.7.8.5 Foundation Object and Generic Object Fields in Ad Hoc Reports for Job Applications

While generating Ad Hoc reports in SAP SuccessFactors, you can include Foundation Object and Generic Object fields defined in the Job Application template.

For custom Foundation Object and Generic Object fields types on the Job Application to be available in Ad Hoc reports, it must be configured in ► [Provisioning](#) ► [Managing Recruiting](#) ► [Configure reportable custom fields](#) ►. These fields would then also be available for filtering and can be used to filter records in a report.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### ⓘ Note

For the Foundation Object and Generic Object fields, the Role-Based Permissions and Target Population are not honored while viewing, generating, sharing, or downloading a report.

RBP and Target Population permissions are considered while viewing, generating, sharing, or downloading a report. If you don't have the required permissions (a minimum of Read permission on the Entity), the values aren't visible. The values are blanked out even when you try to filter based on these values when you don't have permissions.

In Ad hoc reports, you can display the effective-dated version of the Foundation Object and Generic Object - `externalName`.

To display the effective-dated version of `externalName` object, the *Allow users to select only those instances that are active as of the date in the Start Date field in the Job Requisition, Application and Offer Detail pages* option must be enabled in ► [Admin Center](#) ► [Manage Recruiting Settings](#) ► [Generic Object / Foundation Object \(GO/FO\) field types](#) ►.

If this option is not enabled, the current system date is used as the value for the `externalName` object, in the Ad hoc report.

| Status   | Description                                                                                                                                                                                                          |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Disabled | The name is as of the current system date.                                                                                                                                                                           |
| Enabled  | RBP and Target Population permissions are considered while viewing, generating, and sharing reports. The value displayed is always from the effective-dated version (active or inactive), that is, as of 31-12-9999. |

## 21.7.8.6 Foundation Objects and Generic Objects for Job Applications

Supported areas for Foundation Objects and Generic Objects in Job Application.

You can include custom fields of type Foundation Objects and Generic Objects in the application template. Changes to values are captured in the Application history. You can also use these fields as tokens. Customers can search job applications based on object fields in the new applicant workbench.

If you wish to populate data into FO/GO fields on the application from the Job Requisition, you can create business rules to auto-populate. This is different to how data flows from FO/GO on the Offer Template.

Business rules on objects within the application template support change rule (onChange) and save rule (onSave) types.

Objects on the application template only allow a single value to be selected.

Objects support role-based permissions (RBP) and permissions defined in the XML template just like any other field.

Objects within the application template are only supported on the new application workbench, the fields are not visible on the legacy workbench.

Objects on the application are supported to map data to flow to Offer Approval Template, Onboarding and Employee Central. Mapping to Onboarding is done from the admin page called Recruit-to-hire. Mapping to EC is done via a transformation template configured in Provisioning.

You can configure objects on the application to be tokens to be used in email or offer templates, this is configured in provisioning.

You can import Candidate Applications with Foundation Object and Generic Object fields in bulk through the job applications import job in Provisioning. However, you can import job applications with other fields in bulk.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### ⓘ Note

- Legacy data migration bulk imports are supported using Scheduled Job for Foundation Objects and Generic Objects in job applications.
- Integration Center doesn't support upserting/updating Foundation Objects and Generic Objects in job applications.

## 21.7.8.7 OData Operation for Job Application

The Foundation Object/Generic Object fields that are defined in the Candidate Application template are available for OData API operations under the following conditions:

### Generic Object Fields

- The Object definition (MDF Entity) must have the API Visibility set appropriately (Editable or Read-only).
- Under Object definition, if the Generic Object field isn't marked as Secured, no permissions are considered while accessing data for the Generic Object.

For the secured Generic Object,

- If the API user has OData MDF Admin access ([Admin access to MDF OData API](#)), no RBP permissions are considered
- If the API user doesn't have the permission, apply RBP Object Level permission and Target Population permission.

#### ⓘ Note

##### API validations for Generic Object fields

Permission validation is performed on data retrieval and modification.

#### ⓘ Note

Following are the prerequisites for any operation on MDF entities:

- ▶ [Metadata Framework](#) ▶ [Read/Write Permission on Metadata Framework](#) ▶ )
- ▶ [Admin access to ODATA API](#) ▶ [Manage Integration Tools](#) ▶ )

### Foundation Object Fields

- If the API user has [Employee Central API](#) permissions, no RBP permissions are considered. The user can access all Foundation Object data on the Requisition.
- If the API user doesn't have the permission, RBP Permissions (Under Manage Foundation object types) on the entity is considered

#### ⓘ Note

- **API validations for Foundation Object fields.**  
Permission validation is performed on data retrieval and modification.  
Data validation such as externalCode and field criteria validations are performed only on data modification (INSERT/UPSERT/UPDATE).
- SFAPI doesn't support Foundation Objects and Generic Objects in Candidate Profile.

## 21.7.9 Using Applications

### 21.7.9.1 Identify New and Updated Applications

Recruiting users viewing the candidate summary page can identify new and updated applications by viewing the [New](#).

The [New](#) column contains one of the following values:

- [New](#): This value appears for applicants that the recruiting user hasn't yet opened up. As soon as the recruiting user opens the applicant, the "New" flag disappears.

- **Updated:** This value is only available in environments that have multi-stage application functionality enabled. This value appears when the candidate has edited the application since the recruiting user last viewed the application. This value disappears once the recruiting user opens the applicant.
- **Blank:** The applicant doesn't fit in either of the scenarios, New or Updated.

#### ⓘ Note

The flag that indicates that there are new candidates appear for job requisitions appear only appear for new candidates that you've never selected previously.

## 21.7.9.2 About Sending Emails From Candidate Application

Recruiting users can initiate outgoing emails to applicants from within the product.

To email en masse, check the boxes next to several applicants in the [Candidate Summary](#) page on the requisition and click [Contact Candidate](#).

The send email screen allows the recruiting user to select from the Recruiting Email templates. The language field defaults to the recruiting user's language but the recruiting user can select an alternative language.

The email sends as shown, except that each user listed in the Candidates and CC field receives an independent copy of the email; candidates can't see each other's email addresses.

If desired, the recruiting user can attach one or more documents that appear as attachments on the email.

Emails sent to an applicant through the Recruiting Management product is in the Correspondence portlet on the application record.

While emailing Agency candidates through the job applications, use the [Send to Agency](#), or [Send to Candidate](#), or [Send to Both](#) options to send emails.

## 21.7.9.3 Print or Save Applications

A Recruiting user can choose to print the application's hard copy, or save the applications to their local computer.

- While a Recruiting user can collapse some sections of an application, you can't change the default the print view to hide or display different sections.
- Resumes can also be printed en masse from the inline resume viewer as accessed from the candidate summary page.

#### ⓘ Note

Customizing the print layout isn't supported.

### Working with Candidate Profile Printing

When viewing a candidate summary page, the Recruiting user can check the boxes next to several applicants and select ► [Actions](#) ► [Print or Save](#) ►.

A pop-up window prompts the Recruiting user to select which elements of the application they wish to include in the PDF document being printed or saved. The Recruiting user can select between only candidate-entered data, or from all data saved on the application.

After making appropriate content selections, the Recruiting user can choose [Print Preview](#) or [Save to File](#).

[Print Preview](#) pulls up a print-friendly PDF copy of the selected applications. The act of creating the PDF can take a few moments, during which a loading screen displays.

Once the PDF is created, the Recruiting user sees a single PDF document containing all the relevant content, and can easily print in a single action.

[Save to File](#) pulls up a compressed (zipped) file that contains a PDF copy of the application, resume, and cover letter for each selected applicant. The act of creating the zipped file can take a few moments, during which a loading screen displays.

When finished, the Recruiting user is prompted to download the zipped file.

The Recruiting user can then save the zipped file to the desired location on their computer.

Alternatively, the Recruiting user can choose to print one applicant at a time from within the application record using the [Print Application Detail](#) button.

A print-friendly version of the application appears.

The Recruiting user can choose to collapse sections of the application, leaving the section heading visible in the printed copy. The Recruiting user can also select [Display Options](#) and unselect sections of the application, which removes them altogether from the printed copy. Resumes and cover letters can't be included in this single-record print approach.

## 21.7.9.4 Save a Partially Completed Application

Candidates can fill in part of an application and return later to finish the remaining application and apply.

It's possible to configure the system to allow the applicant to save an in-progress application and return to complete it at a later date. When enabled, a Save button displays on the application and a Saved Applications tab is available to logged-in candidates.

### Quick Facts:

- It isn't possible to complete a draft application after the job posting has expired or been removed.
- It isn't possible to report on whether or not a candidate has a draft application, or report on data from a draft application
- There's no notification reminder or email option for candidates who have incomplete, draft applications.

## 21.7.9.5 Application Prescreen Questions for Candidates

When the requisition includes prescreen questions, candidates applying to the job are presented with the prescreen questions on the application.

These questions are found at the bottom of the application page during their initial application. If some of the questions are set up as cascading questions, more questions can appear as the candidate completes the visible questions.

### ⚠ Restriction

If you're creating requisitions with free-text questions and the candidate applies for this job, then answers can't include end-of-line characters.

## Related Information

[Requisition Pre-Screen Questions \[page 282\]](#)

## 21.7.9.6 View Completed Application Prescreen Questions

Recruiting users with appropriate permissions to the `questionResponse` field see a [Screening Details](#) section on the application page. This section lists all the applicant's responses to the prescreen questions.

Recruiting users with appropriate permissions see [Rating](#) (from the `averageRating` field) that contains the total sum of all points assigned to weighted questions.

Rating is also available in the candidate summary display options and can be used to sort applicants to find the highest-rated applicants.

## 21.7.9.7 Enabling the Addition of Attachments to a Previously Submitted Application

Enabling this setting allows users to upload attachments after they've already applied to a job.

## Prerequisites

You have access to Provisioning.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Procedure

Navigate to **Provisioning** > **Company Settings** and select *Enable Additional Attachments Post Application*.

*Application XML* contains one or more attachments — or `<multiattachmentselection>` — fields.

- In a multistage application environment, this task is best done by using the multistage functionality.
- The language on this option is adjusted automatically depending on the instance settings:
  - Multistage and Enable Additional Attachments: View/Edit Application and Add Attachments
  - Single Stage and Enable Additional Attachments: View Application and Add Attachments (only if the attachment field is empty and candidates didn't add attachments during the initial application process.)
  - Multistage and disable Additional Attachments: View/Edit Application
  - Single Stage and disable Additional Attachments: View Application

### Note

Uploaded documents won't appear unless you configure the field as `<multiattachment>` or as `<multiattachmentselection>`.

## Results

Candidates can now upload attachments to an existing job application by selecting *View/Edit Application and Add Attachments*. However, if it's a **Single Stage** application environment, then candidates can upload attachments only if they didn't add them during the initial application process.

### Note

Candidates can delete the standard resume and cover letter attachments from the Application. Once attachments have been deleted, they aren't searchable. You can still view the file's content and it's still visible in the audit record, but the content isn't editable.

## 21.8 Interviews in SAP SuccessFactors

Interviews are an important part of the candidate selection process. With SAP SuccessFactors Recruiting you can schedule interviews, communicate with candidates about interviews, and assess candidates after the interview.

## Related Information

[Configuring Interview Central \[page 1168\]](#)

[Configuring Interview Scheduling \[page 1142\]](#)

## 21.8.1 Configuring Interview Scheduling

Configure interview scheduling to enable recruiters to specify their availability for interviews, organize interviews with other interviewers, and email candidates about available interview times.

### Prerequisites

- At least one pipeline step with the Interview Assessment permission is configured in the Job Requisition template.

```
<feature-permission type="interviewAssessment">
  <description><![CDATA[The following roles can launch interviews]]></description>
  <role-name><![CDATA[R]]></role-name>
  <role-name><![CDATA[T]]></role-name>
  <role-name><![CDATA[W]]></role-name>
  <role-name><![CDATA[Q]]></role-name>
  <status><![CDATA[Interview]]></status>
</feature-permission>
```

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- You have the [Enable Calendar](#) and [Enable Interview Scheduling Permission](#) permissions.
- All relevant Recruiting users have the [Calendar](#) and [Interview Scheduling](#) permissions.
- V12 Career Site is enabled.
- If using Data Retention Management, DRM 2.0 is required. DRM 1.0 isn't supported.

### Context

#### ⚠ Caution

Don't enable interview scheduling if your organization needs to use the OData API to create/update/upsert the `JobApplicationInterview` entity or related navigational properties, like `interviewer` or `interviewOverallAssessment`.

When interview scheduling is enabled, the OData API isn't supported for interview-related entities or navigational properties. Use the UI to manage interview records, such as scheduling interviews or providing ratings, instead.

## Procedure

1. Use picklist management tools in Admin Center to configure a picklist for interview virtual location and interview location.
2. Go to ► [Admin Center](#) ► [Manage Recruiting Settings](#) ► and check *Enable Interview Scheduling*.
3. [Set virtual interview locations](#) and [Set face-to-face interview locations](#) to map the two interview scheduling picklists.
4. Go to ► [Admin Center](#) ► [Recruiting Email Triggers](#) ► and configure the following email triggers:
  - Candidate Self-Schedules Interview
  - Interview Confirmation to Candidate
  - Interview Confirmation to Organizers
  - Interview Confirmation to Interviewers
  - Interview Delete Notification
  - Interview Availability Notification
  - Interview Cancellation to Organizers
  - Booked Interview Cancellation to Interviewers
  - Booked Interview Cancellation to Organizers
  - Booked Interview Reschedule Email to Candidate
  - Candidate Interview Response Reminder
  - Booked Candidate Interview Update
  - Cancel Interview Notification
  - Interview Invite Failure Notification to Organizers

## Results

You can now start scheduling interviews at ► [Recruiting](#) ► [Interview Scheduling](#) ►.

The [Interviewers](#) section on the job application no longer exists.

## Next Steps

You can now choose to integrate interview scheduling with Microsoft Office Outlook or enable text message notifications for interviews. If you choose to integrate interview scheduling with Microsoft Office Outlook, you can choose to integrate either using basic authentication or modern authentication.

If you need to delete requisitions after interview scheduling is enabled, use the [Job Requisition Delete](#) feature in the Admin Center.

## Related Information

### 21.8.2 Interview Scheduling with Winston

If have a license for *SmartRecruiters Winston for SAP SuccessFactors*, you can enable candidates to self-schedule their interview using SmartRecruiters Winston.

As an interview coordinator, you can use [Interview Scheduling](#) to send an email invitation to candidates that enables them to use Winston to schedule their own interview.

#### Note

Currently, this feature is only made available on request. If you're interested in using this feature, please contact your Account Executive to get started.

For more information, refer to [SmartRecruiters Winston for SuccessFactors](#)  (requires sign-in with a SmartRecruiters account).

### 21.8.3 Microsoft Outlook Integration for Interview Scheduling

Outlook Integration for Interview Scheduling enables you to access and use the Microsoft Outlook Calendar for scheduling interviews, viewing meeting times, and using invitations.

You can schedule interviews using up-to-date interviewer availability information that is made available through Microsoft Outlook Calendar. Times that are blocked for meetings or other activities doesn't show on the availability grid.

0 time slots selected to cover 3 interview sessions

Selected Available Already sent

You can send meeting invites to interviewers to help them track and attend the interview on time. You can also get their responses using hello. The email invite sent to an interviewer allows the interviewer to accept, decline, provide a tentative response, or propose a new time by choosing the corresponding response buttons.

Candidate interviews can be rescheduled as necessary and interviewers can remove previously scheduled interviews using the Microsoft Outlook Calendar.

The HCM suite dashboard displays candidate responses. To view the candidate's response to the meeting invite, go to [Recruiting](#) [Scheduling](#).

### Note

The back-end system updates interviewer and room availability statuses once an hour.

From 1H 2024 onwards, you can set up custom service connection and grant admin consent to enable Microsoft Outlook for SAP SuccessFactors processes, using the [Work Tech Configuration](#) page. For more information, refer **Related Information**.

### Note

- The [Set Up Interview Scheduling Outlook Integration](#) page will no longer be supported for scheduling interview using Microsoft Outlook.
- For existing customers, all configurations and set up for Microsoft Outlook in Interview Scheduling is moved to [Work Tech Configuration](#).
- You can use the [Work Tech Configuration](#) page to set up new configurations or modify exiting configurations.

### 21.8.3.1 Technical Details for Interview Scheduling Outlook Integration Using Modern Authentication

Learn about using Modern Authentication for Interview Scheduling Outlook Integration (ISOI) with Microsoft Exchange Online and Microsoft Office 365.

Interview Scheduling Outlook Integration (ISOI) supports integration with Microsoft Exchange Online and Microsoft Office 365 using Modern Authentication. Exchange Online supports this integration with or without multifactor authentication enabled. ISOI connects to Exchange Online using Microsoft Graph and Microsoft Authentication libraries, which implement OAuth 2.0 token-based authorization.

Integrating Interview Scheduling with Exchange Online and Outlook 365 using Modern Authentication follows these two tasks:

1. Registering an application for your Service Account in Microsoft Azure portal and noting down the credentials. For more information, refer to the *Important Considerations While Registering an Application on the Azure Portal* section in this topic.
2. Setting up connection for ISOI with Exchange Online on the ► [Admin Center](#) ► [Work Tech Configuration](#) ▾ page. For more information, refer to *Integrating Interview Scheduling with Microsoft Office Outlook Using Modern Authentication*.

### Important Considerations While Registering an Application on the Azure Portal

Azure Active Directory (Azure AD) manages the connectivity of Office 365 with Interview Scheduling and Exchange Online. To set up this integration, you must register an application with Azure AD and use the information generated in Azure AD to configure ISOI. For detailed information about the steps to register an application on the Azure portal, refer to **Microsoft documentation**.

While registering your application on the Azure portal, ensure that you complete the following actions:

- Note down the following information generated in Azure AD:
  - Application (client) ID
  - Directory (tenant) ID
  - Client secret value

#### Note

To prevent problems that can occur when a client secret expires, you can set the client secret to “never expires” when you register your application on the Azure portal.

- Note down the email ID of the Service Account associated with your application. For example: `Interview.Scheduling@customerdomain.com`.

### Note

If you're switching over from Basic Authentication to Modern Authentication, use the same email ID associated with the Service Account in Exchange Web Server. This ensures that previously scheduled interviews and meetings, and settings for email triggers are retained in the new setup.

- Ensure that you choose the following API permissions and grant admin consent to allow ISOI to access the required Graph APIs for sending or receiving emails, and accessing the calendars of organizers and interviewers:
  - [Delegated permissions](#)  
Calendars: `Calendars.Read.Shared` and `Calendars.ReadWrite.Shared`
  - [Application permissions](#)  
Calendars: `Calendars.Read` and `Calendars.ReadWrite`  
Mail: `Mail.ReadWrite` and `Mail.Send`  
With these permissions, you can attach files up to 3 MB to the meeting invites.

### Note

If you need to attach files greater than 3 MB to the meeting invites, Microsoft recommends enabling the `Mail.ReadWrite` Application permission.

## Service Account

The ISOI feature uses a Service Account to authenticate and to interact with Microsoft Exchange Online. The Service Account is a normal Exchange account and all interaction with Exchange Online is done through this Service Account. The Service Account creates, sends, updates, or deletes meeting requests for any users and resources you want to include in the interviewing process.

## Security Considerations

The ISOI acts as a client or user to read free and busy times and manages meeting notices sent from the Service Account. ISOI doesn't store any schedule or email data except interview data managed by SAP SuccessFactors.

### Note

Customer security teams need to understand the implications of implementing ISOI in their specific situations. SAP SuccessFactors encourages customer security teams to discuss the implementation of Exchange Online with the customer Exchange support staff or the email service provider.

## Questions and Answers

1. Does ISOI support multiple domains in a tenant?  
No.

2. Can meetings scheduled in Outlook 365 be retained when switching over from Basic Authentication to Modern Authentication?  
Yes. While creating your account in Azure AD, ensure that you use the same email ID associated with your Service Account in Microsoft Exchange Web Server (EWS). By retaining the same email ID, meetings scheduled in Outlook 365 for upcoming interviews are automatically migrated to Azure AD.
3. Is there a way to test this connection?  
Yes. The ISOI Admin Tool can test the connection. This test can be run at any time and must be completed successfully before ISOI is enabled.
4. Does ISOI support HTTP protocol while using Modern Authentication to connect with Exchange Online?  
No. ISOI supports only HTTPS protocol to connect with Exchange Online.
5. Does ISOI support Modern Authentication if Multifactor Authentication (MFA) is enabled for only few users in Exchange Online?  
Yes. ISOI supports Modern Authentication irrespective of whether MFA is enabled for all or few users in Exchange Online.
6. Are there any known limitations that I must be aware of while switching over from Basic Authentication to Modern Authentication?  
In ISOI using Basic Authentication, you can forward an interview email notification to an existing interviewer in a booked interview. You can find this option by expanding the interview panel and choosing the interviewer's photo.  
ISOI using Modern Authentication is designed to support this functionality. However, the Microsoft API necessary for this functionality to work is currently not available.
7. Is a hybrid Outlook landscape with some users using on-premise Outlook and others using Office-365 (Cloud) supported?  
No.

[Integrating Interview Scheduling with Microsoft Office Outlook Using Modern Authentication \[page 1148\]](#)

### 21.8.3.2 Integrating Interview Scheduling with Microsoft Office Outlook Using Modern Authentication

Learn how to use Modern Authentication to integrate Interview Scheduling with Microsoft Azure Active Directory and Exchange Online.

## Context

Set up custom service connection and grant admin consent to enable both Microsoft Outlook and Teams online meetings for SAP SuccessFactors processes, such as interview scheduling using Outlook and Teams online meetings.

## Procedure

1. Go to [Admin Center](#) > [Manage Recruiting Settings](#).
2. Choose [Verify and Connect](#) from [Microsoft Integrations with Interview Scheduling](#) > [Validate your connection with Microsoft 365 using this option](#).
3. Choose [Enable Microsoft Outlook Integration](#).
4. Choose [Save](#).
5. To Set up custom service connection and grant admin consent to enable Microsoft Outlook meetings for SAP SuccessFactors processes, such as interview scheduling using Outlook, refer to [Enabling Microsoft Outlook and Teams Online Meetings for SAP SuccessFactors Processes](#) link in the **Related Information** section.

## Related Information

[Enabling Microsoft Outlook and Teams Online Meetings for SAP SuccessFactors Processes](#)

### 21.8.3.3 Booking Rooms with Outlook Integration

Room bookings are supported with Outlook integration.

## Context

Admins must keep a record of the file to make updates. Rooms can't be downloaded from the Admin page and a full file needs to be uploaded each time. Uploading only delta rooms clears the existing rooms.

## Procedure

1. To configure rooms, import a list of meeting rooms and details using [Recruiting](#) > [Manage Recruiting Settings](#) > [Microsoft Integrations with Interview Scheduling](#) > [Import Interview Rooms](#). The file format must be comma-separated value (CSV).

Column headings in the CSV file must be in uppercase and must follow this order: email, room\_name, location, phone, capacity, and status. Appropriate values for the status are active or inactive (case sensitive, lowercase).

2. Navigate to [Recruiting](#) > [Interview Scheduling](#).
3. Choose a candidate profile and click [Interviews](#) > [Interview](#).

4. Select the rooms. Organizers see a link to add possible rooms to the interview. They can include multiple rooms that can be suitable for the interview, and the system picks the first room that is available in no particular order. Pick multiple rooms if you're doing Candidate Self-Scheduling to improve the chances of room availability by the time the candidate books.
5. Receive room confirmation. Once the slot is booked, the Interviewers and first available room receive a meeting invitation, and the room appears in the *location* field on the meeting invite. If rooms are unavailable, the Organizer receives an e-mail notification saying the room declined (assuming the *Outlook Response to Interview Organizer* e-mail trigger is configured). If the room declines, the Organizer can go to the *Interview Scheduling* dashboard and change the room by clicking on the room icon on the *Candidate Card* in *Booked*.

### 21.8.3.4 Setting Up E-Mail Notifications for Interview Scheduling Responses

Set up e-mail notifications and e-mail triggers for the Outlook Integration for Interview Scheduling, so that a notification is triggered when interviewers and rooms respond to a meeting invitation.

#### Procedure

1. Go to ► *Admin Center* ► *Manage Recruiting Email Templates* ► to enable the e-mail trigger.
2. Configure a template including the tokens *Outlook\_Interview\_Respondent* and *Outlook\_Interview\_Response*.
3. Go to ► *Admin Center* ► *Manage Recruiting Email Triggers* ► and enable the *Outlook Response to Interview Organizer* trigger.

## Results

The e-mail trigger automatically sends an email notification to all of the assigned Organizers. Customers can also choose to include any Recruiting Roles on the e-mail.

### 21.8.4 Microsoft Teams Integration for Interview Scheduling

Microsoft Teams Integration for Interview Scheduling enables you to include Microsoft Teams meeting information when you schedule an interview.

You can do the following:

- Add a Microsoft teams virtual conference room and meeting information as part of the interview scheduling process.
- Select single or a panel of interviewers when scheduling the online interview with Microsoft Teams.
- Trigger emails which includes Microsoft Teams meeting information based on the action of candidates, interviewers, and organizers.

#### Note

- For an existing customer who is already using the Outlook Integration for Interview Scheduling, this option is enabled by default in the Admin Center.
- For a new customer opting for the Microsoft Teams Integration for Interview Scheduling feature, you've to set up the integration between your SAP SuccessFactors system and Microsoft 365 in the Work Tech Configuration page.

#### 21.8.4.1 Technical Details for Interview Scheduling Teams Integration

Learn about Interview Scheduling Teams Integration with Microsoft Exchange Online and Microsoft Office 365.

Microsoft Teams Integration with Interview Scheduling supports integration with Microsoft Exchange Online and Microsoft Office 365. Microsoft Teams connects to Exchange Online using Microsoft Graph and Microsoft Authentication libraries, which implement OAuth 2.0 token-based authorization.

Integrating Interview Scheduling with Exchange Online and Outlook 365 using Modern Authentication follows these two tasks:

1. Registering an application for your Service Account in Microsoft Azure portal and noting down the credentials. For more information, refer to the *Important Considerations While Registering an Application on the Azure Portal* section in this topic.
2. Setting up a connection for Interview Scheduling Microsoft Teams Integration with Exchange Online in the [Admin Center](#) > [Microsoft Integration with Interview Scheduling](#) > [Verify and Connect](#) page.

## Important Considerations While Registering an Application on the Azure Portal

Azure Active Directory (Azure AD) manages the connectivity of Office 365 with Interview Scheduling and Exchange Online. To set up this integration, you must register an application with Azure AD and use the information generated in Azure AD to configure Microsoft Teams Integration for Interview Scheduling. For detailed information about the steps to register an application on the Azure portal, refer to **Microsoft documentation**.

While registering your application on the Azure portal, ensure that you complete the following actions:

- Note down the following information generated in Azure AD:
  - Application (client) ID
  - Directory (tenant) ID
  - Client secret value

### Note

To prevent problems that can occur when a client secret expires, you can set the client secret to “never expires” when you register your application on the Azure portal.

- Note down the email ID of the Service Account associated with your application. For example: Interview.Scheduling@customerdomain.com.
- Ensure that you choose the following API permissions and grant admin consent to allow Microsoft Teams Integration for Interview Scheduling to access the required Graph APIs for sending or receiving emails, and accessing the calendars of organizers and interviewers:

#### Application Permissions

- For Online Meetings: `OnlineMeetings.Read.All` and `OnlineMeetings.ReadWrite.All`
- For Online Meeting Artifact: `OnlineMeetingArtifact.Read.All`
- For Calendars: `Calendars.Read` and `Calendars.ReadWrite`

## Service Account

The Interview Scheduling Microsoft Teams Integration feature uses a Service Account to authenticate and to interact with Microsoft Exchange Online. The Service Account is a normal Exchange account and all interaction with Exchange Online is done through this Service Account. The Service Account creates, sends, updates, or deletes meeting requests for any users and resources you want to include in the interviewing process.

## Security Considerations

The Interview Scheduling Microsoft Teams Integration acts as a client or user to read free and busy times and manages meeting notices sent from the Service Account. ISOI doesn't store any schedule or email data except interview data managed by SAP SuccessFactors.

## Note

Customer security teams need to understand the implications of implementing ISOI in their specific situations. SAP SuccessFactors encourages customer security teams to discuss the implementation of Exchange Online with the customer Exchange support staff or the email service provider.

## 21.8.4.2 Configurations and Requirements for the Microsoft Teams Integration

Start setting up the Microsoft Teams Integration by enabling these prerequisites and doing the necessary configurations.

Prerequisites and Configurations for Different Roles

| As a Microsoft Exchange Administrator                                                                                                                                                                                                 | As a SuccessFactors Administrator                                                                                                                                                                                                                                                                                                                                 | As a SuccessFactors Recruiting Administrator                                   |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
| Create an application registry and enable the following permissions to integrate SAP SuccessFactors Recruiting and Microsoft Teams:                                                                                                   | <ul style="list-style-type: none"><li>• Role-based Permission - <a href="#">Enable Access to OAuth Configurations</a> in <a href="#">Administrator Permissions</a> <a href="#">Manage Security Center</a>.</li><li>• Enable <a href="#">Work Tech Configuration</a> <a href="#">Administrator Permissions</a> <a href="#">Manage System Properties</a>.</li></ul> | Ensure to enable the necessary prerequisites for Interview Scheduling feature. |
| <ul style="list-style-type: none"><li>• <code>OnlineMeetings.Read.All</code></li><li>• <code>OnlineMeetings.ReadWrite.All</code></li><li>• <code>OnlineMeetingArtifact.Read.All</code></li><li>• <code>User.Read.All</code></li></ul> |                                                                                                                                                                                                                                                                                                                                                                   |                                                                                |

| As a Microsoft Exchange Administrator                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | As a SuccessFactors Administrator                                                                                                                                                                                                                    | As a SuccessFactors Recruiting Administrator                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The permissions mentioned in the previous row allows specific recruiting users to include the meeting information such as meeting ID, link, and passcode in the emails sent to candidates, interviewers, and organizers.</p> <p>Organizers and interviewers must enable the following permissions to reserve time slots on the calendar within the Microsoft Teams Application:</p> <ul style="list-style-type: none"> <li>• <code>CalendarRead</code></li> <li>• <code>CalendarReadWrite</code></li> </ul> | <p>Navigate to the <a href="#">Security Center</a> page and input the required information in the <a href="#">OAuth Configuration</a> section. You can copy the information from the Microsoft Exchange portal and proceed to save the settings.</p> | <p>Run a scan to validate your configurations by clicking on the <a href="#">Verify and Connect</a> option. The verification initiates some background processes to confirm that integration is working correctly.</p> <p>After successful verification, select the <a href="#">Enable Microsoft Teams Integration</a> option from the <a href="#">Interview Settings</a> <a href="#">Manage Recruiting Settings</a> page.</p> |
| <p>To configure these settings, contact the Microsoft Exchange Administrators within your organization. Note that these administrators aren't from SAP SuccessFactors.</p>                                                                                                                                                                                                                                                                                                                                     | <p>Access the <a href="#">Work Tech Configuration</a> page, and after successfully connecting and authenticating the Microsoft Teams for online meetings, proceed to enable the integration.</p>                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <p>For more information, go to <a href="https://learn.microsoft.com/en-us/graph/outlook-calendar-online-meetings?tabs=java">https://learn.microsoft.com/en-us/graph/outlook-calendar-online-meetings?tabs=java</a>.</p>                                                                                                                                                                                                                                                                                        | <p>For more information, go to <a href="#">Integrating SAP SuccessFactors with Microsoft 365</a>.</p>                                                                                                                                                | <p>For more information, go to <a href="#">Enabling Microsoft Teams Online Meetings for SAP SuccessFactors Processes</a>.</p>                                                                                                                                                                                                                                                                                                  |

## 21.8.4.3 Setting Up Interview with Microsoft Teams

Interview scheduling supports Microsoft Teams meeting information as part of the interview process.

### Prerequisites

- Ensure that you've configured [Interview Scheduling](#).
- Verify and connect to Microsoft Exchange Online. A service account is set up on the Microsoft Exchange Web Server.
- The following application permissions must be enabled to use Microsoft Teams.
  - For Online Meetings: `OnlineMeetings.Read.All` and `OnlineMeetings.ReadWrite.All`
  - For Online Meeting Artifact: `OnlineMeetingArtifact.Read.All`
  - For Calendars: `Calendars.Read` and `Calendars.ReadWrite`
- Ensure that you've the Application access policy to enable the Microsoft Graph APIs or Microsoft Teams integration.
- Ensure that you've enabled [Enable Microsoft Teams Integration with Interview Scheduling](#) option in [Admin Center](#) [Manage Recruiting Settings](#).

## Context

Interviewers and candidates can use the Microsoft Teams meeting to attend phone, virtual, or face-to-face meetings during an interview process.

## Procedure

1. Navigate to [Recruiting](#) > [Interview Scheduling](#).
2. Go to the [Job Requisitions](#) tab.

Recruiters can see all the job requisitions they have `interviewAssessment` permissions for, provided they have `VisibleTo` permissions for the status set.

3. Select the candidate for which you would like to schedule an interview and choose [Start Scheduling](#).
4. Enable [Microsoft Teams](#) option available as part of the Online meeting options.
5. Select [Save](#) and [Continue](#).

## Results

An email with the details about the interview and Microsoft teams meeting link is sent to the candidate.

### Note

- The email that is sent out using the [Candidate Self-schedules Interview](#) trigger doesn't include Microsoft Teams meeting information.
- The emails that are sent out after an interview confirmation, using the following triggers include Microsoft Teams meeting information:
  - [Interview Confirmation to Candidate](#)
  - [Interview Confirmation to Interviewers](#)
  - [Interview Confirmation to Organizers](#)
- For reschedule scenarios, applicable trigger emails include the Microsoft Teams meeting information.

## Related Information

[Enabling Microsoft Teams Online Meetings for SAP SuccessFactors Processes](#)

## 21.8.4.4 Expected Behavior for Interview Scheduling Teams Integration

- For customers who have enabled Outlook integration, the configurations and setup are maintained separately in the [Set Up Interview Scheduling Outlook Integration](#) page until this solution is migrated to Work Tech. The probability of updates to the existing configuration is less.
- Short Message Service (SMS) is not supported for Microsoft Teams. The Microsoft Teams meeting information is not sent as part of any SMS specific triggers that work with Interview Scheduling.
- The Microsoft Teams meeting doesn't include information such as call in details, phone numbers, and toll free numbers as these are specific to the service account defined in the Azure portal and isn't country/region-specific.
- The Microsoft Teams meeting information and other details aren't displayed in the [My Calendar](#) section of the interviewer.
- If an interview requires multiple interviewers and a candidate, a consolidated email is sent to the candidate with multiple meeting information (different meeting ids) in a tabular format. Each interviewer receives an email with the corresponding meeting id and other information. This is valid for both interview creation and reschedule scenarios.
- If a recruiter selects the option to schedule an interview using Microsoft Teams, the option is always enabled. If the same interview is rescheduled, the recruiter can't convert the Teams meeting to an offline interview. However, you can reschedule the interview by deleting the earlier interview slot. The recruiter can update the meeting option to choose an online or offline interview.
- When the recruiter reschedules an interview, an option to enable the toggle is available to the interview organizer even if the Microsoft Teams toggle was disabled initially. Also, for a rescheduled interview, the recruiter can convert the initial offline interview to an online interview.
- The email confirmation sent to a candidate for an interview with one or more interviewers includes Microsoft Teams meeting information, interviewers details, and the candidate information.
- If you are an external candidate, wait for the recruiter or interviewer to admit you into the meeting, irrespective of whether you use Outlook integration. This restriction doesn't apply to the internal candidates as they're already part of the system.

## 21.8.5 Interviews in the SAP SuccessFactors Application in Microsoft Teams

You can use SAP SuccessFactors application to manage the interview process in Microsoft Teams.

During an interview process, you can assist interviewers by notifying them about an upcoming interview and providing them with generated interview questions based on the job description in the SAP SuccessFactors application.

The interviewers are notified about an upcoming interview in the SAP SuccessFactors application in Microsoft Teams which helps them prepare in advance to interview the candidate. Additionally, you can also provide feedback after an interview and view the evaluation results.

## 21.8.5.1 Generating Interview Questions

Assists interviewers by providing them with generated interview questions based on the job description.

### Prerequisites

- You've purchased the **AI units** license. For more information about **AI units** license, please contact your Account Executive.
- You've enabled the [Admin Center](#) > [Manage Recruiting Settings](#) > [Interview Settings](#) > [Interviews in Microsoft Teams SAP SuccessFactors App](#) > [Enable Interview Alerts in Microsoft Teams](#) option.
- You've enabled the [Admin Center](#) > [AI Services Administration](#) > [Feature Settings](#) > [Recruiting](#) > [Assisted Interview Questions](#) setting.
- You have the [User Permissions](#) > [AI Access](#) > [Assisted Interview Questions](#) permission.

### Context

Interviewers receive a notification 24 hours before an upcoming interview in the SAP SuccessFactors application in Microsoft Teams, which helps them to prepare in advance.

### Procedure

You receive an [Applicant Information](#) section along with the upcoming interview notification. This section provides the applicant name and the applied position details. You can do the following in this section:

1. Generate questions based on job description using the [Generate Interview Questions Using AI](#) option.

#### Note

The **AI Usage Acknowledgment** dialog is not applicable for generating interview questions using generative AI capabilities.

2. Navigate to the applicant profile in SAP SuccessFactors system using the [View Applicant Profile](#) option.

### Results

The [Suggested Interview Questions](#) section appears displaying interview questions that are generated based on the job description using AI.

### ⓘ Note

The suggested interview questions are generated using AI. Ensure that you review the results and make the necessary changes.

## Next Steps

You can view the skills and competencies that are used to evaluate the applicant and manually prepare additional questions for an interview using the [Interview Evaluation](#) section. This section also appears in the SAP SuccessFactors application in Microsoft Teams 24 hours before the interview.

## 21.8.5.2 Evaluating Interviews and Viewing Results

You can view the skills and competencies to evaluate an applicant and provide interview feedback using Microsoft Teams in SAP SuccessFactors.

## Prerequisites

- You've set up the integration between your SAP SuccessFactors system and Microsoft 365 in the Work Tech Configuration page. For more details, refer to the **Related Information** section.
- You've selected the following options in the [Interviews in Microsoft Teams SAP SuccessFactors App](#) section in [Admin Center](#):
  - [Enable Interview Alerts in Microsoft Teams](#)
  - [Enable Interview Assessment in Microsoft Teams](#)

## Context

The [Interview Evaluation](#) card appears in the SAP SuccessFactors application in Microsoft Teams 24 hours before the interview.

## Procedure

1. Choose [Provide Feedback](#) option in the [Interview Evaluation](#) card to evaluate the applicant.

The [Interview Evaluation](#) card expands to display the applicant name, applied position, and the assessment form where you can provide rating for the configured competencies and skills.

2. Provide your rating for individual skills in the [Interview Evaluation](#) card.

The values for ratings of each skill are configurable in the SAP SuccessFactors system.

3. You can also provide an [Overall Rating](#) for the applicant, which allows you to choose whether they're [Recommended](#) or [Not Recommended](#) in the [Interview Evaluation](#) card.

4. Choose [Submit](#) once you complete evaluating the applicant in the [Interview Evaluation](#) card.

An [Interview Evaluation Completed](#) card appears after you submit the feedback.

5. You can choose one of the following options in [Interview Evaluation Completed](#) section to view the evaluation results:

- [View Evaluation](#) option to view the results of the evaluation in Microsoft Teams itself.
- [View in Interview Central](#) SAP SuccessFactors system.

### 21.8.6 Setting Up an Interview Schedule Without Interviewer Details

Enable recruiters to reserve custom interview time slots in advance for a job requisition.

## Prerequisites

Ensure that you configure [Interview Scheduling](#).

## Context

Each requisition displays the total number of candidates available for an interview and displays the interview status as either [Booked](#) or [Not Booked](#). You can set up interview availability on an on demand or recurring basis.

When [Interview Scheduling](#) is configured, interview setup is no longer configured through the [Interviewers](#) portlet on the application. The [Interviewers](#) portlet is hidden.

## Procedure

1. Go to the [Job Requisitions](#) tab.

Here, recruiters can see all the job requisitions they have `interviewAssessment` permissions for, provided they have `VisibleTo` permissions for the status set.

2. Choose [Interview Steps](#) to display details about candidate's position in the interview process.
3. Choose the [X not started](#) button to schedule a new interview.
4. Select the candidate for which you would like to schedule an interview and choose [Start Scheduling](#).
  1. On this screen, you can provide a title for the interview, assign other users to help with scheduling, set the interview type (phone, virtual, or face-to-face), and choose a location for the interview. Assigned participants in an interview can edit the schedule.
  2. You can also set up a group candidate interview by increasing the number of candidates who can book the same time slot to greater than one.

### Note

- If your system has been configured with two-level cascading picklist, then you see two levels for the [Location](#) dropdown. If it has been configured for three levels, then you see three levels. If you've it as a single level, then you see only one [Location](#) field.
- You can add a new location value for face-to-face interviews by selecting [Add New](#) from the first picklist dropdown list. However, the second and third picklist dropdown lists don't get updated with any value.
- If tokens for second and third picklist dropdown lists aren't configured in the [Manage Recruiting Settings](#) page, then they don't resolve for face-to-face interviews, and virtual interviews.
- For [Add New](#) field, tokens for second and third picklist dropdown lists don't resolve as only one level picklist is supported.
- Organizers sometimes schedule interviews for participants who are in distant time zones from themselves. For example, the candidate and interviewer could be 12 or more hours ahead of the organizer's time zone. When using [Add Custom Slot](#) to choose a [From](#) and [To](#) date and time, the system allows the organizer to schedule interviews for any time of day, even beyond midnight in the recruiter's own time zone.

5. Under the [Choose a time slot](#) section, select [Add Custom Slot](#), and add the appropriate time slots. Select [Continue](#).
6. Select an email template and language, and edit the default template if necessary. Add any relevant attachments.

If the organizer selects only one time slot for the interview, organizers can confirm this time on behalf of the candidate or candidates. A checkbox appears on the [Contact Candidate](#) screen that says [Book this slot for candidates](#). If this box is checked, the candidate or candidates are booked into this time.

Organizers can also book a candidate for an interview time slot without forcing the candidate to log on. They can book the interview for all interviewers, including creating an [Interview Assessment](#) form in [Interview Central](#).

If the organizer hasn't received a response or must send an invitation again, they can do so from the [Booked Candidates](#) popup by choosing the interviewer's photo.

7. Choose [Send to Candidate](#).

After the time slot is scheduled, the candidate receives an invitation email, to invite them to select an interview session or confirm the appointment. Organizers can choose to update an interview schedule without sending an email to the candidate.

If a change is necessary after an interview has been sent, the organizer can reschedule or update the details in the interview. The candidate is notified via email.

The organizer can also delete the entire interview and the system notifies all relevant participants of the change via email.

## Next Steps

If interview was scheduled without adding interviewers, organizers need to update the interview later to include interviewers.

## 21.8.7 Setting Up an Interview Schedule with Interviewer Details

Enable recruiters to reserve interview time slots for interviewers and candidates in advance for a job requisition.

## Prerequisites

Ensure that you configure [Interview Scheduling](#).

## Context

Each requisition displays the total number of candidates available for an interview and displays the interview status as either [Booked](#) or [Not Booked](#). You can set up interview availability on an on demand or recurring basis.

When [Interview Scheduling](#) is configured, the interview setup is no longer configured through the [Interviewers](#) portlet on the application. The [Interviewers](#) portlet is hidden.

## Procedure

1. Go to the [Job Requisitions](#) tab.

Here, recruiters can see all the job requisitions they have `interviewAssessment` permissions for, provided they have `VisibleTo` permissions for the status set.

2. Choose [Interview Steps](#) to display details about a candidate's position in the interview process.
3. Choose the [X not started](#) button to schedule a new interview.
4. Select the candidate for which you would like to schedule an interview and choose [Start Scheduling](#).
  1. On this screen, you can provide a title for the interview, assign other users to help with scheduling, set the interview type (phone, virtual, or face-to-face), and choose a location for the interview. Assigned participants in an interview can edit the schedule.
  2. You can also set up a group candidate interview by increasing the number of candidates who can book the same time slot to greater than one.

### Note

- If your system has been configured with two-level cascading picklist, then you see two levels for the [Location](#) dropdown. If it has been configured for three levels, then you see three levels. If it has been configured as a single level, then you see only one [Location](#) field.
- You can add a new location value for face-to-face interviews by selecting [Add New](#) from the first picklist dropdown list. However, the second and third picklist dropdown lists aren't updated with any value.
- If tokens for second and third picklist dropdown lists aren't configured in the [Manage Recruiting Settings](#) page, then they don't resolve for face-to-face interviews, and virtual interviews.
- For [Add New](#) field, tokens for second and third picklist dropdown lists don't resolve, as only single level picklist is supported.

5. Complete the following steps:

1. Select the interviewers, then choose [Find Availability](#) to see available times the interviewers have in common.  
Interviewers can be added by name or requisition recruiting role. Recruiting teams can also be used.

### Note

If interviewers have set up the Microsoft Outlook Calendar integration, then interviewer availability is obtained directly from their Microsoft Outlook Calendar. Otherwise, it's obtained from the available slots that they've added under [Interview Scheduling > My Calendar](#).

There's no optional attendees function for interviewers. You can configure back-to-back interviews where several interviewers attend the interview one after another and each interviewer has their own allocated time slot to attend the interview.

To view availability on a specific date in the future, you can type the date in the [Date](#) field apart from choosing the [>](#) button to move to the next date.

2. Click and drag to move the bar to change the interview order. Or, schedule a break between interviews to create back-to-back interviews (interviews with different interviewers who aren't all present at the same time).

### Note

If a user is an interviewer on an active application or job requisition, the user isn't purged as part of the purge inactive user job.

3. Set the interview duration.

#### Note

Interviews have a default 30-minute time interval.

4. To create a panel interview, select an interviewer, extend the bar to set the duration, and add the rest of the interviewer team.

#### Note

When looking for time slot availability:

- Dark Gray time slots are times common to both interviewers and fully available.
- Lighter Gray time slots are common to both interviewers, but have been sent for another interview, although they aren't yet booked.
- Blue time slots are ones the recruiting user has selected, or slots that have already been sent for that interview.
- If there aren't enough available time slots left to schedule an interview, organizers can choose to view time slots where some interviewers are unavailable by selecting [Show slots even if some users are unavailable](#). The system shows who is unavailable in each case and provides a link to email this person to ask if they can be available. This option to display partially available time slots shows slots only where up to two interviewers are available.

Organizers can add time slots on behalf of an interviewer in case the interviewer is available but hasn't yet added their available time into the system using the [Add Custom Slot](#) link. Organizers can also choose a specific start time, even if the time doesn't show on the availability finder.

Organizers sometimes schedule interviews for participants who are in distant time zones from themselves. For example, the candidate and interviewer could be 12 or more hours ahead of the organizer's time zone. When using [Add Custom Slot](#) to choose a [From](#) and [To](#) date and time, the system allows the organizer to schedule interviews for any time of day, even beyond midnight in the recruiter's own time zone.

By default, the availability time slots are hidden. To see availability, select [Show Slots](#).

Once you have designated available time for interviews, organizers can see upcoming appointments and cancel interviews. If an interview is canceled, the booked candidate receives a reminder to book a new interview time. If no times are available, the candidate sees a link to contact the recruiter. The ability to cancel interviews isn't configurable.

5. Click [Continue](#).
6. Select an email template and language, and edit the default template if necessary. Add any relevant attachments.

If the organizer selects only 1 time slot for the interview, the organizer can confirm this time on behalf of the candidate or candidates. A checkbox appears on the [Contact Candidate](#) screen that says [Book this slot for candidates](#). If this box is checked, the candidate or candidates are booked into this time.

Organizers can also book a candidate for an interview time slot without forcing the candidate to log on. They can book the interview for all interviewers, including creating an [Interview Assessment](#) form in [Interview Central](#).

If the organizer hasn't received a response or must send an invitation again, they can do so from the [Booked Candidates](#) popup by choosing the interviewer's photo.

7. Choose [Send to Candidate](#).

After the time slot is scheduled, the candidate receives an invitation email, to invite them to select an interview session or confirm the appointment.

If a change is necessary after an interview has been sent, the organizer can reschedule or update the details in the interview. The candidate is notified by email.

The organizer can also delete the entire interview and the system notifies all relevant participants of the change through email.

## Results

Once the candidate confirms an interview time, the interviewers receive an email confirmation and a to-do list item to complete the [Interview Assessment](#) in [Interview Central](#).

## 21.8.8 Selecting Locations for Face-To-Face Interviews

Select specific locations by narrowing down your choice for face-to-face interviews using cascading dropdown lists. You can therefore speed up the task of setting up interview locations, instead of going through a long list of available locations.

## Prerequisites

Ensure that you have checked [Enable Interview Scheduling](#) in [Manage Recruiting Settings](#).

## Context

You can configure up to three levels of selection for face-to-face interview location. Lower-level picklist value is dependent on the top-level picklist value. Similarly, lowest level picklist value is dependent on the lower-level picklist value. In the [Interview Scheduling](#) tab, you can select entries for the first picklist dropdown list. The next picklist values get filtered based on the value selected in the top level. You can enter your own labels in multiple languages using [Change Language](#) dropdown list.

For all the face-to-face interviews that are scheduled before updating the top-level picklist ID, the [Interview Scheduling](#) tab displays existing value of the picklist. For interviews that are scheduled after you configure values for all the three picklists, the changes are applied to the [Interview Scheduling](#) tab. You can then view the [Location](#) field in the [Interview Scheduling](#) tab.

Candidates can view these labels and the selected values for an interview location under [My Interviews](#) tab. Both internal and external career sites display these values after you schedule an interview. The system displays these labels for all three level picklists according to the selected language in the Career Site.

## → Remember

Changing the picklist ID values for face-to-face interview locations in [Manage Recruiting Settings](#) is going to impact interview locations for draft interviews, and for interviews that aren't booked in [Interview Scheduling](#).

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Settings](#) ►.
2. Find the [Interview Central](#) section on the page.
3. Select picklist IDs for the following fields in the [Set face-to-face interview locations](#): screen area.
  - Set face-to-face interview location top-level picklist:
  - Set face-to-face interview location lower-level picklist:
  - Set face-to-face interview location lowest level picklist:

### 📌 Note

- You can create your own labels in multiple languages using the [Change Language](#) dropdown list.
- You can enter values for your own choice for [Picklist Labels](#). These values reflect as field names for the picklist dropdown lists in [Interview Scheduling](#) tab.
- Define your picklist labels in the [Manage Recruiting Settings](#) page in any other language that you want to use for them to be displayed in those languages in the [Interview Scheduling](#) page.

4. Choose [Save](#).

### 📌 Note

If your configurations don't save correctly, it might be due to a data issue in your location picklists. Try this workaround:

1. Go to ► [Manage Recruiting Settings](#) ► [Interview Settings](#) ► [Set face-to-face interview locations](#) ►.
2. Use the [Change Language](#) menu to select a language that doesn't have any picklist configured (such as the troubleshooting locale English Debug).
3. For [Picklist ID](#), choose "No Selection". For [Picklist Label](#), clear the field so there's no value.
4. Save.
5. Use the [Change Language](#) menu to select the language you want to set picklists for.

Now, you should be able to configure and save the settings.

## Results

You can see these three picklist dropdown lists when choosing face-to-face interview locations in the [Interview Scheduling](#) tab.

## 21.8.9 Interview Scheduling - Candidate View

In the [Careers](#) tab, the candidate sees a new tab called [My Interviews](#). This tab displays any scheduled interviews that need confirmation, upcoming confirmed interviews, or previous interviews.

Candidates can choose to cancel an interview or decline and reschedule. Candidates can't reschedule a confirmed interview within 24 hours of the scheduled interview time.

Candidates can see scheduled interview time with time zone on the Candidate Portal (internal and external). All the interview screens display the interview time along with the time zone to make sure that candidates don't miss interviews. These issues can occur if a candidate is traveling or if the candidate uses a VPN connection. In these cases, the time gets converted to a time zone that isn't the intended one.

## 21.8.10 Updating and Rescheduling an Interview

Organizers can reschedule or update a previously scheduled interview.

### Prerequisites

Ensure that the following email triggers are enabled:

- [Email Notification to Interviewers for Rescheduled or Updated Interview](#)
- [Email Notification to Organizers for Rescheduled or Updated Interview](#)
- [Email Notification to Candidates for Rescheduled or Updated Interview](#)

### Context

As an organizer, you can update interviews that are in the [Booked](#) or [Not Booked](#) states to make the following changes:

- Add or delete interviewers.
- Modify interview location, interview type, interview date, time slots, or interview duration.

#### Note

You can't reschedule an interview if one or more candidates on the interview are already rated.

### Procedure

1. Go to  [Recruiting](#)  [Interview Scheduling](#)  and choose the [Job Requisition](#) tab.

2. Select the interview title to edit and reschedule the interview.
3. Modify the details, as required.

#### 📘 Note

- You can update the details of an interview only if you don't edit the list of candidates in the interview.
- To change the status of a *Booked* interview to *Not Booked*, first change the date or the time of the interview and make sure that the *Book this slot for candidates* checkbox isn't selected.
- The *Previously Selected Slots* section retains details about the previously reserved time slots. You can use these details for reference when you update the time slots in the interview.
- When interviewers are added to a *Booked* interview, they see the complete list of candidates on the *Interview Central* page upon logging on to SAP SuccessFactors Recruiting.
- Organizers sometimes reschedule interviews for participants who are in distant time zones from themselves. For example, the candidate and interviewer could be 12 or more hours ahead of the organizer's time zone. When using *Add Custom Slot* to choose a new *From* and *To* date and time, the system allows the organizer to reschedule interviews for any time of day, even beyond midnight in the recruiter's own time zone.

4. Select the *Book this slot for candidates* checkbox on the *Contact Candidate(s)* page, if you need to book candidates for the updated interview.
5. Do one of the following:
  - Select an email template and language, and edit the default template, if necessary. Add any relevant attachments and click *Send to Candidate* to send an email notification to the candidate.
  - Choose *Skip Email* to save the changes without sending an email notification to the candidate.

#### 📘 Note

If integrated with Microsoft Outlook Calendar, when interviewers are added or removed from an interview, all interviewers (existing, removed, or newly added) receive an email notification stating that the interview has been updated. However, the newly added or removed interviewers aren't sent a specific email notification stating that they've been added or removed from the interview.

## 21.8.11 Timezone Impact on Interview Scheduling

Information on timezones and how they relate to the internal and external candidates.

The following table depicts timezone explanations that affect both internal and external candidates, unless otherwise indicated.

| Scenario                        | The interview notification to interviewers displays in the interviewer's timezone and includes the expanded value. For instance, "Pacific Standard Time" instead of "PST". | The interview notification to organizers displays in the organizer's timezone and includes the expanded value. For instance, "Pacific Standard Time" instead of "PST". | The interview notification to candidates displays in the candidate's timezone and includes the expanded value. For instance, "Pacific Standard Time" instead of "PST". | The interview notification to the candidate is determined by the candidate's GMT offset in their browser settings, which displays along with the interview time. For instance, 1:00 - 1:30 pm GMT -8:00. |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Booked on behalf of candidate   | X                                                                                                                                                                          | X                                                                                                                                                                      | X                                                                                                                                                                      | N/A                                                                                                                                                                                                      |
| Candidate confirms interview    | X                                                                                                                                                                          | X                                                                                                                                                                      | Internal Candidates Only                                                                                                                                               | External Candidates Only                                                                                                                                                                                 |
| Interview canceled by candidate | X                                                                                                                                                                          | X                                                                                                                                                                      | Internal Candidates Only                                                                                                                                               | External Candidates Only                                                                                                                                                                                 |
| Candidate removed from card     | X                                                                                                                                                                          | X                                                                                                                                                                      | X                                                                                                                                                                      | N/A                                                                                                                                                                                                      |
| Interview rescheduled           | X                                                                                                                                                                          | X                                                                                                                                                                      | Internal Candidates Only                                                                                                                                               | External Candidates Only                                                                                                                                                                                 |
| Interview deleted               | X                                                                                                                                                                          | X                                                                                                                                                                      | X                                                                                                                                                                      | N/A                                                                                                                                                                                                      |

### Note

If there are multiple interviewers in different timezones, the interview notification picks one of their timezones to mark the interview time. An e-mail goes to all interviewers, and the timezone is expanded so the interviewers notice it and can adjust it to their own timezone.

## 21.8.12 Configuring Interview Central

Configure Interview Central so that interviewers can use Interview Assessment forms to provide feedback on an applicant.

### Prerequisites

You have access to Provisioning.

## → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Context

Interview Assessment forms pull competencies, skills, and interview questions from the requisition. This allows interviewers to provide a numeric rating and comments on each competency and skill. Additionally, interviewers can provide an overall for the applicant by choosing **Recommended** or **Not Recommended**, add overall comments, and possibly attach documents to their feedback.

### Note

This is an SAP SuccessFactors Business Beyond Bias feature. Use it to support processes that detect, prevent, or eliminate the influence of bias, helping you achieve your diversity and inclusion goals.

Here are some important things to keep in mind before you start using it:

- Interviewers can provide only one set of feedback to each applicant. If one or more interviews take place, one set of competency ratings is saved for each interviewer. The overall rating is then calculated as the average of all ratings provided by interviewers for each applicant.
- Once an interviewer has rated a candidate, don't change the competencies, skills, rating scale, or reverse scale option in the Job Requisition template as it causes incorrect data to appear in the Interview Assessment form.
- Recruiters add Interview questions to a Job Requisition through the Job Profile. Interviewers can view these interview questions linked to a Job Requisition in the *Print and Go* pack in *Interview Central*.

## Procedure

1. Go to **Provisioning** > **Company Settings** and select the following options:
  - *Enable Interview Central and Set up Interviewers Popup*
  - *Enable Stack Ranker style Interview Assessments*
2. Perform the following in Job Requisition template.
  - a. Set up the competencies field ID in the Job Requisition template. We recommend that you make it a required field.

### Sample Code

```
<field-definition id="competencies" type="competencies" required="false"
custom="false">
  <field-label mime-type="text-plain"><![CDATA[Interview
Competencies]]></field-label>
  <field-label mime-type="text-plain"><![CDATA[Interview
Competencies]]></field-label>
</field-definition>
```

- b. Set up the assessment scale element and a valid rating scale in the Job Requisition template. Note that only competencies and skills can be rated on the Interview Assessment form. Other data elements can't be shown.

#### Sample Code

```
<assessment-scale reverse-scale="false">
  <scale-id><![CDATA[Interview Scale]]></scale-id>
</assessment-scale>
```

The reverse-scale option in the Job Requisition template is used when lower scores are visually portrayed as preferable on the [Interview Assessment](#) and [View Candidate Ratings](#) screens.

- c. Specify the interviewAssessment feature-permissions for the relevant statuses (one feature-permission block for each status) in the Job Requisition template.

#### Sample Code

```
<feature-permission type="interviewAssessment">
  <description><![CDATA[description]]></description>
  <role-name><![CDATA[S]]></role-name>
  <role-name><![CDATA[T]]></role-name>
  <role-name><![CDATA[R]]></role-name>
  <role-name><![CDATA[G]]></role-name>
  <status><![CDATA[Interview]]></status>
</feature-permission>
```

#### → Tip

The customer can prefer to have the same permission for interview statuses and all statuses beyond interview. Because in practice, there's no difference between accessing interview setup and accessing interview results.

- d. Set up the Interview Guide in the Job Requisition template.

#### Sample Code

```
<field-definition id="interviewGuide" type="multiattachment"
  required="false" custom="false">
  <field-label mime-type="text-plain"><![CDATA[Interview Guide Documents]]></field-label>
  <field-description><![CDATA[Interview Guide Documents]]></field-description>
</field-definition>
```

- e. Set up the Hiring Manager note in the Job Requisition template. When adding permissions for this field, ensure that the Hiring Manager has Edit permissions.

#### Sample Code

```
<field-definition id="hiringManagerNote" type="textarea" required="false"
  custom="true">
  <field-label><![CDATA[Hiring Manager Note]]></field-label>
  <field-description><![CDATA[Hiring Manager Note]]></field-description>
</field-definition>
```

3. Perform the following in the Job Application template.

- a. To display interview-related data on the application record and make some interview information reportable and tokenized, define the `interviewResult` and `overdueInterviews` fields.

#### Sample Code

```
<field-definition id="interviewResult" type="derived" required="false"
custom="false" public="false" readOnly="false" anonymize="false">
  <field-label mime-type="text-plain"><![CDATA[Interview Result]]></field-label>
  <field-description><![CDATA[average rating of the interviews
completed]]></field-description>
</field-definition>
<field-definition id="overdueInterviews" type="derived" required="false"
custom="false" public="false" readOnly="false" anonymize="false">
  <field-label mime-type="text-plain"><![CDATA[overdueInterviews]]></field-label>
  <field-description><![CDATA[number of overdue interviews]]></field-description>
</field-definition>
```

The `interviewResult` field contains the average rating of the completed interviews and the `overdueInterviews` field contains the number of overdue interviews. An overdue interview is one that's incomplete, has no start date, or has a start date in the past. The [overdue interview](#) option appears after the scheduled date of the interview. If there's no scheduled date, that status is always displayed.

- b. If using single stage application, add permissions for the `interviewResult` and `overdueInterviews` fields in the Job Application template. If using multistage application, add the permissions in the Job Requisition template.
- c. Optionally, define the field-refs in the Job Application template display options.

#### Sample Code

```
<candidate-summary-display-options-config>
  <category id="invCategory" name="invCategory">
    <label><![CDATA[Interview Results]]></label>
    <column field-ref="interviewResult" select-by-default="false"
gridOrder="1"></column>
    <column field-ref="overdueInterviews" select-by-default="false"
gridOrder="2"></column>
  </category>
</candidate-summary-display-options-config>
```

When these fields are defined in the display options, the system doesn't respect the [Display Interview Result and Overdue Interviews in candidate summary page](#) option in [Manage Recruiting Settings](#).

4. Go to [Admin Center](#) [Manage Recruiting Settings](#) and do the following:
  - a. To allow interviewers to access the application page of the applicant they're interviewing, scroll down to the [Interview Central](#) section and select the access level for the [Grant Interviewers the access level of](#) option. If interviewers don't need to have application access level, set this option to [No Selection](#).

#### Note

Interviewers with the access-level setting can also access the applicant's information in the redesigned Applicant Management tool.

- b. If you want to display interview-related options on the applicant list page even if `interviewResult` and `overdueInterviews` fields aren't configured as display options in the Job Application template, scroll

down to the [Candidate Summary](#) section. Then, select [Display Interview Result and Overdue Interviews](#) on the candidate summary page.

## 21.8.12.1 Setting Up Interview Competencies and Skills

Interviewers can use competencies and skills added in a job requisition to evaluate applicants and provide ratings in Interview Central.

Interview Central works without competencies and skills present on the requisition. However, with competencies and skills, the user experience is enhanced when an interviewer views the Interview Assessment form.

The [Expected Rating](#) and [Weight %](#) columns aren't used in the Interview Central functionality. There's no way to disable these unused columns.

When a candidate is moved to the **Hired** status, the skills assessed during the interview process, specifically those matched to the job requisition and those evaluated by interviewers, are automatically transferred into the new employee's Growth Portfolio once the [Manage Pending Hires](#) step is completed. The Growth Portfolio can be accessed from the employee profile.

For example, If a job requisition has 4 skills and the candidate matches 3 of the skills, the matched skills that are present in the [Talent Intelligence Hub](#) will be added to candidate's Growth Portfolio once hired. If the skills are not present in [Talent Intelligence Hub](#), they will be placed in an inferred state until they are reviewed and approved by an administrator.

### Note

Only skill names are transferred to the Growth Portfolio. Proficiency levels must be updated manually.

## 21.8.12.2 Setting Up Interviewer Data for Sending E-Mails

Set up a list of interviewers, apply the list of interviewers to applicants, and send e-mail notifications to the interviewers.

### Prerequisites

- You must be a recruiting user with the required feature permissions.
- You are in a status to see the `interviewAssessment` feature of an applicant.

### Procedure

1. Locate the [Interviewers](#) screen area, and choose [Set up Interviewers](#).

2. Set up an interview team by adding names of interviewers you want in the team.

When setting up a list of interviewers, you can specify a date and time for the interview, as well as notes. These fields can't be made required.

### Note

You can enter dates and times for the interview for individual interviewers.

- **Name:** Only active SAP SuccessFactors HCM suite users can be selected as interviewers.
- **Date-Time:** This field is optional and can't be made required. There's no calendar integration. Therefore, this field has no relation to a calendar-based interview scheduling.  
Date and time display in the Employee Profile time zone of the logged in user. If another user in a different time zone views the information, it automatically adjusts to the correct date and time for the time zone in their Employee Profile. Interviewers who receive an e-mail notification see the date and time in the time zone stored in their Employee Profile.
- **Notes:** This field is optional and can't be made required. The **Notes** field has a 2,000 character limit.
- **Same people as last time:** If an interviewer list has previously been set up on another applicant on the requisition, the recruiting user can use this button to instantly apply the same list to the applicant being viewed.
- **Apply Interviewer List To All Applicants:** This button allows the recruiting user to define the same list of interviewers for every applicant. This list applies to every applicant presently in interview status and applicants who are placed in an interview status in the future.  
**Apply Interviewer List To All Applicants** only works for in progress statuses that have been set up with **interviewAssessment** feature permissions in the XML. the default status isn't supported.  
If the interviewer list is being applied to many applicants, then a scheduled job is set up automatically to process adding the interviewers to all applicants. It can take a few minutes to fully apply the interviewers to the applicants. This helps to maintain page load speed and user experience since the user isn't waiting for the confirmation page to load.
- **Include in the invitation e-mail:** Selects the attachments to be included in the e-mail notification to the interviewer. Only resume, cover letter from the application record, and the standard **interviewGuide** field from the requisition can be included in the e-mail notification. Note the **interviewGuide** field can be set up as a multiattachment field if the client wishes to include many requisition-related attachments.
- **Save:** Saves the interviewer list and adds Interview Assessment forms on the Interview Central tab without sending an e-mail notification to the interviewers.
- **Send e-mail:** Saves the interviewer list, adds Interview Assessment forms on the Interview Central tab, and sends an e-mail notification to the interviewers.  
If you click **Send e-mail** after changing an existing interviewer list, the system prompts you to select whether the e-mail is sent to **All Interviewers** or only **Added/Updated Interviewers**.  
It's also possible to include a resume or an interview guide as attachments. If attachments need to be included, disable the document management service, as follows: In **Provisioning**, click **Company Settings** and then, deselect **Enable Document Management Service**.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

The text of the interviewer e-mail notification is defined in ► [Admin Center](#) ► [E-mail Notification Templates Settings](#) ► [Recruiting Interviewer Notification](#) ►. The interview e-mail has several special tokens to allow certain interview-specific content to populate into the e-mail.

- [Close](#): Closes the interviewer setup popup window without saving changes.

## 21.8.13 Assigning and Editing Ratings in Interview Assessments

Completing assessment for an interview helps in capturing ratings for evaluating candidates. This helps in identifying candidates that are best suited for a requisition.

### Context

Recruiting supports rating scales with whole number value only for interview assessments. If you have any rating scale with decimal value, we recommend you to change the rating scale to whole number in ► [Admin Center](#) ► [Rating Scales](#) ►.

Interview Assessment forms remain available on the [Interview Central](#). The *Print and Go!* pack contains the date and time of the overall interview schedule. If there are multiple interviewers in the schedule, then individual start times aren't displayed.

#### ⚠ Caution

Using \ in a job title can cause an issue on print preview when viewing interview results.

### Procedure

1. From Recruiting, select the [Interview Central](#) tab.  
A list of requisitions appears.
2. Expand each requisition to see the list of applicants.
3. Choose [Rate now](#) for an applicant to open the interview assessment form. If you've already rated the candidate and would like to edit the ratings, choose [Edit ratings](#).
4. Complete the interview assessment form by providing ratings for each skill set.

You can now review the assessment results. Once you complete an assessment, you can review the interview results and flags for overdue interviews on the candidate summary page. Hovering over a value reveals more detailed information about the interview feedback. You can also see a [View Candidate Ratings](#) link on the interviewer portlet.

You can also open and view the candidate's application record from the interview assessment form, based on the permission level selected by your administrator. If competencies are defined on the requisition, the interviewer can select ratings for each competency that calculates the summary rating. You can use the [Stack Ranker](#) on the right-hand side to compare candidates in summary or competency by competency to identify the top-rated candidate in each category.

## 21.8.14 Reviewing Interview Assessment Results

View the results of the interview assessment.

### Context

On the [Interview Assessment](#) screen, interviewers can only view their own ratings.

Interviewers can open and view the applicant's application record from the interview assessment form. The interviewer sees data on the application based on the permission level selected by the administrator in [Manage Recruiting Settings](#).

The application can only be accessed from the interview assessment form. The applicant's name on the Interview Central dashboard doesn't appear on the interview assessment form.

### Procedure

- **Applicant List Page**

Recruiting users with the appropriate permissions can see Interview Results and a flag for overdue interviews on the candidate summary page. Hovering over a value reveals more detailed information about the interview feedback.

The list of interviewers is sorted based on the User IDs of the interviewers found in the user data file.

- **Application**

Recruiting users can view the total interview result and interview status data as fields on the application record if the `interviewResult` and `overdueInterview` fields are configured. If these fields are configured on the Application XML, users with reporting access can report on this data, and administrators can use this data in Recruiting email notifications.

- **Candidate Ratings Page**

Recruiting users can see a [View Candidate Ratings](#) link on the interviewer portlet once the interview assessment forms are completed. It's beneficial to leave the `interviewAssessment` feature-permission set up in all statuses past Interview.

#### Note

There is no role-based permission specifically for [View Candidate Ratings](#). If an operator has permissions to view an application, then the link will be available. The applicant needs to have interview ratings for the link to show up.

The Candidate Ratings page displays the names of applicants arranged in alphabetical order and shows a summary of all interviewer ratings on each competency and a total summary rating. Hovering over a competency allows the Recruiting user to view the ratings and comments from each interviewer.

Choose [Print Preview](#) on the Candidate Ratings screen or select the print icon that appears when you hover over the applicant's name to produce a full overview of all interactive activity.

- **Mobile**

Permissioned users can access the interview portlet and view both overall interview feedback and Candidate Ratings using mobile devices.

## 21.8.15 Generating Interview Feedback Insights

Use generative AI capabilities to consolidate individual interview feedback into comprehensive insights.

### Prerequisites

- You've purchased the **AI units** license. For more information about **AI units** license, contact your Account Executive.
- You've enabled *Assisted Interview Feedback Insights* from ► [Admin Center](#) ► [Manage Permission Roles](#) ► [User Permissions](#) ► [AI Access](#) ►.
- You've enabled *Assisted Interview Feedback Insights* from ► [Admin Center](#) ► [AI Services Administration](#) ► [Recruiting](#) ►.
- You've enabled the *View Candidate Rating* feature permission in the Job Requisition template.
- You're allowed to view or edit a Job Requisition.

### Context

The AI-generated insights provides a comprehensive evaluation, incorporating assessments of skills and competencies, overall comments, notes, skill-specific feedback, and the final recommendation.

You can generate, view, and regenerate the insights as needed. As interviewers provide new inputs during the candidate's interview process, regenerating the results ensures it reflects the latest insights. With each update, the insights becomes more comprehensive, helping recruiters and hiring managers make well-informed and efficient decisions.

#### 📘 Note

To generate the insights, at least one interviewer must provide at least one input. Without any inputs, the insights can't be generated.

You can view the interview feedback insights audit data in the ► [Applicant Information](#) ► [Change History](#) ► section in the redesigned Applicant Management tool.

## Procedure

1. Go to [Recruiting > Job Requisitions](#).
2. Select a job requisition in the list to open and view its details.
3. Choose the [View Candidate Ratings](#) tab.
4. In the [Summary > AI Interview Feedback Insights](#) section, choose [Generate](#) for a candidate.
  - The insights window for the selected candidate is displayed.

### → Remember

The AI-generated insights consolidates inputs from multiple interviewers to provide a comprehensive overview. While AI can process vast amounts of data, it may have limitations in fully understanding context, complex human emotions, and nuanced feedback. Keep these factors in mind when interpreting the insights. We recommend using your expertise and judgment to make well-informed decisions.

- You can review the interviewer input data used to generate these results in the [Data Referenced](#) section.
5. Choose [Regenerate](#) to regenerate the interview feedback insights.  
A new version of the insights is displayed.
  6. Choose [Close](#) to return the View Candidate Ratings page.  
Once the insights are generated for a candidate, it is saved and can be viewed anytime. The [Generate](#) button is replaced with the [View](#) button for that candidate.
  7. Choose [View](#) to view the previously generated insights for the candidate.

## Related Information

[Interview Feedback Insights Frequently Asked Questions \[page 1177\]](#)

### 21.8.15.1 Interview Feedback Insights Frequently Asked Questions

Find answers to common questions about Interview Feedback Insights in the FAQs below:

#### Permissions and Access

- What permissions are required?  
Users with access to the "View Candidate Ratings" page can generate and view summaries.
- Can I assign separate View or Edit permissions to different roles ( Recruiters, Managers and so on)?  
No, currently, separate View or Edit permissions cannot be assigned to different roles.

#### Data Privacy and Processing

- Are interviewer names included in the generated summary? Is personal data sent to the LLM?

No, actual interviewer names are replaced with dummy names before sending data to the LLM. The LLM returns results using these dummy names, which are then mapped back in the UI before displaying the summary.

### Insights Generation

- Can I generate insights for all my candidates at once?  
No, to ensure fairness, insights are generated individually. Candidates may be at different interview stages or have varying levels of feedback quality, which is considered when using this functionality.
- What data is used to generate the insights?  
The insights are based on:
  - Unstructured data: Interview notes (DOCX, PDF, TEXT), free-text comments
  - Structured data: Skills/competency ratings, recommended flag

### LLM Context and Customization

- What context is provided to the LLM? Can we configure additional context?  
It is not possible to manually configure additional fields for the LLM. However, predefined standard fields that are defined in the system will be used to provide context about the position, interviewer, or candidate.
  - job\_req\_title
  - job\_req\_description
  - job\_req\_locale
  - candidate\_current\_role
  - candidate\_locale
  - interviewer\_name
  - interviewer\_department
  - interviewer\_locale
  - interviewer\_role

## 21.8.16 Interview Central Commonly Asked Questions

Answers to commonly asked questions about Interview Central.

**If interviewers are removed from the list and the [Mass Apply](#) button is clicked, what happens to those interviewers on other applicants?**

Absent interviewers who haven't begun to provide feedback are removed from all applicants and they can't access their interview assessment forms. If one of the removed interviewers had already begun to provide feedback on the interview assessment form, then that interviewer isn't removed from the interviewer list for that applicant. This is done to ensure that all collected data remains available.

**Is it possible to manually adjust the interviewer list on a single applicant after Mass Applying an interview list?**

Yes, manual adjustments are saved. Clicking the [Mass Apply](#) button again later overrides the manual adjustments.

**Can I remind interviewers of their overdue interview?**

To remind interviewers of overdue interviews, you can configure these features:

- **overdueInterview** field: Configuring this field displays an e-mail icon to automatically resend the Recruiting Interviewer Notification e-mail. This feature doesn't support automatic overdue interview emails. You can't

configure this feature to send a different e-mail template. Configure the Recruiting Interviewer Notification in [Admin Center > E-mail Notification Template Settings](#).

- Interview Assessments Outstanding e-mail trigger: When configured, this e-mail trigger automatically emails the interviewer, depending on the defined conditions for the trigger. Configure these conditions in [Admin Center > Managing Recruiting > Recruiting Email Triggers](#).

These features can be configured together or individually.

#### How do I enable the "Outlook integration" calendar icon?

Go to [Admin Center > Company System and Logo Settings > Outlook Calendar Integration](#).

Outlook calendar integration provides an icon on the application page. Clicking the [Create Meeting](#) icon pops up an ics file (appears as an Appointment in Outlook) with the applicant's name populated in the Subject line. This isn't an interview scheduling integration. No additional data flows into the appointment record (no interviewers, date and time, and applicant data). No acceptance data is passed from the appointment into Recruiting.

Disabling this feature is recommended because most clients are seeking full interview integration. This is an enhancement request and under consideration, but enabling the Outlook Calendar Integration may open a conversation about this need that could lead to increased client dissatisfaction.

#### How do I change the content of the calendar popup or integrate interviewing to Outlook or another e-mail client?

This action isn't supported.

#### If ratings are not provided for a disqualified candidate, will the [Pending](#) label remain visible even if the To-Do item is removed?

Yes. As per the legacy workbench design, the [Pending](#) label in the Interview Feedback column remains visible even after disqualification.

## 21.9 Reimagined Candidate Experience

The reimagined Candidate Experience introduces a seamless, efficient, and user-friendly application process designed to enhance engagement for both internal and external candidates. The experience is built on three core components: [Guided Application Experience](#), [My Applications](#), and [My Profile](#), each offering features that work together to optimize the candidate journey.

### Guided Application Experience: Streamlined and Adaptive Application Flow

The guided application experience provides a smoother and more intuitive application process. With its adaptive design, it adjusts to the scope of information required for each job, offering either a wizard-based or form-based

template. You can create business rules to further customize the experience so that it adapts dynamically to the information provided. This ensures that candidates are only required to provide the most relevant information, making the application process simple and quick.

## My Applications: Centralized Management and Tracking

The [My Applications](#) page provides a centralized hub where applicants can efficiently manage their entire application journey. Using intuitive, logically arranged cards, applicants can track the status of their submissions, manage in-progress drafts, and act on any required tasks. The [My Applications](#) page ensures that everything related to the application process is easily accessible in one place, eliminating the need for multiple systems or unnecessary navigation.

## Manage Account

The [Manage Account](#) page enables candidates to manage their account settings, ensuring a seamless and secure experience on your career site. They can update passwords, set job alerts, manage privacy preferences, and even delete their account if necessary.

## My Profile

The [My Profile](#) page serves as a centralized hub that provides a holistic view of a candidate's qualifications, skills, past employment, and other relevant details. Candidate profiles help streamline the application process and enable recruiters to match candidates with the right opportunities.

## Important Notes

- If you're an existing customer, there are no configurations required. All your existing setup and configurations are integrated within the reimagined Candidate Experience, when you've enabled in your instance.
- If you're a new customer, you need to set up successfully complete all prerequisites and also configure the following templates - Job Requisition, Candidate Profile, Job Application, and Offer, as per your business requirement. For information on prerequisites and template configurations, refer to **Enabling the Reimagined Candidate Experience** and **Recruiting Configuration Templates** in the **Related Information** section.
- As of 1H 2025, the following features aren't supported:
  - Document upload for Dropbox and Google Drive.
  - Applying for jobs using LinkedIn
  - Saved Jobs
  - Employee referral for Internal Candidate Search
  - Fields configured as picklists or object-type fields cannot be masked when marked as sensitive.

- Quick Apply is implemented with the existing UI and application process, maintaining continuity for candidates.

## Recommendations to Optimize your Candidate's Experience

The following features help to optimize the overall candidate experience:

- SAP Customer Data Cloud Authentication for External Candidates - provides a general framework for setting and enforcing authentication methods for external candidates applying for jobs within the Career Site.
- Unified Data Model - Enhances the integration between Career Site Builder and other parts of SAP SuccessFactors Recruiting.

## 21.9.1 Enabling the Reimagined Candidate Experience

Learn now to enable the reimagined Candidate Experience in your instance.

### Prerequisites

- Set up the integration with Career Site Builder, including Mobile Apply and Candidate Account Simplification. Career Site Builder (CSB) must be enabled for both internal and external career sites as this feature is available independently for each user. Enabling it for both internal and external career sites ensures consistent experience.

#### Note

The reimagined Candidate Experience doesn't support uploading of documents from Dropbox and Google Drive.

- Verify that the Sign-In Widget and Locale Selector options are enabled on your career site:

1. In Career Site Builder, go to [Appearance > Styles > Headers > <Locale> > <Brand>](#).
  2. For both [Desktop Layout](#) and [Mobile Layout](#), ensure that the [Sign-In and Language](#) component is added and that the [Use Sign In Widget](#) and [Use Locale Selector](#) settings are enabled in both layouts.
- You use DPCS 2.0 for consent agreements.

#### Note

If you're an existing customer with the required configurations in place, no additional setup is needed. Your existing configurations automatically integrate into the reimagined Candidate Experience upon enablement.

## Context

You have successfully set up your templates - **Job Requisition**, **Candidate Profile**, **Job Application** and **Offer**, based on your business needs and you're ready to enable the reimagined candidate experience. For information, refer **Recruiting Configuration Templates** in the **Related Information** section.

## Procedure

1. Go to [Admin Center > Manage Recruiting Settings > Career Sites](#).
2. Choose the [Enable Candidate Experience for Career Site](#) setting.
3. Choose [Save](#) to save your changes.

## Results

The reimagined Candidate Experience is now enabled for your instance. Candidates who register or log in to the Career Site see the Guided Application Experience, My Applications, and My Profile page.

## Next Steps

- You can create business rules to control the behavior of fields in the application flow.
- For each brand configured in Career Site Builder, you can configure a corresponding theme in [Theme Manager](#), to ensure consistent branding throughout the candidate experience.

[Creating a Brand in Career Site Builder \[page 501\]](#)

## 21.9.2 Candidate Guided Experience

The guided application experience provides a smoother and more intuitive application process. With its adaptive design, it adjusts to the scope of information required for each job, offering either a wizard-based or form-based template. This adaptation ensures that candidates provide only the most relevant information in the quickest possible time, making the application process simple.

### 📘 Note

- For new customers, you need to configure the following templates - **Job Requisition**, **Candidate Profile**, **Job Application** and **Offer Letter**, based on your business requirement. The configurations define the application sections that are displayed to the candidate in the guided application experience. For details on how to configure these templates, refer to **Configurations for the Candidate Journey** in the **Related Information** section.
- Existing customers need not make any template configuration changes when switching to the reimagined Candidate Experience. All the existing setup and configurations are seamlessly integrated within the new experience.
- As of the 1H 2025 release, **Apply with LinkedIn** isn't supported.

### → Remember

- When configuring background elements in the Candidate Profile template—such as Professional Experience, Education, Certifications, Language Skills, Geographic Mobility, and Travel Preferences—ensure that **Professional Experience** and **Education** are set as the first and second elements. This configuration ensures a logical flow and a better user experience, as these two elements are always displayed up front in the application wizard. Other background elements are placed under the **Additional Information** section, which appears only when needed.
- In high-volume scenarios, failing to configure **Professional Experience** and **Education** as recommended causes them to be hidden in the **Additional Information** section instead of being displayed up front in the wizard.

## Key Functionalities

- Adaptive application process - The system presents either a wizard-based or form-based application template based on the Job Application Template configuration. If there are more than two sections in the template, the wizard-based application is used.
- Resume upload and Pre-Fill - Candidates can upload a resume to extract relevant information and pre-fill sections of the application. Alternatively, they can manually enter or edit their details..

- **AI-Assisted Skill Suggestions** – The system analyzes the resume to extract skills and leverages AI to suggest relevant skills based on the job description. Candidates can review, select, or modify these suggestions as needed.
- **Job Description Access** - The [View Job Description](#) button allows candidates to check the job details they're applying for at any stage of the application.
- **Flexible Navigation** – Candidates can navigate back to and edit any section of the application wizard at any time during the application process.
- **Review and Submission** - Once all the required information is filled in, candidates are taken to a review page where they can verify all details before submission.
- **Post-Submission Actions** – After submission, candidates can withdraw their application using the **Withdraw Application** button. If withdrawn, they can reapply for the same job using the **Re-Apply** button, provided the job is still active.

## 21.9.3 My Applications

The [My Applications](#) page provides a centralized hub where applicants can efficiently manage their entire application journey. Using intuitive, logically arranged cards, applicants can track the status of their submissions, manage in-progress drafts, and act on any required tasks.

It consists of three key sections:

- Take Actions
- Continue Applying
- View Applications

### Note

When a candidate registers on the career site but doesn't apply for a job, they're initially redirected to this page. From here, they can either explore available job opportunities or navigate to their [My Profile](#) page to update personal and professional information. Maintaining an updated profile enhances their chances of securing suitable roles and allows recruiters to consider them for relevant opportunities in the talent pool.

## Take Actions

The [Take Actions](#) section contains a list of action cards that appear once an application progresses and requires further inputs from the candidate. These actions include: Providing additional details, Confirming an interview schedule, Taking an assessment, Accepting an offer and so on.

Action cards are dynamically displayed based on the status of an application. Once the hiring team initiates a request, the corresponding action card appears in this section, prompting the candidate to take the necessary steps.

## Continue Applying

The [Continue Applying](#) section displays a list of draft applications that a candidate has started but hasn't yet completed. If an application was left incomplete for any reason, it appears in this section along with the corresponding job title.

Candidates can click on these draft application cards to resume and submit their applications. This design ensures that no potential opportunity is missed due to an unfinished application.

## View Applications

The [View Applications](#) section provides an overview of all submitted applications. Each application card displays the current status of the job application, such as: Reviewing your application, Hiring Manager Interview, Application Withdrawn, Not Proceeding and so on.

### Note

In the reimagined Candidate Experience, the **My Interviews** and **My Offers** links are no longer available in the Options menu. Instead, candidates can access these pages directly from the application cards, where links to their interviews and offers are provided for future reference. These cards remain visible until the application is purged from the system.

If no applications or actions are available, candidates can explore new jobs using [Explore All Jobs](#) or update their profile using [My Profile](#) to improve their visibility to recruiters.

## 21.9.3.1 Manage Account

The [Manage Account](#) page enables candidates to personalize and control their account settings, ensuring a seamless and secure experience while using the career site. The following actions are available:

### Change Password

Candidates can update their account password to enhance security and ensure continued access to their profile.

### Manage Two-Factor Authentication

The Manage Two-Factor Authentication setting is available only when SAP Customer Data Cloud is enabled in your instance. For more information, refer to **SAP Customer Data Cloud based Authentication in Recruiting** in the **Related Information** section.

Two-Factor Authentication (TFA) adds an additional layer of security to your user authentication flows. After the user enters their credentials, SAP Customer Data Cloud generates a code and sends it to the user via phone (voice message/SMS) or Time-Based One Time Password (TOTP). The user then enters this code to complete their authentication.

The Two-Factor Authentication method used for an authentication session depends on the Risk-Based Authentication (RBA) rules configured by the Admin in the SAP Customer Data Cloud console.

### Preferred Language

The Preferred Language setting allows you to select the language in which you want to view your account- related pages - [My Applications](#), [My Profile](#), and [Manage Account](#), ensuring a personalized user experience.

#### Preferred Language - Default Behavior

| Candidate Type     | Scenario                                          | Resulting Preferred Language Behavior                                                                                                                                        |
|--------------------|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| External Candidate | New candidate exploring the public career site.   | Applies directly for a job.                                                                                                                                                  |
|                    |                                                   | Creates an account but doesn't apply for any job.                                                                                                                            |
|                    | Returning candidate (pre-existing before feature) | Logs in to apply or view account                                                                                                                                             |
|                    |                                                   | By default, the language in which the job application is submitted becomes the candidate's preferred language.                                                               |
|                    |                                                   | By default, the language used to explore the career site becomes the default preferred language in the candidate's account.                                                  |
|                    |                                                   | By default, the language used in the last applied job is set as the preferred language for all account-related pages. Candidates can manually change the preferred language. |
|                    |                                                   | The system retains the updated preferred language until changed again by the candidate.                                                                                      |
| Internal Candidate | Candidate enters the internal career site         | Preferred language will be set to the language selected by the employee in their settings, by default. If required, the employee can update their preferred language.        |

#### Note

- In the **Candidate Guided Experience** pages, the application content is presented in the language specified in the job posting, while the header and footer are displayed in the preferred locale.
- To ensure candidates have a seamless experience, ensure that the list of languages chosen in the Career Site Builder aligns with the languages chosen in the [Manage Recruiting Languages](#) page.

### Manage Job Alerts

Candidates can create, modify, or delete job alerts based on their preferences. This feature ensures they receive notifications about relevant job opportunities.

### Update Preferences

Manage profile visibility settings to control how recruiters can discover the candidate's profile. Candidates can also enable or disable email notifications for job-related campaigns.

### Data Privacy

View the **Data Privacy Consent Statement (DPCS)** that was agreed to during registration. If needed, candidates can revoke their consent to the DPCS. However, doing so would make their account non-compliant with company policies, leading to the permanent deletion of their account.

### Delete Account

Permanently remove the account, including all personal and application-related data.

## 21.9.4 My Profile

The [My Profile](#) serves as a centralized hub that provides a holistic view of a candidate's qualifications, skills, past employment, and other relevant details, helping streamline the application process and enabling recruiters to match candidates with the right opportunities.

Candidates who register on the career site but haven't yet applied for a job are guided to the [My Profile](#) page through the [Applications](#) page, where they can update and maintain their information. Keeping their profile up-to-date increases their chances of getting shortlisted in the candidate pool and reduces the time needed to apply for future opportunities.

For existing customers, the candidate's profile and application-specific data were previously combined in a single form within a single-page view. With the reimagined Candidate Experience, the **My Profile** is now a standalone page, while application-specific details are maintained within the [My Applications](#) page. This improvement allows candidates to manage their career journey more efficiently, without needing to update their information for every job application. Existing customers experience this streamlined approach seamlessly, without requiring any configuration changes.

## 21.10 Setting Up and Enabling LinkedIn Recruiter System Connect (RSC) Integration

Learn how to set up and enable LinkedIn RSC to create a more efficient hiring process, saving time and improving data quality.

### Prerequisites

- You'll need administrative access to both LinkedIn Recruiter and SAP SuccessFactors Recruiting
- LinkedIn Requirements:
  - Your organization has at least one **Recruiter Corporate** or **Recruiter Professional Services** license with LinkedIn. For details, refer to the **LinkedIn Recruiter** product page in the **Related Information** section.
  - You've reviewed and accepted the LinkedIn cookie policy.
  - When data is synced from SAP SuccessFactors Recruiting to LinkedIn, it is stored in LinkedIn owned and operated data centers in the United States, and processed with security measures in place and in compliance with customers' instructions. For details, refer to **Related Information** section.

- Ensure that you have the following permissions:
  - ► [User Permissions](#) ► [MDF Recruiting Permissions](#) ► [LinkedInDeveloperApplication](#) ►
  - ► [User Permissions](#) ► [MDF Recruiting Permissions](#) ► [LinkedInIntegrationConfiguration](#) ►
- You've enabled the [Manage LinkedIn Setup and Implementation](#) permission from ► [Administrator Permissions](#) ► [Manage Integration Tools](#) ►.

## Context

The typical set-up workflow for LinkedIn RSC integration will follow these steps in [Security Center](#):

1. Creating and signing-in to a customer LinkedIn account.
2. Selecting a relevant contract for RSC.
3. Enabling RSC from the [Recruiter System Connect](#) plug-in.

LinkedIn RSC is enabled once the data synchronization between LinkedIn and SAP SuccessFactors Recruiting has been initiated and completed successfully.

Data synchronization involves exchange of the following data: Job Requisition, Job Applications and Candidate data.

- SAP SuccessFactors Recruiting to LinkedIn: Job Requisitions, Candidates and Applications (pre-configured fields and not available in the UI)
- LinkedIn to SAP SuccessFactors Recruiting: Candidate data only.

## Procedure

1. Go to ► [Admin Center](#) ► [Security Center](#) ► [LinkedIn Account Setup](#) ►
2. Select [Enable Customer LinkedIn Account](#) option.  
The [Create Customer LinkedIn Account](#) button appears.
3. Choose [Create Customer LinkedIn Account](#).  
The [Recruiter System Connect](#) plugin is displayed and the [Status](#) is [Inactive](#).
4. Choose [Enable](#).  
You will notice that the [Status](#) has changed to [Pending Contract](#) and a new button [Select Contract](#) is displayed.
5. Choose [Select Contract](#).  
A prompt to sign in to LinkedIn will be displayed.
6. Choose [Sign in](#) and sign into LinkedIn using the provided credentials.  
You'll need to select a contract to proceed. At this moment, the RSC contract status is inactive.
7. Once you've selected the contract to proceed with, choose [Continue](#).  
The LinkedIn widget is loaded where you can choose the required integrations for RSC.
8. Choose [Choose Integrations](#).  
The integrations are made available for selection.
9. Select the [Recruiter System Connect](#), and choose [Save](#).
10. Choose [Close](#).

In the RSC plugin, the *Status* will change to *Pending Contract Selection*. A link *Review Sync Configuration* is available.

11. Choose *Review Sync Configuration*.

You are redirected to the *LinkedIn Recruiter System Connect Sync Configuration* page.

For a quick understanding of what the *LinkedIn Recruiter System Connect Sync Configuration* page contains, choose *View Information*.

By default, you will land on the *Data Transfer to LinkedIn* tab.

12. In the *General Settings* section, verify the candidate type, permissions and privacy reference settings and make changes based on your requirement.

#### → Remember

These settings cannot be changed once a data sync has been initiated. Ensure that you have verified these settings before you proceed.

13. In the *Field Mapping* section, verify the default field mapping values for both *Job Requisition* and *Candidate* tabs to suit your business requirement.

#### 📌 Note

The *Job Requisition* and *Candidate* fields are preconfigured with default mappings. You can customize these mappings to meet your business needs, or proceed to start the data sync using the default mappings.

To modify an existing *SAP SuccessFactors Recruiting Field ID* in the *Job Requisition* or the *Candidate* tab, use the following steps:

- a. Choose *Edit*.
  - b. In the *SAP SuccessFactors Recruiting Field ID* column, identify the field you want to modify and choose the value picker  icon.
  - c. Identify the fields that you require, and choose *Select*.
  - d. Choose *Save* to save the changes.
14. Go to the *Data Transfer from LinkedIn* tab.

To modify an existing *LinkedIn Field ID* in the *One-Click Export* section, use the following steps:

    - a. Choose *Edit*.
    - b. In the *LinkedIn Field ID* column, identify the field you want to modify and choose the value picker  icon.
    - c. Identify the fields that you require, and choose *Select*.
    - d. Choose *Save* to save the changes.
  15. Go to the *Data Sync and Monitoring* tab.
  16. Choose *Initiate Sync* from the *SAP SuccessFactors Recruiting to LinkedIn Sync* section.

#### 📌 Note

This button triggers a full historical sync of the last two years of data.

- It can only be used once every 24 hours to prevent system overload.
- Once triggered, the button will remain disabled until the 24-hour period has passed.
- Use *Initiate Sync* only to perform a full sync. A delta sync runs automatically every 30 minutes to process newly added or corrected records, so a full sync is not required for routine updates.

## Results

Your data sync has been initiated, and the LinkedIn RSC integration has been activated. You can monitor the data sync details in the [SAP SuccessFactors Recruiting to LinkedIn Sync](#) section on the [Data Sync and Monitor](#) tab. Use the [Refresh](#) button to view the latest sync progress.

### → Remember

- LinkedIn processes data sync from any SAP SuccessFactors Recruiting environment as live updates. To avoid unintended changes, please sync only from your Production environment.
- If you've synced your test data with LinkedIn's live system, reach out to LinkedIn Support to help delete your test data.

[LinkedIn RSC Frequently Asked Questions \[page 1197\]](#)

## 21.10.1 Forward Candidates to Recruiting using LinkedIn Recruiter System Connect (RSC)

You can retrieve and process candidate data from LinkedIn with the integration of LinkedIn's Recruiter System Connect (RSC) with SAP SuccessFactors Recruiting

Recruiters can forward candidates from LinkedIn to job requisitions using [One-Click Export](#). [One-Click Export](#) refers to the data synchronization from LinkedIn to Recruiting. Candidates exported in this manner will have the [Forwarded](#) status displayed in the [Applicant Workbench](#).

### 📘 Note

If the candidate's email ID is unavailable, the candidate will not be forwarded to the requisition and the recruiter will receive an email informing them that the export wasn't successful.

## Candidate Matching

When exporting candidate data from LinkedIn, it's important to ensure that records are accurate and up-to-date. The candidate information is updated using two key identifiers: Person URN and email address. A Person URN (Uniform Resource Name) is a unique identifier assigned to each LinkedIn profile. It helps systems distinguish between candidates, even if they have similar names.

- **Person URN Match, No Email Match:** If the Person URN matches an existing record but the email does not, the system will not update the candidate.
- **Person URN and Email Match:** If both the Person URN and email match, the system updates the existing candidate's details.
- **No Person URN, Email Match:** If the Person URN isn't found but the email matches an existing record, the system checks for a different URN linked to that email.
  - If there's no other URN, the new URN is added and the candidate's details are updated.
  - If a different URN is already associated with that email, no update occurs to avoid confusion.
- **No Person URN, No Email Match:** If neither the Person URN nor the email matches any existing record, a new candidate profile is created.

## Related Information

|----------------------------|---------------------------------------------------------------------------------------|----------|--------------------------------------------------|------------------------------------|
| profileUrl                 | URL of the member's public LinkedIn profile.                                          | Yes      | RCM_CANDIDATE => LINKEDIN_PROFILE_URL            | System                             |
| emailAddresses             | List of candidate email addresses manually entered by the user during 1-Click Export. | Yes      | RCM_CANDIDATE => EMAIL_ADDRESS1 & EMAIL_ADDRESS2 | Standard - Editable (Replace only) |
| yearsOfExperience          | Years of experience calculated based on member's LinkedIn profile.                    | No       | CUSTOM_FIELD                                     | Custom                             |
| positions                  | The most recent two experiences from a member's profile.                              | No       | BG_TYPE                                          | Custom                             |
| position.companyName       | Company name as entered by the member                                                 | No       | CUSTOM_FIELD                                     | Custom                             |
| position.description       | Description for this position.                                                        | No       | CUSTOM_FIELD                                     | Custom                             |
| position.title             | Title name of the position.                                                           | No       | CUSTOM_FIELD                                     | Custom                             |
| position.startMonth-Year   | The joining date. Month and Year of Joining.                                          | No       | STARTDATE                                        | Custom                             |
| position.endMonthYear      | The last date. The Month and Year of last day.                                        | No       | ENDDATE                                          | Custom                             |
| educations                 | The member's education history.                                                       | No       | BG_TYPE                                          | Custom                             |
| educations.school-Name     | School name                                                                           | No       | CUSTOM_FIELD                                     | Custom                             |
| educations.degree-Name     | Degree attained at this school.                                                       | No       | CUSTOM_FIELD                                     | Custom                             |
| educations.fiel-dOfStudy   | Degrees achieved in respective fields of study.                                       | No       | CUSTOM_FIELD                                     | Custom                             |
| educations.startMonth-Year | Start date of the education.                                                          | No       | STARTDATE                                        | Custom                             |
| educations.endMonth-Year   | End date of the education.                                                            | No       | ENDDATE                                          | Custom                             |

## Job Requisition

| Destination Field ID     | Description                                                                                                  | Required | Source Field ID                          | Field Type                         |
|--------------------------|--------------------------------------------------------------------------------------------------------------|----------|------------------------------------------|------------------------------------|
| accessRestricted         | Flag indicating whether the job requisition is ACL-protected.                                                | Yes      |                                          | System                             |
| externalJobRequisitionId |                                                                                                              | Yes      | RCM_JOB_REQ => JOB_REQ_ID                | System                             |
| title                    | Title of the job requisition.                                                                                | Yes      | RCM_JOB_REQ_LOCAL => EXTERNAL_TITLE      | System                             |
| description              | Description of the job requisition.                                                                          | Yes      | RCM_JOB_REQ_LOCAL => EXT_JOB_DESCRIPTION | System                             |
| externalCreatedAt        | Time at which the Job Requisition was created.                                                               | Yes      | RCM_JOB_REQ => DATE_CREATED              | System                             |
| externalLastModifiedAt   | Time at which the Job Requisition was last modified.                                                         | Yes      | RCM_JOB_REQ => LAST_MODIFIED             | System                             |
| targetedStartAt          | Target start date for candidates hired using this particular job requisition.                                | No       | RCM_JOB_REQ => JOB_REQ_START_DATE        | Standard - Non Editable            |
| locations                | Location array which contains all locations corresponding to the Job Requisition.                            | Yes      | LOCATION, LOCATION_OBJ                   | Standard - Editable (Replace only) |
| locationName             | The actual location, e.g. "San Francisco, California", "Los Angeles, California, United States"              |          |                                          | Standard - Editable (Replace only) |
| locationType             | Type of the location - UNKNOWN, PRIMARY and ALTERNATE                                                        |          |                                          | System                             |
| categories               | Job-specific duties (e.g., Accounting, Marketing, Sales), similar to a "department" for the Job Requisition. |          | RCM_JOB_REQ_job-Function                 | Standard - Non Editable            |
| workplaceTypes           | The workplace nature of the job - On-site, Hybrid or Remote.                                                 |          | CUSTOM_FIELD                             | Custom                             |
| industries               | The industries of the job or company.                                                                        |          | RCM_JOB_REQ => INDUSTRY                  | Standard - Non Editable            |
| employmentStatus         |                                                                                                              |          |                                          | Standard - Non Editable            |

| Destination Field ID | Description                                                                                                                                                                                                                                                                                                                             | Required | Source Field ID                       | Field Type |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|---------------------------------------|------------|
| requisitionStatus    | Status of the Job Requisition. Possible values are Open or Closed.<br>Available options are: <ul style="list-style-type: none"> <li>• OPEN</li> <li>• CLOSED</li> </ul>                                                                                                                                                                 | Yes      | RCM_JOB_REQ => INTERNAL_STATUS        | System     |
| requisitionType      | Type of Job Requisition representing whether it is a standard requisition or an evergreen (pipe-line) requisition. Note that EVERGREEN requisition should not contain parentJobRequisitionId. Available options are: <ul style="list-style-type: none"> <li>• STANDARD</li> <li>• EVERGREEN.</li> </ul> STANDARD is the default option. | No       | RCM_JOB_REQ => REQUISITION_TYPE       | System     |
| owners.firstName     | First name of the owner.                                                                                                                                                                                                                                                                                                                | No       | USERS_SYSINFO => USERS_SYS_FIRST-NAME | System     |
| owners.lastName      | Last name of the owner.                                                                                                                                                                                                                                                                                                                 | No       | USERS_SYSINFO => USERS_SYS_LAST-NAME  | System     |
| owners.emailAddress  | Email address of the owner. This is mandatory.                                                                                                                                                                                                                                                                                          | Yes      | USERS_SYSINFO => USERS_SYS_EMAIL      | System     |
| numberOfOpenings     | Number of Openings that need to be closed with this particular Job Requisition                                                                                                                                                                                                                                                          | Yes      | RCM_JOB_REQ => NUMBER_OPENING         | System     |
| parentRequisitionId  | Used to represent parent requisition ID for a particular requisition.                                                                                                                                                                                                                                                                   | No       | RCM_JOB_REQ => PARENT_JOB_REQ_ID      | System     |

## 21.10.3 LinkedIn RSC Frequently Asked Questions

### What is the time frame for the Historical Sync?

Historical Sync includes the last two years of data, calculated from today. This is a fixed time frame that cannot be modified.

### How often is data synced?

- Historical sync: A one-time manual activity when we click on 'Initiate Sync' button that syncs the last two years of data. It should not be run repeatedly. Once started, delta sync also begins automatically.
- Delta sync: Runs automatically every 30 minutes for new and updated records.
- One Click Export: Near real-time
- Access Control List (ACL) job: Runs automatically once every 24 hours to refresh ACL data for job requisitions.
- InMail Stub Profile job: Runs once every 24 hours to retrieve profile data of LinkedIn members who have replied to InMails sent from Recruiter seat holders and have consented to share their contact information. The retrieved stub profile data is then updated in SAP SuccessFactors Recruiting.

### Where is LinkedIn data stored?

When data is synced from SAP SuccessFactors Recruiting to LinkedIn, it is stored in LinkedIn owned and operated data centers in the United States, and processed with security measures in place and in compliance with customers' instructions.

### Is LinkedIn RSC available for all SAP SuccessFactors data centers?

Yes. It is a customer configured feature available across all SAP SuccessFactors data centers. Customers are responsible for enabling and maintaining the integration and ensuring compliance with local privacy regulations.

### Who is responsible for GDPR/DPA compliance?

Customers are responsible for ensuring compliance with GDPR, the Data Protection Act, and local privacy regulations. SAP provides the technical integration but does not enforce regional legal obligations.

### Can the *General Settings* in the *LinkedIn Recruiter System Connect Sync Configuration* page be modified after a successful sync?

No, General Settings in mapping are one-time and cannot be changed after the first sync is initiated.

### What happens after clicking the *Initiate Sync* button in the *LinkedIn Recruiter System Connect Sync Configuration* page?

Once the *Initiate Sync* button is triggered, both the *Initiate Sync* and *Edit* buttons are disabled for 24 hours. This prevents repeated changes or multiple sync triggers, which could otherwise overload the system or cause data inconsistencies.

### Why is it recommended to perform the data sync in the Production instance only?

LinkedIn does not have a test system. A sync from any SAP SuccessFactors Recruiting environment will be treated as live updates in LinkedIn's system. To remove inconsistent data or test data, customers must create a ticket with the LinkedIn team.

### What should customers do if sync errors occur?

- Check that the LinkedIn contract is active and RSC is enabled in Security Center.
- Review the field mapping and configuration. Ensure that all mandatory fields are mapped and that those fields contain valid values otherwise the sync will fail.
- Check the error message, if any, for details on rejected fields.
- If the issue remains unresolved, raise a ticket with SAP Technical Support.

### What is the current scope of ACL?

Currently, ACL is only for job requisitions.

### **Are Application fields customizable?**

No, Application fields are not customizable and are currently hardcoded.

### **How is consent handled for candidate profiles in SAP SuccessFactors Recruiting?**

Even if a candidate has given consent on LinkedIn to share information with SAP SuccessFactors Recruiting, this consent is not automatically recognized. The candidate must accept the customer's DPCS statement before the data is considered consented. Additionally, if DPCS hasn't been accepted and a recruiter clicks [View LinkedIn Profile](#), the system will display the message "No Candidate Found."

### **How is sync handled if there are multiple DPCS consents?**

If there are multiple DPCS consents, the sync will proceed if at least one consent is given, even if it is not the latest one.

### **Under what conditions will one-click export not be performed?**

If the URN is different but the email ID is the same, one-click export will not be performed.

### **What happens during the one-click export flow if DPCS has not been accepted?**

When a candidate is created in SAP SuccessFactors via LinkedIn and forwarded to a job requisition, the candidate will not be synced back to LinkedIn if DPCS has not been accepted. This means updates made in SAP SuccessFactors will not sync back to LinkedIn. Data in SAP SuccessFactors cannot be synced back to LinkedIn without DPCS or explicit customer permission.

### **How is candidate privacy handled?**

SAP does not accept LinkedIn consent as valid. Candidates must accept the customer's DPCS statement in SAP. Sensitive fields marked in SAP are excluded from sync. Audit logs capture candidate creation and updates.

### **What if LinkedIn seat information changes?**

Seat data is refreshed once daily. Any seat changes in LinkedIn seats are reflected in SAP SuccessFactors Recruiting after the next refresh job.

### **What if a customer uses multiple LinkedIn contracts?**

Customers can configure multiple contracts in [Security Center](#). Only the selected active contract is used for sync. Inactive contracts may block integration.

### **What if duplicate candidates exist across SAP SuccessFactors Recruiting and LinkedIn?**

SAP SuccessFactors Recruiting tries to map candidates via identifiers like email and URN. If no match is found, duplicates may be created. Customers are responsible for the duplication.

### **What happens if the data in SAP SuccessFactors Recruiting is more up-to-date than the information on LinkedIn?**

In some cases, candidate information in SAP SuccessFactors Recruiting may be more current than what is available on LinkedIn. When the recruiter performs a One-Click Export, the data from LinkedIn will overwrite the corresponding fields in SAP SuccessFactors. This action is based on the recruiter's decision, as One-Click Export always transfers the latest data available in LinkedIn Recruiter to the SAP SuccessFactors Recruiting system.

### **What happens if a preconfigured field, such as Address, is deleted from the mapping page?**

Some fields, such as Address, appear by default in the mapping page because they are mandatory as per LinkedIn's schema. If a recruiter deletes such a field in mapping page, it cannot be added back manually from

the list, as it may not exist in the customer's template. To restore it, simply cancel and reopen the mapping screen - the default mandatory fields will reappear automatically.

#### Why don't I see all fields in the mapping dropdown?

We only show common fields across all templates. If a field exists only in one specific template, it will not appear in the mapping list.

#### Is deletion of standard fields allowed from the mapping pages?

No, deletion of standard fields or leaving them unmapped is not supported. Standard fields that were previously synchronized can only be replaced with other available fields. If the mapping is saved without selecting a replacement field, the system retains the previously mapped values after save.

## 21.11 Using the Inline Resume Viewer

Use the inline resume viewer to view resumes and cover letters directly in a web browser, without downloading them and opening them in a separate application.

### Prerequisites

[Enable inline viewing of resumes](#) is enabled in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

#### 📘 Note

- Resumes and cover letters are converted to images when the candidate uploads them.
- When you choose to view a cover letter or a resume in the inline resume viewer, the system checks whether there's an image copy available. If no image is found, the system attempts to convert the documents to image format.
- No migration or extra configuration is required for resumes that are already available in the system before this feature is enabled.
- Few resumes (roughly 2%) are formatted in such a way that they fail during the image conversion process. When this issue occurs, you can choose to download the original file.
- Certain Microsoft Word features aren't readable as part of the image conversion process, notably:
  - Content gets stored in Microsoft Word **Content controls**. These content control components are a proprietary technology that treats a Word document like any data entry form. However, the method in which Word saves this information isn't readable by all programs.

- Microsoft Word image cropping. An image that appears cropped in the Word document appears in full in the converted image.
- You can mass print and mass save candidate resumes and cover letters from directly within the inline resume viewer.
- You can add comments to the application when viewing a resume from the inline resume viewer.

## Procedure

Launch the inline resume viewer in any of the following ways:

- Go to [Candidate Search Results](#) and select the checkboxes next to several candidates and click [View Resume button](#).
- Go to [Application List Page](#) and select the checkboxes next to several applicants and click [▶ Action ▶ View Resume ▶](#).
- Go to [▶ Application Page ▶ Resume ▶](#).

## 21.12 Configuring Candidate Purge Email Notification

You can configure email alerts to be sent to inactive candidates. The email notifications ensure that the candidate can perform necessary actions in advance to avoid the permanent deletion of their profiles from the system.

### Prerequisites

Enable Intelligent Services Center framework.

### Context

You can set up this functionality for both DRM 2.0 and DRTM 2.0 to send advance email notifications to inactive candidates.

## Procedure

1. Go to [▶ Admin Center ▶ Recruiting Email Triggers ▶](#).
2. Enable the [Imminent Candidate Purge Notification](#) trigger.

3. Add an appropriate email template based on the notification content that has to be sent to the candidates. Save the email trigger.
4. Go to ► [Admin Center](#) ► [Data Retention Management](#) ► and click [Create New Purge Request](#).
5. Select the request type.
  - In DRM 2.0, choose the [Purge Inactive Candidate](#) request type.
  - In DRTM 2.0, choose the [DRTM Inactive Candidate Purge](#) request type.
6. In the [Notify candidates before...](#) section, specify the number of days before which the affected candidates should receive the email notification before the candidate profiles are purged. This value is configurable.
7. Schedule the purge request. Ensure that you've selected a schedule start date, which allows for lead time.

For example, the [Notify candidates before...](#) value is set to 7 days. Set the schedule to begin 7 days after the email notification date. The system calculates and sends the Imminent Candidate Purge Email Notification to the affected candidates before their profiles are purged due to inactivity.

#### Note

The [Period of Inactivity](#) must be greater than the [Notify candidates before...](#) value.

8. Go to [Purge Request Monitor](#) and approve the purge. Navigate to the preview report to see which candidates should receive the email notification before their candidate profiles are purged.

## 21.13 Short Message Service (SMS) Integration with Recruiting

By integrating SMS with Recruiting, you can send texts on demand or trigger them automatically.

Send texts on demand for the following:

- Contact Candidate
- ► [Interview Scheduling](#) ► [Contact Candidates](#) ►.

Trigger texts automatically for the following situations:

- When a candidate opts-in to receive SMS texts.
- When you need to inform a candidate about status changes.
- When you want to send interview scheduling notifications to the list of candidates in [Not Booked](#) and [Booked](#) statuses.

For more information, refer to *Integrating Short Message Service (SMS) Notifications with Recruiting*.

## 22 Job Offers in SAP SuccessFactors

When you've found a good candidate to fill an open position, you need to prepare an offer. You can define job offer details and set up the internal approval process using SAP SuccessFactors Recruiting. After it's approved, you can create a job offer letter or employment contract for the candidate to accept or decline.

A recruiter or an appropriate individual enters the details of the offer. Details consist of all the necessary information, along with an ad-hoc list of approvers. They then send the offer for an approval. Approvers can approve or reject with comments. The offer process starts when an authorized person decides to hire a candidate to fill a job requisition. The offer process consists of the following:

- Job Offer Detail Template – configured in advance so that all job offers use the same formatting. The offer details are extended out to candidates, and routed to approvers.
- Job Offer Letter Templates – create rich-text templates that are specific to country/region, company, business unit, and so on.
- Job Offer Letters – allows you to select a template, update the contents, and generate a letter with offer details and language for use in negotiating and finalizing offer terms with a candidate.
- Job Offer Approvals – when the candidate has advanced to Offer status, the offer is created and sent out to approvers to approve or decline.

### 22.1 Job Offer Detail Templates

Configure the Job Offer Detail Template so that you don't have to format each job offer individually.

Use either of these two methods to configure the template:

- The *Import/Update/Export Offer Detail Template* tool in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- The [Manage Templates](#) tool in Admin Center.

## 22.1.1 Offer Details Template Using Manage Templates Tool

You can add, and edit your offer detail templates using Manage Templates tool in Admin Center.

### Offer Details Template Page

You can configure multiple offer details templates and specify which templates you want to make active from the Offer Details Template List page. The list comprises the following columns:

| Column Name                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Template Name</a>        | Name of your offer details template.                                                                                                                                                                                                                                                                                                                                                                                                            |
| <a href="#">Active</a>               | You can mark which templates you want to make active.                                                                                                                                                                                                                                                                                                                                                                                           |
| <a href="#">Version</a>              | The version of that Offer detail template.                                                                                                                                                                                                                                                                                                                                                                                                      |
|                                      | <div>  <b>Note</b><br/>           You can view all version by selecting the hyperlinked version number under this column that opens up the <a href="#">Version and Audit Log</a> dialog box. When viewing the <a href="#">Version and Audit Log</a>, the <a href="#">Changed On</a> date displays the time in the logged in user's time zone.         </div> |
| <a href="#">Updated On</a>           | The date when the offer details template was last updated. The date stamp displays the logged in user's time zone.                                                                                                                                                                                                                                                                                                                              |
| <a href="#">Template Description</a> | Description that was entered for that offer detail template.                                                                                                                                                                                                                                                                                                                                                                                    |

## Adding and Revising Offer Detail Templates

You can add multiple offer detail templates or revise existing templates using [Manage Templates](#) tool in Admin Center. When you add new offer detail templates, you can add fields sourced from job application, requisition templates, and for mobile. You can also add Offer Approver steps from the [General Settings](#) menu for your offer template.

### → Remember

When you've added new offer detail templates, you must configure your offer approval permissions in the job requisition template.

For more information on using [Manage Templates](#) tool, about offer approver steps, and configuring offer approval permissions in the job requisition templates, refer to the [Related Information](#) section of this topic.

## Predefined Approvers

You can add predefined offer approvers by going to ► [Manage Templates](#) ► [Job Offer Template](#) ► [General Settings](#) ► [Offer Approvers](#) ►.

## Additional Information

Refer to related links at the end of this topic to learn more about:

- How to manage, modify, view version and audit log of recruiting templates using [Manage Templates](#) tool.
- How to add predefined approvers using [Manage Templates](#) in your offer detail template.
- Configure offer approval permissions in job requisition template.

## 22.1.2 Configuring the Job Offer Detail Template in Provisioning

Configure the Job Offer Detail XML template to set up job offers for your recruiting process.

### Prerequisites

- [Enable Offer Approval](#) is enabled in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- Job Requisition, Job Application, and Candidate Profile templates are configured.

### Context

#### 📘 Note

If you don't have access to Provisioning, configure your templates in the [Manage Templates](#) tool in the Admin Center.

Setting up job offer details involves many steps, including setting up your offer approval permissions in the job requisition template. There are specific ways that offer detail templates handle data fields:

- You can't set different permissions at the field level. All recruiting operators that have recruiting permissions can view the same fields.
- The template doesn't contain read/write permission information.
- You can't anonymize or purge stand-alone fields from template. You can, however, create application fields to use in the offer details template.
- The template doesn't allow you to add an unlimited number of stand-alone fields, unless you source them from other templates. Like the stand-alone fields, you also can't anonymize or purge these sourced fields.

### Procedure

1. Go to ► [Provisioning](#) ► [Managing Recruiting](#) ► [Import/Update/Export Offer Detail Template](#) ►.
2. Copy and paste the entire code from the Job Offer Detail Template form to an XML editor.
3. **Required:** Make two copies of the XML code and save them.

Mark one copy as the original and archive it. Then work with the second copy. This way, you can revert to the original code at any point if something goes wrong in your working copy.

4. Configure the following sections of the template:
  - Template name
  - Field definitions
  - Mobile fields
5. Save the template.
6. Go to ► [Provisioning](#) ► [Managing Recruiting](#) ► [Import/Update/Export Offer Detail Template](#) ►.
7. Copy the modified code from your configured template and paste it into the Job Offer Detail Template form.
8. Choose [Save Form](#).

## Next Steps

Proceed to configure Offer Approval Permission in the Job Requisition template.

## Related Information

[Job Offer Detail Element: Template Name \[page 1207\]](#)

[Job Offer Detail Element: Field Definition \[page 1208\]](#)

[Job Offer Detail Element: Mobile Fields \[page 1213\]](#)

## 22.1.3 Job Offer Detail Element: Template Name

In the Offer Detail XML, the <template-name> tag defines the template name. Use a descriptive name to define the template.

You can also add <template-desc> element to define a description of the template and also the `template-lastmodified` element to get the last modification date of the offer detail list.

Both the `template-name` and `template-desc` elements must immediately follow the `offer-detail-data-model` element. You can change the CDATA content as it does not appear anywhere in the instance or in Provisioning, is not referenced by any other XML, and is invisible to the customer.

### Sample Code

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE offer-detail-template PUBLIC "-//SuccessFactors, Inc.//DTD Offer
Detail
Template//EN" "offer-detail-template.dtd">
<offer-detail-template>
  <template-name>
    <![CDATA[Offer Details]]>
  </template-name>
```

```

<template-desc>
<![CDATA[Offer Details]]>
</template-desc>
<template-lastmodified>10/9/28 9:58 AM</template-lastmodified>

```

## Related Information

[Configuring the Job Offer Detail Template in Provisioning \[page 1206\]](#)

## 22.1.4 Job Offer Detail Element: Field Definition

Field definitions in the Offer Detail XML template specify the fields visible to all users when making an offer. Unlike other Recruiting components, you can't configure specific permissions for certain fields based on who the user is.

The leading best practices are:

- Field labels in *Job Offer Detail* templates exactly the same as field labels in the Job Requisition or Job Application templates.
- If possible, pull fields from the Job Requisition or Job Application templates into the Job Offer Detail template, instead of using standalone Job Offer fields.
- Use business rules to select *Job Offer Detail* templates you want to use.
- Use business rules to update the candidate's decision to accept or decline the job offer.

### Sample Code

```

<field-definition id="title" type="textarea" required="true" custom="false"
  template-type="job-req" anonymize="false">
  <field-label mime-type="text-plain">
    <![CDATA[Internal Business Title]]>
  </field-label>
</field-definition>
<field-definition id="jce_customString2" type="jobCode" required="true"
  custom="false"
  template-type="job-req" anonymize="false">
  <field-label mime-type="text-plain">
    <![CDATA[Grade Level]]>
  </field-label>
</field-definition>
<field-definition id="workSamples" type="multiattachment" required="true"
  custom="true"
  template-type="job-application" anonymize="false">
  <field-label mime-type="text-plain">
    <![CDATA[Work Samples Attach]]>
  </field-label>
</field-definition>
<field-definition id="firstName" type="text" required="false" custom="false"
  template-type="job-application" anonymize="false">
  <field-label mime-type="text-plain" lang="en_US">
    <![CDATA[First Name]]>
  </field-label>
</field-definition>

```

```

    </field-label>
  </field-definition>
  <field-definition id="lastName" type="text" required="false" custom="false"
    template-type="job-application" anonymize="false">
    <field-label mime-type="text-plain" lang="en_US">
      <![CDATA[Last Name]]>
    </field-label>
  </field-definition>
  <field-definition id="candStartDate" type="date" required="false"
    custom="true"
    template-type="job-application" anonymize="false">
    <field-label mime-type="text-plain" lang="en_US">
      <![CDATA[Projected Start Date]]>
    </field-label>
  </field-definition>
  <field-definition id="candSalary" type="currency" required="false"
    custom="true"
    template-type="job-application" anonymize="false">
    <field-label mime-type="text-plain" lang="en_US">
      <![CDATA[Annual/Hourly Base Salary]]>
    </field-label>
  </field-definition>
  <field-definition id="currency" type="enum" required="false" custom="false">
    <field-label mime-type="text-plain"><![CDATA[Currency]]></field-label>
    <enum-value value="EUR">
      <enum-label><![CDATA[EUR]]></enum-label>
    </enum-value>
    <enum-value value="GBP">
      <enum-label><![CDATA[GBP]]></enum-label>
    </enum-value>
    <enum-value value="USD">
      <enum-label><![CDATA[USD]]></enum-label>
    </enum-value>
    <default-value>USD</default-value>
  </field-definition>

```

## Related Information

[Job Offer Detail Element: Template Name \[page 1207\]](#)

[Job Offer Detail Element: Mobile Fields \[page 1213\]](#)

[Offer Details Template Using Manage Templates Tool \[page 1204\]](#)

[Configuring the Job Offer Detail Template in Provisioning \[page 1206\]](#)

[Job Offer Detail Field Definition: Attributes \[page 1209\]](#)

[Job Offer Detail Field Definition: Field Label \[page 1212\]](#)

### 22.1.4.1 Job Offer Detail Field Definition: Attributes

The `field-definition` element serves as the container for defining the data and attributes of fields.

The `field-definition` element carries various attributes such as `id`, `type`, `required`, `custom`, `template-type`, and `anonymize`.

```
<field-definition id="title" type="text" required="true">
```

```
custom="false" template-type="job-req" anonymize="false">
```

## id Attribute

Field definition is used when you want to define the unique name of the field. When the field definition is referenced from another template such as job requisition or job application; the field definition ID in the Offer Details templates must match the ID in the referenced template.

These custom fields appear as stand-alone fields in the Offer Details template. Stand-alone fields appear this way in the Offer Detail template.

```
<field-definition id="title" type="text" required="true"
  custom="false" template-type="job-req" anonymize="false">
```

| Custom Field ID                    | Field Data Type |
|------------------------------------|-----------------|
| customString1 – customString15     | text            |
| customLong1 – customLong10         | number          |
| customDate1 – customDate10         | date            |
| customPicklist1 – customPicklist10 | picklist        |

### Note

The **number** data type for these standalone fields show as decimals on the screen. Saving them, however, removes any numbers entered after the decimal, and replaces them with 00.

These field IDs are the same IDs used on the Job Requisition for Job Code Entity fields. To prevent conflicts, preface the Job Code Entity fields with **jce** when referenced in the Offer Details XML. For example, **jce\_customString1**.

If the offer stand-alone fields are configured in multiple Offer Detail XML templates in the same instance, configure the fields identically in each template.

You can only reference certain field IDs from the Job Requisition XML and Job Application XML. The following table lists the fields that aren't supported for referencing on offer details:

| Field ID           | Source Template |
|--------------------|-----------------|
| mfield1 – mfield15 | Job Requisition |
| cellPhone          | Job Requisition |
| numberOpenings     | Job Requisition |
| extTitle           | Job Requisition |

Ensure that all Job Requisition and Job Application fields defined in the Offer Details XML are set up and synced as custom reportable fields in Provisioning. Otherwise, these fields aren't editable, not populated correctly or unavailable as tokens.

## type **Attribute**

In addition to the stand-alone offer detail fields, the following field types are supported when referenced from the Job Requisition XML or Job Application XML.

```
<field-definition id="title" type="text" required="true"
  custom="false" template-type="job-req" anonymize="false">
```

### → Recommendation

Don't change field type in the Offer Detail template to avoid application errors for existing records. The field data type must match with the field from the referenced template.

## Required **Attribute**

The `required` attribute specifies whether or not a field is required. If not required, the field can be left empty.

```
<field-definition id="title" type="text" required="true"
  custom="false" template-type="job-req" anonymize="false">
```

## custom **Attribute**

True or false value that declares whether a field is custom or standard. Don't change the position of reportable custom fields once defined in the offer detail template, because changing reportable custom fields can cause fields to report incorrect values.

```
<field-definition id="title" type="text" required="true"
  custom="true" template-type="job-req" anonymize="false">
```

## template-type **Attribute**

Attribute required for any field pulled from the Requisition or Application XML. This attribute must be set to either [job-req](#) or [job-application](#). If the field is an Offer Details stand-alone field, omit this attribute.

```
<field-definition id="title" type="text" required="true"
  custom="false" template-type="job-req" anonymize="false">
```

## anonymize **Attribute**

SAP SuccessFactors provides the ability to purge user data that you don't need. The **anonymize** attribute identifies whether a field needs to be purged, and this attribute is used in Data Retention Time Management (DRTM) and Legacy Data Retention Management (DRM)

```
<field-definition id="title" type="text" required="true"
  custom="false" template-type="job-req" anonymize="false">
```

## 22.1.4.2 Job Offer Detail Field Definition: Field Label

The field-label element usually controls the appearance of the field name in the user interface.

However, this label does not control all the field labels in the user interface. On certain fields, the Succession Data Model controls the field label and on other fields, there are Provisioning settings that control the label used in the system.

The label element is not conditional. It is not possible for one field to display one label to internal candidates and a different label to external candidates. Likewise, it is not possible for one field to display one label to candidates and a different label to internal recruiting users.

The field-definition element must contain at least one field-label element:

```
<field-label mime-type="text-plain"><![CDATA[First Name]]></field-label>
```

### Note

Make sure this label matches the label in the Job Requisition XML or Job Application XML template if you're referencing fields from the requisition or application.

## mime-type **Attribute**

Mime-type determines whether or not the system renders any HTML tags that are defined in the CDATA content. The two supported mime types are:

- **text-plain**: Unformatted plain text.

```
<field-label mime-type="text-plain"><![CDATA[First Name]]></field-label>
```

## CDATA Content

You can configure CDATA content to contain the preferred text of the client.

```
<field-label mime-type="text-plain"><![CDATA[First Name]]></field-label>
```

## 22.1.5 Job Offer Detail Element: Mobile Fields

If SAP SuccessFactors mobile option is enabled, Offer Details can be approved through the mobile application by configuring mobile fields in the Offer Detail XML template.

Specify the existing field IDs in the `mobile-fields` element:

```
<mobile-fields>
  <field refid="title"/>
  <field refid="firstName"/>
  <field refid="lastName"/>
  <field refid="candStartDate"/>
  <field refid="candSalary"/>
</mobile-fields>
```

## 22.2 Job Offer Letter Templates

You can create different rich text templates that are used to generate offer letters for job offers for candidates in specific country/region, company, division, or business unit.

When you've configured your Offer Detail template, you can configure *Job Offer Letter* template to define what's presented to candidates that accept or decline job offers. Offer letter templates are used in order to use standard tokens that act as variables that autopopulate data into the body of the job offer letters sent out to candidates.

Tokens are derived from any of these templates:

- [Job Requisition](#)
- [Job Application](#)
- [Job Offer Detail](#)

[Creating Offer Letter Templates \[page 1215\]](#)

[Creating Page Breaks in Offer Letters \[page 1240\]](#)

## 22.2.1 Enabling Role-Based Permissions for Offer Letter Templates

You can enable the role-based permission to restrict which Recruiting users can view and select specific offer letter templates.

### Context

#### ⓘ Note

Role-based permissions aren't honored for Foundation and generic object fields in ad-hoc reports for offers. Users can view Foundation and generic objects in ad-hoc reports that they don't have role-based permissions.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Settings](#) ►.
2. Go to the [Offer Letter](#) section and select [Enable Role-Based Permissions for Offer Letter Templates](#).
3. Select [Save](#) in the [Offer Letter](#) section to finish.

### Next Steps

You can now set up permissions for offer letter templates. To understand more about using role-based permissions, refer to [Using Role-Based Permissions](#).

### Related Information

[Using Role-Based Permissions](#)

## 22.2.2 Creating Offer Letter Templates

You can create offer letter templates that use rich text formatting to generate offer letters.

### Prerequisites

You have the following permissions enabled to configure the offer letter templates:

- [Manage Offer Letter Templates](#) role-based permissions, located in ► [Administrator Permissions](#) ► [Manage Recruiting](#) ► [Manage Offer Letter Templates](#) .
- [Recruiting Offer Letter Templates](#), located in [User Permissions](#). Select *All* when you want to give access to all items from the list and *Others* to select specific items for that role.

### Context

Creating multiple offer letter templates allows Recruiting users to select from a list of offer letter templates to send out offer letters to candidates. The [Manage Offer Letter Templates](#) tool groups offer letter templates by country/region and language, and the templates appear alphabetically in the list. You can't change the groupings. For example, U.S. recruiters view U.S. offer letter templates only.

The [Manage Offer Letter Templates](#) column headers identify offer letter templates by name, status, translated languages, and the last modified date. The last modified time displays the local time zone of the person viewing this page.

Standard tokens act as variables that autopopulate requisition, application, and offer details data into the body of the offer letter template.

### Offer Letter Template-Related Business Rule Scenarios

The following business rule scenarios allow you to create rules and triggers for offer letters:

- [Configure Rule to Preselect Offer Letter Templates](#): This scenario allows you to configure business rules to automatically identify which specific template to use when a new offer letter is created.
- [Configure Business Rules to Add Conditional Sections in Offer Letters](#): This scenario allows you to configure business rules to populate dynamic tokens on offer letters.

Refer to *Creating Business Rules for Recruiting* and *Business Rules for Offer Letters* for more information.

### General Display Name and Internal Candidates

You can display the chosen name of internal candidates in the offer letter template. Select the [Enable adoption of General Display Name](#) option in ► [Admin Center](#) ► [Company System and Logo Settings](#) . and insert the `[[CANDIDATE_FULL_NAME]]` token in the template.

Organizations that consider an offer letter to be a legal document should address internal candidates by their legal name. To use their legal name, insert the `[[CANDIDATE_PROFILE_NAME]]` token instead.

Note that the `[[CANDIDATE_FULL_NAME]]` won't display correctly in the offer letter when you're using the `candidateName` field in the offer approval template. To avoid this, don't use `candidateName` in the offer approval

template. Otherwise, use the [ [CANDIDATE\_PROFILE\_NAME] ] token in the offer letter template instead and have the offer letter display the internal candidate's legal name.

Refer to *Adoption of General Display Name in Recruiting* for more information about this setting.

## Procedure

1. Go to [Admin Center](#) [Manage Offer Letter Templates](#).

You see a list of grouped offer letter templates.

2. Select [Create New Template](#).

The [Manage Offer Letter Templates: Add New Offer Letter Template](#) page appears.

3. Complete the fields in the template.

| Option                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Change Country/Region &amp; Language</b> | <p>Choose the country/region and language you want from the dropdown lists.</p> <div><p><b>Note</b></p><p>Choose the country/region carefully. After you save your template, this field becomes read-only and can't be changed.</p></div> <p>The form only lets you select one language at a time. To provide an offer letter template in multiple languages, you create and save this template first, then edit it to save additional copies of that template in different languages. Refer to <a href="#">Editing Offer Letter Templates</a>.</p>                |
| <b>Template Name</b>                        | (Required) Enter a unique name for the offer letter template.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Status</b>                               | <p>Choose <a href="#">Enabled</a> or <a href="#">Disabled</a>.</p> <p>If you don't choose a status, the system saves the template in disabled status.</p>                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Subject</b>                              | <p>(Required) Enter the email subject line.</p> <p>The text you enter in <a href="#">Subject</a> automatically appears in the subject line of the email that uses the template.</p>                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Body</b>                                 | <p>(Required) Enter text and any tokens.</p> <p>To insert standard tokens, select <a href="#">Insert Job Requisition Field</a> in the rich text editor. This opens a dialog box with the list of standard job requisition fields you can use.</p> <p>Any custom tokens require setup in Provisioning. Refer to <a href="#">Configuring Custom Recruiting Tokens</a> for more information.</p> <div><p><b>Note</b></p><p>If you change the position of any reportable custom field, tokens saved in an offer letter template can render the wrong values.</p></div> |

4. Verify that all links in the offer letter template are valid.
5. Choose [Save Changes](#) to save your settings.

## Results

You've now created a new offer letter template, and it should now be listed in the [Manage Offer Letter Templates](#) summary page.

## Next Steps

If you want to make your offer letter template available in additional languages, refer to *Editing Offer Letter Templates*.

## 22.2.3 Editing Offer Letter Templates

You can easily edit to make changes to your offer letter template from the [Manage Offer Letter Templates](#) page, including making the template available in multiple languages.

## Prerequisites

- [Manage Offer Letter Templates](#) role-based permissions are enabled.
- You already have an offer letter template you've created and saved.

## Context

To provide an offer letter template in multiple languages, you first create the template, then save additional copies of that template in different languages.

### Note

Offer letter templates don't support language assembly when using *If* conditions in business rules.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Offer Letter Templates](#) ►, which directs you to [Manage Offer Letter Templates](#) with the list of templates.
2. Go into edit mode for a template by selecting the name of the offer letter template in the [Template Name](#) column, or by selecting the pencil picker icon in the [Action](#) column.
3. Make any necessary changes.
4. **Optional:** To provide your offer letter template in an additional language, use the following settings:

| Option                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Change Country/Region &amp; Language</b> | <p>The <a href="#">Country/Region</a> field was set when you first created the offer letter template. The field is read-only, and can't be changed.</p> <p>From the <a href="#">Language</a> dropdown list, choose a language other than what's already selected.</p> <p>For example, if you chose <b>English US (English US)</b> when you initially created the template and you want to provide the same template in Spanish, select <b>Español (Spanish)</b> for <a href="#">Language</a>.</p> <div><b>Note</b><br/>When you choose a different language, the rest of the form becomes blank so that you can provide content in the new language.</div> |
| <b>Template Name</b>                        | (Required) Enter a template name. For improved usability, consider using the same language you're specifying here.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Status</b>                               | You can ignore this field. The status is set by the main offer letter template.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Subject</b>                              | (Required) Enter the email subject line in the language you're using for this version of the template.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Body</b>                                 | <p>(Required) Enter text in the additional language, and any tokens.</p> <div><b>Tip</b><br/>You can initially save this language version with a blank <a href="#">Body</a> field. After you save this additional language, you can copy and paste the body of the original template and translate it here, so that the content is similar across languages.</div>                                                                                                                                                                                                                                                                                         |

5. Select [Save Changes](#) to finish.

If you edited the template to add an additional language, your main offer letter template is now available in the multiple languages you configured. To verify success, go to the [Manage Offer Letter Templates](#) summary page. The multiple locales are now listed in the [Translated In](#) column for the template.

## 22.2.4 Deactivating Offer Letter Templates

When you no longer need an offer letter template, you can choose to deactivate it.

### Context

You can edit offers associated with a deactivated offer detail template, by reactivating the offer letter template. When you've changed the offer, you can deactivate that template. When you deactivate the offer detail template, you also can't edit the associated offer letter template.

#### ⓘ Note

[Manage Offer Letter Templates](#) doesn't let you delete templates.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Offer Letter Templates](#) ►, which directs you to the [Manage Offer Letter Templates](#) with the list of templates.
2. Edit the template using one of the following options:
  - Select the hyperlinked template name that you want.
  - Select the pencil picker icon under the [Action](#) column of the template that you want.
3. Select [Disabled](#) to deactivate your offer letter template.

## 22.3 Job Offer Letters

The Offer Letter feature in SAP SuccessFactors Recruiting you to select a prebuilt template, update the contents, and generate a letter containing offer details and language for use in negotiating and finalizing offer terms with a candidate.

These are the delivery options available for offer letters:

| Offer Letter Distribution Type               | Description                                                                        |
|----------------------------------------------|------------------------------------------------------------------------------------|
| <a href="#">Online Offer with eSignature</a> | An online offer that allows candidates to sign their offer letters electronically. |

#### ⓘ Note

This feature requires DocuSign.

| Offer Letter Distribution Type | Description                                                                                                                                                             |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Online Offer</i>            | An online offer that doesn't request an electronic signature from candidates. Candidates can accept and decline offers from the career site when they log in.           |
| <i>Email as PDF attachment</i> | You're sent to a screen to send the candidate an e-mail. The offer letter is a PDF document, and any attachments on the offer letter are attached to this e-mail.       |
| <i>Email as text</i>           | When you choose to proceed from a confirmation screen, the candidate is sent an e-mail containing the offer letter text, including any attachments to the offer letter. |
| <i>Print</i>                   | The system prompts you to download or save a PDF copy of the offer letter.                                                                                              |
| <i>Verbal Offer</i>            | The system only records the offer letter without sending it to the candidate.                                                                                           |

## Supported Attachment File Extensions

Offer letters support the following file extensions: doc, pdf, htm, gif, png, jpg, jpeg, html, rtf, bmp, docx, txt, docm, and tif.

## 22.3.1 Offer Letter Permissions for Recruiting Operators

You can add the Offer Letter feature permission in the job requisition XML in all stages where recruiting operators require access to offer letter information.

### Offer Letter Permissions

You can specify which recruiting operator roles have access to [Offer Letter](#) under the `<feature-permission type="offerLetter">` section in the job requisition template. Here's a sample code snippet:

#### Sample Code

```
<feature-permission type="offerLetter">
  <description><![CDATA[R can launch offer letters during statuses
    with an Offer category.]]></description>
  <role-name><![CDATA[T]]></role-name>
  <role-name><![CDATA[R]]></role-name>
  <status><![CDATA[Offer Negotiation]]></status>
</feature-permission>
```

### Note

The feature permission `offerLetterPortlet` gives visibility to the portlet but doesn't allow the creation of an offer letter.

The feature permission `offerLetter` gives the user the ability to create an offer letter; that is, the action.

If the permission `offerLetterPortlet` isn't configured, then everyone can view the portlet regardless of status.

Then by default, if an operator role has `offerLetter` permission, they then automatically get a view of the portlet as well.

As a best practice, configure the offer letter or approvals in all steps where users require access to the offer information. When you allow a recruiter or a hiring manager create an offer approval, they also have access to other steps after approvals such as:

- Offer Extended
- Background Check
- Hired

You can declare multiple roles as `role-name` tags, but use only one status tag.

## Restricting View Access to the Offer Letter Portlet in a Candidate Application

You can set permissions for which recruiting operator role can view offer letter information under the [Offer Letter](#) portlet of the candidate application profile.

### Note

If you don't include these code blocks in the template, the offer letter section is visible to anyone with access to candidate application profiles. When the read permission is removed, the offer letter section isn't visible.

You can define the recruiting operator roles under the `<application-status-config>` section in the job requisition template. Here's a code sample snippet:

### Sample Code

```
<feature-permission type="offerLetterPortlet">
  <field-permission type="read">
    <description><![CDATA[DESCRIPTION HERE]]></description>
    <role-name><![CDATA[ROLE]]></role-name>
    <role-name><![CDATA[ROLE]]></role-name>
    <status><![CDATA[STATUS NAME]]></status>
  </feature-permission>
```

## 22.3.2 Configuring Online Offers in Manage Recruiting Settings

You can configure online offers in [Manage Recruiting Settings](#).

### Context

The [Online Offer](#) option doesn't include the ability for candidates to accept offers using an electronic signature. Electronic signatures are only available with the [Online Offer with eSignature](#) option, which requires integration with DocuSign. Refer to [Configuring Online Offers with eSignature in Manage Recruiting Settings](#) for details.

### Procedure

1. Go to the [Offer Letter](#) section in [Admin Center](#) [Manage Recruiting Settings](#) and configure the following settings:

| Option                                                    | Description                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Role-Based Permissions for Offer Letter Templates  | Select this option to control who can view and select offer letter templates.                                                                                                                                                                                                                                         |
| Set date format to be displayed in Offer Letters          | Use the dropdown list to choose the way dates display in offer letters.                                                                                                                                                                                                                                               |
| Allow candidates to accept offers online                  | Select this option so that candidates can accept offers online.                                                                                                                                                                                                                                                       |
| Enable electronic signature for offer letters             | <div><b>⚠ Restriction</b><br/>Do <b>not</b> select this option.</div> <p>This field is used to turn on the Online Offer with eSignature option, which requires an integration with DocuSign. Refer to <a href="#">Configuring Online Offers with eSignature in Manage Recruiting Settings</a> for instructions.</p>   |
| Allow candidates to email job requisition operator        | <p>Select this optional field if you want to allow candidates to email the job requisition operator.</p> <div><b>ℹ Note</b><br/>When you select this option, the candidate <a href="#">Email Recruiter</a> history doesn't display under the <a href="#">Offer Letter</a> portlet in the candidate application.</div> |
| Select an operator who will receive emails from candidate | If you enabled <a href="#">Allow candidates to email job requisition operator</a> , use the dropdown list to choose which recruiting operator role receives email from candidates.                                                                                                                                    |

2. Choose [Save](#) to finish.

## Next Steps

You can now send online offer letters.

### 22.3.3 Configuring Online Offers with eSignature in Manage Recruiting Settings

As an SAP SuccessFactors Recruiting administrator, configure [Manage Recruiting Settings](#) to enable Online Offer with eSignature so that you can get DocuSign electronic signatures from candidates in offer letters.

## Prerequisites

- Your organization needs a DocuSign account. If your organization already has a DocuSign account for use with any other SAP SuccessFactors application (such as Onboarding), you can also use it for SAP SuccessFactors Recruiting. If you don't have an existing DocuSign account, contact your SAP SuccessFactors Account Executive to purchase a subscription of SAP Signature Management from DocuSign.
- DocuSign eSignature allows one e-mail address to be tied to one SAP SuccessFactors Recruiting user account per DocuSign environment (Demo and Production). Even when testing, each recruiting user that uses Online Offers with eSignature requires a unique e-mail address.
- The user's e-mail address and name, including the middle name or initial, must be an **exact** match between the DocuSign system and the HCM suite. If candidates have a middle name or initial in one system, their name must match exactly in the other system.
- Your DocuSign eSignature administrator account doesn't require password reset questions. The account does, however, need the following permissions granted in the DocuSign system:
  - Account-Wide Rights
  - Send On Behalf Of Rights (API)
- The [eSignature Sender](#) role-based permission is enabled.

## Context

### Note

To increase security, DocuSign switched to OAuth authentication in September 2023. If you had Online Offer with eSignature enabled but didn't make the switch, you need to update your settings, as well as grant

Recruiting permission to access DocuSign on your account's behalf. Until you do, Online Offer with eSignature doesn't work in your system. Follow the instructions here, as if you never had the feature enabled.

DocuSign is an electronic signature and digital transaction management service provider. You can use eSignature, a service provided by DocuSign, to electronically sign documents on any device, from almost anywhere, at any time. A digital signature prevents documents signed with DocuSign from edits.

- The Online Offer with eSignature feature uses only DocuSign eSignature, and doesn't support other eSignature options.
- DocuSign refers to transactions as "envelopes," which are equivalent to offer letters (or the act of sending an offer letter) in SAP SuccessFactors.
- This feature includes only the Candidate eSignature process to be assigned through the SAP SuccessFactors system. However, you can add additional signers on demand within the DocuSign portal.
- Online Offer with eSignature follows existing online offer functionality. For example, if you create a new online offer with eSignature while an existing offer is pending, the existing offer and eSignature request expire.
- The DocuSign system triggers any email specific to eSignature functionality. You can't modify the branding and content of the e-mail in the SAP SuccessFactors system.
- Contact DocuSign if you need additional users beyond your limit.

#### → Tip

To avoid manually adding and placing the *Signature* and *Date Signed* fields to every offer letter, go to your DocuSign account and configure the *AutoPlace* feature for these fields.

#### ⓘ Note

Using the DocuSign eSignature option requires you to log in to DocuSign. This step involves leaving your SAP Cloud Services for a third-party web service.

Any use of the third-party web service and any information you provide will be governed by the terms of the third-party web service and not the terms of SAP, including those relating to data privacy and security. Unless otherwise expressly agreed, SAP is not in any way associated with the operator of the third-party web service or responsible or liable for any service offered by the third-party web service.

## Procedure

1. Log in to your DocuSign account and get your User ID and API Account ID information, which you need to enable DocuSign eSignature for offer letters.

You can find both fields in your DocuSign account's *My Apps & Keys* page, and are long alphanumeric strings that include hyphens.

Contact your DocuSign administrator for assistance if you don't know, or have forgotten your DocuSign password.

2. Go to SAP SuccessFactors, and configure the following settings in the *Offer Letter* section in ► *Admin Center* ► *Manage Recruiting Settings* ⌵:

| Option                                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enable Role-Based Permissions for Offer Letter Templates</b>  | Select this option to control who can view and select offer letter templates.                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Set date format to be displayed in Offer Letters</b>          | Select the display format of the offer letter date from the dropdown list.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Allow candidates to accept offers online</b>                  | Select this option to allow candidates to accept offers online.                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Enable electronic signature for offer letters</b>             | <p>Select this option so that candidates can provide electronic signatures in their offer letters using DocuSign eSignature. This option appears when you enable <a href="#">Allow candidates to accept offers online</a>.</p> <p>If you don't enable this option, SAP SuccessFactors Recruiting only displays the <a href="#">Online Offer</a> option, instead of both <a href="#">Online Offer</a> and <a href="#">Online Offer with eSignature</a>.</p> |
| <b>Allow candidates to email job requisition operator</b>        | Select this optional field if you want to allow candidates to send e-mail to the job requisition operator.                                                                                                                                                                                                                                                                                                                                                 |
| <b>Select an operator who will receive emails from candidate</b> | <p>If you enabled <a href="#">Allow candidates to email job requisition operator</a>, use the dropdown list to choose which recruiting operator role receives email from candidates.</p> <div> <p><b>Note</b></p> <p>When you select this option, the candidate <a href="#">Email Recruiter</a> history doesn't display under the <a href="#">Offer Letter</a> portlet in the candidate application.</p> </div>                                            |
| <b>Third-Party eSignature Environment</b>                        | <p>Use the dropdown list to specify whether you want to enable eSignature for DocuSign's Demo or Production environment.</p> <div> <p><b>Caution</b></p> <p>Selecting incorrect options can produce authentication errors.</p> </div>                                                                                                                                                                                                                      |

- Go to the [DocuSign eSignature](#) section, and open the [Grant Access](#) link in the [DocuSign Consent](#) field.  
The link opens a new browser tab for you to log in to DocuSign.
- Log in to your DocuSign account.  
When you log in, you see a message similar to **SAP SuccessFactors Recruiting is requesting permission to.**
- Select [ACCEPT](#).  
Selecting this option grants permission for SAP SuccessFactors Recruiting to access DocuSign on behalf of your account.  
If you select [CANCEL](#), the eSignature option for offer letters won't be available.  
You see a confirmation message.
- Return to [Manage Recruiting Settings](#), and enter the following [DocuSign eSignature](#) fields using the information you got from your DocuSign account's [My Apps & Keys](#) page, as described in step 1:

| Option                  | Description                                          |
|-------------------------|------------------------------------------------------|
| DocuSign User ID        | Enter the user ID from your DocuSign account.        |
| DocuSign API Account ID | Enter the API account ID from your DocuSign account. |

- Choose [Save](#) to finish.

## Results

You've successfully enabled and configured DocuSign eSignature for offer letters, so that is now available as an option.

## Related Information

[Add Fields Automatically with AutoPlace \(DocuSign.com\)](#) 

## 22.3.4 Granting Access for Online Offers with eSignature

Recruiters and SAP SuccessFactors Recruiting users who have an active DocuSign account can choose to grant permission to SAP SuccessFactors Recruiting to access DocuSign on their behalf before they initiate any new offer letters.

## Prerequisites

- Settings have been configured in [Manage Recruiting Settings](#) by an administrator, as described in *Configuring Online Offers with eSignature in Manage Recruiting Settings* and *Updating DocuSign eSignature Integrations in Manage Recruiting Settings*.
- You have a DocuSign login that lets you use the DocuSign eSignature functionality in SAP SuccessFactors Recruiting. Contact your DocuSign administrator for assistance if you don't know, or have forgotten your DocuSign password.

## Context

You can log in to your DocuSign account in advance to grant permission to SAP SuccessFactors Recruiting to access DocuSign on your behalf. When you do, offer letters are sent seamlessly to DocuSign when you choose [Online Offer with eSignature](#), and display in a browser window.

Performing this step in advance is for your convenience, and is optional. You can also choose to wait to grant access when you're initiating an offer letter.

## Note

Using the DocuSign eSignature option requires you to log in to DocuSign. This step involves leaving your SAP Cloud Services for a third-party web service.

Any use of the third-party web service and any information you provide will be governed by the terms of the third-party web service and not the terms of SAP, including those relating to data privacy and security. Unless otherwise expressly agreed, SAP is not in any way associated with the operator of the third-party web service or responsible or liable for any service offered by the third-party web service.

## Procedure

1. Choose the environment you want to grant access in, then copy the appropriate URL string and paste it as a single line in a separate browser window:

| Option                            | Description                                                                                                                                                                                                                                                                               |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Demo (nonproduction) environments | <code>https://account-d.docusign.com/oauth/auth?client_id=77f4be2e-6aa7-47f6-b5e5-158425b1aeaf&amp;scope=signature%20impersonation&amp;response_type=code&amp;prompt=login&amp;redirect_uri=https://static-content.successfactors.com/static-content/consent_agreement_result.html</code> |
| Production environments           | <code>https://account.docusign.com/oauth/auth?client_id=77f4be2e-6aa7-47f6-b5e5-158425b1aeaf&amp;scope=signature%20impersonation&amp;response_type=code&amp;prompt=login&amp;redirect_uri=https://static-content.successfactors.com/static-content/consent_agreement_result.html</code>   |

The URL is a static address that lets DocuSign know you're granting access for SAP SuccessFactors Recruiting specifically. Do not replace any values in this URL string.

2. Select [ACCEPT](#).

Accepting this one-time request informs DocuSign that you're granting SAP SuccessFactors Recruiting access to DocuSign on your behalf, and is required before you can use the Online Offer with eSignature functionality. This means that choosing [CANCEL](#) prevents you from using eSignature functionality with online offers.

## Results

You've granted permission to SAP SuccessFactors Recruiting to access DocuSign on your behalf, so that choosing [Online Offer with eSignature](#) in a new offer letter immediately displays the DocuSign view of the offer letter in your browser window.

## Related Information

[Choosing Online Offer with eSignature Option \[page 1231\]](#)

### 22.3.5 Locales and Time Zones When Using DocuSign eSignature

Understand the behavior of locales and time zones when using DocuSign eSignature.

The DocuSign portal is translated to the candidate's locale. Candidates can override this function by selecting a language on the DocuSign site.

For external candidates, the dates that display for these fields are based on their browser time zone:

- *Offer Date*
- *Accepted Date*
- *Declined Date*
- *eSignature status: Signed on*

For internal candidates, these fields display dates based on their login time zones.

### 22.3.6 Creating Offer Letters

You can start the offer letter process once you have a specific applicant you want to extend an offer to.

#### Prerequisites

- Recruiting operator with feature permissions for offer letters in the requisition template.
- You have the appropriate offer letter permission.

#### Context

##### Note

This page describes functionality available in both the redesigned Applicant Management tool and legacy Candidate Workbench.

## Procedure

1. Go to ► [Recruiting](#) ► [Job Requisitions](#) ►.

2. Select a job requisition and choose the number from the [Candidates](#) column.

If you're using the legacy Candidate Workbench, you can also choose the job title and select the [CANDIDATES](#) tab.

The applicant list for the job appears.

3. Select the applicant to go to their detail view, then launch the offer letter form using the following method:

| Option                                 | Description                                                                                                                                      |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Legacy Candidate Workbench</b>      | Select ► <a href="#">Take Action</a> ► <a href="#">Offer</a> ► <a href="#">Offer Letter</a> ► to launch the offer letter form for the applicant. |
| <b>Redesigned Applicant Management</b> | Select the <a href="#">More</a> icon for the applicant, then choose <a href="#">Offer Letter</a> .                                               |

The offer letter form for the applicant appears.

4. Select the values you want for these fields:

| Option                | Description                                                                                                                                             |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Country/Region</b> | Choose the country/region from the dropdown list.                                                                                                       |
| <b>Language</b>       | Choose the locale from the dropdown list.                                                                                                               |
| <b>Template</b>       | Choose the offer letter template you want to use from the dropdown list.                                                                                |
| <b>Subject</b>        | This field is automatically filled with the email subject text you set up in the offer letter template. You can manually change the text in this field. |

### ⚠ Caution

The applicant's e-mail address populates the [To](#) field. Do **not** edit the address directly in this field. Doing so causes the DocuSign integration to fail in the Online Offer with eSignature option.

5. **Optional:** Make any changes to the offer letter from what's provided in the template.

The Offer Letter [Message](#) field populates with the offer letter template name. You can edit this field in the iFrame. The Recruiting user can then drag and drop tags onto the offer letter.

Select [Reset Template](#) if you want to revert your offer letter back to the original template.

6. **Optional:** Choose [Save as Draft](#) if you want to save the offer letter, but don't want to send the offer letter to the applicant yet.

Selecting [Cancel](#) closes the offer letter and returns you to the candidate workbench.

7. Choose [Next](#).

A draft is automatically saved in the system, and you see a preview of the offer letter.

### 📘 Note

The [Preview](#) button performs the same function as [Next Step](#). The result is the same regardless of which option you choose.

8. Verify that the tokens are populated with values in the preview.

If you see any blank tokens, you need to either select [Back](#) to go back and replace them manually, or make sure you have values associated with the tokens you use in the template. Otherwise, your candidate receives the offer letter with incomplete information.

9. **Optional:** Choose [Print](#) if you want to convert the offer letter content from HTML to a PDF file that's downloaded to your local environment.

The [Print](#) option doesn't automatically send the offer letter to a printer, and it also doesn't send the offer letter to the candidate. The PDF only uses the Arial Unicode MS font. Other font selections are honored when Offer Letter contents are sent using the [Email as Text](#) option.

## Results

You've completed the setup of the offer letter to a specific candidate, and you're now ready to send it.

## Next Steps

Choose the delivery type for the offer letter:

- [Online Offer with eSignature](#)
- [Online Offer](#)
- [Verbal Offer](#)
- [Email as text](#)
- [Email as PDF attachment](#)

### ⚠ Caution

You can't cancel an offer once you send it to a candidate. Your only option for "cancelling" a current offer is to send a new offer. When you send a new offer, the candidate is alerted to the voided and new offers.

## Related Information

[Offer Letter Permissions for Recruiting Operators \[page 1220\]](#)

## 22.3.6.1 Choosing Online Offer with eSignature Option

After you've started the offer letter process to specific candidates, you can choose to send out online offer letters to them with eSignature using DocuSign by selecting the [Online Offer with eSignature](#) option.

### Prerequisites

- Settings have been configured in [Manage Recruiting Settings](#) by an administrator, as described in *Configuring Online Offers with eSignature in Manage Recruiting Settings*.
- Completed the fields in the offer letter as described in *Using Offer Letters*.

### Context

By default, all DocuSign notifications for candidates and recruiting users are enabled. Individuals can change these settings to manage their notifications. Additionally, the [Recruiting E-mail Triggers](#) setting allows you to enable e-mail notifications when candidates choose to accept or decline an offer.

#### Note

Using the DocuSign eSignature option requires you to log in to DocuSign. This step involves leaving your SAP Cloud Services for a third-party web service.

Any use of the third-party web service and any information you provide will be governed by the terms of the third-party web service and not the terms of SAP, including those relating to data privacy and security. Unless otherwise expressly agreed, SAP is not in any way associated with the operator of the third-party web service or responsible or liable for any service offered by the third-party web service.

### Procedure

1. Select [Online Offer with eSignature](#) in your draft online offer.
2. Follow the instructions based on what you see when you selected [Online Offer with eSignature](#):

| Option                                                        | Description                                                                                                                                                                                                                                                |
|---------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>The offer letter appears in a DocuSign browser window.</b> | <p>This means that you have a DocuSign login <b>and</b> you've already granted permission for SAP SuccessFactors Recruiting to access DocuSign on your behalf.</p> <p>Proceed to your eSignature offer letter.</p>                                         |
| <b>You're directed to the DocuSign login page.</b>            | <p>This means that you have a DocuSign account, but you still need to grant permission for SAP SuccessFactors Recruiting to access DocuSign on your behalf:</p> <ol style="list-style-type: none"><li>1. Enter your DocuSign login and password.</li></ol> |

| Option                                                                                                                                       | Description                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                              | <p>A message similar to <b>SAP SuccessFactors Recruiting is requesting permission</b> asks you to allow SAP SuccessFactors Recruiting to access DocuSign on your behalf.</p> <p>2. Choose <a href="#">ACCEPT</a>.</p> <p>You can now proceed to your eSignature offer letter.</p>                                                                 |
| <b>You see a message that SAP SuccessFactors Recruiting created a DocuSign login for you and that you got email with an activation link.</b> | <p>This means that you don't yet have a DocuSign login.</p> <p>Activate your DocuSign login from the link provided in your email. After you set up your account, you're asked to grant permission, for SAP SuccessFactors Recruiting to access DocuSign on your behalf. Accept this, so that you can proceed to your eSignature offer letter.</p> |

The eSignature-enabled offer letter displays in the Recruiting browser window.

- From the [Standard Fields](#) section, drag and drop any standard field for your eSignature offer letter, including the following:

| Option                         | Description                                                                   |
|--------------------------------|-------------------------------------------------------------------------------|
| <a href="#">Signature icon</a> | The location where you want candidates to sign their offer letter.            |
| <a href="#">Date Signed</a>    | The location that displays the date when candidates sign the letter.          |
| <a href="#">Initial</a>        | The location where you want candidate initials to appear in the offer letter. |

#### ⚠ Caution

While in the DocuSign user interface:

- Do not change the email ID or candidate name in the DocuSign user interface. Changing the email or name can lead to an error when the candidate tries to add an electronic signature in the offer letter.
- Do not use the [Back](#) button in the DocuSign window.

#### → Tip

If you don't want to add and place the [Signature](#) and [Date Signed](#) fields to every offer letter manually, you can go to your DocuSign account and configure the [AutoPlace](#) feature for these fields.

- Add any other fields that you want to use.
- Make all necessary changes to the offer letter.
- Optional:** Select one of the following to return to [Offer Method Selection](#):
  - [Cancel eSignature offer](#)
  - [Go Back](#)
  - [Discard Changes](#)

#### ⚠ Caution

Don't choose [Save Draft](#). This option is **not supported**. If you select this option, you lose the work instead of saving it.

7. Select [Send](#) for the online offer with eSignature option.

When successful, you see a message that contains the [Continue to Candidate](#) button. At the same time, candidates receive e-mail from DocuSign that includes a link to the offer letter.

8. Select [Continue to Candidate](#) to go to that candidate's profile.

## Results

After you send the offer letter, the candidate receives e-mail from DocuSign with a link to the online offer. Refer to *The Candidate Experience for Online Offer with eSignature* for details.

You can view the record of the eSignature offer that was sent out under the [Offer Letter](#) section of the candidate profile.

## Related Information

[Granting Access for Online Offers with eSignature \[page 1226\]](#)

### 22.3.6.1.1 The Applicant Experience for Online Offer with eSignature

This topic describes the general process that candidates experience when you use the Online Offer with eSignature option to send them an offer letter.

#### Note

Applicants don't need a DocuSign account to provide an eSignature.

The general process that applicants experience is as follows:

1. Applicants receive email from DocuSign that includes a link, labeled [View Documents](#), to the offer. The link takes them to the sign-in page for the internal or external career site, based on the applicant type.
2. Applicants sign in to the career site, then see the details of their offer display in [My Offers](#).
3. Applicants view the online offer, and accept or decline the offer, or send email to the recruiter. When applicants select [Accept & eSign](#), the DocuSign screen is visible.

#### Note

In public career sites and internal career sites powered by Career Site Builder, the DocuSign screen opens in the existing window. In internal career sites not implemented through Career Site Builder, the DocuSign screen opens in a popup window.

Applicants see a disclosure statement — configured in the DocuSign admin — then can choose one of the following:

- [Review Document](#)
  - [Decline](#) – updates the eSignature status to [Declined by Candidate](#).
  - [Finish Later](#) – returns applicants to [My Offers](#) so that they can go through the eSignature process later.
4. Applicants select [Review Document](#).
  5. Applicants choose their signature, then they can sign and complete the document.

When applicants accept the offer, hiring managers are notified, and you can view the results from the [Offer Letter](#) section within their application profile.

## 22.3.6.2 Choosing Online Offer Option

After you initiate offer letters for your candidates, you can choose [Online Offer](#) to send online offers to candidates that don't require an electronic signature.

### Prerequisites

- Online offers is configured in [Manage Recruiting Settings](#).
- Candidate Relationship Management is enabled.
- If you're using a Career Site Builder-enabled career site:
  - Brand and Email Layouts are configured in Career Site Builder.
  - Candidate Relationship Management is enabled.

### Context

If you prefer to obtain an electronic signature from your candidates, you need to choose [Online Offer with eSignature](#) instead of [Online Offer](#).

### Procedure

1. Select [Online Offer](#) in your offer letter draft that opens up the [Email link to Online Offer Letter](#) page.
2. Select the appropriate locale from the [Language](#) menu.
3. Specify the following if you're using Career Site Builder for your career site:
  - [Brand](#) – select the brand you want to use.
  - [Email Layout](#) – this field appears when you select the brand. Choose the email layout you want to use.
4. Go to [Template](#) to choose the online offer letter that you want.
5. Make any changes that you want to the online offer letter.
6. Select [Next](#) to go to the [Preview Offer Letter](#) page to view how it appears to the candidate.

7. Choose [Back](#) to edit your offer letter, or [Send](#) to finish.

When you've sent out the offer letter, all offer letter options are grayed out except for the following choices:

- [Online Offer with eSignature](#)
- [Verbal Offer](#)

8. Select [I'm Done](#) to finish.

## Results

When the online offer is generated, candidates receive an email that notifies them that they've received an offer and which contains a link to view and accept the offer.

After you send the online offer, the Offer Letter portlet shows you when the letter was sent, if it was accepted or is pending acceptance, and if the candidate has viewed the letter or not. You can also see comments the candidate has left on the Offer Letter in the portlet. You can't print comments from the Application screen, but they're reportable through ad-hoc Reporting. Online Offers are reportable through ad-hoc Reporting, as with any other offer letter. Once an online offer has been extended to a candidate, you can select [Cancel Offer](#) in the Offer Letter portlet. Only the individual who created the offer can cancel it. Configure the [Online Offer Cancelled by Sender](#) and [Online Offer Cancelled by Sender Candidate Notification](#) email triggers to send notifications about offer cancellations.

## Related Information

[Creating Email Layouts in Career Site Builder \[page 520\]](#)

### 22.3.6.2.1 The Applicant Experience for Online Offers

This topic describes the general process that applicants experience when you use the Online Offer option to send them an offer letter.

The general process the applicants experience is as follows:

1. Applicants receive email notifying them that they've received an offer.  
The email contains a link that takes applicants to the sign-in page for the internal or external career site, based on the applicant type.
2. Applicants sign in to the career site, then see the details of their offer and job description display in [My Offers](#).
3. Applicants can view the online offer, which includes the offer date, as well as the following:
  - Start date – this is taken from the standard application field called [startDate](#) if configured on the application template.
  - Job location – this is either taken from the offer approval or job requisition depending on the configuration.Applicants can then choose to accept or decline the offer, or — if the option to contact an operator is enabled — e-mail the recruiter.

Choosing any of these options opens a rich text editor where applicants can enter comments before performing the action. An applicant comment is required to decline the offer.

The [My Offers](#) tab supports multiple versions of an Offer Letter for the same job requisition, but the applicant can only accept the most recent version. Applicants can view older offer letters, offers for other requisitions, or any expired offers on the [My Offers](#) tab. Once enabled, you can add the `[[CANDIDATE_OFFER_URL]]` token to the offer letter to create a direct link to the online offer.

When the applicants accept the offer, hiring managers are notified, and you can view the results from the [Offer Letter](#) section within their application profile.

### 22.3.6.3 Choosing Verbal Offer Option

You can send out verbal offers when you've initiated the offer letter process for the specific candidate.

## Context

The [Verbal Offer](#) option becomes available at the bottom of the email template form after you've initiated the offer letter for your candidate and advanced to the next step.

## Procedure

1. Select [Verbal Offer](#) in your offer letter draft.

The prompt at the top of the page states that the verbal offer has been recorded.

2. Select [I'm Done](#) to finish.

## Results

When a verbal offer is sent, the Offer Letter portlet for in the candidate's application detail page is updated, so that the [Send Mode](#) field shows the value [verbal](#).

## 22.3.6.4 Choosing Email as Text Option

You can use the [Email as Text](#) option when you want to send a job offer in the body of an email to a candidate.

### Context

The [Email as text](#) option becomes available at the bottom of the email template form after you've initiated the offer letter for your candidate and advanced to the next step.

### Procedure

1. Select [Email as text](#) in your offer letter draft.
2. Select [Send](#) when the [Confirm Email as Text](#) dialog box appears on your screen.

When you've sent out the offer letter, all offer letter options are grayed out except for the following choices:

- [Online Offer with eSignature](#)
  - [Verbal Offer](#)
3. Select [I'm Done](#) to finish.

## 22.3.6.5 Choosing Email as PDF Attachment Option

You can send offer letters as emails that contain a PDF attachment of the offer letter for company instances with or without Career Site Builder configured.

### Prerequisites

If you're using a Career Site Builder-enabled career site:

- Brand and Email Layouts are configured in Career Site Builder.
- Candidate Relationship Management is enabled.

### Context

The [Email as PDF Attachment](#) option becomes available at the bottom of the email template form after you've initiated the offer letter for your candidate and advanced to the next step.

## Procedure

1. Select [Email as PDF Attachment](#)

You're taken to the [Email Offer Letter as PDF Attachment](#) page.

2. Select the appropriate locale from the [Language](#) menu.
3. Specify the following if you're using Career Site Builder for your career site:
  - [Brand](#) – select the brand you want to use.
  - [Email Layout](#) – this field appears when you select the brand. Choose the email layout you want to use.
4. Select the offer template you want to use.
5. Make any changes that you want to the offer letter.
6. Select [Next](#) to see a preview of how the offer email appears to the candidate.
7. Choose [Send](#) to finish.

When you've sent out the offer letter, all offer letter options are grayed out except for the following choices:

- [Online Offer with eSignature](#)
  - [Verbal Offer](#)
8. Select [I'm Done](#) to finish.

## 22.3.7 Offer Letter Portlet Fields

After an online offer is sent, you see an entry in SAP SuccessFactors Recruiting for the offer letter in the Offer Letter portlet.

The Offer Letter portlet is part of the application detail page.

### ⚠ Caution

Modifying permissions for individual fields in the portlet can directly impact such things as the candidate experience and integration settings. Refer to *SAP Note 3098726 – Modifying Offer Letter Portlet permission through Manage Templates – Recruiting Management* for details.

The following table describes the fields you see in the portlet.

| Field                     | Description                                |
|---------------------------|--------------------------------------------|
| <a href="#">Author</a>    | The person who initiated the offer letter. |
| <a href="#">Send Mode</a> | A link to view the offer.                  |

| Field                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">View Certificate</a>       | <p>This field is visible only if the offer letter used eSignature functionality. The link allows you to view the DocuSign certificate of the audit history of the signing process.</p> <p>You can track signers in the certification document available from the Offer Letter portlet. The Offer Response status doesn't update based on the additional signers. <a href="#">View Certificate</a> lets you view the response from additional signers.</p> <p>If selecting <a href="#">View Certificate</a> takes you to a message similar to <b>SAP SuccessFactors Recruiting is requesting permission</b>, choose <b>ACCEPT</b>. Refer to <i>Granting Access for Online Offers with eSignature</i> for more information.</p> |
| <a href="#">Offer Extended On</a>      | Displays the date the recruiting user sent the offer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <a href="#">Offer Response</a>         | <p>Displays the candidate's response to the offer. Possible values are:</p> <ul style="list-style-type: none"> <li>• <a href="#">Accepted</a></li> <li>• <a href="#">Declined</a></li> <li>• <a href="#">Expired</a> – displays when an offer has expired because of a creation of a new online offer.</li> <li>• <a href="#">Canceled</a></li> </ul>                                                                                                                                                                                                                                                                                                                                                                         |
| <a href="#">Candidate Responded On</a> | Displays the date when the candidate responded to the offer. This isn't necessarily the date of the eSignature response.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <a href="#">eSignature Response</a>    | <p>This field is visible only if the offer letter used eSignature functionality. Possible values are:</p> <ul style="list-style-type: none"> <li>• <a href="#">Pending with Candidate</a></li> <li>• <a href="#">Declined by Candidate</a></li> <li>• <a href="#">Declined</a> – implies additional recipient added, not candidate.</li> <li>• <a href="#">Completed</a></li> <li>• <a href="#">Expired</a> – eSignature has expired because of a creation of a new offer.</li> <li>• <a href="#">Canceled</a></li> </ul>                                                                                                                                                                                                     |

## 22.3.8 Creating Page Breaks in Offer Letters

You can manually insert a page break using HTML code when viewing your offer letter as a PDF, using the Print command, or when you use the [Email as PDF attachment](#) delivery option.

### Prerequisites

You've launched an offer letter form for an applicant, as described in [Creating Offer Letters \[page 1228\]](#).

### Context

There are two generic page break elements work across multiple browsers:

- Add the following to a paragraph or heading at the **top** of the next page:

```
<p style="page-break-after: always;"> </p>
```

- Add the following to a paragraph at the **bottom** of your page, above the intended break:

```
<p style="page-break-before: always;"> </p>
```

Using the `always` syntax forces the page to break after the principle box in the CSS code. Page break doesn't work when you have a floated parent container. Page break elements must be blocks, not inline. When using Chrome, you need to use both `Page-break-before: always` and `Page-break-after: always` — the same code works in most browsers. Refer to *Guidelines for Creating Page Breaks in Offer Letters* for more information.

### Procedure

1. Select the offer letter where you want to insert the page break.
2. In the offer letter, insert the following after the text where you want the page to break:

```
<p style="page-break-after: always;"> </p>
```

#### ⓘ Note

You can also use the following **before** the text where you want the line to break:

```
<p style="page-break-before: always;"> </p>
```

3. Select [Next Step](#) to continue.
4. Select [Print](#).
5. You can either save the PDF file or select [Open](#) to review the page break in the offer letter.

Don't choose [Preview](#); it doesn't allow you to see the inserted page break.

6. Choose the offer letter delivery type that you want to use.
7. Select *I'm Done* to finish.

## 22.3.8.1 Guidelines for Creating Page Breaks for Offer Letters

There are guidelines you can follow in order to create page breaks when you want to manually insert a page break when viewing your offer letter: as a PDF, using the Print command, or when you use the [Email as PDF attachment](#) delivery option.

When you use the **Always** as your generic page break value, it forces a page break after the principal box. The **Always** generic break immediately generates a page break for paged media. When you generate page break, it's done using CSS, you use either one of the two page break values:

| Values                                  | Description                                                                                                                                                                                   |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>page-break-after: always;</code>  | <p>Insert this code after a paragraph at the bottom of your page before you intend to break.</p> <p>This property is compatible with Microsoft Edge.</p>                                      |
| <code>page-break-before: always;</code> | <p>Insert this optional code before the paragraph, heading, or other block level element at the top of the next page.</p> <p>This property is compatible with Firefox and Microsoft Edge.</p> |

### Note

Chrome isn't technically supported using the **Always** generic break, but is supported for paged media.

## Cascading Style Sheets (CSS)

Consider the following when using style sheets:

- Include without a default media attribute such as `media="screen"`
- Use print media query to wrap the CSS for printers. In your CSS, you can add a section like this example:

```
@media print { /*styles for printers */ }
```

- Page breaks don't work when a parent container is floated. That means that for all the content you want to print with page breaks, you need to disable all of the floats of parent containers by setting them to `'float: none !important;'`
- Use on block elements. Elements that contain the `page-break-after: always;` or `page-break-before: always;` are blocks and aren't inline.  
Block elements include **DIV**, **P**, and **OL**. Inline elements include **SPAN**, **INPUT**, **textarea**, and **script**.

## 22.3.9 Redirect Candidates to Complete Multistage Application Fields After Accepting Offers

In the default setting, candidates who finish accepting an offer see an option to view the offer. If recruiting users need to capture additional information from candidates after they accept an offer, such candidates can be redirected to the job application page to complete the required information.

This functionality is available for both Online Offer and Online Offer with eSignature when the following are configured:

- Mobile Apply
- Multistage application
- Business rule for candidate's decision on offer letter to move candidates to the next stage

If this functionality is enabled for:

- Online Offer with eSignature: The [Continue to Next Step](#) button appears after a candidate accepts a job offer. This button appears only if there are mandatory fields that need to be reviewed and completed by the candidate in the job application. By clicking this button, the candidate is navigated to the [Job-Specific Information](#) page to fill in the necessary information.
- Online Offer: Candidates are automatically redirected to the [Job-Specific Information](#) page if there are mandatory fields that need to be completed.

### Related Information

[Enabling Multistage Applications \[page 1115\]](#)

## 22.4 Job Offer Approvals

When the candidate has advanced to [Offer](#) status, the offer is created and sent out to [ad-hoc](#) approvers to approve or decline.

There are two types of job offer approvals: Legacy offer approvals and mass offer approvals.

### Note

When you enable Mass Offer Approvals, you can still continue to use legacy offer approvals providing that you select the correct offer template. Selecting the incorrect offer template leads to error messages, because all standards fields that's supported for legacy offer approvals are supported for Mass Offer Approvals.

| Offer Approval Type    | Where You Can Initiate Offers                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------|------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Legacy Offer Approvals | Candidate <a href="#">Application Profile</a>                          | <p>For Legacy Offer Approvals, you can only view, create, edit, decline, or cancel offers when you select a specific offer from the Candidate Offers list for one offer at a time.</p> <ul style="list-style-type: none"> <li>• Originators can create offer approvals from a single candidate <a href="#">Application Profile</a> by selecting <a href="#">Offer Approvals</a> from the <a href="#">Take Action</a> menu.</li> <li>• Originators can edit, or cancel single offer approvals, as well as create new offer approval versions for any offers in declined, completed, or canceled status from the Candidate Offers page.</li> <li>• Approvers can approve or decline single offers when selecting the candidate from the Candidate Offers page.</li> </ul> |
| Mass Offer Approvals   | Candidate <a href="#">Application Profile</a><br>Candidate Offers page | <p>You can select multiple offers from the Candidate Offers page.</p> <ul style="list-style-type: none"> <li>• Originators can create, edit, or cancel offer approvals, as well as create new offer approval versions for any offers in declined, completed, or cancelled status.</li> <li>• Approvers can approval a single offer for a candidate or approval all for multiple candidates, as well as decline offers one at a time.</li> </ul>                                                                                                                                                                                                                                                                                                                         |

## Ad hoc Approvers and Predefined Approvers

You can configure predefined approvers as a workflow so that they appear as [Approver 1](#) under the [Approvers](#) section of any offer. When there aren't predefined approvers, that field appears as [Ad hoc Approver](#). When you predefine approvers, only one workflow option can be associated per offer template. However, you can use multiple offer templates.

## 22.4.1 Offer Details Considerations

Some of the important points to be considered while working with Offer Details.

- Comments upon routing for approval cannot be disabled or required.
- Users can add custom help text on Offer Approval fields.
- The [Default Due Date](#) option in Form Template Settings drives the Offer Approval due dates.
- If an Offer Approval is denied, originators see a [Cancel](#) option that cancels the Offer Approval, irrespective of the current status of the candidate and removes the corresponding item from the To Do list of the user.
- A column named [Job Start Date](#) is available on the Offer Approval Summary page. This column is sortable and the value of this column is fetched from the offer approval standard field **job start date**. If the value is not available in the offer approval, the value is fetched from the start date of the Job Requisition. If this value cannot be fetched either from the Offer Approval or the Job Requisition, this value remains blank. Additionally, the existing [date](#) column is renamed to [Last Modified date](#).
- In [Admin Center](#) > [Recruiting Settings](#), there is a switch "Do not pull updated job application and job requisition field data on the offer approval when an offer approval is edited or a new version is created." This is effective for those fields of offer which are write enabled including custom fields.

## 22.4.2 Enabling Offer Approvals

[Offer Approvals](#) can be enabled in Provisioning so that job offers for candidates are sent to [Ad hoc Approvers](#) to approve or decline.

### Procedure

1. Go to [Provisioning](#) > [Company Settings](#) > [Recruiting](#) and select [Enable Offer Approvals](#).
2. Select **Save** to finish.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your Implementation Partner. If you're no longer working with an Implementation Partner, contact SAP Cloud Support.

### Results

When [Enable Offer Approvals](#) is turned on in recruiting, you can now use Job Offer Approval functionality in recruiting.

### 📘 Note

Once offer approvals are turned on, don't use the legacy `<offer-fields>` section within the job requisition template that can cause errors in offer letters.

## 22.4.3 Supported Field Types for Offer Approvals

When you want to include fields referenced from job requisition and job application templates, here are the supported data types for fields for job offer approvals.

All field types in the [Supported for Mass Offer Approvals](#) table are supported for legacy job approvals. However, not all are supported for Mass Offer Approvals. See the [Supported for Mass Offer Approvals](#) column to view that information.

### → Tip

When viewing this document in a web browser, you can filter and sort on the column, show or hide columns, or use full-text search to find what you are looking for. For example, if you want to filter your results by Field Type or Mass Offer Approvals Support columns.

#### Standard Field Types

| Field Type               | Mass Offer Approvals Support | Referenced Template                | Notes                    |
|--------------------------|------------------------------|------------------------------------|--------------------------|
| boolean                  | Supported                    | Job Application                    |                          |
| currency                 | Supported                    | Job Application<br>Job Requisition |                          |

## 22.4.4 Supported Standard Fields for Job Offer Approvals

When you want to include fields referenced from job requisition and job application templates, here are the fields that are supported for job offer approvals.

### Foundation and Generic Object Field Permissions in Ad-Hoc Reporting

Role-based permissions aren't honored for Foundation and generic object fields in ad-hoc reports for offers. Users can view Foundation and generic objects in ad-hoc reports that they don't have the granted role-based permissions for.

### Custom Fields

Custom fields from job requisition and application template must be reportable in order for them to be editable for offer approvals. Refer to the [Related Information](#) to configure reportable custom fields in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Field Information in Table

All fields in the [Supported Standard Field Names for Job Approvals](#) table are supported for legacy job approvals. Mass Offer Approvals, however, isn't supported by all fields. See the [Mass Offer Approvals Support](#) column. When viewing this topic in a web browser, you can filter and sort on the column, show or hide columns, or use full-text search to find what you're looking for. For example, if you want to filter your results by the field type, use [Field Type](#) to select the filter link for that column to view information on fields that you want. You can also sort by field data type to see all fields that use that data type.

## Supported Standard Field Names for Job Approvals

| Field ID               | Field Type       | Mass Offer Approvals Support | Referenced plate | Tem- | Read/Write mission | Per-<br>Notes    |

## 22.4.5 Configuring Predefined Approvers

You can define offer approvals to automatically populate the [Approver](#) field with individuals that belong to specific recruiting operator roles, recruiting groups, or specific users.

### Context

Predefining the approval workflow prevents approvers being added incorrectly and also populates the approvers in the [Ad hoc](#) field of the approval request. You can predefine three types of approvers:

- Recruiting operator role
- Recruiting group
- Specific individual.

You can specify number of approvers and the order in which they appear on the approval request and the ability to reorder approvers when you select the up and down arrow icons.

When a recruiting group is set for an approver, the recruiting user working with the offer approval can select other users within that recruiting group using the [Advanced Search](#) feature.

Predefine your approver workflow using the [Manage Template](#) tool.

### Procedure

1. Go to ► [Admin Center](#) ► [Recruiting](#) ► [Manage Templates](#) ►.

The [Manage Templates](#) page appears.

2. Go to ► [Recruiting Management](#) ► [Offer Detail](#) ► to view the list of templates.
3. Select the template that you want to use.
4. Expand [General Settings](#) and choose [Add New](#)

The [Offer Approvers](#) page appears.

5. Choose [True](#) for the following two fields in the [Offer Approvers](#) page:

| Option                                     | Description                                                            |
|--------------------------------------------|------------------------------------------------------------------------|
| <a href="#">Approval Workflow Editable</a> | <a href="#">True</a> lets you edit the different approver step fields. |
| <a href="#">Approval Workflow Reorder</a>  | <a href="#">True</a> lets you reorder predefined approvers.            |

6. Select the hyperlinked [Offer Approval Steps defined. Click to modify](#) text to open the [Offer Approval Steps](#) dialog box.
7. Select [Add Offer Approval Step](#) to open up your approval step configuration options:

| Option                                 | Description                                                                                                                                                                                                                                                                                                                              |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Step Id</a>                | <p>This required field is the step approver ID name you want to use.</p> <div>  <b>Caution</b><br/> Name must start with a letter, colon, or an underscore and can't start with any variation of letters that contain the word <code>xml</code>. </div> |
| <a href="#">Approver Step Editable</a> | The same values you've previously selected appears here, which should be <a href="#">True</a> .                                                                                                                                                                                                                                          |
| <a href="#">Edit Invalid User</a>      | Select to enable editing when the individual in the approver field is no longer an employee or an approver.                                                                                                                                                                                                                              |
| <a href="#">Approver Type</a>          | <p>Use the dropdown list to choose a type:</p> <ul style="list-style-type: none"> <li>• <a href="#">role</a> – the operator role</li> <li>• <a href="#">user</a> – the approver</li> <li>• <a href="#">recruitinggroup</a> – the recruiting group</li> </ul>                                                                             |
| <a href="#">Approver Value</a>         | <p>Enter a name for the approver type in the text field:</p> <ul style="list-style-type: none"> <li>• A name for the operator role</li> <li>• A name for the approver</li> <li>• A name for the recruiting group</li> </ul>                                                                                                              |
| <a href="#">Step Label</a>             | Step label name you want to use.                                                                                                                                                                                                                                                                                                         |
| <a href="#">Add More+</a>              | Select this to open the Configure New Labels dialog, where you can add label names for locales in other languages. If you have more than one locale, you can use this dialog to choose the default locale.                                                                                                                               |

8. Select [Done](#) to save.

## Results

When you configure your approver workflow step, code snippets appear for each approver type in the offer detail template. Refer to the Related Information section to learn more about recruiting groups and recruiting operator roles.

| Approver Type            | Sample Code Snippet                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## 22.4.6 Legacy Offer Approvals

You can generate offer approvals from the candidate application profile for one candidate at a time.

### Approving Single Offers

Legacy Offer Approvals supports the following from job requisition and application template:

- Standard and custom fields.
- Generic Object standard fields.

### Working on Single Offers

You as an originator can create, edit, or cancel single offers. Approvers can approve or decline single offers. You can filter by:

- *All*
- *Draft*
- *Pending*
- *Completed*
- *Cancelled*
- *Declined*

#### → Remember

For Legacy Offer Approvals, you can only view, create, edit, decline, or cancel offers when you select a specific offer from the Candidate application profile for one offer at a time.

### Related Information

## 22.4.6.1 Creating Legacy Offer Approvals

You can create offer approvals for single candidates from the candidate application profile.

### Prerequisites

[Permission to Create Forms](#) role-based permission is enabled, in ► [User Permissions](#) ► [General User Permission](#) ►. Select [All](#) when you want to give access to all items from the list and [Others](#) to select specific items for that role.

### Procedure

1. Go to ► [Admin Center](#) ► [Recruiting](#) ► [Job Requisitions](#) ►, and access Applicant Management using one of these methods:
  - Select the candidate link under the [Candidates](#) column of the job requisition list that you want.
  - Select the job requisition that takes you to the [JOB REQUISITION](#) default tab, then select the [Candidates](#) tab.
2. Select the candidate that you want from Applicant Management for your requisition to open the candidate's application profile.
3. Go to ► [Take Action](#) ► [Offer Approvals](#) ► from that candidate application profile.

The candidate offer details page appears.
4. Choose [Select Offer Template](#) to select the template that you want.

All of the fields appear on the candidate [Job Offer Detail](#).
5. Make your necessary changes to the offer approval.
6. Go to [Ad hoc approver](#) to select the approver that you want.

The time next to the approver's name displays the local time zone of the person viewing this page.

#### Note

You can also predefine your approvers. Those approvers appear in fields other than [Ad hoc approver](#) field. Refer to [Configuring Predefined Approvers](#) for details.

The approver's name appears in that field. The date stamp displays the local time zone of the person viewing this page.

7. **Optional:** Select [Save](#) to edit the form without sending it.
8. When you're ready to send your offer, select [Send for Approval](#).
9. Select [Yes](#) to continue, or [Cancel](#).

## 22.4.6.2 Editing Legacy Offer Approvals

As an originator or as an approver, you can edit any offer approval that's in declined, completed, or canceled status. When you edit legacy offer approvals, a new version is created.

## Prerequisites

## Context

You can use the filter to locate your offer approval, which can be in draft, declined, completed, or canceled status.

## Procedure

1. Go to ► [Recruiting](#) ► [Job Requisitions](#) ► [Offers](#) ► that takes you to the Candidate Offers list page.

### Note

The displayed time under the [Last Modified Date](#) appears in the logged in user's time zone.

2. Select the candidate that you want from the list. When you select the candidate you want, you're directed to the [Candidate Offer Detail](#) page.
3. Select [Edit Offer Detail](#).
4. Make the necessary changes.
5. Choose **Save** or **Send for Approval**.

### Note

Only originators can choose [Save](#). Approvers can't edit offer approvals.

## Results

A new version is generated when you edit a candidate offer approval. You can view multiple versions when you select the navigation arrow at the top of the page.

The screenshot displays the SAP Offer Approval interface for 'Mateo Salazar for Project Manager'. It features a side-by-side comparison of two versions of the offer. The left pane shows the current version, and the right pane shows a previous version (Version 1 (07/21/2020)). Both panes display the same offer details, including Language (English US (English US)), Template Name (Standard Offer Details), Requisition ID (101), Title (Project Manager), Position Number (500300212), Hiring Manager (Geoff Hill), Division (Manufacturing (MANU)), and Department (Production US (50150011)).

| Field                | Current Version          | Previous Version (07/21/2020) |
|----------------------|--------------------------|-------------------------------|
| Language             | English US (English US)  | English US (English US)       |
| Template Name        | Standard Offer Details   | Standard Offer Details        |
| Requisition ID       | 101                      | 101                           |
| Title                | Project Manager          | Project Manager               |
| Position Number      | 500300212                | 500300212                     |
| Hiring Manager       | Geoff Hill               | Geoff Hill                    |
| Division             | Manufacturing (MANU)     | Manufacturing (MANU)          |
| Department           | Production US (50150011) | Production US (50150011)      |
| Location of Position |                          | San Francisco (1710-2003)     |

Side-by-Side View of Multiple Offer Versions

## 22.4.7 Mass Offer Approvals

You can create, edit, cancel approve multiple offers using the Mass Offer Approvals feature.

### Originators

Originators can perform the following:

- Create, edit, or cancel offer approvals.
- Create new offer approval versions for any offer in declined, completed, or cancelled status.
- Filter offer approvals using the following fields when Mass Offer Approvals is enabled:
  - Approval Status
  - Requisition Template
  - Offer Template
  - Candidate Type
  - Job Title

These filters aren't available when using [Legacy Offer Approvals](#) feature. Refer to [Offer Approval Status and Filter Action Options](#) for more details.

### Approvers

Approvers can approve or decline offer approvals, with the following specifics:

- Approve a single offer for a candidate or approve offers for all selected candidates.

- Decline only one offer at a time.

## Related Information

### 22.4.7.1 Configuring Feature Permissions for Offers in Not Started Status

When the originator permission role isn't included in the `feature-permission` type, they can't view offers in *Not Started* status. You can edit the feature permission definition for *offerApproval* feature permission type to include the operator role permissions.

## Prerequisites

The *Visible To* setting for the *Operator* role is selected for the *Offer Approval* status in the *Edit Applicant Status Configuration* in the Admin Center.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Templates](#) ► [Recruiting Management](#) ► [Job Requisition](#) ►.
2. [Manage Templates Create/Edit Template page](#).
3. Go to ► [General Settings](#) ► [Application Status Configuration](#) ►.

There's a page where you can select the *Application Status Configuration* *Select the job requisition that you want that direct you to the* status set you want to use. You can edit field permissions and feature permissions from this page.

4. Verify the status set you want to use. Otherwise, select a different one from the *Application Status Configuration* menu.
5. Select the *Feature Permissions Defined. Click to modify* link to add the *Offer Approval* to feature permissions that opens up the *Feature Permissions* dialog box.
6. Select *Add feature permission*.
7. Enter the feature permission description.

The following roles can launch offer approvals during statuses with an Offer category.

8. Go to *Feature Permission Type* and select *offerApproval*.
9. Go to *Feature Permission Role Name* to add the necessary permission roles.
10. Go to *Feature Permission Status* *Select the job requisition that you want that direct you to the* and select *Offer*.

11. Select [Done](#) to save your changes that closes up [Feature Permissions](#).
12. Select [Save as Draft](#) if you just want to save. When you want to finish, select [Publish](#).

## Results

The code snippet in the requisition XML file looks similar to this once you've saved the new defined feature permissions so that originators have permissions to view offers in [Not Started](#) status.

### Sample Code

```
<feature-permission type="offerApproval">
  <description><![CDATA[The following roles can launch offer approvals
during specified status]]></description>
  <role-name><![CDATA[S]]></role-name>
  <role-name><![CDATA[O]]></role-name>
  <role-name><![CDATA[R]]></role-name>
  <role-name><![CDATA[G]]></role-name>
  <status><![CDATA[offerApproval]]></status>
</feature-permission>
```

## 22.4.7.2 Special Handling of Field Types for Mass Offer Approvals

There are fields and field data types that aren't supported for Mass Offer Approvals feature.

The following field types are not supported:

| Field Type                   | More Information                                                                                |
|------------------------------|-------------------------------------------------------------------------------------------------|
| <a href="#">object</a>       | Includes both Foundation and generic objects in the <a href="#">Offer Details XML</a> template. |
| <a href="#">jobcode</a>      | <a href="#">Offer Details XML</a> template.                                                     |
| <a href="#">mfields</a>      | <a href="#">Offer Details XML</a> template.                                                     |
| <a href="#">derived</a>      | <a href="#">Offer Details XML</a> template.                                                     |
| <a href="#">questions</a>    | <a href="#">Offer Details XML</a> template.                                                     |
| <a href="#">competencies</a> | <a href="#">Offer Details XML</a> template.                                                     |
| <a href="#">comments</a>     | Referenced from the <a href="#">Application XML</a> template.                                   |

### Note

Cascading picklists **are** supported.

When you select a candidate to either create or edit offer approvals, an error message appears at the top of the Offer Details Page for Selected Candidates that specifies when you're using fields or field data types that aren't supported for Mass Offer Approvals feature.

## 22.4.7.3 Basic Filters and Column Behavior for Candidate Offers Page

You can sort and filter your data that appear in the Candidate Offers page columns. Not all columns are sortable and data in specific columns doesn't appear for all approval statuses.

The following table shows the basic filters for Mass Offer Approvals that appear in the Candidate Offers page.

| Filter Label                                        | Description                                                                                                                                                         |
|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Status</a>                              | Filter your candidate list by offer approval status.                                                                                                                |
| <a href="#">Filter by Requisition Template Name</a> | Filter your candidate list by job requisition template.                                                                                                             |
| <a href="#">Filter by Offer Template</a>            | Filter your candidate list by offer template.                                                                                                                       |
| <a href="#">Candidate Type</a>                      | Filter your candidate list by candidate type using these selections: <ul style="list-style-type: none"><li>• All</li><li>• External</li><li>• Internal</li></ul>    |
| <a href="#">Job Title</a>                           | Filter your candidate list by job title that is an autocomplete field that allows you to enter in a few letters of the job title to open up the list of job titles. |

The Candidate Offers contains standard columns, but not every column appears for all approval statuses. The following table shows the standard columns and behavior for the Candidate Offers page.

### Note

All columns are sortable except for [Approval Version](#).

| Column Header Title                  | Column Data                                                                                                                       | Additional Information                            |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
| <a href="#">Candidate Name</a>       | Column data appear for all statuses.                                                                                              |                                                   |
| <a href="#">Job Title</a>            | Column data appear for all statuses.                                                                                              |                                                   |
| <a href="#">Requisition Template</a> | Column data appear for all statuses.                                                                                              |                                                   |
| <a href="#">Offer Template</a>       | Column data doesn't appear for these statuses: <ul style="list-style-type: none"><li>• Not Started</li><li>• All Offers</li></ul> | <a href="#">Approval Version</a> is not sortable. |
| <a href="#">Approval Version</a>     | Column data doesn't appear for these statuses: <ul style="list-style-type: none"><li>• Not Started</li><li>• All Offers</li></ul> |                                                   |
| <a href="#">Location</a>             | Column data appear for all statuses.                                                                                              |                                                   |
| <a href="#">Offer Status</a>         | Column data appear for all statuses.                                                                                              | Data appear for all Statuses.                     |

| Column Header Title                | Column Data                          | Additional Information                                              |
|------------------------------------|--------------------------------------|---------------------------------------------------------------------|
| <a href="#">Currently With</a>     | Column data appear for all statuses. | Can be an approver or the originator for the offer.                 |
| <a href="#">Job Start Date</a>     | Column data appear for all statuses. | For offers without job start dates, no data appears in this column. |
| <a href="#">Last Modified Date</a> | Column data appear for all statuses. | The displayed date stamp appears in the logged in user's time zone. |
| <a href="#">Recruiter</a>          | Column data appear for all statuses. |                                                                     |
| <a href="#">Req ID</a>             | Column data appear for all statuses. |                                                                     |

## 22.4.7.4 Offer Approval Status and Filter Action Options

When you want to create or edit offer approvals for multiple candidates, there are a number of different filtering options. The table in this topic maps out what actions are available based on approval status and other filter options.

The [Status](#) filter allows you to view offers in specific status such as when recruiter or a hiring manager has moved a candidate to [Offer](#) status, you can view these offers when you choose [Not Started](#) status in that filter. What type of action you can take as an originator or as an approver is dependent on that same filter. However, when checkboxes are visible or selectable is dependent on conditions stated in the [Checkbox Visibility](#) column in the [Offer Approval Status and Filter Action Options](#) table.

When viewing this table in a web browser, you can filter and sort on the column, show or hide columns, or use full-text search to find what you are looking for. For example, if you want to filter your results by [Status Filter](#), select the filter link for that column to view status that you want.

Offer Approval Status and Filter Action Options

| Status Filter | Filter Options                                                                                           | Available Action                         | Checkbox Visibility                                                                                                                                                                                                                 |
|---------------|----------------------------------------------------------------------------------------------------------|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pending       | <a href="#">Offer Template Name</a><br><a href="#">Candidate Type</a><br><a href="#">Job Title</a>       | <a href="#">Approve or Decline Offer</a> | <p>Checkboxes are visible when both are selected:</p> <ul style="list-style-type: none"> <li>• Offer template</li> <li>• <a href="#">With Me</a> link</li> </ul> <p>Checkboxes are hidden when <a href="#">All</a> is selected.</p> |
| Not Started   | <a href="#">Requisition Template Name</a><br><a href="#">Candidate Type</a><br><a href="#">Job Title</a> | <a href="#">Create Offer</a>             | <p>Checkbox is visible when a job requisition template is selected.</p>                                                                                                                                                             |

| Status Filter | Filter Options                                                                                                                                            | Available Action                                                         | Checkbox Visibility                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| All           | <a href="#">Candidate Type</a>                                                                                                                            | None                                                                     | There are no checkboxes.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### → Tip

For offer approvals in [Pending](#) or [Declined](#) Approval status, you can view hyperlinked number of total pending requests and the number of requests assigned to you when you're an approver.

## 22.4.7.5 Enabling Mass Offer Approvals

You can now enable Mass Offer Approvals feature from the [Manage Recruiting Settings](#) page.

### Prerequisites

- [Offer Approval](#) is enabled in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Settings](#) ►.
2. Go to ► [Manage Recruiting Settings](#) ► [Offer Approval](#) ►.
3. Select [Enable Mass Offer Approval](#).
4. Save your settings.

### Next Steps

You can now use the Mass Offer Approvals feature when you access the Candidate Offers page.

## 22.4.7.6 Viewing the Candidate Offers Page

You can select multiple offers to initiate, create, approve, decline, and cancel offer approvals from the Candidate Offers page.

### Procedure

1. From the Admin Center, go to [Recruiting](#) and select the [Job Requisitions](#) tab on the SAP SuccessFactors Recruiting page.
2. On the [Job Requisitions](#) page, select  [Offers](#).

The Candidate Offers page appears, and displays a list of candidates and their associated offers.

## 22.4.7.7 Creating, Editing, and Submitting Multiple Offers

As the originator, you can create offers, and edit offers that are in draft approval status from the Candidate Offers page.

### Prerequisites

[Permission to Create Forms](#) role-based permission is enabled, in ► [User Permissions](#) ► [General User Permission](#) ►. Select [All](#) when you want to give access to all items from the list and [Others](#) to select specific items for that role.

### Context

You can't use business rules to preselect an offer approval template based on [Job Requisition](#) and [Job Application](#) fields. You can, however, run business rules based on [Offer Detail](#) template fields.

### Procedure

1. Go to ► [Admin Center](#) ► [Recruiting](#) ► [Job Requisitions](#) ►.
2. Display the [Candidate Offer](#) page by selecting  [Offers](#) from the top-right section of the page.

The page contains all configured columns defined in your XML template.

The date in the [Last Modified Date](#) column displays the local time zone of the person viewing this page.

3. Choose an option from the dropdown list in the [Status](#) field:

| Option                      | Description                                                                                                                                                                     |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Not Started</a> | You see the <a href="#">Filter by Requisition Template Name</a> field. Select the requisition template you want.                                                                |
| <a href="#">Draft</a>       | You see both <a href="#">Filter by Requisition Template Name</a> and <a href="#">Filter by Offer Template Name</a> fields. Select the requisition and offer templates you want. |

4. Select the candidates that you want, up to 30 at a time.
5. Choose an offer approval based on the status setting you chose:

| Option                      | Description                                                               |
|-----------------------------|---------------------------------------------------------------------------|
| <a href="#">Not Started</a> | Select <input checked="" type="checkbox"/> <a href="#">Create Offer</a> . |
| <a href="#">Draft</a>       | Select <input checked="" type="checkbox"/> <a href="#">Edit Offer</a> .   |

| Option | Description                                                                                                                                                         |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|        | You can also select  ( <a href="#">delete</a> ) to delete draft offer approvals. |

The [Language and Offer Template Selection](#) dialog box appears.

- Go to the [Language](#) dropdown list to select the language you want to use in the [Language and Offer Template Selection](#) dialog box.
- Go to the [Offer Template](#) dropdown list to select the offer template you want to use.
- Select [Continue](#).

Your selected candidates appear as an applicant list in the side navigation panel of the Offer Details Page for Selected Candidates. The offer approval form appears for the selected candidate at the top of [Applicant List](#) until you select a different candidate.

- Select the candidate you want from [Applicant List](#).

The selected candidate's [Offer Approval](#) form appears.

- Make any changes you want to the form.
- Optional:** Select [Save](#) to edit the form without sending it.
- Go to [Approvers: Version 1](#) when you're ready to send for approval, and fill out the required fields.
- Add approvers.

The approver's name appears in that field. The date stamp displays the local time zone of the person viewing this page.

#### Note

You can select the approver that you want in [Advanced Search](#). Add additional approvers using [Add Another](#). Delete them using the [Trash](#) icon.

- Choose [Send for Approval](#).

A confirmation dialog appears.

- Saving your changes doesn't change the offer approval status or send approvals for that candidate.
- Complete all required fields before you send offers for approval.
- You can't recall offers after sending them out for approval.

## Results

The selected candidate is now in [Pending](#) status. When there are multiple candidates in your Offer Details Page for Selected Candidates page, you can continue to the next candidate off the same the list.

## 22.4.7.8 Using Advanced Search Options for Mass Offer Approvals

You can use advanced search for Mass Offer Approvals when you have defined approver steps for specific individuals, recruiting operator roles, or recruiting groups, or you want to select a different approver other than the listed [Ad-hoc](#) approver or one that's predefined.

### Procedure

1. From the Admin Center, go to [Recruiting](#) [Job Requisitions](#) and select [Offers](#) from the top right section of the page to display the Candidate Offers page.
2. Select candidates you want to create or edit approvals.
3. Select your language and offer template when prompted.

You're directed to the Offer Details Page for Selected Candidates [Applicant List](#) until you select a different candidate.

4. Select the candidate you want from the [Applicant List](#), which contains a list of candidates.

By default, the offer approval form appears for the selected candidate at the top.

5. Go to the candidate's approval form and locate the [Approvers](#) section.
6. Perform your search using one of these methods:

- Select [Search](#) to retrieve the list of approvers; you can search employees in the same recruiting group.
- Search employees with the same recruiting group.

When you specify an approver, you can use the Advanced Search dialog box to select individuals. The advanced search works when you select the [Select Value Help](#) icon of an approver field.

To use the advanced search, you can use the autocomplete feature by entering the first three characters of the approver name so that a list appears where you can select your approver.

#### → Tip

You can view all employees that belong to the [recruiting group](#) already predefined when you select the [Search](#) button in the [Find Employee](#) dialog box that only works for recruiting groups.

Refer to *Supported Advanced Search Standard Fields for Mass Offer Approvals* for the list of supported fields.

7. **Optional:** Add additional approvers by selecting [Add Another](#), or remove by selecting the trash icon.

You can change the order of approvers using the up or down arrows.

8. To finish, select either [Save](#) or [Send For Approval](#).

## 22.4.7.8.1 Supported Advanced Search Standard Fields for Mass Offer Approvals

Limited standard fields are supported for Mass Offer Approvals when you perform searches by field in the Advanced Search dialog box.

Custom fields are supported in Succession Data Model for advanced search.

| Field Name                | Data Type | Information                                                                                                                                                                                                                      |
|---------------------------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>First Name</i>         | Text      |                                                                                                                                                                                                                                  |
| <i>Middle Name</i>        | Text      | Supported for Mass Offer Approvals only; not supported for legacy offer approvals.                                                                                                                                               |
| <i>Last Name</i>          | Text      |                                                                                                                                                                                                                                  |
| <i>Username</i>           | Text      |                                                                                                                                                                                                                                  |
| <i>Division</i>           | Object    | Use the dropdown list to select the division you want to search.                                                                                                                                                                 |
| <i>Department</i>         | Object    | Use the dropdown list to select the department you want to search.                                                                                                                                                               |
| <i>Location</i>           | Object    | Use the dropdown list to select the location you want to search.                                                                                                                                                                 |
| <i>Job Code</i>           | Object    | Use the dropdown list to select the job code you want to search.                                                                                                                                                                 |
| <i>Groups</i>             | Object    | Use the dropdown list to select a permission group.                                                                                                                                                                              |
| <i>PERSON_ID_EXTERNAL</i> | HRIS      | <p>A unique identifier of an employee. Employees can have multiple user IDs, but can only have one <i>PERSON_ID_EXTERNAL</i>.</p> <p>Requires Employee Central. Global Assignment and Concurrent Employment must be enabled.</p> |

## 22.4.7.9 Choosing to Approve Offers

You can approve job offers for single or for multiple candidates using the Mass Offer Approvals feature for offers that are in pending status.

### Procedure

1. From the Admin Center, go to [Recruiting > Job Requisitions](#) and select [Offers](#) from the top right section of the page to display the Candidate Offers page.
2. Go to the [Status](#) filter and select [Pending](#).

You can now view all offer approvals in pending status. The [Approve or Decline Offer](#) link appears but is not yet interactive.

3. **Required:** Select both of the following so the checkboxes appear:
  - The [With me](#) link.
  - The offer template that you want to use from the [Filter by Offer Template Name](#).
4. Select candidates that you want.
5. Select [Approve or Decline Offer](#).

You're directed to the Offer Details Page for Selected Candidates. The selected [Applicant List](#) appears as your side navigation panel in the Offer Details Page for Selected Candidates page. By default, the offer approval form appears for the selected candidate at the top of the [Applicant List](#) until you select a different candidate.

6. Choose either of the following for approvals:
  - [Action > Approve](#) for the selected candidate only.
  - [Action > Approve All](#) for all candidates from the applicant list and any comments you want to add.
7. Select [Confirm](#) when prompted or cancel.

### Related Information

[Offer Approval Status and Filter Action Options \[page 1261\]](#)

## 22.4.7.10 Choosing to Decline Offers

As an approver, you can decline offers for multiple candidates as a single action from the Offer Details Page for Selected Candidates.

### Context

#### Note

When declining offers for multiple candidates in the Offer Details Page for Selected Candidates page, the [Decline](#) action executes for one candidate at a time.

### Procedure

1. From the Admin Center, go to [Recruiting](#) [Job Requisitions](#) and select [Offers](#) from the top-right section of the page to display the Candidate Offers page.
2. Go to the [Status](#) filter and select [Pending](#).

You can now view all offer approvals in pending status. The [Approve or Decline Offer](#) link appears but isn't yet interactive.

3. **Required:** Select both of the following so the checkboxes appear:
  - The [With me](#) link.
  - The offer template that you want to use from the [Filter by Offer Template Name](#).
4. Select [Approve or Decline Offer](#).

You're directed to the Offer Details Page for Selected Candidates. The selected [Applicant List](#) appears as your side navigation panel in the Offer Details Page for Selected Candidates page. By default, the offer approval form appears for the selected candidate at the top of the [Applicant List](#) until you select a different candidate.

5. Go the [Approvers](#) section and decline the request by entering a comment in the [Comment](#) field.
6. Select [Action](#) [Decline](#).
7. Select [Confirm](#) when prompted, or cancel.

#### Note

When you select [Confirm](#), that candidate disappears from the view. When you've declined approvals for all candidates, the recruiting system directs you to the Candidate Offers page.

### Related Information

## 22.4.7.11 Creating New Offer Approval Versions for Multiple Offers

You can now create new offer approval versions when offer approvals are completed, canceled, or declined status from the Candidate Offers for multiple candidates.

### Context

A common scenario is when the first version of the job offer is declined during the approval process because of incorrect details, the second version would contain the correct information. The *Approval Version* column is available when viewing approvals from the Candidate Offers page.

### Procedure

1. From the Admin Center, go to ► *Recruiting* ► *Job Requisitions* ► and select  *Offers* from the top right section of the page to display the Candidate Offers page.
2. Go to the *Status* filter and select any of the following offer approval statuses:
  - *Completed*
  - *Cancelled*
  - *Declined*

3. Go to *Filter by Offer Template Name* and select the offer approval template you want.

Offer template must be selected in order to choose candidates.

4. Select candidates that you want.
5. Select *Create New Offer Version* link.

The *Language and Offer Template Selection* dialog box opens.

6. Go to *Language* menu to select language you want to use in the *Language and Offer Template Selection* dialog box.
7. Go to *Offer Template* menu to select the offer template you want to use.
8. Select *Continue*.

You're directed to the Offer Details Page for Selected Candidates. The selected *Applicant List* appears as your side navigation panel in the Offer Details Page for Selected Candidates page. By default, the offer approval form appears for the selected candidate at the top of the *Applicant List* until you select a different candidate.

9. To finish:
  - Select *Save* when you want to save the offer without sending out for approval.
  - Select *Send for Approval*. The confirmation dialog box opens up that prompts you if you want to send the offer detail for approval.

### → Remember

You can't save or send offer for approval unless all approver fields are populated. You can add additional approvers by selecting [Add Another](#) or remove by selecting the [Trash](#) icon.

## Results

When you view the offer page for any selected candidate, a new version number appears at the top of the page.

## 22.4.7.12 Canceling Multiple Declined Offers

You can cancel declined requests for multiple candidates.

## Context

You can cancel declined offers when you're the originator of the request after the approver has declined it.

## Procedure

1. From the Admin Center, go to [Recruiting](#) > [Job Requisitions](#) and select [Offers](#) from the top right section of the page to display the Candidate Offers page.
2. Go to the [Status](#) filter and select offers in [Declined](#) status.
3. Go to the [Filter by Offer Template Name](#) filter to select the offer template you want.

All declined offers with the selected offer template appear on the screen.

4. Select [With me](#) link so that only offers that list you as the originator appears.

### Note

When you've selected the [With me](#) link, checkboxes appear. You can't cancel requests that were initiated by someone else.

5. Select the candidates that you want.
6. Select [Cancel Offer](#) at the top of the page to go to the Offer Details Page for Selected Candidates page.

By default the offer approval form appears for the selected candidate at the top of the [Applicant List](#) until you select the next candidate.

7. Choose [Cancel](#).
8. When prompted, choose [Confirm](#). If you select [Cancel](#), you are cancelling the cancel request.

When you confirm the cancellation by choosing [Confirm](#), that request disappears and you can move to the next candidate on the list. When you cancel the last candidate on your list, you're directed back to the Candidate Offers page.

## 22.4.7.13 Uploading Common Documents with Specific Job Offer

You can upload and save common documents for use in multiple jobs offers across different candidates.

### Prerequisites

You've set up the `multiattachmentselection` field type in the job offer details template.

### Context

Mass Offer Approvals supports being able to download and upload multiple attachments so you can save them to a library. You can associate the common documents from that library with a specific job offer for multiple candidates. Every attachment you upload for multiple candidates remains visible in your library unless you remove it permanently.

#### Note

You can download attachments from candidate for offers in any status. However, you can't upload and associate documents with offers that are in pending status, since those fields aren't editable.

### Procedure

1. From the Admin Center, go to [Recruiting](#) [Job Requisitions](#) and select [Offers](#) from the top right section of the page to display the Candidate Offers page.
2. Go to [Status](#) filter to select offers using either of the two approval statuses:
  - [Not Started](#)
  - [Draft](#)
3. Select candidates that you want from the Candidate Offers page list.
4. Select your language and offer template when prompted and choose [Continue](#) that directs you to the Offer Details Page for Selected Candidates that contains the [Applicant List](#).
5. Select the candidate you want from the list.
6. Upload your documents:

- a. Select the attachment field to open the [My Library](#) dialog box.
- b. Select **+** to open [My Library](#) dialog box, and browse for the files you want.
- c. Select one document you want to save to your library.

Your document appears in your library as a list.

#### Note

You can only select one document at one time. When the document is uploaded, it's associated to that offer. When you want to disassociate the attachment from specific offer, you can uncheck that document.

7. **Optional:** Associate documents to the job offer:
  - a. Select the custom attachment link to open up [My Library](#) dialog box.
  - b. Selecting any of the documents from the list and it automatically associates those documents with specific job offer.

A success message appears at the top of the dialog box.

## 22.4.7.13.1 The multiattachmentselection Field

The `multiattachmentselection` field type is a standalone custom field in the job offer details template so that you can select and upload multiple attachments to your library, and associate with specific job offers.

Field definition parameters for the `multiattachmentselection` in the offer details template.

```
<field-definition id="Custattachment" type="multiattachmentselection"
  required="false" custom="true" anonymize="false">
  <field-label mime-type="text-plain"><![CDATA[Additional documents ]]></field-label>
  <field-label mime-type="text-plain" lang="de_DE"><![CDATA[PZusätzliche
  Dokumente]]></field-label>
  <field-label mime-type="text-plain" lang="en_US"><![CDATA[Additional documents]]></
  field-label>
  <field-description><![CDATA[Additional documents:]]></field-description>
```

## 22.4.7.14 Downloading Documents for Mass Offer Approvals

You can download resumes, cover letters, and other documents using Mass Offer Approvals.

### Context

Mass Offer Approvals supports being able to download and upload multiple attachments so you can save them to a library. You can associate the common documents from that library with a specific job offer for multiple candidates. Every attachment you upload for multiple candidates remains visible in your library unless you remove it permanently.

### Note

You can download attachments from candidates for offers in any status, one candidate at a time. However, you can't upload and associate documents with offers that are in pending status, since those fields aren't editable.

## Procedure

1. From the Admin Center, go to ► [Recruiting](#) ► [Job Requisitions](#) ► and select [Offers](#) from the top right section of the page to display the Candidate Offers page.
2. Select offers in any status.
3. Use filters to select your job requisition and offer template.
4. Select the candidates that you want.
5. Verify your selections in the [Language and Offer Template Selection](#) and select [Continue](#) to go to the Offer Details Page for Selected Candidates.
6. Select [resume](#), [Cover Letter](#), or any document to download.
7. Save the file to your hard drive when prompted.

You don't see a dialog box to save if your browser is configured to download automatically.

## 22.4.8 Changing the Assignment of Offer Approvals

You can reassign active offer approvals to different individuals when offer approvals stall, or they're assigned to an approver who's no longer available.

### Prerequisites

You have the appropriate permissions needed to reassign offers.

[Reassign Offer Approvals](#) role-based permissions enabled.

### Context

## Procedure

1. Go to ► [Admin Center](#) ► [Reassign Offer Approvals](#) ►.

2. Enter the name of the current assignee in the [Find Current Offer Approver](#) to search across active and inactive approvers.
3. Select the name of this current assignee that appears in the result.

If the person is assigned to any pending offers, you see a list of offer approvals.

4. Select the checkbox next to the offer approvals you want to reassign.
5. Enter the name of the user you want to reassign the offer to in [Reassign Offer Approvals to](#) to search active users.
6. Choose [Reassign](#), then confirm your selection in the dialog box.

You see a success message that the offers are reassigned. To Do list items are also reassigned to the new approver.

Both the new approver and the system admin are notified of the reassignment via e-mail.

## 22.4.9 Pending Offer Approvals When Initiator or Approvers Are Deactivated

There are different scenarios when the Initiator or Approver of a pending Job [Offer Approval](#) request is no longer an active employee. Based on specific scenarios ranging from employee termination or via employee import, what happens to the offer and how to approve them.

The following tables describe the various scenarios for pending offers. [Soft Delete](#) refers to whether you can perform a soft delete for job requisitions.

Pending Offer Approval Scenarios for Deactivated Approvers

| Employee Status | Offer Approval Status | Soft Delete | Scenario                                                                                                                                                                                                                      | What Happens to Offer                                                                          | How to Approve Offer                                                                              |
|-----------------|-----------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Inactive        | Current               | No          | Approver is deactivated using <a href="#">Admin Center &gt; Manage Users</a> by setting <a href="#">Active</a> to <a href="#">No</a> and <a href="#">Remove in Progress Documents</a> for instances without Employee Central. | Offer-related data isn't affected.                                                             | Offer Approval can be reassigned from the inactive employee to an active employee as an Approver. |
| Inactive        | Current               | No          | Employee is current Approver for job offer and is deactivated through Employee Central termination process.                                                                                                                   | Offer related data isn't affected.                                                             | Offer Approval can be reassigned from the inactive employee to an active employee as an Approver. |
| Inactive        | Current               | No          | Employee deactivated using Employee Central termination or via Employee Central import process before data purge is performed.                                                                                                | Data purge isn't allowed for deactivated employee when an Approver of a pending offer process. | Offer Approval can be reassigned from the inactive employee to an active employee as an Approver. |

| Employee Status                                                                                      | Offer Approval Status Order | Soft Delete | Scenario                                                                                                                                                                                                                                                 | What Happens to Offer                                                                                                                                                                                                                                                                                             | How to Approve Offer                                                          |
|------------------------------------------------------------------------------------------------------|-----------------------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| Inactive                                                                                             | Current<br>Future           | Yes         | Employee deactivated using Employee Central termination or via Employee Central import process before data purge is performed.                                                                                                                           | Employee record is purged and the job offer is declined since the job requisition has been soft deleted. You can restore the job requisition to reassign job offer to a different Approver.                                                                                                                       | The originator or initiator can opt to create a new version of the job offer. |
| <b>Employee A or Primary Approver = Inactive</b><br><b>Employee B or Secondary Approver = Active</b> | Future                      | No          | <b>Employee A</b> or the <b>Primary Approver</b> is a future Approver in the offer approval process when the offer is currently pending for approval with <b>Employee B</b> or the <b>Secondary Approver</b> . <b>Employee B</b> completes the approval. | <b>Employee A</b> or the <b>Primary Approver</b> is a future Approver in the current process but isn't an active employee. <b>Employee B</b> , or the <b>Secondary Approver</b> . <b>Employee B</b> is the current Approver and the following step is skipped because <b>Employee A</b> isn't an active employee. | Offer Approval isn't blocked.                                                 |

The following table describes the two scenarios for deactivated initiators. There's no Offer Approval status order for these scenarios, and the employee status for both is inactive.

#### Pending Offer Approval Scenarios for Deactivated Initiators

| Soft Delete | Scenario                                                                                                                                                                                                                                 | What Happens to Offer                                                                                                                          | How to Approve Offer                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| No          | Employee is the initiator of offer that's currently pending for approval with the Approver. The initiator is deactivated using Employee Central termination or using the Employee Central import process before data purge is performed. | When the initiator is no longer an employee, the initiator is listed as <i>v4admin</i> . The Approver can either approve or decline job offer. | Pending offer can be either approved or declined by Approver. |
| Yes         | Employee is the initiator of offer that's currently pending for approval with the Approver. The initiator is deactivated using Employee Central termination or using the Employee Central import process before data purge is performed. | When the initiator is no longer an employee, the initiator is listed as <i>v4admin</i> . The Approver can either approve or decline job offer. | Pending offer can be either approved or declined by Approver. |

#### Note

Go to ► [Admin Center](#) ► [Reassign Offer Approvals](#) ► in cases when the job offer must be reassigned to a different Approver that's an active employee.

Refer to *Setting Up and Using Data Protection and Privacy* in the SAP Help Portal.

### 22.4.10 To-Do Behavior for Offer Approvals When Job Requisitions Close

As an approver, you can view offer approvals in your to-do list for open job requisitions only.

The following table describes what happens:

| Action                                                                   | Description                                                                                                                                                        |
|--------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| When a job requisition is closed and there's a pending offer             | The system moves the pending offer to a cancelled state, and the corresponding to-do entries are removed.                                                          |
| When a job requisition is closed and the approver has declined the offer | The offer is <b>not</b> moved to a cancelled state. Upon reopening the requisition, the to-do list for the initiator of the offer approval is <b>not</b> restored. |

If you'd like to create an offer for a closed requisition, reopen the job requisition and create a new offer approval for it. The system automatically generates a new to-do entry when you create that new offer approval.

## 22.5 Job Offer with HR Master Data

Job Offer in Recruiting provides the capability to reuse HR Master data (data defined in other modules) using Foundation Object and Generic Object. If you are not looking for implementing Job Offer with HR Master data, you can skip this section.

## Related Information

[Offer Template Configuration \[page 1278\]](#)

[Effective-Dated Foundation Objects and Generic Objects for Offer \[page 1278\]](#)

[Field Criteria Definition for Offer \[page 1279\]](#)

[Permissions for Offer \[page 1280\]](#)

[Labels Derivation for Offer \[page 1280\]](#)

[The Use of Tokens for Offer Letters \[page 1280\]](#)

[OData Operation for Offer \[page 1281\]](#)

[Create Multiple Job Offers for the Same Position \[page 1282\]](#)

[Behavior of Position Generic Object on Offer \[page 1282\]](#)

## 22.5.1 Offer Template Configuration

In the **Offer Detail** template, you have an XML attribute **object-type** for which only a field of type Foundation Object and Generic Object can be defined, if the field is derived from the Job Requisition, that is, a field with the attribute **template-type="job-req"**.

You can maintain the Offer Detail Template for Foundation Object and Generic Object field types using [Manage Templates](#).

The following code has these properties:

- **object - type** is the type of Foundation Object or Generic Object.
- The attribute type is always set to **object**.

```
<field-definition id="division_obj" type="object"
  required="false" custom="false" object-type="Division"
  template-type="job-req" anonymize="false">
  <field-label><![CDATA[Division obj offer1]]></field-label>
  <field-label lang="en_GB"><![CDATA[Division obj offer1 UK]]></field-label>
  <field-label lang="fr_FR"><![CDATA[Division obj offer1 FR]]></field-label>
  <field-label lang="ja_JP"><![CDATA[Division obj offer1 JP]]></field-label>
  <field-label lang="th_TH"><![CDATA[Division obj offer1 TH]]></field-label>
  <field-label lang="zh_CN"><![CDATA[Division obj offer1 Chinese]]></field-label>
</field-definition>
```

You can't define fields of type Foundation Object and Generic Object directly in the **Offer Detail** template. Fields of type Foundation Object and Generic Object field types are derived from the Job Requisition.

The Offer Template supports single select option and doesn't support selecting multiple values for Location and Position field, even if it's possible on the Job Requisition.

To configure the standard Position object field in Job Offer, enable one of the following options from Provisioning:

- Enable Position Management
- Succession Management
- JDM v2.0/Skills Management

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## 22.5.2 Effective-Dated Foundation Objects and Generic Objects for Offer

An Offer Approval can be created with fields of type Foundation Objects and Generic Objects that have currently inactive values, that become active in future.

For example, a Hiring Manager can start the hiring process for a new Location **Loc**, which will become active in a month. An Offer Approval can be created for this newly created **currently inactive** Location.

The [jobStartDate](#) field is used to identify the date on which to validate, if the value is active or not. It ensures that the validation is not restricted to the current system date. If the [jobStartDate](#) is not defined directly on the Offer

Detail template, it is derived from the Job Requisition. If it is not defined in both Offer Detail and Job Requisition templates, the current system date is taken as default.

In the preceding example, the *jobStartDate* field is populated with the date on which the currently inactive Foundation Objects and Generic Objects field is expected to be active to hire the candidate. At the time of saving the Offer Approval, the system validates to see if the entered values for Foundation Objects and Generic Objects fields are active as of the *jobStartDate*. If the fields are inactive on the *jobStartDate*, it returns an error and you can save neither *Offer Approval* nor *Send For Approval*.

To validate the Foundation Objects and Generic Objects fields on the *jobStartDate*, go to ► [Admin Center](#) ► [Manage Recruiting Settings](#) ► [Generic Object / Foundation Object \(GO/FO\) field types](#) ► [Allow users to select only those instances that are active as of the date in the Job Start Date field in the Job Requisition and Offer Detail pages](#) ►.

In general, the working is similar to that of *Job Requisition Details* page.

## 22.5.3 Field Criteria Definition for Offer

Field criteria cannot be defined in the *Offer Detail* template. Field criteria for a field with `template - type = "job - req"`, is derived from the Job Requisition template.

If the option, *Allow users to select only those instances that are active as of the date in the Job Start Date field in the Job Requisition and Offer Detail pages* is enabled in ► [Admin Center](#) ► [Manage Recruiting Settings](#) ► [Generic Object / Foundation Object \(GO/FO\) field types](#) ►, the field criteria validation happens as of the *jobStartDate*, which is similar to that of *Job Requisition Details* page.

The following table explains the field criteria behavior for parent and child field permissions:

| Parent Field Permission | Child Field Permission | Field Criteria Behavior                                                                                                                                             |
|-------------------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| READ                    | WRITE                  | Field criteria is applied as defined in the Job Requisition template.                                                                                               |
| READ                    | READ                   | Since parent and child have read-only permissions, there will be no changes to the values, and the field criteria will be ignored.                                  |
| No READ and WRITE       | READ                   | The field criteria isn't applied because the child value can't be changed.                                                                                          |
| No READ and WRITE       | WRITE                  | Even though the child field has write permission, you don't see any values in the child field dropdown because the parent doesn't have read and write permissions.  |
| WRITE                   | READ                   | While it's possible to save the offer on changing the parent value even if the child value is incorrect, you should avoid using that method to modify the template. |
| WRITE                   | WRITE                  | Both parent and child fields have write permissions, so the field criteria will be applied as defined.                                                              |

## 22.5.4 Permissions for Offer

In continuation to the existing behavior, you can't provide Write permission in **Offer** to the standard Generic Object fields.

Following are the standard Generic Object fields for which you can't provide Write permission:

- Legal Entity
- Business Unit
- Division
- Department
- Cost Center
- Position

The standard [Location](#) object and standard [Position](#) object fields are writable by default. They can't be configured as read-only fields. Custom fields derived from the Job Requisition can have Write permission, if they're marked as **Custom Reportable Fields** in ► [Provisioning](#) ► [Managing Recruiting](#) ► [Configure Reportable Custom Fields](#) ►.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## 22.5.5 Labels Derivation for Offer

For Offer-specific fields, all labels are derived from **Offer Detail** template.

### 📘 Note

The labels shown in the Offer and Requisition can be different as the labels for the seven standard Foundation Object/Generic Object fields are not read from the Succession Data Model.

## 22.5.6 The Use of Tokens for Offer Letters

You can use the fields of type Foundation Object and Generic Object defined on the Offer Detail template as tokens. Using tokens for [Offer Letters](#) is similar to using them for job requisitions.

The support for Effective-Dated Foundation Objects and Generic Objects is similar to the Job Requisition.

### Tips for Using Tokens

Here are a few tips when working with tokens for offer letters:

- Tokens with no data to populate appears as the token placeholder and must be removed.
- Tokens often appear with yellow highlighting when inserted. The yellow highlighting can vanish when you use the print preview feature. As a best practice, it's better to adjust the formatting of the letter so that the highlighting doesn't appear.
- A logo token is available to populate the default logo of the company or images can be copied and pasted into the offer letter. Images must be hosted in the same data-center of the client.
- "Letterhead" functionality isn't currently supported, so margins, page number presence, and formatting can't be adjusted. Images can't be inserted behind the offer letter text.

Refer to *Tokens for Foundation Object and Generic Object Fields* more information on using tokens in Job Requisition.

## Related Information

[Tokens for Foundation Object and Generic Object Fields \[page 233\]](#)

[Configuring Custom Recruiting Tokens \[page 1436\]](#)

## 22.5.7 OData Operation for Offer

OData for **Offer** is similar to the behavior of Job Requisition OData.

### Points to remember while operating with OData for Offer

- Custom Foundation Object/Generic Object fields that are listed in ► [Provisioning](#) ► [Configure Reportable Fields](#) ► can be accessed through OData.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- Editable standard fields **location\_obj** and **std\_position\_obj** can be updated through Offer OData API.
- Permissions and validations for Foundation Object/Generic Object fields on **Offer** is handled similar to how MDF Foundation Object/Generic Object fields are handled in Requisition.
- When [Allow users to select only those instances that are active as of the date in the Job Start Date field in the Job Requisition and Offer Detail pages](#) option is ON, the OData API works similar to that of [Offer Approval](#) page.
- The Position Generic Object (**std\_position\_obj**) is not supported in SFAPI for Offer entity.

## Related Information

[OData Operations for Job Requisitions \[page 240\]](#)

## 22.5.8 Create Multiple Job Offers for the Same Position

Currently, it's possible to create multiple Offer Approvals for the same Position (values of the field **std\_position\_obj**).

When you try to create an Offer Approval with a same position that is already used in another Offer Approval that isn't in *Canceled* or *Rejected* state, a message about such reuse is displayed on the UI. This message is not displayed as part of Offer OData API operations.

## 22.5.9 Behavior of Position Generic Object on Offer

You can generate a job offer only for those positions (values of the field **std\_position\_obj**) that are selected on the job requisition.

# 23 Suite Integration with SAP SuccessFactors Recruiting

You can integrate SAP SuccessFactors Recruiting with your core HRIS and with other parts of the HCM suite.

## Know Before You Start

- Understand what other SAP SuccessFactors solutions are implemented in the system and how they impact Recruiting configuration.
- If you use MDF picklists, create a lookup object to map the `externalCode` in MDF to `optionId` in Recruiting. Recruiting uses `optionId` to reference picklists.
- If you use Job Profile Builder with Employee Central, ensure that the jobcode type is `JOBCLASSIFICATION`. If use it without Employee Central, the jobcode type is `JOBCODE`.
- When possible, use OData API with any integrations that need to be configured.

## Leading Practices

- Before you integrate Recruiting with other SAP SuccessFactors solutions, complete training in the other solution or work with a counterpart who is trained in the other solution.
- Use OData API for integration, not SFAPI. SFAPIs are being deprecated.

## Related Information

[Integration of Recruiting with Employee Records in Employee Central \[page 1284\]](#)

[Integration of Recruiting with Position Management in Employee Central \[page 1318\]](#)

[Integration of Recruiting with Onboarding \[page 1352\]](#)

[Integration of Recruiting with SAP ERP HCM \[page 1362\]](#)

[Configuring Recruiting Integration with Job Profile Builder \[page 1339\]](#)

## 23.1 Integration of Recruiting with Employee Records in Employee Central

The integration between Recruiting Management to Employee Central provides a seamless way to transition an external candidate record into a new employee account, including issuing an Employee ID.

- Customers using both Recruiting and Employee Central can hire internal and external candidates and automatically sync them into their Employee Central database.
- The integration template can pull from the candidate application, job requisition, and offer letter. To maximize data transfer, make sure these XML templates are configured to include the supported fields listed in the Recruiting-Employee Central Transformation Template:
  - Requisition
  - Application
  - Offer Details
- Because the [Manage Pending Hires](#) list is populated based on offer approval information, a candidate must go through an approved offer approval before being set to [Ready to Hire \(Hirable\)](#).
- Permission to view applicants in [Manage Pending Hires](#) is based on the requisition operators, not on applicant data.

Map the data from Recruiting Management directly to the equivalent fields in Employee Central. This mapping requires Professional Services configuration in both the Recruiting and Employee Central modules. External Candidate Profile background elements are synched to the Employee Profile automatically when correctly mapped.

With this functionality enabled and configured, Recruiting users can:

- Stage a candidate in a prehire status in the Recruiting module
- Access the Employee Central page for creating an employee
- Review and edit new hire account data pulled directly from the Recruiting module
- Submit a new hire for approval (for example, creation and routing of a new employee account)
- Receive automated notifications of the process progress (for example, final approval received)
- Update the Candidate Profile with the Employee ID
- Auto-synch background element information from candidate profile to Employee Profile after the hire

### → Tip

Background elements don't pass to Employee Central. They're synched directly from the external candidate profile to the Employee Profile .

### 23.1.1 Instructions in the Application XML

If you want, you can add one or more instructional fields in the Application XML that describe the integration process and provide instructions to Recruiting users on how to complete the hire process into Employee Central.

Recruiting users usually need to know the exact set of conditions that must be met in order for the candidate to appear in [Manage Pending Hires](#). If they don't know these conditions, there can be confusion when processing new hires.

If you're using multistage application, configure these fields so that they're only visible in the appropriate offer or hire statuses.

## Related Information

[Configuring the Job Application Template in Provisioning \[page 1076\]](#)

## 23.1.2 Configuring Applicant Status for Employee Central Integration

If you're using Employee Central with Recruiting, you must configure the Applicant Status Set with required statuses to initiate the integration.

## Prerequisites

You need access to Provisioning.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Context

For a status set, we recommend you to configure only one status each for *Hire* and *Hirable*. You may see issues in the hiring process if you configure these statuses more than once.

## Procedure

1. Go to [Provisioning](#) > [Managing Recruiting](#) > [Applicant Status Configuration](#).
2. Select [Edit Base](#) to edit the base status set, then select [Add New](#):
  - In the *Type* field, select **In-Progress**.
  - In the *Status Name* field, enter **Hirable**.
  - In the *Category* field, select **Hired**.
3. Save changes and select [Applicant Status Configuration](#) to return to the previous page.

4. Edit the default status set to update the *Hired/Hirable* statuses. To edit, select the name of the status set in the *Status Set Name* column.
5. Select *Hire* in the *Status Name* column:
  - Enter **Hired** in the *Internal Label* field.
  - Select the *Enable this status* options.
  - Under *Hirable Options*, select **Hired**.
6. Create a status for the *Hirable Option* by selecting *Add New*.
  - Select *Hireable*.
  - Select *Add*.
7. Select *Hireable* in the *Status Name* column:
  - Enter **Ready to Hire** in the *Internal Label* field.
  - Enter **Ready to Hire** in the *Candidate Label* field.
  - Select the *Enable this status* options.
  - Under *Hirable Options*, select **Hireable**.
8. Move the **Hirable** status before the *Hire* status to keep a consistent applicant status trail.
9. Save your changes.

## Results

This additional status, *Ready to Hire (Hirable)*, is now available in the applicant status trail in the application.

## 23.1.3 Configuring Transformation Template

When data is sent from Recruiting to Employee Central, you have to configure the transformation template so that data can be transferred.

## Prerequisites

You have access to Provisioning.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Procedure

1. Go to ► [Provisioning](#) ► [Managing Recruiting](#) ► [Import/Export Candidate to employee integration template](#) ►.
2. Click [Export](#) and [Submit](#) to start configuring the template.

## Results

The default template gets downloaded on to your system and it looks like the following:

### Sample Code

```
<object-mappings integration-type="CandidateToEmployee">
  <entity-details-mapping>
    <mapping-attribute>
      <source entity-type="application" refid="firstName"/>
      <target refid="personalInfo.first-name"/>
    </mapping-attribute>
    <mapping-attribute>
      <source entity-type="application" refid="lastName"/>

<role>G</role>
<role>G</role>
</target-roles>
</role-mapping>
</object-mappings>

```

### 23.1.3.1 Transformation Template Elements

There are various transformation template elements that let you configure the template so that the validations and transformations occur based on the configuration when the data is sent from Recruiting to Employee Central.

#### object-mappings Element and entity-details-mapping Element

Always declare these elements and attributes at the top of the Candidate to Employee integration XML template that got exported from [Provisioning > Import/Export Candidate to employee integration template](#).

### Sample Code

```
<object-mappings source="RCM" target="EC" integration-type =  
"CandidateToEmployee">  
  <entity-details-mapping>
```

## mapping-attribute Element

Declare one **mapping-attribute** element for every field that you intend to map from Recruiting to Employee Central.

### Sample Code

```
<mapping-attribute>  
  <source refid="firstName" entity-type="application"/>  
  <target refid="personalInfo.first-name" />  
</mapping-attribute>
```

## source Element

Each mapping-attribute Element must contain one source Element. This declares the origin of the data in Recruiting.

### Sample Code

```
<mapping-attribute>  
  <source refid="firstName" entity-type="application"/>  
  <target refid="personalInfo.first-name" />  
</mapping-attribute>
```

## refid Attribute for source Element

Each source element must contain one **refid** attribute. This declares the field in Recruiting that is sent to Employee Central.

### Note

Some fields that contain complex data, such as application comments, questionResponse, competencies are currently not supported.

### Sample Code

```
<source refid="firstName" entity-type="application"/>
```

## entity-type Attribute

Each source element must also contain one **entity-type** attribute. This declares which object the field data pulls from when it is sent to Employee Central. Allowable values are application, jobrequisition, and offerletter.

### Sample Code

```
<source refid="firstName" entity-type="application"/>
```

## target Element

The **target** element defines the mapping of the Recruiting Data into Employee Central.

### Sample Code

```
<mapping-attribute>
  <source refid="firstName" entity-type="application"/>
  <target refid="personalInfo.first-name"/>
</mapping-attribute>
```

## refid Attribute for Target Element

The **refid** attribute for a target element defines what object and field data has to be placed into Employee Central. The refid must be in the format `hrisElementName.hrisFieldName.<entityName>` for all the objects. For phone and email, the entityName (for example, H, P, and so on) has to match the externalCode of the phone/email type picklist on Employee Central.

### Sample Code

```
<target refid="personalInfo.first-name"/>
```

## Examples for Multi-value Configuration for Target Elements

The [1] in each of the following samples represents the first record in the mapping:

### Sample Code

```
<mapping-attribute>
  <source refid="cust_emergencyName" entity-type="application"/>
  <target refid="emergencyContactPrimary.[1].name"/>
</mapping-attribute>
```

### Sample Code

```
<mapping-attribute>
  <source refid="cust_emergencyRelationship" entity-type="application"/>
  <target refid="emergencyContactPrimary.[1].relationship"/>
</mapping-attribute>
```

### Sample Code

```
<mapping-attribute>
<source refid="cust_emergencyPhone" entity-type="application"/>
<target refid="emergencyContactPrimary.[1].phone"/>
</mapping-attribute>
```

## role-mapping Element

The Recruiting-Employee Central transformation template has to include a **role-mapping** element. This element contains two subelements. One is used to control the permissions used in the Manage Pending Hires tool and the other is used to identify which requisition operator is the new employee's manager.

### Sample Code

```
<role-mapping>
<target-roles>
  <role>O</role>
  <role>V</role>
  <role>R</role>
  <role>T</role>
  <role>G</role>
</target-roles>
<manager-roles>
  <role>G</role>
</manager-roles>
</role-mapping>
```

## target-roles Element

Each role-mapping Element must contain one **target-roles** element.

In other areas of the suite, the target permissions in Role-based Permissions are based on the employee data. As the applicant in the Manage Pending Hires tool is not yet an employee, the permissions cannot be based on their data. Instead, the user attempting to process the applicants in Manage Pending Hires can view only the pending hires where one or more of the requisition operators are included in their allowable target population.

### → Tip

Designating the **O** Recruiting operator as the target role can cause complications, because if originating user is inactivated, the originating user does not get changed and the process fails.

Multiple roles can be specified within target-roles.

### Sample Code

```
<target-roles>
  <role>O</role>
  <role>V</role>
  <role>R</role>
  <role>T</role>
  <role>G</role>
</target-roles>
```

## manager-roles Element

Each mapping-attribute Element must contain one **manager-role** element. This declares which requisition operator Employee Central considers to be the manager role. Based on this operator, Recruiting identifies the manager and returns the manager's information. Only one role should be specified in manager-roles.

### Sample Code

```
<manager-roles>
  <role>G</role>
</manager-roles>
```

## Field Mapping for Country/Region-Specific Address Formats

Recruiting Management does not support country/region-specific address formats, limiting the precision of address field mappings in transformation templates. While Employee Central supports these formats, Recruiting Management offers the following standard fields only:

- Address Line 1
- Address Line 2
- State/Province
- Country
- Zip

### Note

If one-to-one field mapping is not possible for your country/region, please configure these fields in your template to align as closely as possible to the format of your country/region. For example, Germany uses *Street* for *Address Line 1*, whereas the UK uses *Building Number and Street*.

## Related Information

[Setting Up the Succession Data Model](#)

## 23.1.3.2 Transformation Template Rules and Data Handling

Familiarize yourself with the transformation template rules and data handling.

During the import process, the template is validated:

- An error is displayed for any invalid Employee Central fields. Warnings are displayed if required Employee Central fields are missing.
- On the Employee Central side, elements and fields are validated while processing the hire in the *Manage Pending Hires* tool. If elements or fields result in validation errors, refer to the *All fields from Recruiting*

*Management are mapped and validated* check in the *Manage Pending Hires* area of the *Check Tool* for proposed solutions.

For some entities, it's necessary to provide an additional attribute to the code. For more information, refer to the sample mappings. The following table describes the additional requirements for specific entities:

| Entity                   | Requirement                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| emailInfo                | The entity name and type (for example, <b>H, P</b> in the example template) must match the <b>externalCode</b> of the phone or email type picklist.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| phoneInfo                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| addressInfo              | <p>Recruiting sends a two-character country/region code that converts to a three-character country/region code and identifies the right country/region from the Territory table.</p> <p>To determine the country-specific fields for address, job, and compensation, Employee Central uses the country/region from the <b>address</b> field of Recruiting. During the new hire process, the user can change the Legal Entity on the new hire page, at which point the country-specific fields reset. The value from Recruiting is still displayed for the field.</p> |
| payComponentRecurring    | <p>A single frequency is used for all <b>payComponents</b> sent by Recruiting. The frequency must match the <b>externalCode</b> of the frequency from the <b>FO_FREQUENCY</b> foundation object table. If this doesn't match, the value from Recruiting cannot be displayed due to incompatible data types.</p> <p>The currency sent is used for all <b>payComponents</b> sent by Recruiting.</p>                                                                                                                                                                    |
| payComponentNonRecurring |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

The following table describes how field types are handled when mapping from Recruiting to Employee Central:

| Recruiting        | Employee Central  | Behavior                                                                                                                                                                                                                                                                                                              |
|-------------------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Foundation Object | Foundation Object | Employee Central identifies the Foundation Object for the autocomplete drop-down by searching by NAME, CODE, NAME (CODE), and DESCRIPTION. The NAME (CODE) form handles the case where a Foundation Object from Employee Central has been synced to <b>users_sys_info</b> and that value is being used by Recruiting. |
| Picklist          | Picklist          | The localized value is sent and Employee Central sets the optionID in the corresponding field by querying the picklist table for that localized value. Use the same picklist with the same translations on both sides to match picklist values.                                                                       |
| Picklist          | Non-picklist      | The Recruiting value displays in the field.                                                                                                                                                                                                                                                                           |

| Recruiting | Employee Central | Behavior                                                                                                                                                                                            |
|------------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Boolean    | Boolean          | If the target field in the Employee Central object is of the type Boolean, then you must configure the source field as the type Boolean in your Recruiting templates.                               |
| String     | Number           | Avoid this mapping. Mapping a field of type String to a field of type Number can cause incorrect values. Map fields of type Number in Recruiting only to fields of type Number in Employee Central. |

We recommend using the `std_position_objlist` recruiting field when mapping to the Position field in Employee Central.

[Adding Sync Mapping for Standard Field](#)

### 23.1.3.3 List of Employee Central Objects That Support Data Transfer

Only certain Employee Central objects can receive data from Recruiting. You can choose to collect the data in Recruiting or Onboarding or in a later stage.

Objects

| Employee Central Object | Sample Mapping                                                                                                                                                                                                     |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| personalInfo            | <div> <div>Sample Code</div> <pre>&lt;mapping-attribute&gt;   &lt;source refid="firstName" entity-type="application"/&gt;   &lt;target refid="personalInfo.firstName"/&gt; &lt;/mapping-attribute&gt;</pre> </div> |

personInfo

## Sample Code

```
<mapping-attribute>
  <source entity-type="application"
    refid="country"/>
  <target refid="personInfo.country-
of-birth"/>
</mapping-attribute>
<mapping-attribute>
  <source entity-type="application"
    refid="dateOfBirth"/>
  <target refid="personInfo.date-of-
birth"/>
</mapping-attribute>
```

biographicalInfoLoc

## Note

- You can map only one country/region record, because the required `biographicalInfoLoc.country` key must be unique.
- If the mapping has two or more country/region records, then the [Manage Pending Hires](#) tool in Employee Central accepts only the last one.

Enter the three-digit country/region code to configure a country/region-specific mapping. The following maps `biographicalInfoLoc` for Australia:

## Sample Code

```
<mapping-attribute>
  <source refid="custom_field1"
    entity-type="application"/>
  <target
    refid="biographicalInfoLoc.country"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="custom_field2"
    entity-type="application"/>
  <target refid="biographicalInfoLoc.
[AUS].place-of-birth"/>
</mapping-attribute>
```

## emailInfo

 Note

- You can send multiple emails by mapping a different key for each entity type.
- You have to specify the entity name when mapping **emailInfo**.
- The entity name/type values (for example, **P**, **H**) need to match the externalCode value of the **email** type in the Employee Central picklist.

 Sample Code

```
<mapping-attribute>
  <source refid="contactEmail"
entity-type="application"/>
  <target refid="emailInfo.email-
address.P"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="customPicklist1"
entity-type="offerletter"/>
  <target refid="emailInfo.email-
type.H"/>
</mapping-attribute>
```

## phoneInfo

 Note

- You can send multiple phone numbers by mapping a different key for each entity type.
- You have to specify the entity name when mapping **phoneInfo**.
- The entity name/type values (for example, **O**, **H**) need to match the externalCode value of the **phone** type in the Employee Central picklist.

 Sample Code

```
<mapping-attribute>
  <source refid="homePhone" entity-
type="application"/>
  <target refid="phoneInfo.phone-
number.O"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="cellPhone" entity-
type="application"/>
  <target refid="phoneInfo.phone-
number.H"/>
</mapping-attribute>
```

---

employmentInfo Sample Code

```
<mapping-attribute>
  <source entity-type="application"
    refid="startDate"/>
  <target
    refid="employmentInfo.firstDateWorked"
  />
</mapping-attribute>
<mapping-attribute>
  <source entity-type="application"
    refid="startDate"/>
  <target
    refid="employmentInfo.start-date"/>
</mapping-attribute>
<mapping-attribute>
  <source
    entity-type="jobrequisition"
    refid="legalEntity_obj"/>
  <target
    refid="employmentInfo.company"/>
</mapping-attribute>
```

---

homeAddress Sample Code

```
<mapping-attribute>
  <source entity-type="application"
    refid="address"/>
  <target
    refid="homeAddress.address1.home"/>
</mapping-attribute>
<mapping-attribute>
  <source entity-type="application"
    refid="city"/>
  <target
    refid="homeAddress.city.home"/>
</mapping-attribute>
```

---

jobInfo Sample Code

```
<mapping-attribute>
  <source
    entity-type="jobrequisition"
    refid="businessUnit_obj"/>
  <target refid="jobInfo.business-
    unit"/>
</mapping-attribute>
<mapping-attribute>
  <source
    entity-type="jobrequisition"
    refid="legalEntityCode"/>
  <target refid="jobInfo.company"/>
</mapping-attribute>
```

---

paymentInfo

 Note

- This mapping is applicable if you're using *People Profile 3*.
- The values supported for Pay Type are MAIN, PAY-ROLL, BONUS, and EXPENSES.

 Sample Code

```
<mapping-attribute>
  <source refid="custom1" entity-
type="application"/>
  <target
refid="PaymentInformationV3.custom-
field1"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="cust-paymentmethod"
entity-type="application"/>
  <target refid=
"PaymentInformationDetailV3.
[MAIN].[1].paymentMethod" />
</mapping-attribute>
```

globalInfo

Enter the three-digit country/region code to configure a country/region-specific mapping. The following maps **globalInfo** for the U.S.A.:

 Sample Code

```
<mapping-attribute>
  <source refid="disabiltyStatus"
entity-type="application"/>
  <target refid="globalInfo.
[USA].genericString6"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="race" entity-
type="application"/>
  <target refid="globalInfo.
[USA].custom-string1"/>
</mapping-attribute>
```

compInfo

## Sample Code

```
<mapping-attribute>
  <source refid="cust_isPrimary"
entity-type="application"/>
  <target refid="compInfo.is-
eligible-for-car"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="cust-paygroup"
entity-type="application"/>
  <target refid="compInfo.pay-
group"/>
</mapping-attribute>
```

workPermitInfo

You can send multiple values by using square brackets:

## Sample Code

```
<mapping-attribute>
  <source refid="country" entity-
type="application"/>
  <target refid="workPermitInfo.
[1].country"/>
</mapping-attribute>
```

personRelationshipInfo (Dependent)

## Sample Code

```
<mapping-attribute>
  <source refid="cust_emergType"
entity-type="application"/>
  <target refid=
"dependentInfo.
[1].personRelationshipInfo.relationship
ip_type"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="cust_isPrimary"
entity-type="application"/>
  <target refid=
"dependentInfo.
[1].personRelationshipInfo.is_benefic
iary"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="cust_emergName"
entity-type="application"/>
  <target refid="dependentInfo.
[1].personalInfo.first-name"/>
</mapping-attribute>
```

---

nationalIdCard

You can set single and multiple mappings:

 Sample Code

```
<mapping-attribute>
  <source refid="country" entity-
type="application"/>
  <target refid="nationalIdCard.
[1].country"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="ssn" entity-
type="application"/>
  <target refid="nationalIdCard.
[1].national-id"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="cust_ssn_type"
entity-type="application"/>
  <target refid="nationalIdCard.
[1].card-type"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="cust_isPrimary"
entity-type="application"/>
  <target refid="nationalIdCard.
[1].isPrimary"/>
</mapping-attribute>
```

emergencyContactPrimary

You can send multiple values by using square brackets. Start with the numeric value of 1 then use ascending values:

 Sample Code

```
<mapping-attribute>
  <source refid="cust_emergName"
entity-type="application"/>
  <target
refid="emergencyContactPrimay.
[1].name"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="cust_emergPhone"
entity-type="application"/>
  <target
refid="emergencyContactPrimay.
[1].phone"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="cust_emergEmail"
entity-type="application"/>
  <target
refid="emergencyContactPrimay.
[1].email"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="cust_emergType"
entity-type="application"/>
  <target
refid="emergencyContactPrimay.
[1].relationship"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="cust_emergTypebool"
entity-type="application"/>
  <target refid=
    "emergencyContactPrimary.
[1].isEmergencyContact"/>
</mapping-attribute>
```

globalAssignmentInfo

## Sample Code

```
<mapping-attribute>
  <source refid="EmpIndicator"
entity-type="application"/>
  <target
refid="employmentIndicator"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="IsPrimaryEmp"
entity-type="application"/>
  <target
refid="isPrimaryEmployment"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="AssignType" entity-
type="application"/>
  <target
refid="globalAssignmentInfo.assignmen
t-type"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="AssignStart" entity-
type="application"/>
  <target
refid="globalAssignmentInfo.start-
date"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="PlannedEnd" entity-
type="application"/>
  <target
refid="globalAssignmentInfo.planned-
end-date"/>
</mapping-attribute>
```

## 23.1.4 Configuring Global Assignment and Concurrent Employment

Although Concurrent Employment and Global Assignment data aren't supported natively in Recruiting Management, it's possible to add configuration to Recruiting. Configuration allows internal candidates to apply for more requisitions without vacating their current employment. Therefore, this information flows on to Employee Central.

### Prerequisites

Both Recruiting and Employee Central V2 must be enabled and configured.

## Procedure

1. Create a custom picklist called `employmentIndicatorPicklist` with values as shown in this table. Make sure that the name is written exactly as indicated.

employmentIndicatorPicklist Values

| External Code | Non-Unique External Code | Label                 |
|---------------|--------------------------|-----------------------|
| 0             | 0                        | Concurrent Employment |
| 1             | 1                        | Global Assignment     |

2. Create the following custom fields in [Application Profile](#). The custom fields can have any name, but you must map them correctly to standard Employee Central Placeholders. For example,

- EmpIndicator type custom picklist created: `employmentIndicatorPicklist`
- IsPrimaryEmp type yes/no picklist
- AssignmentType type standard picklist `global_assignment_type`
- AssignmentStart type date
- AssignmentEnd type date

### Sample Code

```
<field-definition id="EmpIndicator" type="picklist" required="false"
custom="true" public="false" readOnly="false" anonymize="false" forward-
intact="true" sensitive="false">
  <field-label mime-type="text-plain"><![CDATA[Employment Indicator]]></
field-label>
  <field-description><![CDATA[Employment Indicator]]></field-description>
  <picklist-id>employmentIndicatorPicklist</picklist-id>
</field-definition>
```

3. Make these new custom fields reportable.
4. Map these custom fields to the standard Employee Central placeholders in the [Candidate to Employee Integration Template](#)

### Note

The placeholder field names for Employee Central are fixed as defined below and have to be configured precisely in the Recruiting Management Employee Central Integration template to the respective custom fields. Please configure custom field mapping as follows (field names are case-sensitive):

| Custom Field (Example Names) | Standard Employee Central Mapping | Description                                                  |
|------------------------------|-----------------------------------|--------------------------------------------------------------|
| EmpIndicator                 | employmentIndicator               | Mandatory for CE/GA identification                           |
| IsPrimaryEmp                 | isPrimaryEmployment               | Optional. Primary employment indicator, relevant only to CE. |
| AssignType                   | gaAssignmentType                  | Optional. Indicates long-term/short-term assignment for GA.  |
| AssignStart                  | gaAssignmentStart                 | Optional. StartDate of GA                                    |

| Custom Field (Example Names) | Standard Employee Central Mapping | Description             |
|------------------------------|-----------------------------------|-------------------------|
| PlannedEnd                   | gaAssignmentEnd                   | Optional. EndDate of GA |

#### Sample Code

```
<mapping-attribute>
  <source refid="EmpIndicator" entity-type="application"/>
  <target refid="employmentIndicator"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="IsPrimaryEmp" entity-type="application"/>
  <target refid="isPrimaryEmployment"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="AssignType" entity-type="application"/>
  <target refid="globalAssignmentInfo.assignment-type"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="AssignStart" entity-type="application"/>
  <target refid="globalAssignmentInfo.start-date"/>
</mapping-attribute>
<mapping-attribute>
  <source refid="PlannedEnd" entity-type="application"/>
  <target refid="globalAssignmentInfo.planned-end-date"/>
</mapping-attribute>
```

#### Note

The *employmentIndicator* and *isPrimaryEmployment* fields are not displayed in the *Recruit-to-Hire Data Mapping* tool. During provisioning, these fields must be manually mapped in the XML of the *Import/Export Candidate to employee integration template*.

## 23.1.5 Changing the Candidate Status to Hired

After a candidate accepts a job, you can change their status to hired.

### Procedure

1. Ensure that the applicant has a completed and approved Offer Details record.

#### → Tip

Offer Approval populates the *Manage Pending Hires* table in Admin Center. If an applicant doesn't receive an offer approval that is approved before entering the *Ready to Hire* (Hirable) status, they'll **not** show up in the *Manage Pending Hires* list.

2. Change the applicant's status to the *Ready to Hire* (Hirable) status. The applicant appears in the *Manage Pending Hires* list in Admin Center.
3. In *Manage Pending Hires*, the user can then *Hire* the appropriate candidate. Once the candidate is hired:

- a. Candidate is added to Employee Central and all data outlined in the integration template is transferred to Employee Central.
- b. As long as the Employee ID field is included in the external candidate profile, the candidate's new employee ID is visible.
- c. The candidate now has an internal candidate profile. The new internal candidate profile contains minimal data and duplicates the external candidate profile unless Candidate to Employee Conversion is configured.
- d. Candidate to Employee Conversion is done by the system.

## 23.1.6 Automatic Hire

Set up your system to automatically hire applicants coming from Recruiting, or Onboarding, or Recruiting and Onboarding into Employee Central with no manual intervention in the Manage Pending Hires tool. Applicants are processed automatically after the Recruiting and Onboarding processes are completed and the applicant is moved to the *Ready to Hire* status.

You can decide if all applicants from Recruiting or Onboarding are processed using the Automatic Hire process or you can set up rules so a subset of applicants go through the Automatic Hire process without manual intervention in the Manage Pending Hires tool.

Automatic Hire supports the following processes:

- For Recruiting:
  - Regular Hire
  - Concurrent Employment (CE)
  - Global Assignment (GA)
- For Onboarding:
  - Regular Hire
  - Rehire
  - Rehire with New Employment

Automatic Hire doesn't support the following processes:

- For Recruiting:
  - Rehire
  - Rehire with New Employment
  - When matching inactive users are found in the system (based on match user configuration)
  - Internal Transfer
- For Onboarding:
  - Internal Transfer
  - Global Assignment (GA)
  - Concurrent Employment (CE)

### Note

- Automatic Hire doesn't support applicants coming from Onboarding 1.0 and SmartRecruiters.

Automatic Hire supports a subset of rule types depending on how the process is initiated:

- Workflows, **onSave** rules, and **onPostSave** rules are supported for processes initiated through both Recruiting and Onboarding.
- **onChange** rules are supported only when the process is initiated through Recruiting.
- **onInit** and **onView** rules are not supported because Automatic Hire runs in the back end without direct user interaction, and those rules are intended for UI-driven scenarios.
- MDF UI rules are not supported.

For rules that are not supported by Automatic Hire, adapt existing rules to supported types.

Applications that need manual intervention appear in the Manage Pending Hires tool. These scenarios are where there is a pending or sent back workflow for an applicant, or a failure occurred due to invalid or missing data, or there is a duplicate user, or there is a matching existing user (in Recruiting). In some cases, mandatory data may be missing. This missing data then causes the automatic hire process to fail. In situations where workflow is associated with the applicant, the Automatic Hire process continues once the workflow has been processed.

When an application from Recruiting Management appears in the Manage Pending Hires tool, before retriggering automatic hire for further applications, refer to the *All fields from Recruiting Management are mapped and validated* check in the *Manage Pending Hires* area of the *Check Tool* to identify missing fields required in Employee Central.

For Additional details about applicants from Automatic Hire process in the Manage Pending Hires tool, see documentation on the tool.

The »» *Automatic Hire* icon after the applicant name is displayed if the applicant has been through the Automatic Hire process.

#### ⓘ Note

Automatic Hire does not validate cost assignment object if Public Sector Management (PSM) is enabled. This means that an Automatic Hire will be processed successfully without cost assignment.

Automatic Hire does not support Employee Central custom hire templates (*Template Type* = Employee).

## 23.1.6.1 Enabling Automatic Hire

Automatic Hire requires set up in Recruiting, or Onboarding to Employee Central for your company.

### Prerequisites

- You've enabled Manage Pending Hires tool.
- You've integrated Recruiting, or Onboarding or both to Employee Central as the case may be based on how your automatic hire process is designed.

## Context

If you have the mapping of the data fields needed for an employee hire in place, you can set up rules and use the Automatic Hire feature for your company. For more information about the processes involved, refer to the [Automatic Hire \[page 1306\]](#) topic.

## Procedure

1. Enable ► [Admin Center](#) ► [Onboarding General Settings](#) ► [Submit Onboarding Data Using Centralized Services](#) ►.
2. Enable ► [Admin Center](#) ► [Onboarding General Settings](#) ► [Enable Automatic Hiring for Onboarding](#) ►.

When the setting is enabled, this feature can be applied to all applicants in Onboarding. Use the [Trigger Automatic Hiring of Applicants for Onboarding](#) business rule scenario in [Configure Business Rules](#) to exclude or set up conditions.

3. Enable ► [Admin Center](#) ► [Manage Recruiting Settings](#) ► [Applicant Profile Settings](#) ► [Enable Automatic Hiring for Recruiting](#) ►.

When the setting is enabled, this feature can be applied to all applicants in Recruiting. Use the [Configure Rule to Automatically Hire Applicants from Recruiting to Employee Central](#) business rule scenario in [Configure Business Rules](#) to exclude or set up conditions.

## Next Steps

Your system is now set up to use automatic hiring for applicants.

## 23.1.7 Manage Pending Hires

[Configure Columns for Manage Pending Hires](#) renders data on the [Manage Pending Hires](#) page in Recruiting and sends it to Employee Central.

Mapping defined in the Candidate to Employee Integration Template for Recruiting and Employee Central integration is used for rendering the data on the [Manage Pending Hires](#) page.

This section lists the possible scenarios that are the reasons for data being not displayed, or errors displayed on the [Configure Columns for Manage Pending Hires](#) page. You can also do sorting, and filtering of data based on the data types on enhanced [Manage Pending Hires](#).

#### [Validations When Configuring Columns for Manage Pending Hires \[page 1309\]](#)

Understand the validations that apply when you configure columns on the Recruiting tab of the [Configure Columns for Manage Pending Hires](#) tool.

#### [Data Types Support for Recruiting Data on Manage Pending Hires \[page 1312\]](#)

View the supported and unsupported data types for the Recruiting data on the [Manage Pending Hires](#) page.

## 23.1.7.1 Validations When Configuring Columns for Manage Pending Hires

Understand the validations that apply when you configure columns on the Recruiting tab of the [Configure Columns for Manage Pending Hires](#) tool.

### Configuration Validation Errors

The columns you configure determine the layout of the [Recruiting](#) and [Drafts \(Recruiting\)](#) pages in [Manage Pending Hires](#). If an error occurs when you configure a field, refer to the following validations.

| Validation                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Custom Field IDs aren't marked Reportable                                                 | To configure a custom field on the <a href="#">Configure Columns for Manage Pending Hires</a> tool, mark the custom field ID as reportable on the <a href="#">Configure Reportable Custom Fields</a> page in Provisioning. <div><b>→ Remember</b><br/>As a customer, you don't have access to Provisioning. ## Validation

Multiple mappings for the same target field with different source field combinations in an integration template

## Description

Data doesn't render when an integration template has multiple mappings for the same target field with different source fields.

The following sample code shows different source entity types with the same Recruiting field mapped to the same Employee Central target field:

### Sample Code

```
<mapping-attribute>
<source refid="currency" entity-
type="Jobrequisition"/>
<target refid="payComponentRecurring.currency-
code.OfferSalary"/>
</mapping-attribute>
<mapping-attribute>
<source refid="currency" entity-
type="offerletter"/>
<target refid="payComponentRecurring.currency-
code.OfferSalary"/>
</mapping-attribute>
```

The following sample code shows the same source entity types with different Recruiting fields mapped to the same Employee Central target field:

### Sample Code

```
<mapping-attribute>
<source refid="currency" entity-
type="Jobrequisition"/>
<target refid="payComponentRecurring.currency-
code.OfferSalary"/>
</mapping-attribute>
<mapping-attribute>
<source refid="Custcurrency" entity-
type="Jobrequisition"/>
<target refid="payComponentRecurring.currency-
code.OfferSalary"/>
</mapping-attribute>
```

The following sample code shows different source entity types with different Recruiting fields mapped to the same Employee Central target field:

### Sample Code

Different source entity types with different Recruiting fields mapped to the same Employee Central target field.

```
<mapping-attribute>
<source refid="currency" entity-
type="Jobrequisition"/>
<target refid="payComponentRecurring.currency-
code.OfferSalary"/>
</mapping-attribute>
<mapping-attribute>
```

| Validation | Description                                                                                                                                                                    |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <pre>&lt;source refid="Custcurrency" entity- type="offerletter"/&gt; &lt;target refid="payComponentRecurring.currency- code.OfferSalary"/&gt; &lt;/mapping-attribute&gt;</pre> |

## Recruiting Data Not Rendered in *Manage Pending Hires*

If the field mappings in the integration templates are valid but some field values are still empty on the *Manage Pending Hires* page, verify which field in the integration template the empty field is mapped to, and whether that field contains data.

For example, if the *Hire Date* field value for a candidate is empty and the *Hire Date* is mapped to the *Start Date* field in the Job Requisition, verify whether the *Start Date* field in the job requisition contains data for the candidate to be hired.

**Parent topic:** [Manage Pending Hires \[page 1308\]](#)

## Related Information

[Data Types Support for Recruiting Data on Manage Pending Hires \[page 1312\]](#)

## 23.1.7.2 Data Types Support for Recruiting Data on Manage Pending Hires

View the supported and unsupported data types for the Recruiting data on the *Manage Pending Hires* page.

## Unsupported Data Types for Sorting Recruiting Data

If the data type of the Recruiting field has one of the following data types, then you can't sort the data on the *Manage Pending Hires* page.

The following data types aren't supported for sorting of Recruiting data on the *Manage Pending Hires* page.

- OBJECT
- ENUM
- TEXTAREA

- QUESTIONS
- COMPETENCIES
- RTE
- OPERATOR\_TEAM
- INSTRUCTION
- MULTIATTACHMENT
- MULTIATTACHMENTSELECTION
- JOBCODE
- JOB\_ROLE
- BOOL
- TYPE\_OPERATOR

## Sorting is Unsupported When Custom Field is Configured with Multiple Data Types on Different Templates

For job requisition and job application, if the custom field is configured in more than one template with different data types, the field isn't sorted and filtered on the [Manage Pending Hires](#) page.

Example code snippet for job requisition template where type values of the custom field custJobReqText1 are text, and object and picklist in different templates.

### Sample Code

Job Requisition Template 1

```
<field-definition id="custJobReqText1" type="text" required="false"
custom="true">
```

### Sample Code

Job Requisition Template 2

```
<field-definition id="custJobReqText1" type="object" required="false"
custom="true">
```

### Sample Code

Job requisition Template 3

```
<field-definition id="custJobReqText1" type="picklist" required="false"
custom="true">
```

## Unsupported Data Types to Filter Recruiting Data

For Job Requisition, Job Application, Job Offer, and Candidate Profile templates, the following data types are unsupported for filtering the recruiting data on the [Manage Pending Hires](#) page.

If the data type of the Recruiting field has one of the following data types, such fields don't appear as a filter on the [Manage Pending Hires](#) page:

- JOBCODE
- JOB\_ROLE
- BOOL
- OPERATOR
- TEXTAREA
- QUESTIONS
- COMPETENCIES
- RTE
- OPERATOR\_TEAM
- INSTRUCTION
- MULTIATTACHMET
- MULTIATTACHMENTSELECTION

## Supported Data Types to Include Dropdown Filter for Recruiting Fields

The following data types are supported for dropdown filter of the Recruiting data on the [Manage Pending Hires](#) page.

If the data type of the Recruiting field ID has one of the following data types, then dropdown filter appears for the field:

- OBJECT
- PICKLIST
- ENUM
- DERIVED

## Sorting and Filtering are Unsupported When Standard Field is Configured with Multiple Data Types

A few standard fields in recruiting entities are configured in different templates with different data types. For example, a standard field can have text area, text or picklist or text or picklist data types. Due to multiple data types, the database stores **options lds** for picklist type, or text for **text** or **textarea** data types. Such standards fields are only displayed on the [Manage Pending Hires](#) page and you can't sort or filter them. The list of standard fields that accept multiple data types are as follows:

## Standard Fields

| Job Requisition Template                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Job Application Template                                                                                                                                                                                                              | Offer Letter Template                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 23.2 Export New Hire Candidates

The New Hire Export functionality allows you to export a CSV file containing candidates in a Hired category status.

To use the New Hire Export, you need the [Administrator Permissions](#) [Manage Recruiting](#) [Export New Hire Candidates](#) permission.

### Note

Many customers find this prebuilt export to be insufficient for their needs. Alternative approaches include integrating with Employee Central, as well as with SAP HCM.

## Related Information

[Integration of Recruiting with Employee Records in Employee Central \[page 1284\]](#)

[SAP New Hire Integration \[page 1371\]](#)

## 23.2.1 Work with the Pre-Built New Hire Export

It's possible to specify the time period from which you wish to extract hired candidates. The dates check against the system-captured hire date, which is recorded when the applicant moves into a status in the Hired category.

When candidates are exported this way, the system sets a hiredOn date. This allows the report to export only candidates who haven't been exported previously.

### Note

The prebuilt SAP new hire integration manages this same data using SFAPI, so it's possible that this date might be set even if the [Export New Hire Candidates](#) feature isn't used.

The [Export already exported candidate](#) option determines whether the criteria used to select the content of the report is restricted to only hired applicants where hiredOn = null or allows all hired applicants, regardless of "exported on" date.

The new hire export includes a preset list of standard fields. The field content of this report isn't configurable and can't be re-mapped. Often these fields are insufficient to meet your needs and so you might choose to build a custom Ad Hoc Report and have an SAP SuccessFactors representative schedule this in [Provisioning](#) > [Managing Job Scheduler](#) > [Manage Scheduled Jobs](#) to export on a scheduled basis to an ftp site for pickup. Alternatively, you may choose to use the SAP New Hire integration pack, or build a custom web-services-based integration.

### Note

[Managing Scheduled Jobs](#)

## 23.3 Integration of Recruiting with Position Management in Employee Central

Integrate Recruiting with Position Management in Employee Central.

This integration enables you to:

- Create a Job Requisition from a position in the Position Organization Chart and the [My Team Positions](#) page. By using this method, you can:
  - Automatically determine the job profile for the requisition created.
  - Create a Job Requisition immediately in Recruiting Management, if you create it on the current date.
  - Create a Job Requisition processing request immediately, if you create it as of a future date. The Quartz Job will automatically create a Job Requisition in Recruiting Management on that date.
- View assigned Job Requisitions or Position Requisition Processing Requests on the position tile.
- View more Job Requisition data in the position side-panel.
- Delete a Job Requisition request.
- Use the [Rules Engine](#) to derive the Job Requisition template to be used for the new requisition.
- Use the [Rules Engine](#) to define field mapping between the position and the new requisition.
- Use [Job Scheduler](#) to create the job requisition automatically from request objects.

- Automatically assign the candidate from the requisition in [Pending Hires](#) to the position linked to that Job Requisition.

Here's an illustration of how all this works together.

## Related Information

[Integrating Recruiting and Employee Central Position Management \[page 1320\]](#)

## 23.3.1 Integrating Recruiting and Employee Central Position Management

Integrating Recruiting and Position Management can be broadly classified as a three-step process, where you activate the integration, create rules, and schedule a job.

### Prerequisites

Both Employee Central Position Management and Recruiting have been enabled and configured in the system.

### Procedure

1. Activate Recruiting integration. Go to ► [Admin Center](#) ► [Position Management Settings](#) ►, enter *Yes* in the *Use Recruiting Integration* field on the *Integration* tab.
2. Create the rule to derive the *Job Requisition Template*. You need this rule if you want to create a requisition from the *Position Org Chart*. Create the rule using the *Derive Job Requisition Template in Recruiting Integration* scenario. You can derive the template from any attributes of the Position. The following example shows that the *Standard Job Requisition* template is used if the Position has *company=Terra AG* or *jobCode=Consultant*. In all other cases, a message is raised informing you that you can't create a Job Requisition for this position.

#### → Recommendation

When carrying out this step, you should always use the default name for the Job Requisition template, as changing or translating the name can cause problems when attempting to load the template later.

You can derive the default name from either the Job Requisition template XML file or on the [Manage Templates](#) screen in the [Admin Center](#).

## DeriveJobReqTTemplate (DeriveJobReqTTemplate)

 Insert New Record

Scenario: Derive Job Requisition Template in Recruiting Integration

### Basic Information

Start Date 01/01/1900

Description

### Parameters

| Name                 | Object                            |
|----------------------|-----------------------------------|
| Context              | System Context                    |
| Position             | Position                          |
| Recruiting Parameter | Position Recruiting Integratio... |

[Collapse All](#) | [Expand All](#)

 If

Position.Company is equal to Terra AG (Terra)

Then

Set Recruiting Parameter.Job Requisition Template to be equal to Standard Job Requisition

 Else If

Position.Job Code is equal to Consultant (Consultant)

Then

Set Recruiting Parameter.Job Requisition Template to be equal to Job Requisition for Consultants

 Else

Raise Message " No\_REQ " with Info severity  
It is not allowed to create Requisition for this Position.

3. If you want to use custom fields in your Recruiting Management integration, ensure that those custom fields are visible. To do this, set the attribute **custom** to **true** in the [Job Requisition Template XML](#). If you don't set this attribute to true, you won't be able to map data to this field when you create the requisitions from the position organization chart.

### Note

- The templates used for integration must always have the following standard fields.
  - numberOpenings
  - std\_position\_obj or positionNumberYou don't have to map these fields using a rule. The system fills them automatically.
- If SFAPI-based Position Integration is enabled in the instance, the integration fails when the template configured in the integration only has std\_position\_obj defined as std\_position\_obj isn't supported in SFAPI.  
Templates can either have positionNumber or positionNumber and std\_position\_obj for this integration. This behavior is only relevant for OData integration.

- Now, create the separate rule required to specify the field mapping. Use the [Map Fields from Position to Job Requisition in Recruiting Integration](#) scenario in [Configure Business Rules](#). To populate the *jobcode* and job role field, map the *jobcode* field from position to job requisition in the Position-Requisition mapping rule.

In the rule itself, you can specify field mappings based on the template derived from the first rule or from any other Position attribute.

### Note

- The value you type in the **Requisition Field** of the created field-mapping object must be the name of the corresponding job requisition field. You can find the name by going to the [Admin Center](#) and selecting [OData API Data Dictionary](#) (under **Integration Tools**).
- If you want to map fields of type Date, Boolean, or Number, you have to use the format () function.
- If you've mapped the data from the Position to either Division, Department, or Location enum-type field, the system searches the text or value passed from Position and could result in displaying the incorrect values when the requisition is created. The reason being that the values passed from Position anywhere in the name of enum-type is fetched. The leading practice is to use the standard Division, Department, Location Generic Objects.

- To map fields of type Foundation Object or Generic Object from the Position Organization Chart to a Job Requisition, you have to create a rule condition using the following format:

Create **Position Requisition Mapping.Field Mapping**

Populate Position Requisition Mapping.Field Mapping with:  
Requisition Field    **location\_obj.externalCode**  
Field Value        **Position.Location.Code**

When mapping a Generic Object or Foundation Object, ensure that you verify the format of the external code field by reviewing the [Corporate Data Model](#) for the Foundation Object and [Object Definition](#) for the Generic Objects.

- If you want to map fields of type [Country/Region](#), you need to map the **Country Code (2 char)** value. For example, US for United States.
- With your rules now created, you have to register them. To do this, go to ► [Admin Center](#) ► [Position Management Settings](#) ►, then go to the [Integration](#) tab and enter the following settings:

| Field                                                    | Value                    |
|----------------------------------------------------------|--------------------------|
| Use Recruiting Integration                               | Yes                      |
| Rule for Deriving Requisition Template ID                | Get Requisition Template |
| Rule for Mapping Fields Between Position and Requisition | MapReqFields             |

- At this stage, your system is in the default setting, which means that no user is allowed to create or view job requisitions in the Position Organization Chart. To change this, you have to assign the [Create Requisition in Position Organization Chart](#) and [View Requisition on Position Organization Chart](#) permissions.

For more information about role-based permissions, refer to [Using Role-Based Permissions](#).

- To ensure that the requisitions planned for creation in the future are created, you have to schedule a periodic job. To do this, go to Provisioning for the relevant company and choose ► [Manage Scheduled Jobs](#) ► [Create New Job](#) ►.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

Select a [Job Name](#) and [Job Owner](#). The job owner has to be an admin user who gets notified when something goes wrong. Select [Position requisition processing](#) as [Job Type](#). Ensure that the job runs at least once a day.

## Results

When the job finishes processing, the admin user receives an email that says whether the creation of the requisitions was successful or not.

## Related Information

### 23.3.2 Viewing Job Requisitions in the Position Organization Chart

If you have the role-based permission for [View Job Requisition in Position Organization Chart](#), and the corresponding position has a job requisition or position requisition processing request assigned, you can see directly on the [Position](#) tile whether a job requisition or job requisition request is assigned.

Here's the tile showing whether a job requisition is assigned:

If you click the right-hand icon of the two in the tile, you get this side panel showing the detailed information for the job requisition.

My Position (RCM\_TEST)

as of Today

> Position Details

> Position History

0 days

Now, here's the tile showing that a job requisition request is assigned.

If you click the right-hand icon of the two in the tile, you get this side panel showing the detailed information for the job requisition request.

While viewing the requisition for which the position is assigned, and the requisition has `std_position_obj` and `positionNumber` fields configured, the job requisition is fetched based on the value stored in `std_position_obj`. If `std_position_obj` is configured and has a blank value, or if the requisition has only `positionNumber` field configured, the `positionNumber` is used to fetch the requisition on the Position Org chart.

If multiple positions are configured on the requisition, the same requisition is fetched for both primary and secondary positions.

You can delete the job requisition by clicking the delete icon:  .

| Requisitions  | Position GO | Position Number | Remarks                                                                                                       |
|---------------|-------------|-----------------|---------------------------------------------------------------------------------------------------------------|
| Requisition 1 | Position 1  | Position 1      | When you search for Position 1, Requisition 1 is returned.                                                    |
| Requisition 2 | Position 2  | -               | When you search for Position 2, Requisition 2 is returned.                                                    |
| Requisition 3 | Position 4  | Position 3      | When you search for Position 3, Requisition 6 is returned, as Position GO value for Requisition 3 isn't null. |
| Requisition 4 | -           | Position 2      | When you search for Position 4, Requisition 3 is returned.                                                    |
| Requisition 5 | -           | Position 5      | When you search for Position 5, Requisition 5 is returned.                                                    |
| Requisition 6 | -           | Position 3      | -                                                                                                             |

### 23.3.3 Creating a Job Profile Builder Requisition from the Position Org Chart

- Create Family and Role. Associate Job Code and Permission to the Role in ► [Admin Center](#) ► [Manage Job Profile Content](#) ⓘ.
- Job Profile Template must be created and associated to the created Family in ► [Admin Center](#) ► [Manage Job Profile Template](#) ⓘ.
- A Job Profile must be created from the created template in ► [Admin Center](#) ► [Manage Job Profile](#) ⓘ.

## Procedure

1. Navigate to ► [Company Info](#) ► [Position Org Chart](#) ⓘ and search for the position created.
2. From the Position card, open the expanded position card and select the menu card. In the menu, click [Create Job Requisition](#).

3. In the window that appears, select the [Job Requisition Template](#) and click [Create](#).
4. Once the Job Requisition has been created, open the Job Requisition from the Position Card.

Job Requisition details such as title, role, code, and position number/standard position object (based on the configuration) can be seen on the Job Requisition Detail page.

## 23.3.4 Creating Requisitions in the Position Organization Chart

You can save time by creating job requisitions directly from the position organization chart.

If you have the [Create Job Requisition in Position Organization Chart](#) role-based permission and the corresponding position doesn't already have a job requisition or position requisition processing request assigned, the [Create Job Requisition](#) option is available in the menu of the position tile. You can then create a job requisition from the position organization chart.

### Note

When you create a requisition through the position organization chart, the default recruiting team isn't added.

Here's the tile, showing the [Create Job Requisition](#) option:

If you choose this menu option, a popup for creating a job requisition appears:

The image shows a screenshot of a web application popup titled "Manage Job Requisition". The popup has a dark blue header bar with the title and a close button (an 'X' in a square). Below the header, the form is white with a light gray border. It contains three input fields: "Job Requisition Template" with a dropdown menu showing "Job Requisition", "\* Date of New Job Requisition" with a date picker showing "04/14/2015", and "\* Number of Openings" with a text input showing "1". A blue button labeled "Create Job Requisition" is positioned at the bottom right of the form area.

If you have the [Select Job Requisition Template in Position Organization Chart](#) role-based permission, you can select from the active job requisition templates when creating your job requisition.

If you choose today's date as the creation date, the system creates a job requisition with values retrieved from the rule used for field mapping. If you choose a future date as creation date, the system creates a position requisition processing request that is automatically converted to a job requisition on the selected creation date.

#### Note

If the originator is filled in the mapping rule and the recruiting setting [Use Originator's preferred language as the default language of a new job requisition](#) is enabled, the default language of the job requisition is the same as the originator's. If the option isn't enabled, the language of the job requisition is the default language from the job requisition template.

## 23.3.5 Auto-Populating the Recruiter Operators on the Job Requisition

By integrating Recruiting with Employee Central Position Management, you can auto-populate the recruiter operators.

### Prerequisites

- Implement Employee Central Position Management and Recruiting Management.
- Ensure that you have **numberOpenings** and **positionNumber** fields on your Job Requisition template.
- Ensure that you match the field types while configuring the Rules. For example, a string field in Employee Central must relate to a text field on the Job Requisition template.

## Auto-Populate Manager of Position

The following snippet allows fetching of the person occupying the position that manages the position for which you want to create the requisition.

Create **PositionRequisitionMapping.Field Mapping**

Populate PositionRequisitionMapping.Field Mapping with:  

|                   |                                                 |
|-------------------|-------------------------------------------------|
| Requisition Field | <b>hiringManager.usersSysId</b>                 |
| Field Value       | <b>Get Next Available Manager By Position()</b> |
|                   | <b>Position Code:</b> <b>Position.Code</b>      |
|                   | <b>As Of Date:</b> <b>Today()</b>               |

## Auto-Populate Roles from Position's Matrix Relationship

The following snippets show fetching of persons whose positions are matrix-related to the position for which you're trying to create the requisition. This allows for fetching of any person using the relationships between positions.

### Note

: It's possible to fetch relationships for the person trying to create the requisition. The system can fetch relationships only for the position for which the requisition is being created.

## 23.3.6 Integrating Recruiting with Employee Central Position Management Frequently Asked Questions

Answers to frequently asked questions about issues in integrating Recruiting with Employee Central Position Management.

### Can I prevent the following error – ‘department invalid, with the index 0’?

Yes. You're getting the error because **Department** doesn't have any active employee assigned. It's recommended that at least one active employee must be assigned to the **Department**.

### Job Title says [Not translated in selected language]. How do I resolve this error?

You're getting this error because, the job title isn't mapped or mapped incorrectly. Use `jobReqLocale.jobTitle`. In some cases, you might have to specify the locale as shown:

`Position.Position Title.English (United Kingdom)`

### I'm getting the following error – ‘formDueDate required, jobReqLocale/jobTitle is required for jobReqLocale/locale en\_GB...’. How do I resolve this?

With SFAPI, the system didn't check if the Job Requisition template had any mandatory fields and one didn't have to include all those fields in the mapping rule.

However, with OData API, the system requires that all the mandatory fields on the Job Requisition template be included in the mapping rule.

If you have a long list of mandatory fields and you don't want to include all of them in the rule, use the **IsDraft** clause to get around the system requirement.

## Can I prevent the following error – ‘Job Requisition has no field with this name that refers to a simple data type’?

Yes. In this case, either the Job Requisition template doesn't have the field defined or is of a different type. For example, the Position field is string and the Job Requisition field is a Picklist.

Also, if the Job Requisition field type is Picklist, then your mapping rule must refer to the external code of the picklist value, for example, **custPayGrade.externalCode**.

## 23.3.7 System Setup Recommendations for Integrating Recruiting with Position Management

### 23.3.7.1 Picklist Mapping

You might request the possibility to use a picklist on the requisition side that is mapped to and prefilled from the position. If not, you can skip this section.

The OData API requires you to map the picklist values from MDF to the optionID of the legacy picklist in Recruiting Management. To do so, define this mapping with the help of an additional object that contains both the code and the optionID value of the legacy picklist.

Set up and maintain the mapping object. Whenever there's a new value in the picklist, you need a new instance of the object. The MDF and the legacy picklist don't have to be manually kept in sync, as there's an automated way of doing so.

Find an example for such a picklist mapping:

MDF Picklist A

| MDF Picklist Code | MDF Picklist Value |
|-------------------|--------------------|
| x                 | Apple              |
| y                 | Orange             |

Legacy Picklist A

| Legacy Picklist Code | Legacy Picklist optionID (system generated) | Legacy Picklist Value |
|----------------------|---------------------------------------------|-----------------------|
| m                    | ab123                                       | Apple                 |
| n                    | cd456                                       | Orange                |

Mapping Object for Pickslit-Tuple A

| MDF Picklist Code | Legacy Picklist optionID |
|-------------------|--------------------------|
| x                 | ab123                    |
| y                 | cd456                    |

### 23.3.7.1.1 Creating a Picklist Mapping Between MDF and Legacy Picklists

Create a picklist-mapping object that enables you to use a picklist in job requisitions that is prepopulated with position information.

#### Procedure

1. Create the mapping object in [Configure Object Definitions](#) with only one custom field called `optionID`.
2. Create a new instance of this object for every mapping. For the mass creation of all values of one or several picklists, it may be best to use the MDF import for the objects.

#### Note

Picklist `optionID` shouldn't contain comma or decimal.

3. Use the mapping object in the field mapping by performing a lookup via the external code.

#### Note

##### Important Points to Consider

- Ensure that the `optionID` in the lookup table matches the `optionID` of the picklist used in the Job Requisition template.
- You can create the rule using the field in Recruiting. For example, the format should be `filter1.id`.

### 23.3.7.2 Job Code Association with Families and Roles

Information on the Families and Roles job code.

There's currently a technical restriction that forces some customers to associate each job code against a role in [Admin Center > Families and Roles](#). These customers aren't using Job Profile Builder (JPB) but wish to use the OData based integration method. The association between roles and job codes hadn't been required to raise a job requisition from the Position Org Chart when using SFAPI-based integration. This dependency will be removed in future versions.

### 23.3.7.3 Recruiting Teams

Recruiting teams now appear as parameters with the OData based method.

It was impossible to use Recruiting teams with SFAPI. However, the actual lookup isn't working yet, so it's impossible to use them in b1608.

| Property Name       | Label               | Type                   |
|---------------------|---------------------|------------------------|
| coordinatorTeam     | CoordinatorTeam     | JobRequisitionOperator |
| hiringManagerTeam   | HiringManagerTeam   | JobRequisitionOperator |
| recruiterTeam       | RecruiterTeam       | JobRequisitionOperator |
| secondRecruiterTeam | SecondRecruiterTeam | JobRequisitionOperator |
| sourcerTeam         | SourcerTeam         | JobRequisitionOperator |
| vTeam               | VTeam               | JobRequisitionOperator |
| vpOfStaffingTeam    | VpOfStaffingTeam    | JobRequisitionOperator |

### 23.3.7.4 Date Fields

Information on Date Fields.

Using OData, it was impossible to fill date fields with b1605 as the system responded with an error message. This issue was due to a missing conversion of the date so that it could be finally consumed by OData. With b1608, you're able to use a new function that performs the necessary conversion. The working name is "Format Date for Position to Job Requisition Mapping()". Please note that this name might still be adapted before the function is released.

### 23.3.7.5 Due Date Available in OData API

Information on due dates in OData API.

In b1605, the due date of a requisition was automatically defaulted to the day in which the Job Requisition had been created when using the OData integration method. You can set the due date to a specific date by using the following parameter:

| Property Name | Label         | Type           |
|---------------|---------------|----------------|
| formDueDate   | Form Due Date | datetimeoffset |

## 23.4 Configuring Recruiting Integration with Job Profile Builder

To populate job requisitions with predefined job profile content, integrate Job Profile Builder (JPB) with Recruiting.

### Prerequisites

- You've enabled and set up Job Profile Builder (JPB). For more information on enabling JPB for your instance, refer to the *Enabling Job Profile Builder in Provisioning* mentioned in the **Related Information** section of this page.
- If you're an existing user of Job Description Manager (JDM) using Families, Roles, and Competencies in requisitions and now choose to migrate to JPB, then refer to *Migrating from Job Description Manager to Job Profile Builder* from the **Related Information** section of this page and ensure that the Provisioning job that's mentioned on that page is completed successfully.

#### Note

If Recruiting instances with Job Description Manager, or Job Profile Builder are integrated with Talent Intelligence Hub, then you can add competencies and skills to job requisitions from Talent Intelligence Hub.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Settings](#) ►.
2. Enable ► [Job Requisition](#) ► [Use Job Profiles in Requisitions](#) ► option.  
By enabling this option, you'll see the [Job Profile](#) tab on [Job Requisitions](#) page.
3. Select [Save](#) to save your changes.

[What is Job Profile Builder?](#)

## 23.4.1 Configuring Job Requisition Templates to Use Job Profile Builder

To work with job profiles in your job requisitions, you must add the necessary configurations to your job requisition templates. You can configure the templates either in Provisioning or in Manage Templates admin center tool.

### Prerequisites

- You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- You have access to [Manage Templates](#) tool in Admin Center.

### Procedure

1. Edit the desired job requisition template.
2. Define a field definition for `jobRole` on the template and permission it appropriately. When defined in the template, the `jobRole` field is supported in the SFAPI, legacy data migration import, ad-hoc reports, offer approval, offer letter, and job requisition tokens.
3. Update the `listingLayout` field permissions on the template to control user access (read or write) to the [Job Profile](#) tab. When the Job Profile Builder integration is enabled, the `extListingLayout` and `competencies` field permissions become irrelevant. The `listingLayout` field permissions control all job profile access.

Even though the `extListingLayout` permissions are controlled by the permissions defined for the `listingLayout`, you need to define `extListingLayout` in the job requisition template for the [Show in external posting](#) option in job profile to work as expected.

## 23.4.2 Migrate Recruiting Data from JDM to JPB

If you're already using Job Description Manager (JDM) and now choose to use Job Profile Builder (JPB), all your JDM data is made available in JPB for your use.

When you enable [Use Job Profiles in Requisitions](#) switch in ► [Admin Center](#) ► [Manage Recruiting Settings](#) ►, the action triggers the following background jobs to bring in the competencies and job role tags from JDM to JPB:

- [Migrate Competencies in Job Requisitions from JDM1.0 to JDM2.0](#)
- [Migrate Job Role Tags from JDM to JPB](#)

You receive e-mail notifications about the status of these jobs and can monitor the jobs in Provisioning.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

You can access the competencies and job role tags on ► [Job Requisitions](#) ► [Job Profile](#) ► page upon successful completion of this migration.

## 23.4.3 Creating Job Requisitions when one Job Code is mapped to Multiple Roles in the Job Profile Builder

Using custom fields in Job Profile Builder, you can map a single job code with multiple job roles.

During a job requisition creation, a job code value determines the value of the job role associated with a job requisition. To map a job code to multiple roles, specific configuration changes are required to ensure the correct value of the job role is associated with the job requisition. You can now use a unique custom field to map a single job code to multiple job roles. A combination of job role and custom field must always be unique before being associated with a job role.

You can allow job codes to be associated with custom fields to fetch unique job roles when using the same job code across different job roles. For example, for a developer job code, you can associate multiple roles like Java Developer, Python Developer, and ABAP Developer. A combination of custom field value and job code will provide a job role for a job requisition.

The following integrations need configuration changes to determine the correct job role association with a job requisition when using one-to-multiple mapping of the job role to job code:

### ⓘ Note

Ensure you've configured the one-multiple mapping of job code: custom field. Refer to the Job Code Association with Multiple Job Roles topic in the Related Information section.

- Creating job requisitions using Position from [Position Org Chart](#).
- Creating job requisitions from [Succession Org Chart](#).
- Creating job requisitions using OData API.

When you map job code to a single job role, no configuration changes are required in your integrations.

### ⓘ Note

The configuration changes do not impact the UI.

## Related Information

[Configuring Recruiting Integration with Job Profile Builder \[page 1339\]](#)  
[Job Code Association with Multiple Job Roles](#)

## 23.4.3.1 Configuration Changes to the Integrations Using Position Org Chart

Configuration changes are required to map one job code to multiple job roles in integrations using [Position Org Chart](#).

Instances where Job Profile Builder is enabled, ensure you complete the following configuration changes to create job requisitions using Position from [Position Org Chart](#):

- Maintain the value of the custom field and the job code on the position relevant to the job code.
- Configure a custom field on the position object with the same name as the custom field in the Employee Profile.
- Update the custom field with the correct value of the custom field that is relevant to the job code linked to the position.
- Update the position to the job requisition mapping rule to determine the correct job role association with the job requisition. Make the following configuration changes:
  - We recommend using the [Lookup](#) on the [Job Profile Builder](#) job role object and selecting GUID as an [externalCode](#) where values are set similarly to the example in the screenshot. To support [externalCode](#), provide the [jobRoleEntity](#) navigation entity. [jobRoleEntity](#) is the navigation property of the Job Profile Builder's role entity for a job requisition. In the mapping rule, select a new [jobRoleEntity](#) navigation property so the [Requisition Field](#) is set to [jobRoleEntity.externalCode](#). An example business rule that will help map one to multiple mapping of the job role and job code using a Technology as the custom field.

### Note

If you are mapping only a job code in the mapping rule, a random job role may be associated with the job requisition. Use the lookup function to associate the correct job role.

## Related Information

[Creating Requisitions in the Position Organization Chart \[page 1331\]](#)

[Job Code Association with Multiple Job Roles](#)

## 23.4.3.2 Configuration Changes to the Integrations Using Succession Org Chart

Configuration changes are required to map one job code to multiple job roles in integrations using [Succession Org Chart](#).

Instances where Job Profile Builder is enabled, ensure you complete the following configuration changes to create job requisitions from [Succession Org Chart](#):

- When the [Succession nomination method](#) value is set to [MDF Position](#), configure the custom field in position and maintain the exact custom field name and the value for the position. For example, if you selected [custom01](#) in ► [Admin Center](#) ► [Manage Business Configuration](#) ► [Employee Profile](#) ► then the field ID is prefixed with "cust\_" to make it [cust\\_custom01](#).
- When the [Succession nomination method](#) value is set to [Role-Person](#) or [Position](#) or if [Employee Central](#) is disabled in your instance, maintain the custom field value as configured in the employee profile.

[Job Code Association with Multiple Job Roles](#)

## 23.4.3.3 Changes to the OData API

Changes are required to the OData API to map one job code to multiple job roles.

In the Job Profile Builder enabled instances, use the `jobRoleEntity` property of the `jobRoleEntity` entity in the `JobRequisition` entity to provide a valid job role value while creating a job requisition using Odata API.

#### Note

You can only use the `JobRole` entity or `jobRoleEntity` entity in the OData API payload.

### Related Information

[JobRequisition](#)

### 23.4.3.3.1 Associate a Job Profile to Job Requisition by Providing JobRole externalCode Using OData API

Associate a job profile with a job requisition by providing the `externalCode` property of the `jobRoleEntity` entity in the `JobRequisition` OData API. The `JobRequisition` entity now has a navigation property called `jobRoleEntity`, with the `externalCode` property that determines a job profile in a job requisition.

The `jobRoleEntity` entity supports the Job Profile Builder enhancement to map a job code to multiple job roles in a job requisition. We added the `externalCode` property to the `jobRoleEntity` entity to associate the correct job profile with a job requisition without providing the Internal ID value.

A GET query on the `JobRole` XML field in the `JobRequisition` entity now returns `jobRole` and `jobRoleEntity` entities to represent the job role data. We recommend using the `jobRoleEntity` entity for the [POST](#) query to update a job role on the job requisition. A sample GET query and response are as follows:

- **Sample Code**

GET Query

```
https://qacand-api.hcm.ondemand.com/odata/v2/JobRequisition(32377L)?  
$format=json&$select=jobReqId,jobRole,jobRoleEntity&$expand=jobRoleEntity
```

- **Sample Code**

GET Response

```
{  
  "d": {

      }
    },
    "roleTalentPoolMappings": {
      "__deferred": {
        "uri": "https://qacand-api.hcm.ondemand.com/odata/v2/
RoleEntity('1021659')/roleTalentPoolMappings"
      }
    },
    "wfRequestNav": {
      "__deferred": {
        "uri": "https://qacand-api.hcm.ondemand.com/odata/v2/
RoleEntity('1021659')/wfRequestNav"
      }
    },
    "roleCompetencyBehaviorMappings": {
      "__deferred": {
        "uri": "https://qacand-api.hcm.ondemand.com/odata/v2/
RoleEntity('1021659')/roleCompetencyBehaviorMappings"
      }
    }
  }
}

```

A sample POST query (when you map a job code with multiple job roles by providing `jobRoleEntity` entity and `externalCode` property) is as follows:

- `{..}` Sample Code

```
{
  "__metadata": {
    "uri": "JobRequisition",
    "type": "SFOData.JobRequisition"
  },
  "templateId": "80",
  "jobRoleEntity": {
    "__metadata": {
      "uri": "RoleEntity('1000435')",
      "type": "SFOData.RoleEntity"
    }
  },
}
```

ⓘ Note

- In your integrations, if you adopt the Job Profile Builder enhancement of mapping one job code to multiple job roles and provide either job code or job role in the OData API Upsert operation, use the `jobRoleEntity` entity and ensure you provide a correct value of the job role. For more information about the Job Profile Builder enhancement of one job code mapped to multiple job roles, see the Job Code Association with Multiple Job Roles topic in the Related Information section.
- If you use one-to-one mapping of the job code and job role, you can continue providing Internal ID for the `JobRoLe` XML field. A random job role will be associated with the job requisition if you provide only

a job code. Hence, we recommended using the `jobRoleEntity` entity to update the job role on the job requisition.

[JobRequisition](#)

### 23.4.3.4 Important Notes

Notes to consider when mapping a single job code with a unique combination of custom fields and mapping them to multiple job roles.

- Error occurs in the following scenarios when you are using `jobRoleEntity` as the navigation property:
  - The `jobCode` and `jobRole` are provided in the payload, and the `jobCode` is not associated with the `jobRole`.
  - An invalid `externalCode` is provided for the `jobRole` entity.
  - A valid `externalCode` is provided for the `jobRoleEntity`, but not provided the `jobCode`.
  - If both the `jobRole` and `jobRoleEntity` properties are used in the OData API payload.
  - If you do not have read permission for the `jobRoleEntity` field of the `RoleEntity` object type.
  - If you provide a job role to a job requisition already associated with a job code and the new job role is not mapped to the existing job code.

#### Note

If you are providing a valid `externalCode` for the `jobRoleEntity`, but not passing the `jobCode`, the job requisition will be created and the job profile successfully associated; however, the `jobCode` related to the `jobRole` will not be linked to job requisition.

## 23.5 SAP SuccessFactors Recruiting Integration with Talent Intelligence Hub

In SAP SuccessFactors Recruiting, you can choose skills and competencies defined in the central attributes library of Talent Intelligence Hub.

To integrate Recruiting with Talent Intelligence Hub:

1. Run the following Recruiting checks via [Check Tool](#) to prepare the data for migration:
  - [Use Job Profiles in Requisitions is enabled](#) for instances integrated with Job Profile Builder
  - [Migration of competencies in job requisitions from JDM1.0 to JDM2.0 is complete](#)
2. Upgrade to Talent Intelligence Hub from ► [Admin Center](#) ► [Upgrade Center](#) ► to use competencies and skills in Recruiting.

### Note

Talent Intelligence Hub is in the early adoption phase and is available only for customers who have enabled Job Description Manager or Job Profile Builder.

- If you're using Job Description Manager, you can upgrade to Talent Intelligence Hub using ► [Admin Center](#) ► [Upgrade Center](#) ►. For more information, refer to **Migrating from Job Description Manager to Talent Intelligence Hub** in the **Related Information** section.
- If you're using Job Profile Builder, you can upgrade to Talent Intelligence Hub using ► [Admin Center](#) ► [Upgrade Center](#) ►. For more information, refer to **Migrating from Job Profile Builder to Talent Intelligence Hub** in the **Related Information** section.

### Note

Skills in Job Profile Builder can't be migrated to Talent Intelligence Hub. So, upgrading to Talent Intelligence Hub doesn't migrate Skill data used as a part of the job profile to Talent Intelligence Hub. As a result, if you're a user who has enabled skills in Job Profile Builder, then you can't enable Talent Intelligence Hub.

### Note

On recruiting instances integrated with Talent Intelligence Hub, you can add skills to a job requisition without using a profile directly from Talent Intelligence Hub. For more information, see the Configuring Skills in the Related Links.

### Note

Competencies on the Job requisition are not accessible via `jobRequisition` OData API if they are added manually for the competencies field on the job requisition when Job Profile builder integration is enabled. Competencies linked to a job profile used in the job requisition are accessible via OData API.

## Related Information

## 23.5.1 Migration Considerations for SAP SuccessFactors Recruiting and Talent Intelligence Hub Integration

Upgrading to Talent Intelligence Hub migrates competency data from Job Description Manager or Job Profile Builder to Talent Intelligence Hub and ensures you continue using the competencies added to job requisitions and interview central.

The *Migrate Recruiting Competencies to Talent Intelligence Hub* job performs the migration, and you can monitor the job in the ► *Admin Center* ► *Schedule Job Manager* ►.

### ⓘ Note

- The toggling of the *Use Job Profiles in Requisitions* option in *Admin Center, Manage Recruiting Settings* isn't allowed when the *Migrate Recruiting Competencies to Talent Intelligence Hub* job is in progress.
- Disabling the *Use Job Profiles in Requisitions* option in *Admin Center, Manage Recruiting Settings* isn't allowed once you upgraded to Talent Intelligence Hub.

## 23.5.2 UI Changes to Support Talent Intelligence Hub Integration

UI changes to support Talent Intelligence Hub integration.

- The existing *Edit* button on the *Job Profile* page is replaced with *Format* and *Add* buttons for the *Skills* and *Competency* sections. The *Format* option enables you to format the title and content style. The *Add* button lets you add competencies and skills from Talent Intelligence Hub.

### ⓘ Note

While adding skills or competencies, you can't filter skills and competencies based on roles.

- ⓘ Note

In Talent Intelligence Hub, when the *AI-Assisted Skills Architecture Creation* upgrade is in progress and when a profile contains inferred skills, these inferred skills are listed in the job requisition created using the profile. You cannot add or remove the inferred skills from the *Add* page and cannot view the skill description. You can only remove these skills from the *Skills* section on the *Job Profile* page.

- On Recruiting instances integrated with Job Profile Builder, the *Library* and *Category* columns are removed from the *Competency* section on the *Job Profile* tab when job requisition isn't using a profile.
- On Recruiting instances integrated with Job Description Manager, the *Library*, *Category*, *Expected Rating %*, and *Weight%* columns are removed from the *Competency* sections.

- The Audit page doesn't display the [Library](#), [Category](#), [Expected Rating %](#), and [Weight%](#) fields.

## 23.5.3 Adding Skills to Job Requisitions Without a Profile

Add skills to a job requisition without a profile when integrated with Talent Intelligence Hub.

To add skills on a job requisition without using a profile, configure a custom field of attribute type SKILL on the job requisition XML template.

### Note

Skills are only supported when the [JDM v2.0/Skills Management](#) option is enabled in [Provisioning](#), and the [Use Job Profiles in Requisitions](#) option is enabled in [Admin Center, Manage Recruiting Settings](#).

## Related Information

[Decision Matrix for Job Profile Builder to Talent Intelligence Hub Migration](#)

### 23.5.3.1 Configuring Skills

Configure a custom field for skills on the job requisition XML template to add skills individually from Talent Intelligence Hub to job requisitions created without using a profile.

Before you configure a custom field for skills on the job requisition template, ensure to meet the following prerequisites:

- Talent Intelligence Hub is enabled.
- The instance is integrated with Job Profile Builder: when the [JDM v2.0/Skills Management](#) option in [Provisioning](#) is enabled.
- The [Use Job Profiles in Requisitions](#) option is enabled in [Admin Center > Manage Recruiting Settings](#).

### Note

Skills aren't supported on Recruiting instances integrated with Job Description Manager (the [JDM v2.0/Skills Management](#) option is disabled in [Provisioning](#)). To add skills to job requisitions from Talent Intelligence Hub, you have to upgrade to Job Profile Builder.

Configure a custom field on the job requisition XML template

### Sample Code

```
<field-definition id="<customer defined>" type="attribute" attribute-
type="SKILL" required="false" custom="true">
  <field-label><![CDATA[Skills]]></field-label>
```

```
<field-description><![CDATA[Select Skill from Talent Intelligence Hub]]></field-description>
</field-definition>
```

### Permission Required

After you upgrade to Talent Intelligence Hub, ensure to provide attribute-level permissions. For more information, refer the Permissions Required for Using Talent Intelligence Hub topic in the Related Information section.

Note the permission required for the skill field is similar to the permissions required for competencies. The `listingLayout` field permission on the job requisition XML template controls the user access (read or write) to the skills data on the [Job Requisition Details](#) page. If you've the `write` field permission for the `listingLayout` field, then you can add or remove skills on the job requisition. The `read` permission on the `listingLayout` field lets you only view the skills added by the other users having the write permission.

Ensure the custom field must meet the following criteria:

- Set the value of the attribute-type field to SKILL.
- Set the value of the `<custom>` to true.
- Configure the attribute-type = SKILL field.
- Maintain a single attribute-type=SKILL field in the job requisition template.
- Maintaining the same `<field-ID>` across all the job requisitions XML templates is mandatory.
- The attribute-type field is required if the value of the `<type>` field is set to attribute.
- The attribute-type field is supported on the job requisition XML template only when you set the value of the type field to attribute.

Skills aren't supported in the following functionalities or pages:

- Business rules
- [Table reports](#) and [Story reports](#) (Hence, you can't configure skill as a reportable custom field.)
- Recruiting V2 Secured reports
- Offer Details Templates
- Manage Pending Hires
- Set Up Onboarding 1.0 Integration and Recruit-to Hire Data Mapping pages.
- Set Up Recruiting Marketing Job Field Mapping page to map Recruiting Marketing fields to job requisition fields.
- OData API and SuccessFactors OData API
- Intelligent Services events published by Recruiting
- Job requisition imports via scheduled jobs
- Recruiting Posting
- FADV (First Advantage for background checks) integration
- Mobile REST API - Skills aren't exposed in mobile rest endpoints to allow evaluation and rating from SAP SuccessFactors Mobile Application.
- Change Audit Logging Reports generated for Interview doesn't audit skills data.
- Tokens - Skills can't be defined as tokens in Interview Central.

[Permissions Required for Using Talent Intelligence Hub](#)

## 23.6 Integration of Recruiting with Onboarding

Integrating SAP SuccessFactors Recruiting with Onboarding allows you to create a more seamless flow of user data by passing candidate information gathered during the Recruiting process on to Onboarding.

You can integrate Recruiting with either of these versions of Onboarding:

- Onboarding (formerly Onboarding 2.0)
- Onboarding 1.0

### 23.6.1 Integration of Recruiting with Onboarding 1.0

To create a seamless flow of user data, clients can choose to integrate the Recruiting Management, Onboarding 1.0, and Employee Central modules. This passes data gathered from candidates during recruiting through the onboarding process and into their new employment.

In order to do this, you need to ensure that all Onboarding 1.0 fields are mapped to Recruiting fields of the same type.

For example, an Onboarding text field must be mapped to a Recruiting text field. The field value must match exactly (including all upper- and lower case characters). So, if Recruiting uses the value `FullTime`, Onboarding 1.0 must use the same value, including the capitalization and spacing.

Choose from the following topics for detailed information about integrating Onboarding 1.0 with SAP SuccessFactors Recruiting.

[Configuring the Integration Between Recruiting and Onboarding 1.0 \[page 1353\]](#)

Map configuration information between Recruiting and Onboarding 1.0 to integrate the two together.

[Settings for Onboarding 1.0 Integration Setup \[page 1354\]](#)

You can navigate to ► [Admin Center](#) ► [Setup Onboarding 1.0 Integration](#) ► page to configure settings for the Onboarding 1.0 integration and map Job Requisition, Job Application, and Job Offer fields to Onboarding fields.

## 23.6.1.1 Configuring the Integration Between Recruiting and Onboarding 1.0

Map configuration information between Recruiting and Onboarding 1.0 to integrate the two together.

### Prerequisites

- You've set up and configured the Onboarding module.
- You've assigned permissions for Onboarding in the Application XML.
- You've assigned permissions for admin users to access the [Setup Onboarding Integration](#) Admin Page.
- You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

When configuring [Onboarding](#) fields, you need to assign the field to its [entity](#) so the mapping tool knows which tab the fields appear on. To do this, select the [Fields](#) icon, then change the Namespace to [Entities](#) and assign the field to application, job requisition, or offer.

### Procedure

1. Go to [Provisioning](#) > [Manage Recruiting](#) > [Recruiting V2 Application](#) > [Enable Onboarding Integration](#) and select [BizX Onboarding Integration](#).
2. Go to [Provisioning](#) > [Company Settings](#) > [Recruiting V2 Application](#) > [Enable Onboarding Application](#) and enter the WebService URL and KMS Rest Web Services credentials. Both are required for the integration.

Example:

WebService URL: <https://qa.online-onboarding.com/SF>

KMS Rest Web Services credentials:

- Username: ECTQA04\_ws
- Password: ECTQA04Sws

3. Go to [Admin Center](#) > [Recruiting](#) > [Setup Onboarding Integration](#).

The [Settings](#) tab allows the Recruiting user to enable [Onboarding](#) for either all job requisitions, or only for certain requisitions.

They can use the dropdown menu to set criteria for the requisitions that have *Onboarding* applied. The fields available in the dropdown menu are drawn from the Internal and External Search Settings in Provisioning. You can only limit *Onboarding* to requisitions based on one field or criteria. For example, you might want to onboard hires in the United States and so could make the *Onboarding* options available only on US requisitions.

## Next Steps

Map the Job Requisition and Job Application fields in the Admin Center.

**Task overview:** [Integration of Recruiting with Onboarding 1.0 \[page 1352\]](#)

## Related Information

[Settings for Onboarding 1.0 Integration Setup \[page 1354\]](#)

[Job Requisition Application Status: Feature Permission \[page 182\]](#)

### 23.6.1.2 Settings for Onboarding 1.0 Integration Setup

You can navigate to ► [Admin Center](#) ► [Setup Onboarding 1.0 Integration](#) ► page to configure settings for the Onboarding 1.0 integration and map Job Requisition, Job Application, and Job Offer fields to Onboarding fields.

The *Settings* tab allows you to enable Onboarding either for all job requisitions or only certain requisitions. You can use the provided dropdown field to set criteria for the requisitions, which have Onboarding applied. The dropdown field isn't configurable and it only supports filter fields, mfields, and enum fields. You can limit the requisitions based on only one field or criteria. You can enter a period in days to define restriction on the reinitiation of onboarding. This prevents the same candidate from being onboarded multiple times in the set timeframe.

The fields marked with a red asterisk in the tool require a field mapping. Fields marked with a blue asterisk show up on more than one form, but can only be mapped to one location.

**Parent topic:** [Integration of Recruiting with Onboarding 1.0 \[page 1352\]](#)

## Related Information

[Field Mapping Between Recruiting and Onboarding \[page 1355\]](#)

## 23.6.1.2.1 Field Mapping Between Recruiting and Onboarding

You can map field from the Job Application, Job Requisition, and Job Offer in Recruiting to Onboarding.

### ⚠ Caution

You can't map fields from the Candidate Profile, or any other Recruiting entities.

Some fields are automatically passed from Recruiting to Onboarding. These fields don't require mapping or any other additional configuration.

### Default Onboarding Field Mapping – Job Requisition

| Onboarding Field ID | Recruiting Template Field | Notes                                          |
|---------------------|---------------------------|------------------------------------------------|
| RecruiterID         | Recruiter operator        | recruiterName                                  |
| RecruiterFullName   | N/A                       | Onboarding fetches these fields automatically. |
| RecruitingTitle     | N/A                       |                                                |
| RecruiterEmail      | N/A                       |                                                |
| ManagerID           | N/A                       |                                                |
| ManagerFullName     | N/A                       |                                                |
| ManagerTitle        | N/A                       |                                                |
| ManagerEmail        | N/A                       |                                                |

### Default Onboarding Field Mapping - Job Application

| Onboarding Field ID        | Recruiting Template Field |
|----------------------------|---------------------------|
| <i>Basic Employee Data</i> |                           |
| LastName                   | lastName                  |
| FirstName                  | firstName                 |
| MiddleName                 | middleName                |
| Suffix                     | No Mapping                |
| EMail                      | contactEmail/primaryEmail |
| Address1                   | address                   |
| Address2                   | address                   |
| City                       | city                      |
| CountryTownship            | No Mapping                |

| Onboarding Field ID          | Recruiting Template Field |
|------------------------------|---------------------------|
| State                        | state                     |
| Zip                          | zip                       |

## 23.6.3 Configuring Initiating Onboarding for Candidates

Once SAP SuccessFactors Onboarding is configured, you can select [Initiate Onboarding](#). You can initiate onboarding for a single or multiple applications of a single Job Requisition.

### Prerequisites

To initiate onboarding for single or more than one application at a time, make sure that you have the following permissions enabled:

| Permission                  | Description                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BizX Onboarding Integration | <p>In <a href="#">Provisioning</a>, go to ► <a href="#">Company Settings</a> ► <a href="#">Recruiting</a> ► <a href="#">Enable Onboarding Integration</a> .</p> <div><p>→ Remember</p><p>As a customer, you don't have access to Provisioning. | Grant feature permissions for Onboarding in the Application XML | For more information on feature permissions, scroll down to see <a href="#">feature-permission Elements</a> in the Related Links section.                                                                                                                                                                                                                                                                                                                                            |

## Context

Place the applicants in one of the application statuses configured to initiate Onboarding. You can initiate onboarding for single or multiple applications of a single Job Requisition. You can initiate Onboarding for a single application from the [Take Action](#) menu on the [Application](#) portlet.

The ability for Recruiting users to see the Onboarding portlet is controlled through the "onboarding" feature permission in the job requisition template. Refer to *Permission Settings for Onboarding Portlet and Initiate Onboarding* for details.

Use these steps to initiate onboarding for multiple applications:

## Procedure

1. Go to [Recruiting](#).
2. Go to [Candidate Summary](#) page and select the candidates you want to initiate onboarding.
3. Under [Action](#), select [Initiate Onboarding](#).

Once the onboarding is initiated, there's a one-time send of data based on the Admin Mapping to the onboarding module.

If both Onboarding (formerly Onboarding 2.0) or Onboarding 1.0 are configured in the same instance, you can initiate onboarding for candidates through either of them. Onboarding in Recruiting Management is enabled based on the rules that you set in Onboarding Integration Setup for Onboarding, and Onboarding Integration Setup for Onboarding 1.0. These rules determine the version of Onboarding through which you can initiate candidate onboarding. The first preference is given to Onboarding. If the rules on Onboarding are satisfied, then the onboarding is initiated through Onboarding. If conditions aren't met in Onboarding, then the initiation of onboarding is done through Onboarding 1.0. If both Onboarding and Onboarding 1.0 don't satisfy the conditions, then onboarding isn't initiated.

### Note

- An error occurs if you try to onboard a candidate more than once.

- You can initiate onboarding for a maximum of 150 candidates at once.
- This portlet appears only with the SAP SuccessFactors Onboarding integration, not with the Verifications Inc. onboarding.
- The portlet appears in the Application page and not in the Candidate Summary page. You can initiate Onboarding from the portlet as well.
- With Onboarding 1.0, if you attempt to onboard a candidate more than once, then a popup is displayed saying that the candidate already has been boarded for a job.
- For Onboarding, you can initiate onboarding again if you or an onboarding user has already canceled the action (Submission Status = Canceled).
- Offer approval requirement based on flows (for both Internal and External Hire candidates):
  - Mandatory: **Recruiting - Manage Pending Hires - Employee Central** and **Recruiting - Employee Central**.
  - Not mandatory: Recruiting - Onboarding (**Recruiting - Onboarding - Manage Pending Hires** and **Recruiting - Onboarding - Employee Central**).
 This requirement is applicable to both Onboarding 1.0 and Onboarding 2.0

4. A confirmation popup appears with a list of selected candidates.
5. Select [Confirm](#).

## Results

You receive an email notification to know the onboarding initiation status of the candidate. You can also view the [Onboarding Initiation](#) column, which displays the status of the candidates (success or failed) in the Candidate Summary page.

Select [Filter](#) options to filter on the onboarding initiation status. You can filter on statuses such as [Cancelled](#), [Failed](#), [Success](#), and so on.

### Note

You can't sort on [Onboarding Initiation](#) column.

When using SAP SuccessFactors Onboarding, the [Submission Status](#) can have one of the following values:

| Status                | Definition                                                                                                                                                                                                                  |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Success               | First-time onboarding initiation is successful.                                                                                                                                                                             |
| Canceled              | A user canceled the onboarding process in SAP SuccessFactors Onboarding. You can reinitiate onboarding by selecting <a href="#">Initiate Onboarding</a> .                                                                   |
| Success (reinitiated) | Reinitiation of the onboarding process, after it has been canceled, is successful. This status is displayed for any consecutive successful initiation, starting with the second one.                                        |
| Failed                | If there's a technical issue, the status appears as <a href="#">Failed</a> . In this case, you can choose <a href="#">Initiate Onboarding</a> to try again. In case this status keeps appearing, recheck the configuration. |

### ⚠ Restriction

- The *Initiate Onboarding* action isn't audited.
- In Recruiting Management, it isn't possible to report on the history of *Initiate Onboarding* action, or see the action history on the portlet or on the screen.
- Only the latest action details are displayed on the *Application* portlet.

To automate the onboarding initiation process, administrators can select the *Enable Automatic Initiation for Onboarding* option in the *Onboarding Integration Setup* page. Additionally, a business rule must be configured to trigger the process. For detailed steps and guidance, refer to the **Related Information** section.

## 23.6.4 Permission Settings for Onboarding Portlet and Initiate Onboarding

The combination of "onboarding" feature permission in the job requisition template and the *Onboarding Initiate Permission* role-based permission allows you to control what Recruiting users can see and do in Recruiting for Onboarding.

- **Perform** the *Initiate Onboarding* action: Set the *Onboarding Initiate Permission* role-based permission.
- **View** the *Onboarding* portlet in both the legacy Candidate Workbench and the redesigned Applicant Management tool: Set the "onboarding" feature permission type in the job requisitions template:

```
<feature-permission type="onboarding">
  <description><![CDATA[View onboarding portlet]]></description>
  <role-name><![CDATA[G]]></role-name>
  <role-name><![CDATA[R]]></role-name>
  <status><![CDATA[On-board]]></status>
</feature-permission>
```

In this example, both the G and R roles have access to the *Initiate Onboarding* portlet when the applicant is in the status On-Board.

For example, Carol the recruiter is assigned both the *Onboarding Initiate Permission* role-based permission and "onboarding" feature permission. Carol can initiate onboarding as well as view the *Onboarding* portlet.

Michael the hiring manager has "onboarding" feature permission to view the *Onboarding* portlet. But Michael doesn't have *Onboarding Initiate Permission* role-based permission, and can't initiate an applicant for onboarding.

| Abilities for Roles                                                                                                                                        | Onboarding Feature Permission | Onboarding Initiate Permission Role-Based Permission |
|------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|------------------------------------------------------|
| <ul style="list-style-type: none"> <li>View <a href="#">Onboarding</a> portlet</li> <li>Perform <a href="#">Initiate Onboarding</a></li> </ul>             | Configured                    | Enabled                                              |
| <ul style="list-style-type: none"> <li>View <a href="#">Onboarding</a> portlet</li> <li>Can't perform <a href="#">Initiate Onboarding</a></li> </ul>       | Configured                    | Not enabled                                          |
| <ul style="list-style-type: none"> <li>Can't view <a href="#">Onboarding</a> portlet</li> <li>Can't perform <a href="#">Initiate Onboarding</a></li> </ul> | Not configured                | Not enabled                                          |

The behavior of the action ([Initiate Onboarding](#)) and the visibility of the portlet ([Onboarding](#)) is summarized in the table:

| Feature Permission - Onboarding | Role-based Permission - <a href="#">Onboarding Initiate Permission</a> | Can I view the Onboarding Portlet? | Can I initiate the onboarding action? |
|---------------------------------|------------------------------------------------------------------------|------------------------------------|---------------------------------------|

## 23.7 Integration of Recruiting with SAP ERP HCM

By integrating your SAP SuccessFactors Recruiting solution with your on-premise SAP ERP HCM system, you can exchange information about candidates and open positions and ensure consistent employee data for seamless end-to-end recruiting.

Information about vacant positions, which you've maintained in the SAP ERP HCM, is transferred to SAP SuccessFactors Recruiting so that the corresponding job requisition can be created there. You can also include existing vacancies in the data transfer. This is useful when you haven't created any job requisitions in SAP SuccessFactors.

Once you've decided to hire a candidate, you can transfer candidate's data back to the SAP ERP HCM system, and then hire the candidate as an employee. The selected candidates are hired, rehired, or transferred to a new position depending on whether the candidate is a new candidate, an alumnus, or an internal candidate.

If the staffing of the positions was completed in the SAP ERP HCM system, the integration ensures that this information is automatically transferred to SAP SuccessFactors Recruiting and the status of the associated job requisition is set to [to be closed](#). Finally, the hiring status is synchronized between SAP ERP HCM and SAP SuccessFactors Recruiting.

### Related Information

## 23.7.1 Prerequisites for Integrating Recruiting and SAP ERP HCM System

Before you start integrating your Recruiting solution with your SAP ERP HCM system, ensure that you've done all the following.

- You have access to Provisioning.

### Note

You can't include any integration user configured in Provisioning in any Recruiting Group. If the user is included in a recruiting group, you can't close or reopen a job requisition.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- You've enabled [SFAPI](#) and [SFAPI Webservices](#) in Provisioning.
- You've enabled the [API User Login](#) permission.
- You've granted permissions for all SFAPI functionalities (18 permissions altogether).
- You've set these API Logon Exceptions in [Admin Center](#) > [Password & Login Policy Settings](#) > [Set API Login Exceptions](#) > [Add](#) :
  - Username – Integration user.
  - Maximum password age (days) – Set to -1 days.
  - IP address restrictions – Designated IP addresses or address range for use with the integration.

### ⚠ Restriction

We don't support domain names in this tool at present.

- You've configured route maps.

### → Tip

The route map can't start with the R role, or any other recruiting role without customizing the integration package to include the relevant operator fields.

[Using Role-Based Permissions](#)

## 23.7.2 Job Requisition Trigger Integration

The Requisitions Trigger integration is required to pass the details of vacant position to SAP SuccessFactors Recruiting when a position is ready for hire.

### 📘 Note

A vacant position describes a position that is ready for hire. This can in some cases be a position that is currently occupied, but it's known that the occupant is taking leave.

When a position is set to vacant, an infotype (for example, 1007) is created for the position. For SAP customers using the integration, a new infotype (for example, 1107) is established automatically when the vacancy is created and closed when the vacancy is closed. The new infotype triggers the creation of a Job Requisition in SAP SuccessFactors Recruiting. If you aren't using vacancies at all in SAP, you can trigger an infotype (for example, IT1107) manually in SAP to create a Job Requisition in Recruiting Management.

A scheduled report running regularly triggers the Job Requisition creation process in SAP SuccessFactors. The position is queried in SAP and standard fields configured in the integration are sent to the SAP SuccessFactors Job Requisition. The attributes sent are stored in the infotype (for example, IT1107).

When the next report runs, all positions with that particular infotype are selected. For those without a NEW flag, the next extract is compared to the previous one that is stored on this infotype. If there are any changes, the Job Requisition is selected for an update. Some fields aren't updated for Recruiting reasons. The Job Requisition is sent to the hiring manager (the manager of the position in SAP). First, the hiring manager completes the position details and the other approvers save the requisition and send the job to the next user in the approval chain.

The Job Requisition template ID must be available in SAP HCM ERP system for the integration to work. If there are multiple templates, the standard integration distinguishes between a manager position and an employee position in SAP and selects the right template ID configured in SAP HCM ERP. If there are other templates involved, you can implement your own business logic to define the right template for the position using Business Add-ons.

### → Tip

You can customize this integration to send jobs to a recruiter or another individual, but this requires customizing the integration package on the SAP side.

You can save the Job Requisition to view the route map and send to the next step.

If you're using the SAP New Hire integration, the information from the New Hire integration is cross-referenced against the open Job Requisitions. If this operation fails, the integration updates the applicant status to *TransferredToSAPError*, leaves the *Exported On* field empty, and provides a more detailed error message in the *sapError* field on the application. However, you can correct any issues with the data and restatus the candidate to *SendToSAP* to try again.

### → Remember

- The prebuilt integration pack contains the minimum required fields and a set of commonly used fields. You can choose to remove any fields that aren't part of the minimum requirements. You can also set up your integration to include more fields that aren't part of the default integration.
- As the integration pack uses SAP PI as middleware, you need to have considerable knowledge in all three technologies (SAP HCM ERP, SAP PI, and SAP SuccessFactors Recruiting) to change the prebuilt integration.

### 23.7.2.1 Job Requisition Template: Field Definitions for Trigger Integration

Define fields in the Job Requisition template that are mapped from SAP ERP HCM.

| <i>Field Definition</i> | <i>Required on Job Requisition Template?</i> | <i>Required in Data Feed to SuccessFactors?</i> |
|-------------------------|----------------------------------------------|-------------------------------------------------|
| guid                    | No                                           | Yes                                             |
| originator              | No                                           | Yes                                             |
| title                   | Yes                                          | Yes                                             |
| sapPositionID           | Yes                                          | Yes                                             |
| dateCreated             | No                                           | Yes                                             |
| jobCloseDate            | No                                           | Yes                                             |
| jobReqStatus            | No                                           | Yes                                             |
| status                  | Yes                                          | Yes                                             |
| country                 | Yes                                          | Yes                                             |

#### → Recommendation

You should import as much information as possible about the position to maintain SAP as the source of truth.

More custom fields have to be added to the SAP SuccessFactors Job Requisition template, if more information is required to import from SAP.

In general, avoid picklists in SAP SuccessFactors for the custom fields filled by SAP. The integration fails if picklists aren't properly maintained with values that match SAP. The intention is to reduce the implementation effort, and creating and updating picklists in the application is expensive.

The Job Requisition fields, which are filled by SAP system, have to be read-only fields in the UI. If there's a change in the SAP system, the Job Requisition gets updated, and all fields are overwritten in the application. Operators don't have to change fields that are eventually overwritten. The single source for all fields sent for the job requisition trigger is the SAP HCM Suite system. No data is transferred back to SAP. The process fails if you don't configure your Job Requisition in the recommended state.

#### → Tip

SAP integration fields aren't standard fields in SAP SuccessFactors Recruiting. These are custom fields and must be defined as reportable custom fields.

### 23.7.2.1.1 Field Behavior for Job Requisition Trigger Integration

If you're using Organization Management (OM) and positions, you might have data maintained in OM and thus only require the position to identify the area to which the candidate has to be assigned.

#### Sample Code

```
<field-definition id="id" type="text" required="false" custom="false">
  <field-label mime-type="text-plain" lang="de_DE_SF"><![CDATA[Requisition

  <field-description><![CDATA[SAP Reference Salary]]></field-description>
</field-definition>
<field-definition id="salaryMax" type="currency" required="false" custom="false">
  <field-label><![CDATA[Amount to]]></field-label>
  <field-label lang="de_DE_SF"><![CDATA[Pay Grade to]]></field-label>
  <field-description><![CDATA[SAP Pay Grade to]]></field-description>
</field-definition>
<field-definition id="sapCompTimeUnit" type="text" required="false"
custom="true">
  <field-label><![CDATA[Time Unit]]></field-label>
  <field-label lang="de_DE_SF"><![CDATA[Time Unit]]></field-label>
  <field-description><![CDATA[Time Unit]]></field-description>
</field-definition>

```

Even if you aren't using Organization Management, you might require other entities at the requisition such as Personnel Area or Subarea, Employee Group or Subgroup, Cost Center, Country, which is required when a candidate has to be hired in SAP SuccessFactors HCM suite. The following fields are also supported in the Requisition Trigger for such cases.

## Sample Code

```
<field-definition id="sapOrgUnitName" type="text" required="false" custom="true">
  <field-label><![CDATA[SAP Org Unit Name]]></field-label>
</field-definition>
<field-definition id="sapOrgUnitID" type="text" required="false" custom="true">
  <field-label><![CDATA[SAP Org Unit ID]]></field-label>
</field-definition>
<field-definition id="sapPersonnelAreaTxt" type="text" required="false"
custom="true">
  <field-label><![CDATA[SAP Personnel Area (std)]]></field-label>
</field-definition>
<field-definition id="sapPersonnelAreaIDTxt" type="text" required="false"
custom="true">
  <field-label><![CDATA[SAP Personnel Area ID (std)]]></field-label>
</field-definition>
<field-definition id="sapPersonnelSubAreaTxt" type="text" required="false"
custom="true">
  <field-label><![CDATA[SAP Personnel Subarea (std)]]></field-label>
</field-definition>
<field-definition id="sapPersonnelSubAreaIDTxt" type="text" required="false"
custom="true">
  <field-label><![CDATA[SAP Personnel Subarea ID (std)]]></field-label>
</field-definition>
<field-definition id="sapEEGroupTxt" type="text" required="false" custom="true">
  <field-label><![CDATA[SAP EE Group (std)]]></field-label>
</field-definition>
<field-definition id="sapEEGroupIDTxt" type="text" required="false"
custom="true">
  <field-label><![CDATA[SAP EE Group ID (std)]]></field-label>
</field-definition>
<field-definition id="sapEESubGroupTxt" type="text" required="false"
custom="true">
  <field-label><![CDATA[SAP EE Subgroup (std)]]></field-label>
</field-definition>
<field-definition id="sapEESubGroupIDTxt" type="text" required="false"
custom="true">
  <field-label><![CDATA[SAP EE Subgroup ID (std)]]></field-label>
</field-definition>
```

## Division, Department, and Locations (Application Standard Fields)

The fields department, division, and location are important fields for the application because they're used for reporting and permissions. The fields are mapped as follows:

- **SFSF Department** > *Org unit or Cost Center*
- **SFSF Division** > *Company code of the org unit the employee is assigned to*
- **Location** > *personnel area of the org unit the employee is assigned to*

The fields are sent as a combination of Name and ID, for example <Name (ID)>.

If the value is an attribute of the User Data File, the Division, Department, and Location can only be sent using API, or else the import fails. For this reason, an example mapping is delivered, but in the standard delivery the mapping shouldn't be delivered as **active**. You've to explicitly activate the mapping for the three fields on the SAP side, as well as define them in the Job Requisition XML.

- **country:** SAP ERP determines the ID of the personnel area from the *Personnel Area* field (PERSA) of the infotype *Account Assignment Features* (1008). For this ID, in the table T500P, the SAP ERP system determines the entry that is stored in the LAND1 field.

#### ⓘ Note

Country is required for SAP SuccessFactors Recruiting Management. The integration fails, if the customer doesn't define country in the HR Master Data or in another way.

- **sapState:** SAP ERP determines the ID of the personnel area from the *Personnel Area* field (PERSA) of the infotype *Account Assignment Features* (1008). For this ID, in the table *Personnel Areas* (T500P), the SAP ERP system determines the key for the region that is stored in the *Region (State, Province, County)* (REGIO) field. This is translated to the name of the region that is stored in the BEZEI field in table T005U.

#### ⓘ Note

If you're using eQuest, the standard State field is required. You might choose to bring sapState across to inform the HM or Recruiters' selection for eQuest State.

- **city:** SAP ERP first determines the ID of the personnel area from the *Personnel Area* field (PERSA) of the infotype *Account Assignment Features* (1008). For this ID, in the table T500P, the SAP ERP system determines the entry that is stored in the ORT01 field.
- **postalcode:** SAP ERP determines the ID of the personnel area from the *Personnel Area* field (PERSA) of the infotype *Account Assignment Features* (1008). For this ID, in the table T500P, the SAP ERP system determines the entry that is stored in the PSTLZ field.

## Default Posting Language

Include the correct language in the following XML parameters, if the Job Requisition is created using the API. You can't update the posting language and default language after the requisition is created. It's necessary to do it when the requisition is first created. If the posting language isn't specified, it defaults to en\_US, regardless of the default language of the site. This can cause errors when creating Job Requisitions using APIs.

- jobPostLanguage
- defaultLanguage

Example XML:

```
<urn:jobPostLanguage>en_GB</urn:jobPostLanguage>
<urn:defaultLanguage>en_GB</urn:defaultLanguage>
```

## Salary Fields

For each of the following fields, regardless of the type of compensation configured, if the field is empty, the SAP ERP system transfers the value 0 to SAP SuccessFactors:

- salaryMin
- salaryMax

- salaryMid

## Compensation Fields

For compensation fields, the infotype *Planned Compensation*(1005) is defined for either the position or the job. If the infotype fields can't be determined for the position, the SAP ERP system uses those for the job.

## Compensation Types and Populating sapPayType

The infotype is divided into three planned compensation types. You can use only one of these planned compensation types per position or job.

The SAP ERP system transfers the information on which planned compensation type is valid for the position or job to the SAP SuccessFactors Application field *sapPayType* on the Job Requisition. This is for reporting purposes in the application, so the Reporting team can use this field to filter reports. The filter options SAP sends SAP SuccessFactors in this field are:

- Salary
- Pay Scale
- Direct

## 23.7.3 SAP New Hire Integration

SAP provides new hire integration between SAP HCM and SAP SuccessFactors Recruiting using an integration pack.

The integration pack allows the transfer of hired applicant data from SuccessFactors into SAP.

To facilitate this integration, SAP HCM and Recruiting must include certain prescribed configuration. The expected functionality and prescribed configuration required in Recruiting for you to use the integration pack out of the box is described here.

- The prebuilt integration pack contains the minimum required fields and a set of commonly used fields. You can choose to remove any fields that aren't part of the minimum requirements. You can also set up the integration to include additional fields that aren't part of the default integration.
- As the integration pack uses SAP PI as middleware, it's required to have considerable knowledge in all three technologies (SAP SuccessFactors platform, SAP PI, and SAP SuccessFactors Recruiting) to change the prebuilt integration.

- Position management integration to create requisitions automatically based on position vacancies is out of scope. A prerequisite to use the new hire integration pack is up to you to create requisitions and maintain necessary position or organizational data on the requisitions manually.

SAP provides an additional guide that details the HCM prerequisites and configuration necessary to support the new hire integration. If there's a contradiction in any details, the SAP guide supersedes this guide.

[Integration Add-On for SAP ERP HCM and SuccessFactors HCM Suite](#)

### 23.7.3.1 Identify Scenarios for Integration with SAP ERP HCM

SAP's prebuilt integration pack includes an extensive set of fields mapped to SuccessFactors requisition fields, but using this full configuration places a significant burden on you to create and maintain a complex set of picklists.

As a leading practice **Scenario A** is considered as the optimal configuration. Scenario A requires you to adjust the integration pack to remove unused fields.

#### Scenario A: You Use SAP Org. Management and Maintain All Related Data

Detailed data such as personnel area, cost center, and other data is associated to a unique position ID in SAP. That is, as long as SuccessFactors sends the position number from the requisition over to SAP, SAP can look up and populate all the additional organizational data for the hire.

#### Scenario B: You Use SAP Org. Management and Doesn't Maintain All Related Data

Some detailed data such as cost center might be associated to a unique position ID in SAP, but other necessary data such as personnel area isn't associated or you wish to allow this data to be overwritten with data specified on the requisition. That is, SuccessFactors must send both the position number and a many other fields of organizational data to process the new hire.

Decide on how much data you have to transmit from SuccessFactors to SAP. This involves the processing of the hire based on their current use of SAP and also the administrative maintenance burdens involved in maintaining data for the fields in Recruiting Management.

## 23.7.3.2 The SAP New Hire Integration Workflow

To save you time and increase data reliability, SAP automatically extracts requisition, application, and offer data from new hires in SAP SuccessFactors and transfers the data to the Platform tool.

1. SAP job queries SAP SuccessFactors for applications in the applicant status of **SendToSAP**, and extracts the requisition, application, and offer data for the resulting applicants. The job then transfers that data to SAP.
2. For a successful operation, the integration updates the applicant status to **TransferredToSAP** and enters a date into the *Exported On* field.  
If this operation fails, the integration updates the applicant status to **TransferredToSAPError**, leaves the field empty, and *Exported On* provides a more detailed error message in the **sapError** field on the application. You can correct any issues with the data and reset the status of the candidate to **SendToSAP** to try again.
3. After successful transaction, the applicant record is transferred to a staging area in the Platform tool for further data entry and processing.
4. After data entry and processing on the SAP side, the integration updates Recruiting by updating the applicant status to **HiredAtSAP**.

### ⚠ Caution

Once the applicants are successfully transferred to SAP, their data can't be changed and they can't be transferred again.

If a user places an applicant in **SendToSAP** status after the successful applicant transfer, and if the applicant currently exists in Platform, the integration recognizes this as a process failure. The applicant is then placed in **TransferredToSAPError** status with an error message.

If you have to change an applicant's data after successful data transfer, work with the SAP data administrators to make those changes directly in Platform.

## 23.7.3.3 Fields and Permissions in the Application XML

Consider defining fields in the Application XML that are mapped from SAP.

All the fields listed in the XML sample must be defined. You can choose to define additional standard or custom fields. If additional fields are defined for use in the integration, you have to customize the SAP integration to map these fields to fields in SAP.

Any custom fields added must be defined in the reportable custom fields in order for them to be available in Ad Hoc reporting.

### → Tip

The SAP integration manages the content of the **sapError** and **sapExportedOnDate** fields, so generally no operators have **write** privileges to these fields. At the least, the operator responsible for placing the applicant in the *SendToSAP* status has to have **read** permission to these fields for information and troubleshooting purposes.

## Sample Code

```
<field-definition id="statusId" type="picklist" required="true" custom="false"
public="false"
  readOnly="false" anonymize="false">
  <field-label mime-type="text-plain"><![CDATA[Status: ]]></field-label>

### 23.7.3.4 Configuring the Applicant Status Set for New Hire Integration

You can configure an applicant status set to ensure that status-triggered email notifications are sent to participants involved in the new hire integration process.

## Prerequisites

You have access to Provisioning.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Context

The participants involved in the new hire integration process are notified about the progress of the applicant using the status-triggered email notifications.

## Procedure

1. Go to  [Provisioning](#)  [Applicant Status Configuration](#)  [Edit Base](#)  [Add New](#) .

2. Add the following statuses with these names as-is: **SendToSAP**, **TransferredToSAP**, **TransferredToSAPError**, and **HiredAtSAP**.

Set the *Category* as *Hired* for all these statuses. SAP recommends you to set the value of *Type* to *Onboard*.

3. Click [Save](#) and then click *I'm Done*.
4. Go to ► [Admin Center](#) ► [Recruiting](#) ► [Edit Applicant Status Configuration](#) ► and select the status set name.
5. Click [Add New](#).
6. Select the statuses that you have created and click [Add](#).
7. Open the newly added status and define labels and preferences according to your requirement.

## Related Information

[Prerequisites for Integrating Recruiting and SAP ERP HCM System \[page 1363\]](#)

### 23.7.3.5 Job Offer Detail Fields for Job Requisition Trigger Integration

Configure offer details to enable the offer approval for routing and approval.

Include the field listed in the XML sample. Also, you can define additional standard or custom fields. If you define additional fields for use in the integration, customize the SAP integration to map these fields to fields in SAP.

```
<field-definition id="startDate" type="date" required="false" custom="true"
  template-type="job-application">
  <field-label mime-type="text-plain"><![CDATA[Start Date]]></field-label>
  <field-description><![CDATA[Start Date]]></field-description>
</field-definition>
```

## Related Information

[Prerequisites for Integrating Recruiting and SAP ERP HCM System \[page 1363\]](#)

### 23.7.3.6 Fields and Permissions in the Requisition XML

Consider defining fields that are mapped from SAP, based on the configuration scenario that you've chosen.

All the fields listed in the scenario must be included, and you might choose to define additional standard or custom fields. If additional fields are defined for use in the integration, you have to customize the SAP integration to map these fields to fields in SAP. Permission these fields according to your preference.

## Scenario A – SuccessFactors sends the position number to SAP

### Sample Code

```
<field-definition id="title" type="text" required="true" custom="false">
  <field-label><![CDATA[Job Title]]></field-label>
  <field-label lang="de_DE_SF"><![CDATA[Job Titel]]></field-label>
  <field-description><![CDATA[Position Title]]></field-description>
</field-definition>
<field-definition id="sapPositionName" type="text" required="true"
custom="true">
  <field-label><![CDATA[SAP Position Name]]></field-label>
</field-definition>
<field-definition id="sapPositionID" type="text" required="true" custom="true">
  <field-label><![CDATA[SAP Position ID]]></field-label>
</field-definition>
<field-definition id="country" type="derived" required="true" custom="false">
  <field-label><![CDATA[Country]]></field-label>
  <field-label lang="de_DE_SF"><![CDATA[Land]]></field-label>
  <field-description><![CDATA[Country]]></field-description>
</field-definition>
<field-definition id="hiringManagerName" type="operator" required="true"
custom="false">
  <field-label><![CDATA[Hiring Manager]]></field-label>
  <field-label lang="de_DE_SF"><![CDATA[Einstellender Manager]]></field-label>
  <field-description><![CDATA[This is the hiring manager]]></field-description>
</field-definition>
```

## Scenario B – SuccessFactors sends the position number and organizational data to SAP

Configure all the fields from Scenario A and also configure the following (the integration pack includes all, so anything you choose to omit has to be removed from the SAP integration mapping):

### Sample Code

```
<field-definition id="division" type="enum" required="true" custom="false">
  <field-label><![CDATA[Area]]></field-label>
</field-definition>
<field-definition id="department" type="enum" required="true" custom="false">
  <field-label><![CDATA[Department]]></field-label>
</field-definition>
<field-definition id="location" type="enum" required="true" custom="false">
  <field-label><![CDATA[Location]]></field-label>
</field-definition>
<field-definition id="sapOrgUnitName" type="text" required="true"
custom="true">
  <field-label><![CDATA[SAP Org Unit Name]]></field-label>
</field-definition>
<field-definition id="sapOrgUnitID" type="number" required="true"
custom="true">
  <field-label><![CDATA[SAP Org Unit ID]]></field-label>
</field-definition>
<field-definition id="sapPersonnelArea" type="picklist" required="true"
custom="true">
  <field-label><![CDATA[SAP Personnel Area]]></field-label>
  <picklist-id>sapPersonnelArea</picklist-id>
</field-definition>
<field-definition id="sapPersonnelAreaID" type="picklist" required="true"
custom="true">
  <field-label><![CDATA[SAP Personnel Area ID]]></field-label>
  <picklist-id parent-field-id="sapPersonnelArea">sapPersonnelAreaID</picklist-
id>
</field-definition>
<field-definition id="sapPersonnelSubArea" type="picklist" required="true"
custom="true">
```

```

    <field-label><![CDATA[SAP Personnel Sub Area]]></field-label>
    <picklist-id parent-field-id="sapPersonnelAreaID">sapPersonnelSubArea</
picklist-id>
    </field-definition>
    <field-definition id="sapPersonnelSubAreaID" type="picklist" required="true"
custom="true">
    <field-label><![CDATA[SAP Personnel Sub Area ID]]></field-label>
    <picklist-id parent-field-id="sapPersonnelSubArea">sapPersonnelSubAreaID</
picklist-id>
    </field-definition>
    <field-definition id="sapEEGroup" type="picklist" required="true"
custom="true">
    <field-label><![CDATA[SAP EE Group]]></field-label>
    <picklist-id>sapEEGroup</picklist-id>
    </field-definition>
    <field-definition id="sapEEGroupID" type="picklist" required="true"
custom="true">
    <field-label><![CDATA[SAP EE Group]]></field-label>
    <picklist-id parent-field-id="sapEEGroup">sapEEGroupID</picklist-id>
    </field-definition>
    <field-definition id="sapEESubGroup" type="picklist" required="true"
custom="true">
    <field-label><![CDATA[SAP EE Sub-Group]]></field-label>
    <picklist-id parent-field-id="sapEEGroupID">sapEESubGroup</picklist-id>
    </field-definition>
    <field-definition id="sapEESubGroupID" type="picklist" required="true"
custom="true">
    <field-label><![CDATA[SAP EE Sub-Group]]></field-label>
    <picklist-id parent-field-id="sapEESubGroup">sapEESubGroupID</picklist-id>
    </field-definition>
    <field-definition id="costCenterId" type="picklist" required="false"
custom="false">
    <field-label><![CDATA[SAP Cost Center]]></field-label>
    <field-label lang="de_DE_SF"><![CDATA[Kostenstelle]]></field-label>
    <picklist-id>jobReqStatus</picklist-id>
    </field-definition>

```

If you wish to define additional, fewer, or different fields in the integration, you have to customize the SAP integration to map these fields to fields in SAP.

### ⚠ Caution

If the position name or data fields from Scenario B are configured as “write” on the requisition and users change the data on the requisition, the data changes don't reflect in SAP HCM until the time of the new hire integration.

Consider the following while configuring and permissioning Job Requisition XML for integration scenarios:

- The circumstances under which each system stores different data for the same field.
- Discrepancy between data in those systems during the hiring.
- Which data you wish to become the master data at the point the new hire is processed in SAP HCM.

### ❁ Example

Personnel Area is a position-associated field in SAP HCM storing the value **HR** and Personnel Area is also a field in the requisition. A recruiting user on the requisition manually changes the Personnel Area to **Legal**. What problems does it cause to have this data set up as **Legal** on the requisition and **HR** in SAP HCM during the period when recruiting is actively in progress? An applicant is hired and SuccessFactors Recruiting Management sends the value **Legal** over to SAP HCM. Does SAP ignore **Legal** or use **Legal** to overwrite **HR**?

## Related Information

### 23.7.3.7 Creating an Ad Hoc Report for New Hire Integration

Under a dummy admin user account, create an Ad Hoc Report named “Importing Recruiting Data from SFSF”.

## Context

#### Note

If the client uses more than one template, create multiple versions of this report and alter the report name to specify which report refers to template A.

## Procedure

1. Define the following fields as columns from the *Application* folder:
  - Application ID
  - Application Status
  - Application Template ID
  - First Name
  - Last Name
  - Gender
  - Date of Birth
  - Any other application fields the client has mapped to SAP
2. Define the following fields as columns from the *Last Offer Details* folder:
  - Start Date
  - Any other offer detail fields the client has mapped to SAP
3. Define the following fields as columns from the *Requisition* folder:
  - All the requisition fields the client has mapped to SAP
  - SAP Position ID
4. Define the following fields as filters, with the specified filter criteria from the *Application* folder
  - Application Status = SendToSAP
  - Template ID = whatever template ID is being used

## 23.7.4 Integration of Recruiting with Third Party HRIS

### 23.7.4.1 Pre-Built New Hire Export

SuccessFactors Recruiting Management includes a prebuilt new hire export capability.

Because of the limitations of this prebuilt export, most clients don't choose to use this method.

### 23.7.4.2 Configuring the Export of Ad Hoc Reports for New Hires

The majority of third-party HRIS clients use an Ad Hoc Report defined to their specifications to facilitate new hire processing.

#### Prerequisites

- You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- Recruiting Management is fully configured.
- Set up an SF or client-owned FTP site, with secure username and password.
- All the necessary fields are configured and planned for as part of the Requisition, Application, and Offer Details XML templates and data collection in the recruiting process.

#### Procedure

1. Navigate to ► [Provisioning](#) ► [Company Settings](#) ► [Ad Hoc Report Builder](#) ►
2. Under a dummy admin user account, create an Ad Hoc Report.
3. Configure the columns based on what your client wants.

The client must specify the data that their HRIS requires to process a new hire.

4. Configure the filters your client wants to use.

Clients can choose any approach to filtering, such as filtering on a selected list of applicant statuses, which would use a process flow such as the following:

1. Recruiting user places the applicant in a filtered status.

2. The applicant is left in this status for the appropriate duration necessary to ensure the scheduled report runs.
3. The scheduled report runs and exports the data to the FTP site.
4. The HRIS picks up the file from the FTP site and processes the new hire.
5. A recruiting user changes the applicant's status to a status that isn't included in the filter.
6. The next run of the report no longer includes that applicant.

There's no variable date filter option such as "Today" or "Last 24 hours" or "Last 7 days", so all new hire export filtering must be done on current status or field data. This also means that the data needs to be maintained in order to eliminate the applicant from the export after processing.

Alternatively, you can set up an export to continuously add new hires as part of a running total of hires, and the HRIS can be made responsible to filter out applicants who were previously received and processed. This has the advantage of reducing post-processing data maintenance for the recruiting user, but does require additional work on the HRIS side.

5. Navigate to ► [Provisioning](#) ► [Managing Job Scheduler](#) ► [Manage Scheduled Jobs](#) ► [Create New Job](#) ► and provide the following information:
  - Choose the job type [Ad Hoc Reports Export](#).
  - Choose Report I.D. [Select the User/Report](#).
  - Check [File Available in FTP](#).
  - Enter the Server Access details for your client.
  - Enter the File Access options for your client.
  - Enter the Job Occurrence & Notification options for your client.
6. Click [Save](#), then [Submit](#).

## Related Information

### 23.7.4.3 Web Services Integration

New Hires can be extracted and processed using custom web services integration, if necessary .

For more information, please consult the Professional Services Web Services expert team.

## 23.8 Intelligent Services Center

The Intelligent Services Center enables you to easily set up and monitor Intelligent Services. As an HR analyst or an IT or HR administrator, you can use it to model your business processes for Intelligent Services.

Publisher and subscriber activities are referred to as Flows. In general, you can only turn preconfigured activities on or off, but activities that run on the Intelligent Services Center framework can be configured using business rules and timing options.

You can configure, customize, and monitor Intelligent Services events that include:

- Publisher details
- Subscriber actions and notifications
- External Event Connector
- Integrations created through the Integration Center
- Event monitoring

### Related Information

[Implementing and Managing Intelligent Services](#)

### 23.8.1 Events Subscribed to by Recruiting

#### 23.8.1.1 Requisitions Reassigned During Employee Short-Term Disability

If a recruiter, hiring manager, or any other Recruiting user is unable to work for a short period of time, you can assign all their requisitions to another user so that those requisitions continue to be processed.

You can specify the requisitions to be automatically reassigned to the employee's next-level manager, or to another designated user. Associated To-Dos will also be reassigned, and email and web notifications are sent.

##### Note

You can configure the Employee Short-Term Disability Event using either the Event Center or Intelligent Services Center. We recommend that you use the Intelligent Services Center.

### Related Information

[Implementing and Managing Intelligent Services](#)

## 23.8.1.1.1 Subscribing to the Employee Short-Term Disability Event

Subscribe to the *Employee Short-Term Disability* event so that the job requisitions affected by the employee's absence continue to be processed.

### Procedure

1. Go to ► *Admin Center* ► *Intelligent Services Center* ►.
2. Choose the *Employee Short Term Disability* event.
3. Choose *Recruiting* and select **On** to subscribe to this event.
4. Choose *Save*.

## 23.8.1.1.2 Configuring the Processing Behavior for Short-Term Disability

Specify the number of days before an event's effective date that it can be preprocessed.

### Procedure

1. Go to ► *Admin Center* ► *Intelligent Services Center* ►.
2. Choose the *Employee Short Term Disability* event.
3. Choose *Recruiting* and select the *Allow processing of event* checkbox.
4. Specify the relevant number of days in the empty field in the same line.
5. Click *Save*.

### 23.8.1.1.3 Configuring the Duration of Employee Short-Term Disability

You can configure the duration of a short-term disability event in days, after which the related events are processed.

#### Procedure

1. Go to ► [Admin Center](#) ► [Intelligent Services Center](#) ►.
2. Choose [Employee Short Term Disability](#) event.
3. Choose [Recruiting](#).
4. Choose [Configure Recruiting Subscriber Settings for Requisition Reassignment](#).

The [Manage Recruiting Settings](#) page is displayed.

5. Specify the relevant number of days under [Process this event if the duration of the Short Term Disability is \\_\\_\\_ or more days](#).
6. Choose [Save](#).

### 23.8.1.1.4 Reassigning Requisitions to the Next Level Manager or a Designated User

For any requisition templates, you can configure which operators will be reassigned to an employee's next level manager (or to some other designated user) during a short-term disability absence.

#### Procedure

1. Go to ► [Admin Center](#) ► ► [Reassign Job Requisitions](#) ►.
2. From the [Select Template](#) dropdown, select the template that you want to modify.
3. Select the requisitions that you want to reassign and click [Continue](#).
4. Click the [Find user](#) link next to the operator you want to reassign.
5. In the [Find User](#) dialog box, search and select the desired user and click [Done](#).
6. Click [Reassign](#).

## 23.8.1.1.5 Enabling Notifications for Employee Short-Term Disability

Enable or disable web notifications for the employee short-term disability event.

### Procedure

1. Go to ► [Admin Center](#) ► [Intelligent Services Center](#) ►.
2. Choose the [Employee Short Term Disability](#) event and go to the [Notifications](#) tab.
3. In the [Recruiting](#) section, enable [Web Notification](#) for [Assigned User notification](#), [Manager notification](#), and [User notification](#).

#### Note

Email notifications are sent by default. You can't turn off these notifications.

4. Choose [Save](#).

## 23.8.1.2 Requisitions Reassigned During Employee Long-Term Disability

If a recruiter, hiring manager, or any other Recruiting user is unable to work for a long period of time, you can assign all their requisitions to another user so that those requisitions can continue to be processed.

You can specify the requisitions to be automatically reassigned to the employee's next-level manager, or to another designated user. Associated To-Dos are reassigned, and email and web notifications are sent.

#### Note

You can configure the Employee Short-Term Disability Event using either the Event Center or Intelligent Services Center. You should always use the Intelligent Services Center.

### Related Information

[Implementing and Managing Intelligent Services](#)

## 23.8.1.2.1 Subscribing to the Employee Long-Term Disability Event

Subscribe to the *Employee Long-Term Disability* event so that the job requisitions affected by the employee's absence continue to be processed.

### Procedure

1. Go to ► *Admin Center* ► *Intelligent Services Center* ►.
2. Select the *Employee Long Term Disability* event.
3. Choose *Recruiting* and select **On** to subscribe to this event.
4. Choose *Save*.

## 23.8.1.2.2 Configuring the Processing Behavior for Long-Term Disability

Indicate the number of days before an event's effective data that it can be preprocessed.

### Procedure

1. Go to ► *Admin Center* ► *Intelligent Services Center* ►.
2. Choose the *Employee Long Term Disability* event.
3. Choose *Recruiting* and select the *Allow processing of event* checkbox.
4. Specify the relevant number of days in the empty field in the same line.
5. Choose *Save*.

### 23.8.1.2.3 Configuring the Duration of Employee Long-Term Disability

Configure the duration of a long-term disability event in days, after which the related events are processed.

#### Procedure

1. Go to ► [Admin Center](#) ► [Intelligent Services Center](#) ►.
2. Choose the [Employee Long Term Disability](#) event.
3. Choose [Recruiting](#).
4. Click the [Configure Recruiting Subscriber Settings for Requisition Reassignment](#) link.  
The [Manage Recruiting Settings](#) page is displayed.
5. Specify the relevant number of days under [Process this event if the duration of the Long Term Disability is \\_\\_\\_ or more days](#).
6. Choose [Save](#).

### 23.8.1.2.4 Reassigning Requisitions to the Next Level Manager or a Designated User

For any requisition templates, you can configure which operators will be reassigned to an employee's next level manager (or to some other designated user) during a long-term disability absence.

#### Procedure

1. Go to ► [Admin Center](#) ► [Reassign Job Requisitions](#) ►.
2. From the [Select Template](#) dropdown, select the template that you want to modify.
3. Select the requisitions that you want to reassign, and click [Continue](#).
4. Click the [Find user](#) link next to the operator you want to reassign.
5. In the [Find User](#) dialog box, search for and select the desired user, and choose [Done](#).
6. Choose [Reassign](#).

## 23.8.1.2.5 Enabling Notifications for Employee Long-Term Disability

Enable or disable web notifications for the Employee Long-Term Disability event.

### Procedure

1. Go to ► [Admin Center](#) ► [Intelligent Services Center](#) ►.
2. Choose the [Employee Long Term Disability](#) event.
3. On the [Notifications](#) tab, go to the [Recruiting](#) section.
4. Enable [Web Notification](#) for [Assigned User notification](#), [Manager notification](#), and [User notification](#).

#### Note

Email notifications are sent by default. You can't turn off these notifications .

5. Choose [Save](#).

## 23.8.1.3 Subscribing Recruiting to the Employment Termination Event

The Employment Termination event enables you to reassign job requisitions and related notifications for the current assignee, a new assignee, and their manager, when an employment is terminated. Subscribe to this event to receive automatic updates in Recruiting.

### Prerequisites

Your instance has been integrated with Employee Central.

### Context

When the Employee Central event [Employee Termination](#) or [Expiration of Work Order](#) is triggered, the Recruiting module updates the Candidate Profile with details of the user's assignment. You can reassign activities for the Hiring Manager, Recruiting, or Recruiting Manager.

## Procedure

1. Go to ► [Admin Center](#) ► [Intelligent Services Center](#) ►.
2. Choose the [Employee Termination](#) event.
3. Under [Activities](#), select [Recruiting](#).
4. Choose [Reassign Requisitions and To-dos for Requisitions](#).

A new flow rule is created. When you click the newly created flow rule, you can configure the web notifications.

5. Go to [Configuration Options](#).

The [Manage Recruiting Settings](#) page is displayed.

6. Go to ► [Recruiting Subscriber Settings](#) ► [Employee Termination](#) ►.
7. Select the desired requisition template, then select the roles you'd like to reassign activities for.

### → Tip

You can reassign activities to either the next level manager or to a specific user.

## 23.8.1.4 Add Global Assignment and End Global Assignment

When an employee goes on global assignment, you can reassign all their open requisitions. When they return,

### Add Global Assignment

When an employee goes on global assignment, the [Add Global Assignment](#) event is triggered. At that point, if an employee is a recruiter, hiring manager, or any other operator (that affects requisitions), all their open requisitions are reassigned. You can specify whether they'll be reassigned to the employee's next level manager or to a specific user.

### End Global Assignment

When the employee comes back from global assignment, the [End Global Assignment](#) event is triggered and those workflow changes are reversed.

When the global assignment ends, the corresponding event is triggered and the workflow changes are initiated. The reassignment of any open requisitions, where the employee is a recruiter, hiring manager, or any other operator, is stopped.

### 📘 Note

Only requisitions in the [Approved](#) and [Pre-approved](#) statuses are reassigned. Requisitions in the [Closed](#) status are ignored.

## 23.8.1.4.1 Configuring Global Assignment Events with Recruiting

Configure the way in which an employee's open requisitions will be reassigned when they go on global assignment.

### Prerequisites

- Recruiting is an active subscriber to the Intelligent Services events [Add Global Assignment](#) and [End Global Assignment](#).
- You've enabled the subscription option in Intelligent Services.

### Procedure

1. Go to ► [Admin Center](#) ► [Intelligent Services Center](#) ►.
2. Select the [Add Global Assignment](#) event.

The [Add Global Assignment](#) page is displayed.

3. Display the [Configuration Options](#) and [Add Rule](#) features. Go to the [Reassign Requisitions and To-Dos for Requisitions](#) activity and click the icon.
4. Select [Configuration Options](#) to continue configuring Global Assignment for an employee.

#### → Remember

You can also choose to add rules for global assignment events. To add rules, select the [Add Rule](#) option.

The [Manage Recruiting Settings](#) page is displayed.

5. Go to ► [Manage Recruiting Settings](#) ► [Recruiting Subscriber Settings](#) ► [Add Global Assignment](#) ► and select a requisition template from the [Select template](#) dropdown.
6. Reassign the activity to the next-level manager. Select the checkbox for each of the three available users, [Hiring Manager](#), [Recruiter](#), and [Recruiting Manager](#).

Alternatively, specify another designated user in the text box.

7. Choose [Save](#).
8. Go to ► [Manage Recruiting Settings](#) ► [Recruiting Subscriber Settings](#) ► [End Global Assignment](#) ► select a requisition template from the [Select template](#) dropdown.
9. Choose [Save](#).

## 23.8.2 Recruiting Events for Intelligent Services

Here's a list of all the Intelligent Services events published by Recruiting, with the corresponding SAP SuccessFactors applications that subscribe to them.

Recruiting Events with Subscribers That Publish Externally

| Event Name                       | Subscribers                      | Description                                                                                   |
|----------------------------------|----------------------------------|-----------------------------------------------------------------------------------------------|
| Update of Job Requisition        | Onboarding                       | This event is raised when a job requisition is updated.                                       |
| Update of Job Application        | Onboarding                       | This event is raised when an application is updated and the applicant is in an applied state. |
| Approval of Offer Detail         | Onboarding                       | This event is raised after the final approval step on an offer detail.                        |
| Update of Job Application Status | None                             | This event is raised when an application status is changed.                                   |
| Update of Candidate Profile      | None                             | This event is raised when update is made to candidate profile.                                |
| Initiate Job Posting             | Automated Job Posting Subscriber | This event is raised when jobs are posted to the external career site.                        |

### 23.8.2.1 Triggers for Update of Candidate Profile Event

This [Candidate Profile](#) event is raised whenever an update is made to the Candidate Profile. Here are the actions that count as updates and that then raise the event.

#### Scenario 1

If Employee Central integration is enabled:

- Posting a Job Requisition with one job application status set to [Hireable](#).
- Moving a candidate to the [Hireable](#) status.
- Going to [Manage Pending Hires](#) and clicking [Hire](#) or [Internal Hire](#).

#### Scenario 2

- Converting an external candidate into an internal candidate through the [External To Internal Candidate Profile Conversion](#) job.

- Triggering an event for the internal and external candidate.
- Deleting the candidate object of the internal candidate, while the candidate object of the original or external candidate remains.

### Scenario 3

- Converting an internal candidate into an external candidate through the [\*Internal To External Candidate Profile Conversion\*](#) job.
- Triggering an event for the internal and external candidate.
- Deleting the candidate object of the external candidate and the candidate object of the original or the internal candidate remains.

# 24 Mass Data Imports to SAP SuccessFactors Recruiting

There are several ways to mass import data into SAP SuccessFactors Recruiting.

## Know Before You Start

- **Recruiting Data Migration**  
Use the Recruiting data migration tool to import data about job requisitions, job applications, and candidate profiles.
- **Integration Center**  
Use Integration Center to import data about job requisitions, job applications, and candidate profiles.
- **Mass import of candidate profile data**  
You can import candidate profile data with a CSV file and bulk upload multiple resumes at once. Many customers do this as part of the candidate relationship management process, when they've gathered profile information offline, such as at a career fair.

## Leading Practices

- Customer is responsible for the data mapping for data imports, as they are generally more familiar with the data.
- Internal candidates generally aren't included in Recruiting imports because information about them is already stored in the employee profile or Employee Central.
- The Legacy Mass Migration has a limit on the number of files that can be processed per day. If you have a lot of files, it may be better to use Integration Center instead.
- After you complete a Legacy Data Migration, request to have the instance indexed.
- Only use Legacy Data Migration for mass data loads, not for daily processing.

## Related Information

## 24.1 Recruiting Data Migration

If you're a new customer and are migrating Recruiting data from a different Applicant Tracking System, the implementation project might require you to migrate data from their legacy tool into SAP SuccessFactors. You migrate such data through CSV flat file imports.

Data migration involves significant effort from both you and the Professional Services, and therefore has an associated cost. The import files need to be manually created by the Professional Services representative using the final signed-off XML configuration for the instance. For this reason, data migration projects can't begin until after the client accepts their configuration.

Requisitions, candidates (profile, background element attachments, and tags), and applications (records and attachments) can be imported.

### Some other things to keep in mind:

- Flat file data imports can only be done as part of data migration with assistance from your implementation consultant. This isn't supported as an ongoing process.
- Only external candidates can be imported. Internal candidate imports aren't supported.
- Special characters aren't supported in the file name for the resume.
- Data migration imports can only create records. It isn't possible to update or delete records using a data migration import.
- Applications can only be imported when the related requisitions and candidates were also imported. It isn't possible to import applications against requisitions manually created in the UI, by the SFAPI, or Odata.
- When importing Employee Profile data, the overwrite feature doesn't apply the candidate profile background elements after the candidate profile has been manually updated. This is due to the way the data is stored when background elements are sm-mapped between the employee and candidate profiles. If an employee profile data import is completed more than once, the additional imports could cause the background elements to be duplicated in the candidate profile.

### Note

- Ensure that the cost is included in the Schedule A before undertaking any data migration work.
- Ensure that the client has signed off on instance configuration, and that no additional configuration change is planned.

### Note

Importing more than 5000 lines of data in a single job can result in unstable behavior. Split the import jobs accordingly.

## 24.1.1 Prerequisites for Importing Recruiting Data

Before you start importing Recruiting data, ensure you've done the following.

### Job Requisition Import

- All Job Requisition templates have been configured and loaded in the instance. A valid [templateId](#) has been mentioned, and the originator has the permission to create forms.
- The [JobReqGuid](#) is unique.
- For all open (approved) and closed Job Requisitions, a one-step default route map has been used and [Step\\_User](#) has been set as the originator.
- For an unapproved Job Requisition, if no route map is attached to the template, they must be imported with the default one-step route map. These Job Requisitions must be the first step of the route map.
- A valid SAP SuccessFactors user ID has been configured in the CSV file.
- The header row value matches the field ID in the Job Requisition template.
- All picklists have been configured and loaded in the instance. Cascading picklist management must be handled for nested picklist support.
- All the required fields in the configured template have been assigned a CSV field value.
- For filter fields, the field label and picklist ID have been configured in [Career Site Search](#) settings in [Provisioning](#).
- For the enum standard field [Currency](#), valid currency codes have been given. If the value is empty, then the default value configured in the template will be used. For valid currency codes, refer to **currencyTable** in `CompCurrencyBean.java`.
- For the enum standard field [stateProvince](#), the CSV field values are available for all required fields in the template. The value must map to the file in the path `content/Recruiting_Country_States.txt`. For example, for Illinois, [stateProvince](#) must be US-IL in CSV file.
- For the text standard field [function](#), the eQuest function name has been mapped to the file in the path `content/jobFunction.csv`.

### Candidate Import

- The primary email field is unique.
- The attachment has been placed in the same location as the CSV file.
- The CSV file contains the [contactEmail](#) field. This is necessary in case users forget their passwords, as the password reminder will be sent to the email address in that field.

### Candidate Background Import

- The primary email field is unique.
- The attachment has been placed in the same location as the CSV file.

- The [CandidateId](#) (primary email) field contains the current primary email address of the candidate, and is the first column in the CSV file.
- The header for second column is one of the following:
  - outsideWorkExperience
  - education
  - languages
  - certificates
  - positionOfInterest
- The first two columns are static and can't be shuffled.
- There are no internal candidates in the list. Recruiting data migration doesn't support internal candidate import.

## Candidate Attachment Import

- The primary email field contains the current primary email address of the candidate.
- The attachments are stored in the same location as the CSV file.
- The [fieldId](#) field is either [coverLetter](#) or [candidateHistory](#).
- The [Primary email](#), [fieldId](#), and [filePath](#) fields are all mandatory.

## Candidate Tag Definition Import

- The combination of the [Tag](#) and [tagLocale](#) fields is unique.
- The [tagLocale](#) field is in the format xx\_XX (for example, en\_US).
- The [user ID](#) field contains an existing user ID.
- The fields [Tag](#), [user ID](#), and [tagLocale](#) are mandatory.

## Candidate Tag Assignment Import

- The [candidateEmailAddress](#), [tag](#), and [user ID](#) fields already exist in the database.
- The combination of the [candidateEmailAddress](#), [tag](#), and [tagLocale](#) fields is unique.
- The [tagLocale](#) field is in the format xx\_XX (for example, en\_US).
- The fields [candidateEmailAddress](#), [tag](#), [tagLocale](#), and [user ID](#) in the Candidate Tag Assignment CSV have been set as mandatory.
- If the [Tag](#) field is a favorite, the combination of the fields [candidateEmailAddress](#), [tag](#), [tagLocale](#), and [user ID](#) must be unique.

## Application Import

- The *JobAppGUID* field is unique.
- The *JobReqGUID* field contains the *JobReqGUID* of the job for which the application is imported.
- The candidate email address field contains the email address of the candidate for whom the Job Applications are imported.
- The combination of *JobReqGUID* and *Candidate Email* must be unique. This is to ensure that the same candidate can apply for a job only once.
- The job (*JobReqGUID*) used for application import is an open job, and either or both of the fields, *intranet* or *corporate posting* are set to "true".

## Application Attachment Import

- The *Uploaded by* field contains the user ID, **not** the username.

### Note

This field is only required if the attachment field in the template is public.

- The *JobAppGUID* is the *JobAppGUID* of the existing application.
- The *FieldID* is one of the *resumes*, *coverLetter*, or the *fieldID* of a *multiattachment* or *multitattachmentSelection* field defined in the Job Application template.

## Related Information

[Importing Recruiting Data with a Scheduled Job \[page 1398\]](#)

## 24.1.2 Importing Recruiting Data with a Scheduled Job

Import Recruiting data with a scheduled job.

## Prerequisites

- You have access to Provisioning.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- You've set up an SAP SuccessFactors or client-owned FTP site with secure username and password.
- You've created a CSV file containing all the data to be imported.

## Procedure

1. Upload your CSV file containing data and attachments (if any) to your FTP path.
2. Log on to Provisioning.
3. Select your company from the [Company Name](#) column.
4. In the [Managing Job Scheduler](#) section, select [Manage Scheduled Jobs](#).
5. Click [Create New Job](#) in the [Manage Scheduled Jobs](#) page.
6. In the [Create New Job](#) page, enter the following details:
  - Job Name
  - Job Owner
  - Job Type
    - For requisition job type, select [Job Requisition Import](#) from the dropdown list.
    - For candidate job type, select [Candidate Import](#) from the dropdown list.

You can select one of the following candidate job types depending on your requirements:

| Candidate job type               | Description                                                               |
|----------------------------------|---------------------------------------------------------------------------|
| Candidate Profile Information    | For importing candidate profile-related information.                      |
| Candidate Background Information | For importing an existing candidate background information.               |
| Candidate Attachments            | For handling all attachments other than resume for an existing candidate. |
| Candidate Tag Definitions        | For importing candidate-specific tags.                                    |
| Candidate Tag Assignments        | For assigning candidates to defined candidate tags.                       |

- For application job type, select [Application Import](#) from the dropdown list.
- You can select one of the following application job types, depending on your requirements:

| Application job type          | Description                                                   |
|-------------------------------|---------------------------------------------------------------|
| Application Import            | For importing job applications of existing candidates.        |
| Application Attachment Import | For handling all attachments for an existing job application. |

7. In the [Server Access](#) section, enter the following details:
  - Host Address
  - FTP Login
  - FTP Password
8. Click [Test Connection](#).

9. Click [Create Job](#).
10. To execute the job, choose [Run It Now](#).

## Results

You have imported recruiting data to your system.

## Related Information

[Scheduling Jobs](#)

### 24.1.3 Templates for Migrating Recruiting Data

When migrating your Recruiting data, we recommend that you use an Excel template with standard labels and validations that always ensure you input clean data.

- The date format should be YYYY-MM-DDThh:mm:ss, and the capital letter "T" should be included between the date and time. For example, [2012-04-01T00:00:00](#).
- Date/time values are stored in the server date/time. For example, let's say your instance is hosted in the US East Coast data center. In order to accurately reflect a last logon date/time of January 1 2010 at 8:00 AM Pacific Time, the value imported will use 2010-01-01T11:00:00.
- Picklist fields use the picklist label value of the locale specified in the import job. The system looks up the appropriate picklist option ID based on this label, and then stores the ID internally for proper multilingual handling.

#### Note

If a picklist value isn't found in the list of picklist definitions, it generates an error that will cause fails the record.

- Parent-child picklist values are validated during the import, and any mismatch in the values will cause the import to fail.
- The data in the file must be from a single locale. Different locales require different files.
- When importing objects that have multiple templates available in the system (such as job requisitions and applications), each import file should include the data for one template.
- Operator fields use the user ID (not the username) of the account.
- The [operatorTeam](#) fields are not supported in the data migration import.
- Fields of type `jobCode` are not supported in the data migration import. Nor do the values automatically populate from the job classification Foundation Object.
- Candidates don't receive any email notifications as a result of data migration imports.
- Imported attachments appear as a [Candidate History Document](#) link.

Refer to [SAP Note 2341614 - Legacy Data Migration - Importing Candidates, Requisitions, Applications via Provisioning - Recruiting Management](#) for more information about data migration.

### 24.1.3.1 Requisition Fields for Data Migration

The Job Requisition fields contained in the template for migrating Recruiting data.

| <i>Required field</i> | <i>Sample data</i>  | <i>Description</i>                                                                                                                                                                                                                                                                                                                  |
|-----------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JobReqGuid            | Test1_201202061316  | Enter a unique ID. We recommend that you include the exact date and time (_130416_1301) in the legacy requisition ID to ensure a unique ID number.                                                                                                                                                                                  |
| jobReqTemplateId      | 302                 | This is the template ID number assigned to the Requisition XML template in Provisioning when you import the Requisition XML.                                                                                                                                                                                                        |
| jobReqLocale          | en_US               | Requisitions can only be imported in a single language. This field shows the default locale of the requisition. It essentially populates the defaultLanguage field in the requisition. <div><b>Note</b><br/>This field needs to match the <a href="#">Supported Locale</a> in the Job Parameters in the Quartz Scheduled Job.</div> |
| templateType          | JOB_REQ             | Always use JOB_REQ. This corresponds to the value in the XML header: <code>job-req-template type="jobReq"</code>                                                                                                                                                                                                                    |
| lastUpdatedDate       | 2012-04-01T00:00:00 | Ensure the date format is YYYY-MM-DDThh:mm:ss, and the capital letter "T" is included between the date and time, as shown.<br><br>This date will be displayed in several places on the UI. It might be the "last updated" date from the legacy system, or the date of the import.                                                   |

| <i>Required field</i> | <i>Sample data</i>  | <i>Description</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### 24.1.3.3 Candidate Attachments for Data Migration

Resume can be imported as part of the Profile import. This is required only if you're importing additional documents.

The following file types are supported: CSV, DOC, DOCX, GIF, JPEG, JPG, PDF, and TXT.

| Required field | Sample data                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### 24.1.3.4 Candidate Tag Definitions for Data Migration

You can load this file even if you haven't purchased data migration. This sets up the library of tags used for the type-ahead when end users are tagging candidates.

This file must be loaded before loading the Candidate Tags file that is part of a data migration import.

| Required field | Sample data         | Description                                                                                                                                                                                                                                                                                                                                                    |
|----------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag            | Great engineer      | The text for the tag. Capitalization matters.                                                                                                                                                                                                                                                                                                                  |
| tagLocale      | en_US               | <p>Multiple tag definition files can be loaded, but each file can have tags from only one locale.</p> <p>This field specifies under which locales are these tags appear during the type-ahead when an end user tags a candidate.</p> <p>Match the selected <a href="#">Supported Locale</a> in the Job Parameters in the Quartz Scheduled Job upon import.</p> |
| dateCreated    | 2012-03-29T00:00:00 | Date format must be YYYY-MM-DDThh:mm:ss and the capital letter T has to be included between the date and time, as shown.                                                                                                                                                                                                                                       |
| userID         | P132345             | User ID of the user to whom the original creation of the tag has to be attributed. Currently, this doesn't appear anywhere on the UI.                                                                                                                                                                                                                          |
| assignmentID   | P132345             | Assignment ID of the user to whom the original creation of the tag is attributed. You can use Assignment ID instead of user ID while importing the candidate tag definitions.                                                                                                                                                                                  |

## 24.1.3.5 Candidate Tag Assignments for Data Migration

Candidate Profiles and Tag Definitions must be loaded before tags are loaded.

| Required field | Sample data         | Description                                                                                                                                                                                                                                                                                                                       |
|----------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| userID         | P132345             | User ID of the user to whom the original creation of the tag has to be attributed. Currently, this doesn't appear anywhere on the user interface.                                                                                                                                                                                                                                                         |
| assignmentID   | P132345             | Assignment ID of the user to whom the original creation of the tag has to be attributed. You can use Assignment ID instead of user ID while importing the candidate tag assignments.                                                                                                                                                                                                                      |
| dateAssigned   | 2012-04-01T00:00:00 | Date format must be YYYY-MM-DDThh:mm:ss and the capital letter T must be included between the date and time, as shown.                                                                                                                                                                                                                                                                                    |

### 24.1.3.6 Application Import for Data Migration

You can only import applications against system imported job requisitions and candidate profiles.

| Required field | Sample data                                 | Description                                                                                                                                                                                                                                                        |
|----------------|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JobAppGuid     | Test1- mylogin@example.com<br>_201202061316 | <p>Make up a unique ID. Recommended to combine the application unique ID and the requisition unique ID to ensure a truly unique ID.</p> <p>Recommended to append the exact date/time (_130416_1301) to the legacy requisition ID to ensure a unique ID number.</p> |

| Required field        | Sample data         | Description                                                                                                                                                                                                                                                                                                                        |
|-----------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JobReqGuid            | Test1_201202061316  | Use the made-up unique ID used on the requisition import file in the JobReqGuid column.                                                                                                                                                                                                                                            |
| candidateEmailAddress | mylogin@example.com | <div>  <b>Caution</b><br/> Don't enter real email addresses in test systems. </div> <p>Use the primaryEmail value used on the candidate profile import file.</p>                                                                                |
| jobAppLocale          | en_US               | <p>Requisitions can only be imported in a single language. This field ID captures the default locale of the requisition. This essentially populates the <i>defaultLanguage</i> field in the requisition.</p> <p>Must match the selected <i>Supported Locale</i> in the Job Parameters in the Quartz Scheduled Job upon import.</p> |
| internalstatusId      | open                | Import applications as open. The open/close feature on applicants is legacy. Use disqualification statuses instead of closed state on applicants today.                                                                                                                                                                            |
| statusItem            | Interview           | Status name (not internal status label) of the applicant status in which the applicant should be imported.                                                                                                                                                                                                                         |
| applicationDate       | 2012-04-01T00:00:00 | <p>Date format must be YYYY-MM-DDThh:mm:ss and the capital letter T must be included between the date and time, as shown.</p> <p>This is the Date Applied.</p>                                                                                                                                                                     |
| lastModified          | 2012-04-01T00:00:00 | <p>Date format must be YYYY-MM-DDThh:mm:ss and the capital letter T must be included between the date and time, as shown.</p> <p>This is the Last Modified date.</p>                                                                                                                                                               |

| Required field | Sample data                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resume         | resume.doc<br>Julie_Armstrong/resume.doc | <p>Resume file name, including extension. Import this even if the resume was already imported on the profile, or the resume field on the application doesn't contain a document.</p> <p>If the resume is placed in the same folder as the import file, you don't have to specify the folder name (first sample data).</p> <p>If the resume is placed in a subfolder of the folder containing the import file, you have to specify the folder name.</p> <div>  <b>Note</b><br/>           Ensure that the direction of the slash is correct (forward slash).         </div> |

#### → Tip

- If you import applications post go-live, it's possible to have applications with an older application\_date, but a higher applicationId. This can cause difficulties when trying to find a candidate's most recent application.
- All of the Required Fields listed in the table must be set to `public="true"`.

## 24.1.3.7 Application Attachments for Data Migration

If you're importing additional documents, resume has to be uploaded through [Application Attachments](#) import job.

The following image file types are supported: GIF, JPG, JPEG, BMP.

| Required field | Sample data                               | Description                                                                                                                                      |
|----------------|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| jobAppGuid     | Test1- mylogin@email.com<br>_201202061316 | Use the jobAppGuid loaded on the application information to form an association to the record that has to receive the attachment being imported. |
| fieldId        | extraAttachments                          | Specify the candidate profile field to which this document has to be attached.                                                                   |

| Required field         | Sample data                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uploadedBy             | <no value>                                          | <p>Use this field to provide the UserSysId of the uploadedBy user. This field heading must be included in the import file, but the value has to be left blank. If this field contains a value, the import fails with an error.</p> <p><b>Sample error:</b> Invalid uploadBy user for jobAppGuld xxxxx and UserId xxxxx, this record is skipped null for the Record #: 1</p>                                                   |
| uploadedByAssignmentID | <no value>                                          | <p>The uploadedByAssignmentID field is used to provide assignment ID of the user. You can use Assignment ID instead of user ID while importing the application attachments.</p>                                                                                                                                                                                                                                               |
| filePath               | <p>resume.doc</p> <p>Julie_Armstrong/resume.doc</p> | <p>Attachment file name, including extension.</p> <p>If the resume is placed in the same folder as the import file, you don't have to specify the folder name (first sample data).</p> <p>If the resume is placed in a subfolder of the folder containing the import file, you have to specify the folder name.</p> <div> <p><b>Note</b></p> <p>Ensure that the direction of the slash is correct (forward slash).</p> </div> |

## 24.1.4 Migrating the Recruiting Data

Migrate the Recruiting data to SAP SuccessFactors.

### Prerequisites

You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Context

Migrating data takes time. First you need to gather all the data you need. Then you have to test it. It can easily take several weeks of testing before you have a clean set of data that's ready for import. Finally, you have to carry out the import. Therefore, it's very important to work with the SAP SuccessFactors Operations team well in advance to put together a realistic timeline. Advise your customer that they'll need a plan to redirect candidates while their old system is unavailable.

## Procedure

1. Gather all the data that you want to import, and ensure that it's all correctly formatted. If any data is missing or incorrect, it can cause that row of the import to fail.

### Note

If you currently don't have all the data that will be required for data migration in the future, you can adjust the XML configuration. To do this, just change the **required** attribute to "false". We recommend that you only leave this setting in place temporarily. Once the import is complete, go back and restore the original attribute.

2. Test your data by running mini-imports and checking to make sure that no errors occur. The available jobs are [Candidate Import](#), [Job Requisition Import](#), and [Application Import](#). For initial testing, begin with a few hundred or a few thousand records. Once these go smoothly, you can run the entire load in test. This might take a significant amount of time and resources, so ensure that it's included in the Statement Of Work.

Each record will succeed or fail individually. If you import 100 records where 80 succeed and 20 fail, the 80 successful records will be created in the instance, and you'll only have to retry the remaining 20. However, during validation, the tool stops validating each record based on the first error it finds. That is, if there's a line in the import that has three errors, the import validation finds the first error and fails the record without continuing to check and find the second and third errors. Because of this, you might need multiple attempts to find all the errors in the file.

3. In Provisioning, go to [Manage Scheduled Jobs](#) and set up the Quartz Scheduled Job that will be used to migrate the data. Here are some things to keep in mind:
  - You can specify whether the job should pull data from the SFTP server or from your hosted server. The SFTP server is usually the best option, since if the files have a large number of attachments, loading them from a hosted server might have a negative effect on the import's performance.
  - Don't zip or encrypt the CSV files or any attachments on your SFTP server.
  - We recommend that the CSV files or attachments are all located in the same folder. You can successfully work with the attachments in sub folders, but this often requires extra troubleshooting.
  - The SAP SuccessFactors Operations team doesn't actually load the data, but they might handle some support tasks. For example, they can help ensure there's enough room on the SFTP server, load the data to the SFTP server from a physical storage device (such as a USB drive or external harddrive), and extract attachment files provided in ZIP format. Contact the Operations team for help with any of these tasks.
4. Freeze the data migration environment. Specifically, advise your customer to shut down their legacy system so that no additional data is received and no existing data is changed. Any changes made after the files are supplied to SAP SuccessFactors will not be reflected in the SAP SuccessFactors Recruiting instance.

5. The customer transfers the data to Operations (remember this can be a physical shipping process, so factor in that time) and Operations loads the data onto the servers.

Depending on the size of the data, this can take anywhere from hours to weeks. There's a maximum file size that Operations can unzip and work with. Work with Operations in advance to find out the maximum file size and ensure that they receive the files broken into appropriate sizes. After the data is loaded on the servers, Operations can initiate the import jobs.

## 24.2 Integration Center and Recruiting Management

The Integration Center enables HR business analysts to build, run, schedule, and monitor simple integrations. It simplifies the most common export and import use cases. You can build integrations quickly and easily through a guided workflow. Predefined templates are available, and you can also create your own templates if you want.

You can access the [Integration Center](#) from the [Admin Center](#) where you can build customized file extracts using any data listed in the SAP SuccessFactors OData APIs catalog.

For more information on the prerequisites, the setup that is needed for Integration Center, as well as on the rich functionality this tool offers, refer to the Integration Center guide.

The Integration Center enables users to create integration exports for simple Ad Hoc reporting purposes as well. This proves especially useful for certain use cases not supported by Recruiting Management out-of-the-box.

### Note

The Integration Center is used mostly by administrators. Ensure that you follow the setup instructions in Integration guide to appropriately enable and permission admin users, so that they can access (read) all the data they want to export.

The Integration Center relies on the same data engine as the OData API. In other words, whatever OData API entities and properties are publicly exposed can be used in the Integration Center.

Use the following resources for exploring the OData API model to see what entities and properties are publicly exposed and available to be used, and how they're interrelated:

- [Admin Center](#) > [OData API Data Dictionary](#)  This tool is used for exploring the details about exposed OData API entities and properties, sorted per SAP SuccessFactors module/domain/sub-solution (for example, Recruiting).
- [Admin Center](#) > [Integration Center](#) > [Data Model Navigator](#)  This tool displays the relationships between various OData API Entities. It makes it easier to understand the (publicly available) data model within SAP SuccessFactors.

## 24.2.1 Prerequisites for Creating an Integration Definition

If you want to create an integration definition from scratch, you have to specify the integration type and starting entity in Integration Center. Once you've done that, you can then set up the integration template.

To set up an integration center template and make it compatible with Interview Central, Prescreening Questions, or Background Check with custom vendor, you have to set the tabs that appear on the screen.

### → Tip

If you want to use sample integration export definitions for import rather than creating it from scratch, skip this section and refer to *Importing Export Definition into SAP SuccessFactors*.

## Related Information

[Specifying the Integration Type for Importing Definitions \[page 1416\]](#)

[Selecting the Starting Entity \[page 1417\]](#)

[Downloading and Uploading Export Definitions into SAP SuccessFactors \[page 1418\]](#)

### 24.2.1.1 Specifying the Integration Type for Importing Definitions

When you're importing integration definition from scratch, you have to specify the integration type that's compatible with Interview Central, Prescreening Questions, or Background Check with custom vendor.

## Procedure

1. Go to ► [Admin Center](#) ► [Integration Center](#) ► [My Integrations](#) ►.
2. Select [Create](#), then [More Integration Types](#). The [Choose Integration Type](#) dialog appears.
3. On the [Choose Integration Type](#) dialog, set the [Trigger Type](#), [Destination Type](#), [Source Type](#), and [Format](#).

The following are settings for a sample integration type:

- Trigger Type: Application / UI
- Destination Type: REST
- Source type: SAP SuccessFactors
- Format: JSON (alternatively, you can use XML).

4. Select [Create](#).

## Next Steps

When you're importing an integration definition from scratch, along with defining the integration type, you have to select the starting entity that's compatible with Interview Central, Prescreening Questions, or Background Check with custom vendor. Refer to *Selecting the Starting Entity*.

## Related Information

[Selecting the Starting Entity \[page 1417\]](#)

[Downloading and Uploading Export Definitions into SAP SuccessFactors \[page 1418\]](#)

### 24.2.1.2 Selecting the Starting Entity

When you're importing an integration definition from scratch, along with defining the integration type, you have to select the starting entity that's compatible with Interview Central, Prescreening Questions, or Background Check with custom vendor.

## Procedure

1. Search for the OData API entity.  
For example, `JobApplicationBackgroundCheckRequest`.
2. Choose [Select](#) to confirm.

## Next Steps

Once you're done with defining the integration type and starting entity, you have to specify the integration template by configuring the tabs on Integration Center.

## Related Information

[Specifying the Integration Type for Importing Definitions \[page 1416\]](#)

[Downloading and Uploading Export Definitions into SAP SuccessFactors \[page 1418\]](#)

## 24.2.2 Downloading and Uploading Export Definitions into SAP SuccessFactors

In order to import export definitions into SAP SuccessFactors, you have to identify the file you want to import. Click the appropriate link in the Integration Center tool to find sample integration export definitions.

### Context

Recruiting users with appropriate permissions can easily import sample export definitions. These definitions provide insights into information gathered during the interview process in the Interview Central tool and also into applicants' answers to pre-screening questions (if they're configured as part of the recruiting process in SAP SuccessFactors Recruiting Management). These exports can be adjusted to meet specific needs.

#### Note

If you're creating the integration definition from scratch, skip the first three steps and start configuring the tabs.

#### Caution

For background checks, if you're using an instance where the product is integrated with either First Advantage or Verifications Inc., you can't import the definition into SAP SuccessFactors.

### Procedure

1. Download the export definition.
  - a. Go to [Admin Center](#) > [Integration Center](#) > [My Integrations](#) > [Browse Catalog](#).
  - b. Open the browser and enter <https://api.sap.com> in the address bar, then search for [Background Check](#) and download the files, including the .icd file.
2. Select [My Integrations](#) > [Create](#) > [Import an Integration Definition](#).
3. Browse for the file you want to import, and select [Upload](#).
4. Configure the tabs.
5. Choose one of the following options at the bottom of the screen based on your requirement:

| Option | Description                                                                                                                                                                                                                                                                |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Save   | <a href="#">Save</a> and <a href="#">Save As</a> allow you to save the export definition for later editing.<br><br><a href="#">Download Preview</a> offers you to download a sample flat-file (for example, .CSV). This feature enables quick verifications of the result. |

| Option       | Description                                                                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | <a href="#">Export Integration Specification</a> produces an export definition file (.icd) that can be imported into other SAP SuccessFactors instances. |
| Set Schedule | The system saves the export and runs it according to the schedule defined in the <b>Scheduling</b> portion of the export options.                        |
| Run Now      | Runs the export once. You can find the export in the defined destination location. See information related to <b>Destination Settings</b> tab.           |

### 24.2.2.1 Tabs in Integration Center

The setup screen contains tabs with specific functionalities. Configure these tabs before you save the export definition.

Overview of Integration Center Options

| Tab                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Options</a>          | You can choose the name of the import ( <b>Integration Name</b> ), add a description, and adjust some parameters such as query page size, the number of maximum preview items, output file type, and more.                                                                                                                                                                                                                                                               |
| <a href="#">Configure Fields</a> | <p>This is where the structure of the output file is defined.</p> <p>You can rename existing column headers, remove columns, or add new ones — simply by browsing through all available fields using the Entity Tree View.</p> <p>For background check integration, the structure defined here gets populated with actual data that is then be sent to the background check vendor.</p> <p>Refer to the <i>Integration Center</i> guide for a detailed walk-through.</p> |

| Tab                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Response Fields</a>      | <p>The inbound part of the integration must be defined here. The main purpose is for the background check vendor to confirm the background check request, say by responding with an order number.</p> <p>Refer to the section that talks about configuring response fields tab.</p>                                                                                                                                                                                                                                                                                                                                                                |
| <a href="#">Filter and Sort</a>      | <p>This tab offers useful functionality for limiting the amount of information that is required to display. Advanced Filters allow you to effectively control the end output. For example, when you have to export information on interview central information for one particular applicant.</p> <p>Time-Based Filters offer advanced database-based time filtering.</p> <p>Advanced Sorting allows you to perform sorting in a cascading manner. You can easily display all Application IDs for a particular job requisition before displaying application IDs for the next Requisition. This makes exports convenient for manual reviewing.</p> |
| <a href="#">Destination Settings</a> | <p>On the <a href="#">Destination Settings</a> page, you enter the endpoint or server settings for the destination of the integration. These settings help you send the output of your integration to the specified SFTP server location, a rest service call, or from one ODATA entity to another.</p>                                                                                                                                                                                                                                                                                                                                            |
| <a href="#">Scheduling</a>           | <p>Exports can happen only once or you can easily automate them to run on a daily, weekly, monthly, or yearly basis.</p> <div style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 10px; margin-top: 10px;"> <p><b>⚠ Caution</b></p> <p>For the Background Check with a Custom Vendor functionality, don't configure this tab. The integration is invoked on a scheduled basis, rather upon a recruiting user clicking the Initiate Background Check.</p> </div>                                                                                                                                                                     |
| <a href="#">Review and Run</a>       | <p>This is where the export definition is conveniently summarized on one page for a quick final review.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

[Configuring the Response Fields Tab for Background Checks \[page 1421\]](#)

[Using the Integration Center](#)

## 24.2.2.1.1 Before Configuring Response Fields for Background Checks

Before you configure the [Response Fields](#) tab for background check vendor integration, make sure you've completed all of the following tasks.

- Set up the integration for the **JobApplicationBackgroundCheckRequest** OData API entity. This contains information about the background check request and the request status.
- Ensured that the synchronous REST call, that is used for the background check integration, is composed of the outbound call (defined under the [Configure Fields](#) tab) and a consecutive inbound call (defined in the [Response Fields](#)).
- Ensured that both the outbound and the returning/inbound part of the synchronous REST call use the same **JobApplicationBackgroundCheckRequest** OData API entity as the starting points.
- Ensured that the synchronous inbound call will be executed shortly after the outbound payload is sent. If it isn't, the connection will time out.
- For populating the results of a background check, another OData API entity is used (**JobApplicationBackgroundCheckResult**). To populate it, customer/vendors/partners can use standard OData API calls to manipulate the data in this and all other publicly available entities.
- The synchronous REST integration type, that is used for the Background Check with a custom vendor requires for the starting entity to be the inbound entity, as well (in our case, **JobApplicationBackgroundCheckRequest**). Other entities can be added, as needed. In the inbound payload, the minimum that the vendor has to send into SAP SuccessFactors, are the required fields in the mentioned, mandatory OData API Entity.

## 24.2.2.1.2 Configuring the Response Fields Tab for Background Checks

Use the [Response Fields](#) tab to configure the inbound part of the integration. This enables the background check vendor to confirm the background check request, say by responding with an order number.

### Context

This scenario assume that the background check vendor is sending its response in the JSON format.

In the following steps, you map this incoming JSON message to the fields that are available in SAP SuccessFactors for the background check functionality.

#### 📘 Note

The operation behind the Integration Center is an OData API **upsert**. When this Integration Center template is used with standard Background Check functionality, the **requestId** is created by clicking the [Initiate Background Check](#) button in SAP SuccessFactors Recruiting Management. Make sure that you map the existing **requestId** with the corresponding destination field, as this ensures that the vendor's incoming message is upserted into the correct entity.

## Procedure

1. On the [Response Fields](#) tab, select [Switch to Field Mapping View](#).
2. Select [Upload Sample JSON](#), then select the sample incoming message structure that the background check vendor uses to send the data back to SAP SuccessFactors, and confirm with [Upload](#).
3. Map the [Source Fields](#) with the [Destination Fields](#) by using drag-and-drop.  
Confirm the results are correct in the [Response Preview](#) section.
4. Select [Next](#) to move to the [Filter and Sort](#) tab.

## 24.2.3 Modification to Existing Export Definitions for Integration

After you import a predefined export definition, you can either use it as-is, or you can modify the definitions to better fit your requirements. These modifications can be as simple as renaming column headers. Additionally, SAP SuccessFactors Integration Center offers a variety of powerful functionality that allows recruiting users with appropriate permissions to get even more creative.

[Adding and Removing Columns from Export Definitions \[page 1422\]](#)

You can add or remove columns from the predefined export definition to adapt them to your specific display requirements.

[Adding Columns That Use Complex Calculations \[page 1423\]](#)

You can perform complex calculations (for example, adding a calculated field) for the predefined export definition.

### 24.2.3.1 Adding and Removing Columns from Export Definitions

You can add or remove columns from the predefined export definition to adapt them to your specific display requirements.

## Context

Let's assume that you have to view the current applicant status for all the candidates in this export.

## Procedure

1. Go to ► [Admin Center](#) ► [My Integrations](#) ► and identify the integration you would like to modify and click the pencil icon next to it.
2. Go to ► [Configure Fields](#) ► [Add](#) ► [Add Field](#) ► and select any of the options according to your requirement.

| Option                       | Description                                                                                                                                                                                                                                      |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Add Field</b>             | Allows adding a field directly from the data model.                                                                                                                                                                                              |
| <b>Add Fixed Value Field</b> | Allows adding fixed value fields.                                                                                                                                                                                                                |
| <b>Add Calculated Field</b>  | This option offers functionality to concatenate several values, adjust upper/lower case, truncate and trim whitespaces, split values and so on. for string values and various calculation options for numeric fields, including age calculation. |
| <b>Remove All Fields</b>     | Allows the user to remove all fields at once and start.                                                                                                                                                                                          |

Use Entity Tree View to add a column for the current applicant status for a candidate. This enables you to quickly identify all the possible fields in the related entities.

3. Once you've selected the field that you would like to add, select [Add Association 'Applicant Status Name'](#).  
The column is now added and displayed.
4. To move the column, you can drag-and-drop, say after the name of the applicant.
5. To rename the column, right-click the column header and edit the [Label](#) textbox.
6. To remove the column, select [Remove Field](#) from the displayed menu.

**Task overview:** [Modification to Existing Export Definitions for Integration \[page 1422\]](#)

## Related Information

[Adding Columns That Use Complex Calculations \[page 1423\]](#)

### 24.2.3.2 Adding Columns That Use Complex Calculations

You can perform complex calculations (for example, adding a calculated field) for the predefined export definition.

## Context

These instructions assume that you have to remove the existing Interviewer column, and then re-create it.

## Procedure

1. Add a complex-type field. Go to ► [Admin Center](#) ► [Integration Center](#) ► [My Integrations](#) and identify the integration you would like to modify, and select the pencil icon next to it.
2. In the [Configure Fields](#) tab, select ► [Add](#) ► [Add Calculated Field](#).
3. Enter the label for the new field.

For example, *Interviewer*.

4. Select the [Field Data Type](#) from the dropdown menu.

For example, *String*.

The data type you choose for the field defines the operations that are allowed to perform in calculating the value.

The possible data types are *String* (for text values), *DateTime* (for time and date), and *Numeric* (for numbers).

5. In the [Calculated Value](#) section, choose the icon next to the [Operand](#) field and associate an operand with the field.

For example, *Associate Field*.

6. Enter the field name.

For example, First Name (firstName) in User.

### → Remember

Interviewer is an existing SAP SuccessFactors Recruiting Management user, so be sure that you select the proper entities and navigation routes.

7. Select [Navigation Routes](#) section and make sure you use the correct route. Do the same for [Entity Tree View](#) and [Field Filters](#). Then select [Change Association to "First Name"](#).
8. Follow the same procedure to append the Last Name of the Interviewer (User) and append a blank space in between.
9. To monitor the result, review the Calculation Trace. Once you see the desired result, select *OK*.

## Results

You can see the newly created column with the header *Interviewer* and each row populated with the first and last name of the interviewer. You can drag and drop the column to modify the final view.

**Task overview:** [Modification to Existing Export Definitions for Integration \[page 1422\]](#)

## 24.2.3.2.1 Options for Calculated Fields

Depending on the data type you select when adding a calculated field, several operations are displayed that can be performed on the operands.

| Field Data Type | Operations           |
|-----------------|----------------------|
| String          | Concatenate/Append   |
|                 | To Upper Case        |
|                 | To Lower Case        |
|                 | Truncate             |
|                 | Trim Whitespace      |
|                 | Remove All           |
|                 | Replace All          |
|                 | Prepend Text         |
|                 | Truncate from Left   |
|                 | Truncate from Right  |
|                 | Substring            |
|                 | Split                |
|                 |                      |
| Numeric         | +                    |
|                 | -                    |
|                 | *                    |
|                 | /                    |
|                 | Floor                |
|                 | Plus Age Calculation |
|                 | Plus Date Difference |
|                 |                      |
| DateTime        | Days                 |
|                 | Months               |
|                 | Years                |
|                 | Hours                |

## 24.2.4 Exports on Interview Central

You can import two sample Interview Central export definitions you're provided with by identifying the corresponding .icd-files in the online catalog. After you import the definitions, you can run them and use the end-results (exports) as an integration input into other systems, say, for reporting purposes.

Refer to *SuccessFactors Integration Center – Recruiting Interview Central Export Templates* in the SAP API Business Hub for more information.

### Export on Overall Interview Assessments

List of properties that are included in this out-of-the box export, which can be modified or replaced.

Columns in the Export on Overall Interview Assessment

| Column Name      | Description                                                                     |
|------------------|---------------------------------------------------------------------------------|
| Requisition ID   | Displays the ID of the requisition record.                                      |
| Job Title        | Displays the Job Title from the requisition record.                             |
| Job Location     | Displays the Job Location from the requisition record.                          |
| Application ID   | Displays the Application ID from the application record.                        |
| Applicant Name   | Display the First and Last Name from the application record.                    |
| Applicant Source | An applicant can be either internal or external.                                |
| Interview Date   | Displays the date of the interview.                                             |
| Interviewer      | Displays the First and Last name of the Interviewer.                            |
| Rated?           | Displays <i>Yes</i> , if the applicant was already rated, otherwise <i>No</i> . |
| Average Rating?  | Displays average rating of individual competency ratings of an interviewer.     |
| Overall Rating   | Displays either <i>Positive</i> or <i>Negative</i> .                            |
| Comments         | Displays overall comments of an individual Interviewer.                         |

### Export on Detailed Interview Assessments

List of properties that are included in the Individual Interview Assessment out-of-the box export, which can be modified or replaced.

#### Properties Included in the Detailed Interview Assessment Export

| Column Name       | Description                                                       |
|-------------------|-------------------------------------------------------------------|
| Requisition ID    | Displays the ID of the requisition record.                        |
| Job Title         | Displays the Job Title from the requisition record.               |
| Job Location      | Displays the Job Location from the requisition record.            |
| Application ID    | Displays the Application ID from the application record.          |
| Applicant Name    | Displays the First and Last name from the application record.     |
| Interview Date    | Displays the date of the interview.                               |
| Interviewer       | Displays the First and Last name of the Interviewer.              |
| Competency        | Displays the name of the competency interviewee was rated by.     |
| Competency Rating | Displays applicant's rating for the competency by interviewer.    |
| Comments          | Displays interviewer's comments per competency for the applicant. |

## Related Information

[SuccessFactors Integration Center – Recruiting Interview Central Export Templates](#) 

## 24.2.5 Exports on Answers to Prescreening Question

You can import the sample export definitions for generating integration exports on answers to prescreening questions you're provided with (identify the corresponding .icd-files in the online catalog).

After you import, you can run them and use the export results as an integration input into other systems, say, for reporting purposes.

### Restriction

Currently, it isn't possible to report on prescreening questions and prescreening question responses in the job requisition using Ad Hoc Reporting. Alternatively, you can use Integration Center to report on Prescreening questions. SAP SuccessFactors provides an integration center template to report on this data. To download the template, see the **Related Information** section. This template is a predefined integration export on answers to Prescreening Questions a candidate enters in the application process in SAP SuccessFactors Recruiting Management.

The output file enables advanced recruiting users to extract information such as the list of questions applicants were asked, what applicants answered, what were the expected answers.

The following table provides a list of properties that are included in this out-of-the box export, and which can be modified or replaced.

Columns in the Export on Answers to Prescreening Questions

| Column Name          | Description                                                                      |
|----------------------|----------------------------------------------------------------------------------|
| Requisition ID       | Displays the ID of the requisition record.                                       |
| Job Title            | Displays the job title from the requisition record.                              |
| Job Location         | Displays the job location from the requisition record.                           |
| Application ID       | Displays the application ID from the application record.                         |
| Applicant Name       | An applicant can be either internal or external.                                 |
| Question             | Displays the question text.                                                      |
| Required?            | Displays <b>Yes</b> , if the question requires an answer, otherwise <b>No</b> .  |
| Disqualifier?        | Displays <b>Yes</b> , if the question is a disqualifier, otherwise <b>No</b> .   |
| Adds to Total Score? | Displays <b>Yes</b> , if the answer is scored and adds to the total score.       |
| Points               | (Optional) Displays how many points applicant's answer added to the total score. |
| Expected Answer      | (Optional) Displays the text for the expected answer.                            |
| Answer               | Displays applicant's answer.                                                     |
| Question Type        | Displays the type of the question.                                               |

Refer to *SuccessFactors Integration Center – Recruiting Prescreening Questions Export Templates* in the SAP API Business Hub for more information.

## 24.3 Enabling Role-Based Permissions to Bulk Create Candidate Profiles from a CSV File

You can choose to enable role-based permissions that allow individuals to bulk create candidate profiles using a CSV file.

### Prerequisites

- Consent to marketing emails configured when *Email Campaign* is used.
- Manual candidate creation notifications configured.

### Context

You can enable *Bulk Create Candidates from .CSV File* role-based permission when you select different recruiting marketing e-mail options and by configuring the *Recruiting Manual Candidate Creation Notification*.

### Procedure

1. Go to ► *Admin Center* ► *Manage Recruiting Settings* ► *General Data Privacy Settings* ► and enable the following settings:
  - a. Select *Show the "Consent to Marketing Emails" checkbox on account creation and on the candidate profile*.
  - b. Select *Enable selection of the "Marketing Emails" checkbox by default at account creation*. This setting becomes available when you enable the *"Consent to Marketing Emails"* setting.
  - c. In the dropdown list for *When bulk creating candidates manually using a resume or .CSV file, set "Consent to Marketing Emails" to "Opt-in" for the following countries/regions:*, select which countries/regions you want to opt-in for consent to marketing emails. This dropdown list becomes available when you enable the *"Consent to Marketing Emails"* setting.
2. Save your changes.
3. Go to ► *Admin Center* ► *Recruiting Email Triggers* ►.
4. Select *Recruiting Manual Candidate Creation Notification* from the trigger list.
5. Select *Enable*.
6. Go to *Exclude Candidates From:* and select any countries/regions that you want to exclude from *Manual Candidate Creation* notification emails, or leave blank.
7. **Optional:** Validate tokens to the e-mail template by selecting **Validate Standard Tokens** before saving.
8. Save your changes.
9. Go to ► *Admin Center* ► *Manage Recruiting Settings* ► *Candidate Profile Settings* ► to enable authorized individuals to be able to bulk create candidates from .CSV file.

10. Select [Save](#) to finish.

## Results

You can now use the following role-based permissions:

- [Administrator Permissions](#) > [Manage Recruiting](#) > [Manage Recruiting Email Templates](#) >
- [User Permissions](#) > [Recruiting Permissions](#) > [Bulk Create Candidates from .CSV File](#) >

### → Tip

If either permission doesn't show up, you can try refreshing the cache. Go to [Admin Center](#) > [OData API Metadata Refresh and Export](#) >.

These permissions enable recruiters to bulk create candidate profiles from a CSV file.

## 24.4 Creating Candidate Profiles from CSV Files

In Recruiting, you can create candidate profiles from CSV files.

### Prerequisites

- Permission granted for creating candidate profiles from CSV files

### Procedure

1. Go to [Candidate Search](#) page, and select [Add Candidates](#) > [Bulk Create Candidates from .CSV File](#) >.

The system opens the [Bulk Create Candidates from .CSV File](#) page.

2. Click [Download Blank .CSV Template](#).

The system downloads the CSV template. The CSV template contains all standard and customized candidate profile fields for these supported field types:

- Text
- Number
- Boolean
- Gender - type derived.
- Picklist

### Note

The template also contains sample picklist fields you can copy into your CSV file as needed.

The following fields can be configured in the template but aren't supported in CSV upload:

- *resume*
- *coverLetter*
- *source*
- *rating*
- *bkgndChkStatus*
- *comments*
- *employeeId*
- *status*
- *name*
- *forwardedBy*
- *candidateId*
- *optInCellNumber*
- *lastModified*

### 3. ⚠ Caution

Don't use Microsoft Excel to edit the CSV file. Microsoft Excel alters the UTF-8 character encoding that causes values not to be recognized by the system. Instead, use a plain text editor to edit the CSV file.

Go to the third row to enter the candidate data into the CSV file. When rows are parsed, each one becomes candidate profiles. Be sure to enter data into all the required fields, including:

- *primaryEmail*
- *firstName*
- *lastName*
- *country*

### ⚠ Caution

Don't change the first row in the CSV file in any way.

Make sure that entries in required fields are spelled correctly. For example, if the name of a country is misspelled, the system doesn't create a candidate profile for the row containing the misspelled country name.

### 4. Save the CSV file to your desktop.

The system downloads the CSV template. The first row in the *.CSV* file is **field ID**. The **field ID** is generated from the candidate profile template. The second row in the *.CSV* file is **field label**. Required fields have an asterisk (\*) at the beginning of the field label.

### 5. Enter a name for the batch in the *Batch Name* field.

### 6. Click *Browse* next to the *\*Select a File* field, browse to the CSV file you created, select it, and click *Upload File*.

### Caution

You can't upload information for more than 1000 candidates in one CSV file.

The system uploads and parses the CSV file. When the job has been completed, the system sends an upload-confirmation e-mail. The e-mail gives the batch name, the number of records successfully created, and the number that failed. You can search for the newly created candidates by searching for the batch name via [Candidate Search](#).

## 24.5 Enabling Role-Based Permissions for a Mass Upload of Resumes to Create Candidate Profiles

Enable individuals that belong to specified permission roles to perform a mass upload of resumes for candidate profiles.

### Prerequisites

- All options for the [Bulk Create Candidate Profiles from .CSV file](#) feature are enabled.
- Consent to marketing emails are configured when [Email Campaign](#) is used.
- [Resume Parsing](#) is enabled and configured.
- [Document Management](#) is enabled and configured.

### Context

If resume parsing wasn't previously selected and configured, you have to configure standardization mapping before performing the following procedure. To configure standardization mapping, go to ► [Admin Center](#) ► [Manage Recruiting Standardization Mapping](#) ► and then map the [Education](#) and [Work Experience](#) fields with template fields.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Settings](#) ►.
2. Select [Enable Recruiting Users to Mass Upload Candidate Resumes](#).
3. Save.

## Results

You can now add the [Mass Upload Candidate Resumes](#) target permission for selected permission roles.

## Next Steps

You can now use the ► [User Permissions](#) ► [Recruiting Permissions](#) ► [Mass Upload Candidate Resumes](#) ► permission.

### → Tip

If either permission doesn't show up, you can try refreshing the cache. Go to ► [Admin Center](#) ► [OData API Metadata Refresh and Export](#) ►.

This permission enables individuals to mass upload resumes to create candidate profiles.

## 24.6 Uploading Multiple Candidate Resumes in Batches

You can create candidate profiles in batches by uploading resumes into Recruiting.

## Prerequisites

- You have the ► [Administrator Permissions](#) ► [Metadata Framework](#) ► [Access to non-secured objects](#) ► permission, so that you can provide a new batch name while performing a mass upload of resumes.
- Resume are no larger than 5 MB and are in one of the following formats:
  - DOCX
  - PDF
  - TXT
  - TIFF
  - JPG
  - BMP
  - GIF

## Context

You can upload up to 100 resumes at a time.

## Procedure

1. Go to [Candidate Search](#) page to select [Add Candidates](#) [Mass Upload Resumes](#).

The system opens the [Mass Upload Resumes](#) page.

2. Enter a unique name in [Batch Name](#).
3. Use the [Select Country/Region](#) dropdown list to assign a country or region to resumes that are missing this information.

The system can't parse resumes correctly when they're missing country/region information. Choosing a value applies a country or region to those resumes in the batch where parsing can't determine the candidate's country/region.

The system adds the country/region selected to the new candidate profile for every resume in the batch that doesn't contain the name of a country/region.

4. Select the [+ Add](#), then choose the file location from the dropdown list.
5. Select up to 100 resumes to upload.

### ⚠ Caution

Don't close the window or navigate away while the system uploads the resumes. Depending on connection speed and the number and size of resumes, the upload can take several minutes. If the resume upload window closes before process completes, the resumes can't process. As a result of not being able to process resumes, candidate profiles aren't generated.

The system uploads and parses the selected resumes. The number of resumes successfully uploaded is displayed in the [Resumes](#) heading. Resumes that failed to upload are listed under the [Unsuccessful Uploads](#) heading with brief messages reporting the causes of the upload failures.

6. Go to the [New Created Candidates](#) page and select [View the successfully uploaded candidates](#) link after the process is completed.

### → Recommendation

Check the candidate profiles after creation by searching for batch name, since some resumes are rejected, or generate inaccurate candidate data.

This opens the [Candidate Search](#) page with a prepopulated [Batch Name](#) search.

### 📌 Note

Candidate indexing can take a while after candidates are created. If all candidates aren't displayed in the search results, refresh the search after a few minutes.

# 25 Emails and Notifications in SAP SuccessFactors Recruiting

You can manage e-mail notifications that are sent out by the SAP SuccessFactors Recruiting system during the recruiting process.

## Know Before You Start

- In SAP SuccessFactors Recruiting, you can set up templates used to generate e-mail notifications to participants in the recruiting process.
- There's a predefined set of standard tokens you can insert in Recruiting e-mail templates. You can also create custom tokens.
- Configure custom Recruiting tokens before you configure Recruiting e-mail templates.
- You can only use Recruiting tokens in Recruiting e-mail templates. You can't use them in system notifications.
- With Recruiting e-mail triggers, you get additional trigger-specific tokens that can be added to e-mail templates.
- Tokens don't need to be reportable fields.
- Ensure that email templates are translated in all the languages enabled in your Recruiting instance. If you fail to provide translations, this can cause emails not to be sent to a candidate..

## Related Information

[Configuring Custom Recruiting Tokens \[page 1436\]](#)

[Configuring Recruiting Email Templates \[page 1437\]](#)

[Configuring Recruiting Email Triggers \[page 1449\]](#)

[Enabling Email Correspondence and the Message Center \[page 1462\]](#)

## 25.1 Configuring Custom Recruiting Tokens

You can use Recruiting tokens in offer letters or email templates to reference field data. For example, relevant personalized information for each candidate when you generate the letter or email, so that you do not have to edit the letter or email manually each time to add the personalized information.

### Prerequisites

- You've identified the field IDs for fields that you want to reference with tokens. You can find them in the relevant XML template.
- You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

Custom tokens are used as placeholders in offer letters or recruiting emails to populate the data stored in a field from a related record.

#### 📘 Note

To use a custom generic object (GO) as a token, make the external *Name* field editable in the [Configure Object Definition](#) tool.

You can configure custom Recruiting tokens for any custom fields that require tokens in the Requisition XML template, the Application XML template, or the Job Offer Detail XML template. Some standard fields are automatically available as tokens, but for other fields, you can define in the same way as custom fields.

#### ⚠ Caution

You can configure job requisition and job application custom fields as a custom field in the offer approval template by referencing the corresponding template.

If you need to use an offer detail custom field as a token in an offer letter, then that offer detail field needs to be made reportable, or else the token won't resolve correctly in the offer letter.

Refer to SAP Knowledge Base Articles [2829856 - Custom Job Offer Detail Token in Offer Letter is Not Getting Resolved - Recruiting Management](#) and [2081508 - Custom Reportable Recruiting Fields - Recruiting Management](#).

## Procedure

1. Go to ► [Provisioning](#) ► [Managing Recruiting](#) ► [Configure Custom Tokens](#) ►.

The *Custom Token Setting* page displays.

2. Choose the relevant tab for the XML template that defines the fields you want to reference with tokens: Job Req, Application, Job Offer Detail, or Candidate Profile.
3. Enter the field IDs for the fields you want to reference with tokens.

### → Tip

Changing the token mapping changes the way data populates a template. For example, if `JOB_APPLICATION_CUSTOM1` is mapped to start date and inserted into an offer letter template. Now if you change token mapping to map to end date, any offer letters generated using the template with that token populates the end date value into the letter.

4. Choose [Save](#).

### → Tip

There are 150 fields available for configuration as custom tokens on the application and requisition. The candidate profile and offer details template have 45 fields available for configuration.

## Results

Now you can use the custom tokens in Recruiting email templates or Offer Letter templates.

## Related Information

[SAP Note 2829856](#) 

[SAP Note 2081508](#) 

## 25.2 Configuring Recruiting Email Templates

Configure Recruiting email templates to define the text and format of emails that are automatically sent during the Recruiting process. Some emails are triggered automatically by certain actions and others can be sent on-demand.

## Prerequisites

You have the [Manage Recruiting E-Mail Templates](#) permission.

## Context

- Some hard-coded Recruiting email triggers are configured in *E-Mail Notification Templates Settings* or *Recruiting e-mail Triggers* instead of the Recruiting e-mails section in Admin Center.
- Some fields, such as `[[CANDIDATE_FULL_NAME]]`, exist as tokens, regardless of whether they're configured in the XML file. When this field is configured, they populate a token with the appropriate value.
- You can't delete email templates, as they might be part of the applicant compliance records.
- Recruiting email templates support the use of CC and BCC functionality. This functionality allows a set of users, operators, or email addresses to be specified on an email template.

### Note

If CC or BCC are enabled for email templates, Recruiting users can see these fields on the email screen when sending an Online Offer Letter.

- You can add the following file types as attachments to email templates: DOC, PDF, HTM, GIF, PNG, JPG, JPEG, HTML, RTF, BMP, DOCX, TXT, DOCM, TIF, and MP4.

### Note

MP4 is not supported in offer letters.

- Email templates used in Recruiting Triggers must be unique even if one of the templates is disabled.

## Procedure

1. Go to ► *Admin Center* ► *Manage Recruiting Email Templates* ►.
2. Choose *Create New Template* and give the template a name.
3. Set the template status to *Enabled*.
4. Create a *Subject* for the email.
5. Select *Attach a document*, choose a file to upload and then click *OK*.

### Note

Admin recruiting users can add "default" attachments that go out at any time when the particular email template is used. For an Ad Hoc communication with candidates, where recruiting users can also use an email template as the starting point, they will have the ability to review and add or remove attachments on that screen too.

6. Write the email body, using tokens where appropriate.
7. Select *Validate Standard Tokens* to validate the tokens you've used.

Tokens are placeholders for information that you can specify in the body of an email template.

8. Copy and paste the relevant token to the appropriate place in the email body.  
For example, to thank a candidate for applying, you might use:

Dear `[[CANDIDATE_FIRST_NAME]]`, We've received your application for `[[JOB_REQ_ID]]`,  
`[[JOB_REQ_TITLE]]` and are excited to review your qualifications against this  
position! We keep you updated by email and you can check the progress of your

- application on our career site. Feel free to apply for other roles that interest you.
9. Optionally, you can enable CC and BCC for all recruiting email templates.
    - a. Select from the list of primary operators (roles) on the requisition. Each selection is listed as a CC or BCC user on the recruiting email template. When an email is sent and a call is made to the template, the user listed in the operator field is looked up and included as a CC or BCC user.
    - b. Select one of these option types for CC/BCC recipients.
      - [By role on the requisition](#)
      - [By employee name](#)  
To do this, type the name or username of an active user, and select the user. Each user is then listed as a CC or BCC user in the recruiting email template. When an email is sent and the call is made to the template, the user listed in the operator field is looked up and included as a CC or BCC user.
      - [By e-mail address](#)  
To do this, manually enter an email address. Each address is then listed as a CC or BCC user in the recruiting email template. When an email is sent and the call is made to the template, the user listed in the operator field is looked up and included as a CC or BCC user.
  10. To add a logo other than the logo stored in company settings, add the URL for the logo desired. The URL must be public. For example: `<p></p>`.
  11. To translate the template, repeat these steps for each language in the [Change Language](#) menu.  
If no alternate languages are available, there's only 1 Recruiting language enabled in the system. You can only select alternate languages from the [Change Language](#) menu if more than 1 is enabled on the [Manage Recruiting Languages](#) page.
  12. Select [Save Changes](#).

## Related Information

[Configuring Custom Recruiting Tokens \[page 1436\]](#)

[Configuring Recruiting Email Triggers \[page 1449\]](#)

[Available Email Triggers in Recruiting \[page 1450\]](#)

[Available Tokens for Configuring Recruiting Email Templates \[page 1439\]](#)

## 25.2.1 Available Tokens for Configuring Recruiting Email Templates

Familiarize yourself with the list of tokens you can use to configure Recruiting email templates.

When you're configuring an email template, you can insert tokens with the Rich Text editor. The Rich Text editor also enables you to edit the HTML source of the email. Customization of emails isn't supported, but customers with HTML resources can create branded email templates more tailored to their unique requirements using this feature.

| Heading | Token | Notes |
|---------|-------|-------|
|---------|-------|-------|

|                                                      |                                |                                                                                                                                                         |
|------------------------------------------------------|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| Candidate E-Mail                                     | [[CANDIDATE_EMAIL]]            | The <b>contactEmail</b> must be configured in the Candidate Profile and Application XML.                                                                |
| Candidate First Name                                 | [[CANDIDATE_FIRST_NAME]]       | The <b>firstName</b> must be configured in the Candidate Profile and Application XML.                                                                   |
| Candidate Full Name                                  | [[CANDIDATE_FULL_NAME]]        | The <b>candidateName</b> must be configured in the Candidate Profile and Application XML.                                                               |
| Candidate Last Name                                  | [[CANDIDATE_LAST_NAME]]        | The <b>lastName</b> must be configured in the Candidate Profile and Application XML.                                                                    |
| Hiring Manager Full Name (as defined by Requisition) | [[HIRING_MGR_FULL_NAME]]       | The <b>hiringManagerName</b> must be configured in the Job Requisition XML.                                                                             |
| Job Requisition Number                               | [[JOB_REQ_ID]]                 | The <b>id</b> must be configured in the Requisition XML.                                                                                                |
| Location (of Job Requisition location)               | [[JOB_REQ_LOCATION]]           | The <b>location</b> (standard field) must be configured in the Requisition XML. If a custom location field is configured, use the custom token instead. |
| Job Title                                            | [[JOB_REQ_TITLE]]              | The <b>title</b> and <b>extTitle</b> must be configured in the Job Requisition XML.                                                                     |

## 25.2.2 Adding Supported Tokens to Recruiting Email Templates

Adding a token from a list of supported tokens provides guidance to help you prevent any future issues that can arise due to incorrect template configurations caused by incompatible tokens.

### Context

When you configure a recruiting email template, you have to add email triggers to it. These email triggers have tokens associated with them. When adding a token, you can see the list of all tokens from which you can select the required token. However, with **Supported Tokens**, you can see tokens that are supported for that particular template.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Email Templates](#) ►.
2. Select a template from the [Templates](#) screen area.
3. Choose [Add Supported Token](#) in the [Associated Triggers](#) field of the selected template.
4. Select the required token in the [Add Supported Token](#) dialog box.
5. Choose [Add](#).
6. Choose [OK](#).

### Results

The selected token gets assigned to the email template.

## 25.2.3 Enabling Role-Based Access to Recruiting Email Templates

Learn how to control access to Recruiting email templates using role-based permissions. By restricting the availability of email templates to specific groups, you can make them easier for Recruiting users to manage.

### Prerequisites

You must be an admin.

## Context

You can define recruiting email templates for a business unit to use templates during communication between applicants and recruiters of that specific business unit or subsidiary. You can select the subsidiary when selecting an email template to narrow down the number of the recruiting email templates that your users are selecting from.

The [Contact Candidate email templates](#) permission impacts the following pages:

- Application
- Candidate Profile
- Talent Pool
- Candidate Search
- Job Requisition-Assessment Integration

The [Offer Letter email templates](#) permission impacts the Template field on the following pages:

- [Email Offer Letter as PDF Attachment](#): This page appears when recruiting users choose to send candidates a PDF copy of the offer letter via email
- [Email Link to Online Offer](#): This page appears when recruiting users choose to send online offer letters to candidates.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Settings](#) ►.
2. In the [Enable Role-based Permissions for Recruiting Email Templates](#) section, select which types of email templates you want to control with role-based permissions.

| Option                                            | Description                                                                                                                                                                 |
|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Contact Candidate email templates</a> | Enables the <a href="#">Contact Candidate email templates</a> permission. This permission enables you to restrict the selection of email templates under Contact Candidate. |
| <a href="#">Offer Letter email templates</a>      | Enables the <a href="#">Offer Letter email templates</a> permission. This permission enables you to restrict the selection of email templates under Offer Letter.           |

3. Save.

## Results

You can now use the following role-based permissions to restrict visibility of Recruiting email templates to specific business units or subsidiaries.

- ► [User Permissions](#) ► [Recruiting Email Templates](#) ► [Contact Candidate email templates](#) ►
- ► [User Permissions](#) ► [Recruiting Email Templates](#) ► [Offer Letter email templates](#) ►

### 📘 Note

You can choose whether to give a group access to all email templates or to only specified ones. Both permissions include the same list of active email templates. Templates that don't have a name translated in the language for your locale are displayed with the label *[No name in your language]*.

## Next Steps

Assign these permissions to the appropriate permission roles, for the appropriate email templates.

## 25.2.4 Support for Attachments in Recruiting Email Templates

Recruiting users can add attachments to Recruiting email templates, while defining them.

These attachments are used in Recruiting email triggers and in Ad hoc communication with candidates. To create, define, and work with Recruiting email templates, go to ► [Admin Center](#) ► [Manage Recruiting Email Templates](#) ►.

## 25.2.5 Help with Recruiting Email Templates

Find the right place to get help with configuring Recruiting email templates.

The [Manage Recruiting Email Templates](#) tool is used to configure Recruiting email templates, which define the text and format of emails that are sent automatically during the recruiting process.

People who use the [Manage Recruiting Email Templates](#) page sometimes run into the following common problems.

For more information about Recruiting email templates, see:

- [Emails and Notifications in SAP SuccessFactors Recruiting \[page 1435\]](#)
- [Configuring Recruiting Email Templates \[page 1437\]](#)
- [Configuring Recruiting Email Triggers \[page 1449\]](#)

### Can't delete Recruiting email templates

There's no option to delete Recruiting email templates because they might be part of the applicant compliance records.

If you want to stop using a given email template, you can remove it from all associated email triggers, then disable the template.

For more, see [Stopping Emails Based on a Given Email Template \[page 1461\]](#).

## Emails still sent after email template is disabled

Sometimes you may find that the system is still sending email notifications, with content based on a given email template, even after that email template has been disabled on the [Manage Recruiting Email Templates](#) page. This is expected behavior because email notifications are generated by email triggers, not by email templates.

When you disable an email template, it's automatically removed from any associated email triggers. As a result, the previously associated triggers are no longer associated with any email template. Until you disable the trigger or associate the trigger with a different template, the system continues to send email notifications that are based on the disabled template.

For more, see [Stopping Emails Based on a Given Email Template \[page 1461\]](#).

## Emails still sent even if trigger isn't associated with a template

Sometimes you may find that the system is still sending email notifications, with content based on a given email template, even if the relevant trigger on the [Recruiting Email Triggers](#) page isn't associated with a template. This scenario usually occurs when the previously associated email template has been disabled, but the trigger hasn't yet been associated with a different template.

When you disable an email template, it's automatically removed from any associated email triggers. As a result, the [Email Template](#) field is left blank in the trigger configuration settings. Until you associate the trigger with a different template, the system continues to send email notifications that are based on the disabled template.

For more, see [Stopping Emails Based on a Given Email Template \[page 1461\]](#).

## How to create custom tokens for fields in Recruiting XML templates.

Custom tokens can be created for standard or custom fields in Recruiting XML templates. But they can only be created in the Provisioning application, which customers don't have access to.

To have custom tokens created for your system, contact your implementation partner, Account Executive, or Technical Support.

For more, see [Configuring Custom Recruiting Tokens \[page 1436\]](#).

## No alternate languages listed in the language menu

When you're creating or editing a Recruiting email template, if there are no alternate languages listed in the [Change Language](#) menu, check that at least 2 languages are enabled at ► [Admin Center](#) ► [Manage Recruiting Languages](#) ►. The menu is only visible if more than 2 languages that are enabled for use in Recruiting.

For more, see [Configuring Recruiting Email Templates \[page 1437\]](#).

## 25.3 Configuring Recruiting Email Triggers

Configure recruiting email triggers to define which emails are sent automatically at various points in the recruiting process.

### Prerequisites

You have the [Recruiting Email Triggers](#) permission.

### Context

#### ⓘ Note

When a trigger is set up, emails are automatically sent regardless of any other notification settings for the recipients. For example, they get Recruiting mails even if they selected ► [Options](#) ► [Notifications](#) ► [Read Messages in the system](#) ►.

### Procedure

1. Go to ► [Admin Center](#) ► [Recruiting Email Triggers](#) ►.
2. Select the email trigger you want to configure.

The [Trigger Point](#) describes a condition in the recruiting process that triggers an email to be sent.

3. Select the [Enable](#) setting to enable the email trigger and make it editable.
4. Select an [Email Template](#) to define the text of the email to be sent.

Ensure the email templates that are used in Recruiting Triggers are unique even if one of the templates is disabled.

5. Use [Preview Email](#) to see the email text and [View Tokens](#) to understand the tokens used in the email text.
6. Specify the [Recipients](#) of the email to be sent.

## 25.3.1 Available Email Triggers in Recruiting

Use these Recruiting email triggers to specify when the system should send emails to candidates.

Select any of these triggers to open a window where you can enable or disable the trigger, select an email template, see the system-specified recipient, specify additional recipients, and view the CC/BCC users specified on the Recruiting email template.

### Note

The ability to configure Recruiting Email triggers for Nudge capability is not supported for the home page.

#### Available Email Triggers

| Email Trigger                                    | Category             | Trigger Point                                                                                                                                                      |
|--------------------------------------------------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Agency User Re-Activated                         | Agency               | Sent when an agency user state is changed from inactive to active.                                                                                                 |
| Applicant Submitted to New Requisition by Agency | Agency               | Sent when an agency successfully forwards an applicant to a requisition.                                                                                           |
| Application Updated by Candidate                 | Candidate            | Sent when the candidate has edited and changed data on the application after (that is, not including) the initial apply.                                           |
| Application Updated by Recruiting Operator       | Application          | Sent when a noncandidate user has edited and changed data on the application.                                                                                      |
| Approved Job Requisition Restored                | Requisition          | Sent upon restoration of an approved Job Requisition.                                                                                                              |
| Booked Interview Cancellation to Interviewers    | Interview Scheduling | Sent to the interviewers when a candidate cancels a booked interview. Required for Interview Scheduling.                                                           |
| Booked Interview Cancellation to Organizers      | Interview Scheduling | Sent to the organizers when a candidate cancels a booked interview. Required for Interview Scheduling.                                                             |
| Booked Interview Reschedule E-mail to Candidate  | Interview Scheduling | Sent to the candidate to confirm that the interview has been rescheduled.                                                                                          |
| Cancel Interview Notification                    | Interview Scheduling | Sent to all participants when interviewers cancel the interview.                                                                                                   |
| Candidate Interview Response Reminder            | Interview Scheduling | Sent to candidates in the status of <i>Not Booked</i> who have been sent an invitation to interview, but haven't responded yet. Required for Interview Scheduling. |
| Candidate Merge Notification                     | Candidate            | Sent to a candidate whose multiple accounts are merged.                                                                                                            |
| Candidate Merge Notification - Master            | Candidate            | Sent to a candidate whose multiple accounts are merged.                                                                                                            |

| Email Trigger                                      | Category             | Trigger Point                                                                                                                                  |
|----------------------------------------------------|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Candidate Self-Schedules Interview                 | Interview Scheduling | Sent to candidates who have been invited to interview, asking them to log in and confirm an interview time. Required for Interview Scheduling. |
| Career Site E-mail Notification                    | Candidate            | Sent when candidates create an account from an external career site.                                                                           |
| Career Site Password Reset for External Candidates | Candidate            | Additional tokens supported for this trigger: [[CAREERSITE_USER_NAME]]. CC and BCC are not supported even if added in the template.            |

#### Note

- Make sure that you include the token [[LOGIN\_URL]] in the chosen template.
- SAP SuccessFactors recommends not to configure the email associated with the trigger to have CC or BCC, as this can result in the email not being sent. The system works this way, because a password shouldn't be sent to anyone other than the account holder.

| Email Trigger                                                           | Category             | Trigger Point                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------------------------|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| E-mail Job to Friend                                                    | Career               | <p>A candidate uses the <a href="#">E-mail Job to Friend</a> feature in the career site. User can select a template to populate the default email text, which a user can then change. An Admin can also select templates that populate a noneditable header and footer text appended to the email and set a character limit for text entered by the sender. If the template exceeds the set character limit, the text gets truncated at the character limit. The maximum value for the character limit is 1000.</p> <div> <p><b>Note</b></p> <ul style="list-style-type: none"> <li>• CAPTCHA is enabled for this feature. You can't disable CAPTCHA in the career site while using the <a href="#">E-mail Job to Friend</a> feature.</li> <li>• When <a href="#">Single Sender</a> option is enabled in Provisioning and a user emails a job to a friend using <a href="#">E-mail Job to Friend</a> option, an email is sent from the email id of the user who is referring. However, when <a href="#">Single Sender</a> option is disabled in Provisioning, an email is sent from the system email address.</li> </ul> <p><b>→ Remember</b></p> <p>As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.</p> </div> |
| Email Notification to Candidates for Rescheduled or Updated Interview   | Interview Scheduling | Sent to candidates if organizers choose to notify them when they reschedule or update an interview.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Email Notification to Interviewers for Rescheduled or Updated Interview | Interview Scheduling | Sent to the interviewers when organizers reschedule or update a booked interview.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Email Notification to Organizers for Rescheduled or Updated Interview   | Interview Scheduling | Sent to the organizers after they reschedule or update a booked interview.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Required for Interview Scheduling.                                                                                                 |
| <div>  <b>Note</b><br/> Candidate-related tokens are unsupported, as a single interview can have multiple candidates. In that case, tokens for candidates are unresolved, as there's only one email sent to all invited candidates. </div> |                                           |                                                                                                                                                                                                           |

| Email Trigger                                       | Category             | Trigger Point                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------------|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interview Cancellation to Organizers                | Interview Scheduling | <p>Sent to the organizers when a candidate declines an interview.</p> <div> <p><b>Note</b></p> <p>When candidates decline an interview without confirming any interview slot, the tokens <code>[[INTERVIEW_DATE]]</code> and <code>[[INTERVIEW_TIME]]</code> aren't resolved because there can be single or multiple interview slots associated and the date and time details aren't known.</p> <p>However, you can use the token <code>[[INTERVIEW_SCHEDULING_INTERVIEW_DATE]]</code> that resolves to the starting date of an interview schedule.</p> </div> |
| Interview Confirmation to Candidate                 | Interview Scheduling | Sent to candidates upon interview confirmation or when the organizer schedules an interview on behalf of the candidate.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Interview Confirmation to Interviewers              | Interview Scheduling | Sent to the interviewers when a candidate confirms an interview or when the interview organizer schedules an interview on behalf of the candidate.                                                                                                                                                                                                                                                                                                                                                                                                             |
| Interview Confirmation to Organizers                | Interview Scheduling | Sent to the interview organizers when a candidate confirms an interview or when they schedule an interview on behalf of the candidate.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Interview Delete Notification                       | Interview Scheduling | Sent to all participants when an assigned user deletes an interview. Required for Interview Scheduling.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Interview Invite Failure Notification to Organizers | Interview Scheduling | <p>Sent to the organizers when the system fails to send an interview invitation email to an interviewer. Required for Interview Scheduling.</p> <div> <p><b>Note</b></p> <p>If the email address of an interviewer is incorrect, the system still sends the email. In this case, the failure notification for the organizer is not triggered.</p> </div>                                                                                                                                                                                                       |
| Invite Candidate to Apply                           | Candidate            | Sent to forwarded candidates once they've been invited to apply for a job.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Email Trigger                                             | Category             | Trigger Point                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Job Alert Expired Notification                            | Candidate            | Sent when a job alert remains unmodified for a long period of time. The job alert expires in the number of days entered in the <a href="#">Job Alert Expiration Days</a> field. Candidates receive the email on the day of expiration to notify them that the job alert is over, so they can choose to configure a new alert. |
| Job Alert Invalidated Notification                        | Candidate            | Sent when the filters specified in a job alert are no longer visible.                                                                                                                                                                                                                                                         |
| Job Alert Notification                                    | Candidate            | Sent according to the schedule defined in the job alert.                                                                                                                                                                                                                                                                      |
| Job Requisition Created                                   | Requisition          | Sent when the job requisition has been created.                                                                                                                                                                                                                                                                               |
| Job Requisition Deleted (Candidate)                       | Application          | Sent to candidates when a job requisition is deleted.                                                                                                                                                                                                                                                                         |
| Job Requisition Deleted (Internal)                        | Requisition          | Sent to internal users when a Job Requisition is deleted.                                                                                                                                                                                                                                                                     |
| New Agency User Alert                                     | Agency               | Sent when an admin creates a new agency user.                                                                                                                                                                                                                                                                                 |
| Offer Approval Declined                                   | Offer Approval       | Sent when an approver declines an offer.                                                                                                                                                                                                                                                                                      |
| Offer Approved by All Approvers                           | Offer Approval       | Sent when all the approvers have approved an offer and there are no further approvals pending.                                                                                                                                                                                                                                |
| Offer Initiated (Sent for Approval)                       | Offer Approval       | Sent when an offer has been sent to the first approver in the queue.                                                                                                                                                                                                                                                          |
| Offer Received an Approval                                | Offer Approval       | Sent when an approver who isn't the last approver approves an offer, and has been passed to the next approver in queue.                                                                                                                                                                                                       |
| One-Time Password for External Candidate Account Creation | Candidate            | Sent when an external candidate creates a new account from the career site page.                                                                                                                                                                                                                                              |
| Online Offer Accepted by Candidate                        | Online Offer         | Sent when the candidate accepts an online offer.                                                                                                                                                                                                                                                                              |
| Online Offer Canceled by Sender                           | Online Offer         | Sent when the operator has canceled the online offer that was in pending state.                                                                                                                                                                                                                                               |
| Online Offer Canceled by Sender Candidate Notification    | Online Offer         | Sent to the candidate when the sender cancels the pending online offer.                                                                                                                                                                                                                                                       |
| Online Offer Declined by Candidate                        | Online Offer         | Sent when the candidate declines an online offer.                                                                                                                                                                                                                                                                             |
| Outlook Response to Interview Organizer                   | Interview Scheduling | Sent to all of assigned organizers when interviewers and rooms respond to a meeting invite. Organizations can choose to include any recruiting roles on that email.                                                                                                                                                           |

| Email Trigger                                     | Category    | Trigger Point                                                                                                                                                                                                                                                                      |
|---------------------------------------------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Recruiting Manual Candidate Creation Notification | Candidate   | <p>Sent to candidates who are created manually to notify them about account details.</p> <div> <p><b>Note</b></p> <p>This feature ensures that external candidates created in Succession get the same notifications, and works the same as those created in Recruiting.</p> </div> |
| Requisition Changed                               | Requisition | Sent when the job requisition data has been updated.                                                                                                                                                                                                                               |
| Requisition Closed                                | Requisition | Sent when the job requisition has changed from an approved state to a closed state.                                                                                                                                                                                                |
| Requisition Opened                                | Requisition | Sent when the job requisition has been opened (after the last approval in the route map).                                                                                                                                                                                          |

| Email Trigger      | Category    | Trigger Point                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Requisition Posted | Requisition | <p>Sent when the job requisition has postings (internal, external, internal private, external private, agency/agencies) that have been newly initiated by an operator.</p> <p>To send consolidated email content, define the <code>[[BEGIN_REPEAT]]</code> and <code>[[END_REPEAT]]</code> tokens in the email template. Any text or job requisition-related tokens included within these tokens repeats.</p> <p><code>[[POSTING_TYPES]]</code> is a custom token supported only in this trigger, and which can't be used for any other trigger or template. This token resolves all the posting types about to expire for the job requisition.</p> <div> <p><b>Note</b></p> <p>When configuring Requisition Posting Expiration email templates, enclose job requisition tokens inside <code>[[BEGIN_REPEAT]]</code> and <code>[[END_REPEAT]]</code> tokens. For example:</p> <pre> Dear recruiter,                                  The following requisitions have expiring job postings:  [[BEGIN_REPEAT]]  [[requisition]]: expires [[date]]  [[END_REPEAT]]  Regards,  System                                The </pre> </div> |

| Requisition Re-opened                 | Requisition          | Sent when the job requisition has changed from a closed state to an approved state.                                                                                                                                                                                                                                                                               |
| Upcoming Interview Notification       | Interview Scheduling | Sent to interviewers who have an upcoming interview that was scheduled on the application that's using Interview Central. These emails are triggered when deleted job requisitions are restored.                                                                                                                                                                  |
| Welcome / Thanks for Creating Account | Career               | Sent when an external candidate has successfully created an active user account.                                                                                                                                                                                                                                                                                  |

## 25.3.2 Validation of Tokens

Each e-mail trigger supports different standard tokens while configuring Recruiting e-mail templates. When you include unsupported standard tokens in the template, a validation is added so that the system alerts you through a warning message.

The validation of standard tokens is possible in [Recruiting Email Triggers](#) page and [Manage Recruiting Email Templates](#) page. Following are the scenarios where the standard tokens configured in the template are validated:

- Click [Validate Standard Tokens](#) in [Admin Center](#) > [Recruiting](#) > [Recruiting Email Triggers](#).
- Click [Save](#) in [Admin Center](#) > [Recruiting](#) > [Recruiting Email Triggers](#).
- Click [Validate Standard Tokens](#) in [Admin Center](#) > [Recruiting](#) > [Manage Recruiting Email Templates](#) (when triggers are already associated to this template).
- Click [Save](#) in [Admin Center](#) > [Recruiting](#) > [Manage Recruiting Email Templates](#) (when triggers are already associated to this template).

## Recruiting Email Triggers Page

In the [Recruiting Email Triggers](#) page, when you click [Validate Standard Tokens](#) or [Save](#) button and if you have used supported standard tokens while configuring the template, a successful validation message is displayed.

If you navigate to another trigger without saving, a message is displayed asking you to save or discard the changes.

In case you have used unsupported standard tokens in the template, upon clicking [Validate Standard Tokens](#) or [Save](#) button, a warning message is displayed saying Invalid tokens configured in e-mail templates. Click [More Details](#) in the warning message to see the list of invalid tokens. This validation happens across locales.

For example, if you have invalid tokens in the e-mail template and an associated trigger, a warning message pops up when you click [Validate Standard Tokens](#) in the [Recruiting Email Triggers](#) page showing the list of tokens that are not applicable for the selected trigger in all the configured locales.

It is also possible to navigate from [Recruiting Email Triggers](#) to [Manage Recruiting Email Templates](#) page by clicking the [Edit template](#) link in the warning message.

### ⓘ Note

The [Validate Standard Tokens](#) button is enabled only when the trigger is active and has an associated template.

## Manage Recruiting Email Templates Page

Similar to Recruiting Email Triggers, you can validate standard tokens in Manage Recruiting Email Templates by clicking [Validate Standard Tokens](#) or [Save](#) button. When you click any of these buttons, a successful validation message is displayed, if you have supported standard tokens and a warning message is displayed if you have unsupported standard tokens with respect to the triggers already associated to this template.

If you navigate to another locale from the current locale page without saving the changes, a message is displayed asking you to save or discard the changes.

Under each template, there is a section, which shows the associated triggers. The [Validate Standard Tokens](#) button is disabled if a template does not have any associated triggers. It is also possible to navigate from [Manage](#)

[Recruiting Email Templates](#) to [Recruiting Email Triggers](#) page by clicking the [Configure Triggers](#) link in the [Associated Triggers](#) section.

## Need to Know

A scenario where a template is configured in a particular locale, but that locale is disabled from [Manage Recruiting Languages](#). In such cases, token validation still happens, but the [Edit template](#) link is shown as the locale is disabled. For example, if the template is configured in fr\_FR (French locale) and at some point in time, the locale is disabled in [Manage Recruiting Languages](#). The Edit template link is not shown.

### 25.3.3 Viewing Supported Tokens in Recruiting Email Triggers

Supported tokens of a recruiting e-mail trigger give you a list of tokens that are compatible with the token. This provides guidance and prevents any future issues that can arise due to incorrect template configurations caused by incompatible tokens.

#### Context

Recruiting e-mail triggers have tokens associated with them. With **View Tokens**, you see a list of tokens that are supported for that particular trigger.

#### 📘 Note

You can view tokens only for enabled triggers.

## Procedure

1. Go to ► [Admin Center](#) ► [Recruiting Email Triggers](#) ►.
2. Select an email trigger on the [Recruiting Email Triggers](#) page.
3. Choose [View Tokens](#) in the [Edit Trigger](#) screen area.

## Results

You see all the tokens that are supported for the selected trigger in the [Supported Tokens](#) dialog box that opens.

## 25.4 Stopping Emails Based on a Given Email Template

Stop the system from sending emails that are based on a given email template.

## Context

If you want to stop using a given email template, you can disable it on the [Manage Recruiting Email Templates](#) page. However, this action only prevents the template from being used in email trigger configuration. It doesn't stop email notifications from being sent. Email notifications are generated by email triggers, not by email templates.

To thoroughly stop using a given email template, you need to both disable the template on the [Manage Recruiting Email Templates](#) page and update the associated trigger on the [Recruiting Email Triggers](#) page.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Email Templates](#) ►.
2. Find the template you want to stop using and choose the template name to view configuration details.
3. Check the [Associated Triggers](#) field to see if the template is associated with any email triggers.  
If a trigger is listed, take note of the name. You need to update the trigger first, before you disable the template.
4. To update the associated trigger, use the [Configure Triggers](#) link to navigate to the [Recruiting Email Triggers](#) page. Then find and update the associated trigger.
  - To stop sending emails for the trigger, disable it. Deselect the [Enable](#) setting and save.
  - To continue sending emails based on different template, choose the desired template in the [Email Template](#) field and save.
5. Return to ► [Admin Center](#) ► [Manage Recruiting Email Templates](#) ►.

6. For the template you want to stop using, verify that there are no triggers listed in the *Associated Triggers* field. If not, the template can now be disabled.
7. To disable the template, find the *Status* field in the configuration details, select the *Disabled* option, and save.

## 25.5 Enabling Email Correspondence and the Message Center

Enabling Email Correspondence for the Message Center to appear in SAP SuccessFactors Recruiting allows the Recruiters to have a complete history of email communication with the candidates and also reply to the candidate from the Message Center.

### Prerequisites

Before you enable Email Correspondence, ensure that you have the following permissions enabled:

- *Enable Generic Objects* option in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- *Manage Upgrade Center* role-based permission to access *Upgrade Center*.
- *Recruiting Permissions* and *Metadata Framework* role-based permissions.

### Context

You can enable Email Correspondence either by selecting *Recruiting Management Email Correspondence* from *Upgrade Center* or from *Manage Recruiting Settings*.

#### ⓘ Note

If Email Correspondence is already enabled from *Manage Recruiting Settings*, *Recruiting Management Email Correspondence* option doesn't appear in *Upgrade Center*.

### Procedure

1. Go to the *Admin Center*.
2. In the *Tools Search* field, enter **Manage Recruiting Settings**.

3. Scroll down to *Email Correspondence and Message Center* section and select *Enable Email Correspondence*.

This option tracks all the manual email conversations between a recruiter and a candidate. Enabling this option allows you to access the Message Center, which displays a list of all user-initiated email correspondence.

4. **Optional:** In the *Email Correspondence and Message Center* section, select *Add a note in the emails to candidates telling them not to include sensitive information in their replies*.

#### → Recommendation

This optional feature adds a note while replying to the candidates. Don't include any sensitive information in this email.

## Results

You can now see the *Message Center* tab in *Recruiting*. To view your email threads with candidates and to know about various display options in *Message Center*, refer to *Accessing and Using the Message Center*.

## 25.5.1 Using the Message Center

As a recruiter, you can view email threads that you've initiated with both internal and external candidates in the Message Center.

## Prerequisites

To access and use the Message Center, ensure that you have enabled *OData API Candidate Export* and *EmailBrandTemplate* permissions, located in ► *Administrator Permissions* ► *Manage MDF Recruiting Objects* ►.

## Context

Email Correspondence enables recruiters to have a complete history of email communication with candidates, so that when a recruiter sends an email to a candidate from Candidate Search, Candidate Profile, Candidate summary page, or Application, and the candidate replies to the email, the entire email communication is stored in the Message Center.

Using this process, you can send an email to multiple candidates, and the responses for each candidate are logged in the Message Center separately.

You can use [Archived Only](#) filter to categorize and search your emails. You can also unarchive them.

You can use [Delete](#) to remove selected conversations in the [Deleted Only](#) category. This doesn't delete the conversations permanently. If you want to delete your conversations permanently, you can choose [Delete](#) in the [Deleted Only](#) category. This doesn't stop you from receiving future messages from the candidates. You can also move these conversations back to [All Messages](#) by using [Restore](#).

#### Note

The Message Center is only for manual emails to candidates. Replies to automatically generated emails, email campaigns, or offer letter emails aren't captured here.

## Procedure

1. Go to  [Admin Center](#)  [Recruiting](#) .

The [Job Requisitions](#) page appears.

2. Select the [Message Center](#) tab to view a list of emails that the recruiter has initiated manually from the Candidate or Application profile.

The most recent email conversation (sent or received) is displayed on top. This list displays the candidate name, date of the latest email thread, subject line of the email, and also displays the first few lines from the email body of the latest conversation thread. When you select the conversation, the email thread displays on the right side.

3. Select [Send](#) to reply to the candidate. You can reply to the candidate from the [Message Center](#) or from their mail inbox.

When a candidate replies to the latest email, the system captures the reply content of the email, stores it in the system, and then sends it to the recruiter, who can see it in the Message Center here as well as in their email inbox.

#### Note

- When a candidate replies to an email and the recruiter or user is placed in CC or BCC list, the conversation is **not** captured in the Message Center. However, an email is sent to their mail inbox.
- When a recruiter replies from the Message Center, the email doesn't include the previous texts from the email thread. Similarly, if a recruiter replies from the email client instead of the Message Center, only the recruiter's content is sent to the candidate and saved in the Message Center and not the previous texts from the email.

4. Select [Preview](#) option to view your reply before you send it to the candidate.

#### Note

Some formatting options, such as bold and italics, may not display in the email preview, but render correctly when the email is sent.

5. **Optional:** Perform additional actions in the Message Center:

| Display Op-<br>tions                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Filter</b>                           | You can filter the emails by date. You can also select <a href="#">Custom Range</a> from the dropdown and select the required date.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Search</b>                           | <p>You can filter or search emails by name or by subject.</p> <p>In the Message Center view, you can search for user initiated emails. For a detailed search, select the <a href="#">Display Options</a> button. To narrow your search criteria with better search results, you can search with a combination of dates, first name, last name, and subject.</p> <p>For example, if you select <a href="#">Filter By Date</a> as <a href="#">Last 6 months</a>, <a href="#">First Name</a> as Carla, <a href="#">Last Name</a> as Grant, and <a href="#">Subject</a> as <a href="#">Interview Schedule</a>, <a href="#">Message Center</a> displays a list of email communication initiated by Carla Grant in the last six months with a subject line showing Interview Schedule.</p> <div><p><b>Note</b></p><p>This <a href="#">Search</a> field doesn't support General Display Name. Refer to <a href="#">Adoption of General Display Name in Recruiting</a> for more information about the feature.</p></div> <p>If you're unable to search the candidates or if there's any discrepancy in the Message Center, you can re-index the candidate in the Provisioning. If the issue persists, then do a reindex on the correspondence. If there's any discrepancy in date and subject search in Message Center, then do a reindex on the correspondence only.</p> <div><p><b>→ Remember</b></p><p>As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.</p></div> |
| <b>Sort</b>                             | You can sort emails in Ascending or descending order. You can also sort emails by date received, Candidate, or by Email subject.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Read/<br/>unread<br/>emails</b>      | <p>You can filter for read and unread messages. When you select the <a href="#">All Messages</a> filter, all the messages including unread messages are displayed.</p> <p>When you select <a href="#">Unread Only</a>, all the unread messages are displayed.</p> <p><a href="#">Message Center</a> also displays the number of <a href="#">All Messages</a> and <a href="#">Unread Only</a> messages.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Include<br/>Brand Tem-<br/>plate</b> | <p>By default, <a href="#">Message Center</a> doesn't allow the recruiter to add any branding.</p> <p>When a recruiter sends an email from <a href="#">Candidate Profile</a> or <a href="#">Application Profile</a> with branding information and wants to retain it while replying to a candidate from <a href="#">Message Center</a>, then the recruiter has to select <a href="#">Include Brand Template</a> checkbox. If a recruiter doesn't select <a href="#">Include Brand Template</a> checkbox, then the email contains just the text of the reply.</p> <div><p><b>Note</b></p><p><a href="#">Include Brand Template</a> checkbox is visible only if the original email has branding information.</p></div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Attach-<br/>ments</b>                | <p>You can view and download attachments in <a href="#">Message Center</a>. In case of multiple attachments, you need to individually download them.</p> <p>When a recruiter sends an email with an attachment from <a href="#">Candidate Profile</a> or <a href="#">Application Profile</a>, an attachment icon is displayed in the <a href="#">Message Center</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Display Options  | Description                                                                                      |

## 25.6 Recruiting Management System Notifications

Both Recruiting Management and Career Site Builder send users system notifications.

To reduce the possibility of duplicate emails, set up a best practice configuration for System Notifications. Use the following table.

| Setting                                         | Enabled? | Notes                                                                                                          |
|-------------------------------------------------|----------|----------------------------------------------------------------------------------------------------------------|
| Document Routing Notification                   | Yes      |                                                                                                                |
| Document Creation Notification                  | No       | This is not supported in the <a href="#">Recruiting</a> module                                                 |
| Document Due Notification                       | Yes      | Requires the job <a href="#">Send Form Due Notification</a> to be scheduled in <a href="#">Provisioning</a> .  |
| Document Late Notification                      | Yes      | Requires the job <a href="#">Send Form Late Notification</a> to be scheduled in <a href="#">Provisioning</a> . |
| External Candidate Forgot Password Notification | Yes      |                                                                                                                |
| Invite Candidate to Apply                       | Yes      |                                                                                                                |
| Job Alert Expired Notification                  | No       | Job alerts not necessary when using Career Site Builder.                                                       |
| Job Alert Invalidated Notification              | No       | Job alerts not necessary when using Career Site Builder.                                                       |
| Job Alert Notification                          | No       | Job alerts not necessary when using Career Site Builder.                                                       |
| New Recruiting Operator Notification            | Yes      |                                                                                                                |
| Recruiting Interviewer Notification             | Yes      |                                                                                                                |

| Setting                                            | Enabled? | Notes                                                                                                                        |
|----------------------------------------------------|----------|------------------------------------------------------------------------------------------------------------------------------|
| Recruiting Even Interviewer Notification           | Yes      |                                                                                                                              |
| Career Site E-Mail Notification                    | No       | Email sent when using the email verification option not supported by Recruiting Management——Career Site Builder Integration. |
| Recruiting Manual Candidate Notification           | Yes      | Email sent to candidates with profiles created manually, notifying them about account details.                               |
| Career Site Password Reset for external candidates | Yes      |                                                                                                                              |
| Recruiting Agency                                  | Yes      |                                                                                                                              |
| Recruiting Imminent Candidate Purge Notification   | Yes      | This email is only applicable to clients who are using DRM 1.0. The email is sent 7 days prior to the scheduled purge.       |
| Share candidate search                             | Yes      |                                                                                                                              |

## 26 Source Tracker

The Source Tracker provides a way for you to track SAP SuccessFactors Recruiting and Career Site Builder data.

Tracking information is generated when jobs are posted in SAP SuccessFactors Recruiting using recruiting posting or XML feeds.

The Source Tracker, located in ► [Recruiting](#) ► [Source Tracker](#) ► includes the following options:

- **Source Report:** Displays a report showing the number of applicants from various sources, such as career site, job board, and so on.
- **Pages:** Lists specific pages from the career site without your need to go into Career Site Builder.
- **Campaign URL Builder:** Allows you to generate tracking URLs.

### 26.1 Source Report

As a recruiter you can use Source Report to view the top sources for visitors, members, and applicants for a specific time period without launching Advanced Analytics.

Career Site Builder is designed so that candidates can access jobs through a variety of different paths. When jobs are posted in SAP SuccessFactors Recruiting using recruiting posting or XML feeds, those jobs always contain tracking.

The Source Report is located in ► [Recruiting](#) ► [Source Tracker](#) ►.

When you use Source Report, you can view filtered Career Site Builder data for these activities:

Tracked Activities in Source Report

| Measured Activity           | Description                                                                                                                                                                                                                                                     |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Source</a>      | Categorized based on custom rules engine.                                                                                                                                                                                                                       |
| <a href="#">Visitors</a>    | Displays visitor count for the selected source. Visits occur when candidate passes from a source to your Career Site Builder that's recorded each time. Visits aren't recorded when candidates navigate to different pages within SAP SuccessFactors Recruiting |
| <a href="#">Subscribers</a> | Subscriber Count. Subscriptions are when candidates join the Talent Community, or when they create their candidate profile. Also occurs when candidate signs up for job alerts or complete their candidate accounts during the process of applying for a job.   |

| Measured Activity             | Description                                                                                                                                                                                                                                                                                           |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Apply Starts</a>  | Displays the <a href="#">Apply Starts</a> for the selected source. An <a href="#">Apply Start</a> is recorded when a candidate selects the <a href="#">Apply Now</a> button on a job on an external career site.                                                                                      |
| <a href="#">Visit/Apply %</a> | Percent of applications per visit that's calculated by dividing the number of <a href="#">Apply Starts</a> by the number of visits.                                                                                                                                                                   |
| Chart data                    | <p>You can view Career Site Builder activity data using different chart types when you select the  horizontal grip selector.</p> <div> <p><b>Note</b></p> <p>This isn't available in Advanced Analytics</p> </div> |

## Available Chart Types

When you've entered the criteria you want to use, the source report table displays data and visualization of your data. By default, the table and pie chart displays data from all sources.

Different Charts Used in Source Reports

| Chart Option                           | Description                                                                         |
|----------------------------------------|-------------------------------------------------------------------------------------|
| <a href="#">Visitors Pie Chart</a>     | Pie chart that displays the percentage of visitor source data.                      |
| <a href="#">Subscribers Pie Chart</a>  | Pie chart that displays the percentage of subscriber source data.                   |
| <a href="#">Apply Starts Pie Chart</a> | Pie chart that displays the percentage of <a href="#">Apply Starts</a> source data. |
| <a href="#">Show Trend</a>             | Graph that displays your trend data.                                                |
| <a href="#">Add Trend to series</a>    | Displays your trend data as a series                                                |

### Note

You can view graphical and pie data for all sources, or by a specific source.

## Incorrectly Tracked Source Data

Incorrectly tracked source data can appear in one of two ways in Source Report:

- High volume of *Direct* source types when improper source tracking is used.
- High volume of *No Type* or *RCM Redirect* visitors when non-SAP SuccessFactors Career Site Builder is used.
- To mitigate such issues, use URL builder to share jobs with third parties. For accurate tracking when sharing job URLs, ensure you use only the Career Site Builder job URLs.

## 26.1.1 Exporting Source Report Files

You can use filtering options to view visitor Career Site Builder data within the Source Report view or export as a .CSV file.

### Prerequisites

You have the [User Permissions](#) > [Recruiting Permissions](#) > [Job Marketing](#) permission.

### Procedure

1. Select the *Source Report* tab in [Admin Center](#) > [Recruiting](#) > [Source Tracker](#).
2. Choose your filter criteria:

| Option                | Description                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Date Range</i>     | Select any predefined set of date ranges. Dates are based on the day the visitor was captured by the career site.                                                                                                                                                                                                                                               |
| <i>Start</i>          | Select your start date as the beginning of the date range you want source reports for. You can also customize your date range.                                                                                                                                                                                                                                  |
| <i>End</i>            | Select your end date as the end of the date range you want source reports for. You can also customize your date range.                                                                                                                                                                                                                                          |
| <i>Country/Region</i> | Select predefined countries/regions from the dropdown list.                                                                                                                                                                                                                                                                                                     |
| <i>Referrer Type</i>  | Select the referrer type you want to use. The choices are: <ul style="list-style-type: none"> <li>• Current Referrer – <i>Apply Starts</i> are grouped by the source that referred each visitor.</li> <li>• Original Referrer – <i>Apply Starts</i> by the source used when candidates created their candidate profile or join the Talent Community.</li> </ul> |
| <i>Campaign</i>       | Enter the campaign number in the optional text field so you can filter searches by campaign number.                                                                                                                                                                                                                                                             |

| Option | Description                                                                                                                                   |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------|
|        | <div> <div>⚠ Caution</div> <div>Enter the exact campaign ID number because searches don't return on partial campaign ID numbers.</div> </div> |

3. Select [Go](#) to view your report.
4. Select **Export** to export your report as a .CSV file.
5. Save the .CSV to your hard drive to finish.

### Results

You can now view your report as a .CSV

### Next Steps

You can view and export visitor data visually as charts.

## 26.1.2 Exporting Charts from Source Reports

You can export your data from Source Report as a .PNG, JPG, or .PDF file to save to your hard drive.

### Procedure

1. Select the chart type you want to use:

| Data Options                | Steps                                                                                                                                                                                                                  |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| All data information        | Select the  horizontal grip selector in the header column of the source report table, then choose the chart option you want to use. |
| Specific source information | Select the  horizontal grip selector in the last column for your source information, then select the chart type you want to use.    |

2. With your desired data and chart type selected, choose the [Export](#) action menu.

3. Select any of these three outputs for your chart data:

- [Export to PNG](#)
- [Export to JPG](#)
- [Export to PDF](#)

## 26.2 Creating Tracking URLs in Campaign URL Builder

You can use Campaign URL Builder to create custom URLs to market jobs across a number of different channels.

### Prerequisites

- The [Recruiting Marketing](#) > [Enable Job Marketing](#) option is enabled in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- You have the [Administrator Permissions](#) > [Recruiting Permission](#) > [Job Marketing](#) permission.
- You've configured the site sources you want to be available for Campaign URL Builder from the [Referrer Types](#) dropdown menu in [Site Source Editor](#).

### Context

In order for the source to be tracked, candidates must land on a page in Career Site Builder.

### Procedure

1. Go to [Recruiting](#) > [Job Requisitions](#).
2. Select the job requisition that you want the URL for, then choose the [CAMPAIGN URL BUILDER](#) tab.

You can also hover over the job requisition, then choose [Campaign URL Builder](#) from the [Actions](#) menu.

You're directed to [Source Tracker](#) > [Campaign URL Builder](#) for the job requisition you selected.

The [URL](#) field is generated by SAP SuccessFactors Recruiting, and is also updated automatically if the title or location is changed in the job requisition.

3. Select the desired [Type](#) category.

4. Choose the source that you want to use from the [Source](#) menu.
5. Enter a custom campaign name for your campaign. For example, **Campus Recruiting** to track jobs marketed as part of college recruiting.

This campaign name appears at the end of the [Campaign URL](#) and in the [Campaign HTML Link](#) fields. You can copy the [Campaign URL](#) or [Campaign HTML Link](#).

6. **Optional:** Create a shortened URL by selecting [Generate Short URL](#).

The shortened URL appears in the [Generated Short URL](#) field. Copy this new short link to use elsewhere.

7. **Optional:** After you create a short URL, you can generate a QR code by selecting [Generate QR Code](#) and saving the image that appears in a new browser window.
8. **Optional:** Select social networks where you'd like to post your job.

#### Note

Social media options appear if enabled. Refer to related links for more information.

If you want a custom workflow, you may need to work with your third-party vendor. SAP SuccessFactors can't control the workflow on the third-party vendor sites.

Sharing the URL by choosing one of these buttons automatically populates the type and engine for tracking with social network information, overriding any manual selection made using the [Type](#) and [Engine](#) dropdown list. This also populates with social network tracking information, even if the social network isn't available in the [Type](#) or [Engine](#) dropdown list.

# 27 Recruiting Advanced Analytics

You can leverage data about career sites that drive traffic to your Career Site Builder career site to understand which sites result in the best quality candidates using SAP SuccessFactors Advanced Analytics.

## Who Uses Advanced Analytics

Typically, Talent Acquisition Leaders, HRIS Administrators, or business analysts use Advanced Analytics to evaluate trends in source performance over time. You can get insight into which sources produce the best candidates, so that you can adjust your media spend.

Advanced Analytics provides prebuilt reporting so that you can drill into specific recruiting information across sources, locations, dates, job categories, and more.

### → Recommendation

We recommend that you synchronize your Applicant Tracking System (ATS) data daily because Advanced Analytics allows you to capture data in source performance.

## Generating Reports

There are three types of reports that sit within three different tabs in Advanced Analytics:

- [Browser](#) allows you to drill down into candidate details such as which candidates came to Career Site Builder from other sources.
- [Detail Query Tool](#) allows you to report on specific or multiple statuses for specific source types to pull candidate and job level data without drilling down to details.
- [Applicant Conversion Report](#) provides you with a view of conversion rates by source type that also summarizes drop-off information.

You can view averages for all Advanced Analytics statuses, which can be turned on by selecting [Show averages](#) action under [Display option](#). When you turn on [Show averages](#), you view the averages per hire:

- [Visits](#)
- [Applications Started](#)
- [Application Completed](#)
- [Qualified applications](#)
- [Interviews](#)
- [Offers](#)
- [Hires](#)

## 27.1 Recruiting Advanced Analytics Configuration

Recruiting Advanced Analytics is configured from the [Analytics Admin](#) option within Command Center.

### Using Command Center

All configuration settings for Advanced Analytics require provisioning access and [Command Center](#). You can configure Advanced Analytics from ► [Command Center](#) ► [Analytics](#) ► [Analytics Admin](#) ►.

#### ⓘ Note

As a customer, you don't have access to Command Center or Provisioning. To complete tasks in Command Center or Provisioning, contact your implementation partner or your Account Executive. For any non-implementation tasks, contact Technical Support.

### Before You Start

Advanced Analytics integrates source data from Career Site Builder with SAP SuccessFactors Recruiting applicant data status. Advanced Analytics is implemented right after Career Site Builder is in production.

There are a number of steps required before you can populate data into Advanced Analytics, that require additional integration steps between Career Site Builder and SAP SuccessFactors Recruiting. Advanced Analytics can be configured in a preview or stage environment to test populating your data. Don't use actual candidate data in your preview or stage environment.

Since Advanced Analytics is designed to report data trends over extended periods of time, the longer data accumulates, the more insightful the trends, and reports become.

#### ⓘ Note

Only Technical Support can import source and cost data to Advanced Analytics that requires that customers open up a ticket.

1. [Setting Up Prerequisites for Advanced Analytics \[page 1476\]](#)  
Enable specific prerequisite settings in Provisioning and grant role-based permissions so that you can use Advanced Analytics.
2. [Configuring OData Integration Settings for Recruiting Advanced Analytics \[page 1477\]](#)  
Advanced Analytics Recruiting uses OData to integrate source data from Career Site Builder with applicant status data from SAP SuccessFactors Recruiting.
3. [Career Site Builder Status Mappings in Advanced Analytics \[page 1479\]](#)  
You map your candidate status from SAP SuccessFactors Recruiting with the correct Career Site Builder statuses for Recruiting Advanced Analytics integration.
4. [Changing Field Labels for Recruiting Advanced Analytics \[page 1486\]](#)

The labels the customer sees in Recruiting Advanced Analytics and the field names in Recruiting Marketing aren't identical. You can customize the label names in the Recruiting Advanced Analytics when customers want the labels to represent the field data more accurately in their reports.

5. [Purging Data from Recruiting Advanced Analytics \[page 1487\]](#)  
If the customer would like to change their status mappings, if data was loaded in error, or if their jobs were patched incorrectly, you can purge the relevant data and start again from scratch.
6. [Uploading Job Patch Files for Recruiting Advanced Analytics \[page 1489\]](#)  
Customers can use a job patch to add data associated with requisitions that is not otherwise available in Recruiting Advanced Analytics. For example, a job patch file can pull in Recruiter or Hiring Manager data that is not available in Recruiting Marketing.
7. [Changing an Integration From Ad Hoc Report and SFTP Method to OData Method \[page 1490\]](#)  
Convert a customer from an existing SFTP integration to the OData integration method by disabling the scheduled SFTP job in Provisioning.
8. [Configuring the SFTP Integration \[page 1491\]](#)  
Use SFTP integration configuration method when you don't want to use OData integration setup for Recruiting Advanced Analytics.

## 27.1.1 Setting Up Prerequisites for Advanced Analytics

Enable specific prerequisite settings in Provisioning and grant role-based permissions so that you can use Advanced Analytics.

### Prerequisites

- Recruiting and Career Site Builder are integrated.
- There's existing Recruiting and Career Site Builder job data.
- Single Sign-On is configured.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Procedure

1. Go to [► Provisioning ► Company Settings ►](#).
2. Go to [Recruiting Marketing](#) and select the following options:
  - [Recruiting Marketing](#)
  - [Enable Job Marketing](#)
  - [Enable Career Site Builder](#)

- [Enable Candidate Account Simplification](#)
3. Enable [Recruiting Marketing Advanced Analytics Permission](#) and [Access Advanced Analytics with Details](#).

You can find the relevant permission under ► [User Permissions](#) ► [Recruiting Permissions](#) ►.

**Task overview:** [Recruiting Advanced Analytics Configuration](#) [page 1475]

**Next task:** [Configuring OData Integration Settings for Recruiting Advanced Analytics](#) [page 1477]

## Related Information

[Using Role-Based Permissions](#)

## 27.1.2 Configuring OData Integration Settings for Recruiting Advanced Analytics

Advanced Analytics Recruiting uses OData to integrate source data from Career Site Builder with applicant status data from SAP SuccessFactors Recruiting.

### Prerequisites

- SAP SuccessFactors Recruiting and Career Site Builder are integrated with job data.
- Recruiter single sign-on turned on in Command Center.
- Command Center

#### Note

As a customer, you don't have access to Command Center. To complete tasks in Command Center, contact your implementation partner or your Account Executive. For any non-implementation tasks, contact Technical Support.

### Procedure

1. Go to the Recruiting Command Center's [Site List](#) page and select  from the [Recruiting Advanced Analytics](#) column for the site.
2. Select [Integration Settings](#).

Confirm that the default [OData](#) option is selected when the [Integration Settings](#) screen loads.

- Go to [Notify](#) field and enter the email address of the individual who's going to monitor the data.

Use the consultant email address during implementation, but the customer administrator's email address at go-live.

#### → Remember

Use a semicolon to separate multiple email addresses. Emails are sent out for status-mapping email notifications. All unmapped statuses must be mapped before data loads into Advanced Analytics. Emails aren't validated.

- Go to [Frequency](#) to select any of the following choices:

| Frequency Configuration Options | Steps and More Information                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Day</a>             | <p>Data processes daily.</p> <div> <p>→ Recommendation</p> <p>Since data can take time to synchronize, select <a href="#">Day</a> for the frequency that you want to retrieve the applicant status information from Recruiting Management.</p> </div>                                                                                                            |
| <a href="#">Week</a>            | <p>When selected, you can choose which day of the week to process the applicant status information.</p> <p>Select which day of the week you'd like your data to synchronize from the <a href="#">On</a> dropdown list.</p>                                                                                                                                       |
| <a href="#">Month</a>           | <p>When selected, you can select which day of the month you want your data to synchronize.</p> <div> <p>❖ Example</p> <p>Days are indicated as <a href="#">Day 1</a>, <a href="#">Day 6</a>.</p> </div> <div> <p>→ Recommendation</p> <p>Consider implementing different customers on different days to avoid a long processing time on certain days.</p> </div> |

- Select the checkbox in the [Get Data](#) field when you want to enable the integration.
- Select the checkbox in the [Process Data](#) field when you want to enable data processing once loaded in Advanced Analytics.
- Select [Save](#) to finish.

#### 📌 Note

Data is synchronized at 12:00 p.m. regardless of which dates you choose. Be sure you add one more day to your end date.

The data is retrieved at 12:00 p.m. and processed at 1:00 p.m. in the data center's local time on the scheduled date. Each subsequent time the process runs, it retrieves data going back to the end of the last run date.

8. **Optional:** Add data for a specified date period by configuring the [Get Data One Time](#) option if you don't want to wait until the next synchronization date.
  - a. Go to [Get Data One Time](#) and select the start date from the [Begin](#) dropdown list.
  - b. Select the end date from the [End](#) dropdown list.

## Results

You've completed the OData integration settings for Recruiting Advanced Analytics.

**Task overview:** [Recruiting Advanced Analytics Configuration \[page 1475\]](#)

**Previous task:** [Setting Up Prerequisites for Advanced Analytics \[page 1476\]](#)

**Next:** [Career Site Builder Status Mappings in Advanced Analytics \[page 1479\]](#)

## Related Information

[Changing an Integration From Ad Hoc Report and SFTP Method to OData Method \[page 1490\]](#)

### 27.1.3 Career Site Builder Status Mappings in Advanced Analytics

You map your candidate status from SAP SuccessFactors Recruiting with the correct Career Site Builder statuses for Recruiting Advanced Analytics integration.

Five standard statuses are displayed within Advanced Analytics; all are mapped to these statuses:

- [Apply Completed](#)
- [Qualified](#)
- [Interviewed](#)
- [Offer Made](#)
- [Hired](#)
- [ATS Capture](#) – used to map statuses you want to keep hidden.

#### Note

There's a 50-character limit for candidate status names in Advanced Analytics

All statuses must be mapped. When there are multiple **not hired** statuses, all of them must be mapped to a status; usually reports.

You can have more candidate statuses in [ATS Capture](#). However, when you've used prescreening questions to disqualify candidates, map [Auto Disqualified](#) status in Recruiting with [Apply Completed](#).

When statuses aren't mapped when integration with Advanced Analytics runs, the synchronization can fail.

Status mappings are done when there's candidate data associated with each status in Applicant Management. Depending on how your status sets are defined, there are multiple candidate statuses that map to a single Career Site Builder status in Advanced Analytics.

You have to take a new requisition with a new candidate through **every single status** in the recruiting process before you can start the mapping process. Advanced Analytics generates incomplete reports when candidates don't go through every single status in the recruiting management process that results in missed statuses. We recommend putting through combination of candidates who pass through recruiting statuses that line up with Career Site Builder.

**Parent topic:** [Recruiting Advanced Analytics Configuration \[page 1475\]](#)

**Previous task:** [Configuring OData Integration Settings for Recruiting Advanced Analytics \[page 1477\]](#)

### 27.1.3.1 Advanced Analytics Status Mapping Table

The table in this topic contains common candidate statuses of your candidate status from SAP SuccessFactors Recruiting with the correct Career Site Builder statuses for RecruitingAdvanced Analytics

#### Note

The table contains the most frequently used SAP SuccessFactors Recruiting Management candidate statuses and isn't a complete list of available statuses you can map for Advanced Analytics.

When viewing this topic in a web browser, you can filter and sort on the column, show or hide columns, or use full-text search to find what you are looking for. For example, if you want to filter your results by Recruiting Management candidate status, select the filter link for that column to view information for the status that you want.

Mapped Candidate Statuses Between SAP SuccessFactors Recruiting Management and SAP SuccessFactors Career Site Builder for Advanced Analytics

| Recruiting Candidate Status | Career Site Builder Status | Career Site Builder Status Description                                              |
|-----------------------------|----------------------------|-------------------------------------------------------------------------------------|
| Default                     | Apply Completed            | Candidate completed the job application, and it's been submitted for consideration. |

| Recruiting Candidate Status                                                                                                                                    | Career Site Builder Status | Career Site Builder Status Description                     |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|------------------------------------------------------------|

## 27.1.3.2 Advanced Analytics Status Mapping Exceptions

When you map SAP SuccessFactors Recruiting statuses for Advanced Analytics, there's number of statuses that aren't mapped.

### Preapplication SAP SuccessFactors Recruiting Statuses

Preapplication statuses doesn't appear for mapping in Advanced Analytics and don't need to be mapped:

- Forwarded
- Invited to Apply

## Internal Career Site Builder Statuses

These internal Career Site Builder aren't mapped:

|                        |                                    |
|------------------------|------------------------------------|
| <i>Unknown</i>         | <i>Qualified: Recruiter Screen</i> |
| <i>Visit</i>           | <i>Qualified: Business Screen</i>  |
| <i>Subscribe</i>       | <i>Qualified: Technical Screen</i> |
| <i>Apply Started</i>   | <i>HM Interviewed</i>              |
| <i>ATS Capture</i>     | <i>Interviewed</i>                 |
| <i>Apply Completed</i> | <i>Offer Made</i>                  |
| <i>Not Qualified</i>   | <i>Hired</i>                       |
| <i>Qualified</i>       | <i>Not Hired</i>                   |

### 27.1.3.3 Setting Up Mapping of Candidate Statuses for Recruiting Advanced Analytics

Applicant data in a Recruiting Advanced Analytics report can have one of six possible statuses, coming from the SAP SuccessFactors Recruiting system. Map them to ensure that the correct status appears.

## Prerequisites

- SAP SuccessFactors Recruiting and Career Site Builder are integrated.
- Implemented both Recruiting and Career Site Builder Job Data.
- Requisitions with candidates are mapped through every status in Recruiting.
- Configured Recruiter Single Sign-On.
- Command Center

#### Note

As a customer, you don't have access to Command Center. To complete tasks in Command Center, contact your implementation partner or your Account Executive. For any non-implementation tasks, contact Technical Support.

## Context

### ⚠ Caution

You can't edit a status after you've selected [Save](#). The only way to remap a status is to purge completely and reload all the status data.

### → Tip

Requisitions with candidates must go through **every single status** in the recruiting process before you can map in Advanced Analytics. You miss statuses if you don't do this, which results in Advanced Analytics generating reports using incomplete data. You don't need to have separate candidates residing in every status, but you need a combination of candidates who have passed through every status in the system. You need multiple candidates because a single candidate can't pass through all statuses (for example, a candidate who's automatically disqualified can't then be hired). Make sure that all statuses in all status sets are mapped.

## Procedure

1. From the Recruiting Command Center's [Site List](#) page, select  from the [Recruiting Advanced Analytics](#) column for the site that takes you to the [Advanced Analytics Admin](#) page, then select  [Status Mapping](#) .
- The [Unmapped Status](#) section displays, and you see the customer statuses that were automatically pulled from Recruiting Management.
2. Go to the [RMK Status](#) column to select the appropriate status to map with the customer status that you want.
3. Select [Save](#) to finish.

### 📘 Note

Consult with your customer to move each unique unmapped status to the [Mapped Status](#) section. For recommended mappings, refer to related links for more information. Recruiting Advanced Analytics doesn't work until you move all unmapped statuses into the [Mapped Status](#) section.

## Results

The customer statuses are now mapped to one of the Recruiting Advanced Analytics status options.

## 27.1.3.4 Running Application Status Audit Trail Report to Verify Mapped Statuses

You can verify your mapped statuses by running an [App Status Audit Trail](#) report using [Report Center](#)

### Prerequisites

- [Report Center](#) enabled.
- All [Report Center](#) role-based permission.

#### Note

You can find relevant permission under ► [Admin Permissions](#) ► [Manage Dashboards](#) ► or ► [User Permissions](#) ► [Reports Permission](#) ►. Refer to related link for more information about [Report Center](#) role based permissions.

### Context

#### Note

This topic doesn't cover how to use [Classic View Reports](#).

For more information on reports and the Report Center, refer to *Implementing Report Center* (which includes role-based permissions), *Using Report Center*, and *Table Reports*.

### Procedure

1. Go to ► [Start Menu](#) ► [Reporting](#) ► that opens up [Report Center](#).
2. Select [New](#).  
The [New](#) dialog box opens.
3. Select [Report - Table](#) template.
4. Select [Single Domain](#).
5. Go to [What data would you like to start with?](#) menu and choose [Recruiting V2](#).
6. In the [General Info](#) tab, enter the name of your report and the priority.
7. Go to [Columns](#) tab and select [Select Columns](#).

When selected, the [Select Columns](#) button opens a dialog where you can add columns that you want.

8. Select the following column and sub-columns:

| Primary Column                         | Additional Available Columns       |
|----------------------------------------|------------------------------------|
| <a href="#">App Status Audit Trail</a> | <a href="#">Application Status</a> |
| <a href="#">Application</a>            | <a href="#">Job Req ID</a>         |
| <a href="#">Candidate</a>              | <a href="#">Candidate ID</a>       |

### Note

You can add additional columns that you want to view in your report.

9. Select [Done](#).

10. Go to the [Filters](#) tab.

11. Select [Add Filter Group](#) [Refine Criteria](#).

When selected, [Refine Criteria](#) opens up the [Select Filter](#) dialog.

12. Select [Candidate Type](#).

When selected, [Candidate Type](#) opens up the [Define Candidate Type Filter](#) dialog.

13. Go to the [By Rule](#) [Add Rule](#).

When selected, the [Add Rule](#) button opens up the conditions line.

14. Select [Equal to](#) [External](#).

15. Select [Done](#) to save your filter.

16. Select [Done](#) again when you're directed back to the [Select Filter](#) dialog box.

17. Select [Preview](#) to review the report.

18. Choose [Save](#) to save your report without running it.

19. Choose [Generate](#).

When selected, the [Generate](#) opens the your report.

20. Select any of the following download options:

- [CSV](#)
- [Excel](#)
- [PDF](#)
- [PPT](#)

21. Select [Close](#).

## 27.1.4 Changing Field Labels for Recruiting Advanced Analytics

The labels the customer sees in Recruiting Advanced Analytics and the field names in Recruiting Marketing aren't identical. You can customize the label names in the Recruiting Advanced Analytics when customers want the labels to represent the field data more accurately in their reports.

### Prerequisites

- Recruiting Management and Career Site Builder are integrated.
- Implemented both Recruiting Management and Career Site Builder Job Data.
- Configured Recruiter Single Sign-On.
- You have access to Command Center and Provisioning.

#### Note

As a customer, you don't have access to Command Center or Provisioning. To complete tasks in Command Center or Provisioning, contact your implementation partner or your Account Executive. For any non-implementation tasks, contact Technical Support.

- Become familiar with the customer's existing field names and job mapping under ► [Admin Center](#) ► [Manage Recruiting](#) ► [Set Up Recruiting Marketing Job Field Mapping](#) ►.

### Context

#### Note

Changing a field label for Recruiting Advanced Analytics is cosmetic, and doesn't alter any of your data or the field names in the database.

### Procedure

1. From the Recruiting Command Center's [Site List](#) page, select  from the [Recruiting Advanced Analytics](#) column for the site, then select [Field Label Customization](#).
2. Enter the new field name for any of the fields on the screen, and save when you're done.

Only those fields that appear on the [Field Label Customization](#) screen are available for new labels. You can't add or remove fields from this screen.

#### Note

Leave the field label blank for fields that doesn't contain data or isn't relevant for Recruiting Advanced Analytics. Leaving a field label blank or deleting an existing label keeps that data from being seen in the customer facing reports.

**Task overview:** [Recruiting Advanced Analytics Configuration \[page 1475\]](#)

**Previous:** [Career Site Builder Status Mappings in Advanced Analytics \[page 1479\]](#)

**Next task:** [Purging Data from Recruiting Advanced Analytics \[page 1487\]](#)

## 27.1.5 Purging Data from Recruiting Advanced Analytics

If the customer would like to change their status mappings, if data was loaded in error, or if their jobs were patched incorrectly, you can purge the relevant data and start again from scratch.

### Prerequisites

- Recruiting Management and Career Site Builder are integrated.
- Implemented both Recruiting Management and Career Site Builder Job Data.
- Configured Recruiter Single Sign-On.
- Command Center access.

#### Note

As a customer, you don't have access to Command Center. To complete tasks in Command Center, contact your implementation partner or your Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

Here are some things to keep in mind:

- Only use the [Data Purge](#) option if something major has gone wrong, as all purged data must be completely reloaded.
- The purge cannot be reversed and data must be reloaded.
- Purging data will only affect Recruiting Advanced Analytics and does not impact Recruiting Marketing or Recruiting Management.
- The data purge process can delete Recruiting Management/Applicant Tracking Systems data, job patch data, or both from Recruiting Advanced Analytics. Recruiting Management/Applicant Tracking Systems data can be deleted from a specified date forward. For instance, if data before September 1, 2016 was correct, enter that date to purge any data after that point. Data cannot be purged if you include a specific end date.
- To change or remap a status, you need to carry out a full history Recruiting Management purge in order to unmap the status first.

## Procedure

1. From the Recruiting Command Center's [Site List](#) page, select  from the [Recruiting Advanced Analytics](#) column for the site, then select [Data Purge](#).
2. Select a [Purge Type](#):

| Option                         | Description                                                                                       |
|--------------------------------|---------------------------------------------------------------------------------------------------|
| <a href="#">Job Patch data</a> | Purges data entered into a bad <a href="#">Job Patch</a> load.                                    |
| <a href="#">ATS data</a>       | Purges Recruiting Management/Applicant Tracking Systems data if status mapping occurred in error. |

3. If you chose to purge [ATS data](#), choose when to purge the data.

| Option                                                               | Description                                                                                                                                                                     |
|----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Purge all data</a>                                       | Deletes all of the Recruiting Management/Applicant Tracking Systems data imported into Recruiting Advanced Analytics. Select this option to purge an incorrectly mapped status. |
| <a href="#">Purge only data loaded from a specified data forward</a> | Deletes only data from a certain date forward, retaining data loaded before that date. Do not choose this option if a status was mapped in error.                               |

4. Choose [Begin Purge](#) to delete the selected data. This process may take several minutes to complete.

### → Remember

A data purge is not related to the day selected in the [Integration Settings](#) screen. When data is purged, the system reloads the data at noon in the timezone of the data center, which means data is reloaded within 24 hours. If there is a significant amount of data being loaded, the data may take longer than 24 hours to completely reload. You must manually reload the job patch data, although Recruiting Management/Applicant Tracking Systems data will reload automatically.

**Task overview:** [Recruiting Advanced Analytics Configuration \[page 1475\]](#)

**Previous task:** [Changing Field Labels for Recruiting Advanced Analytics \[page 1486\]](#)

**Next task:** [Uploading Job Patch Files for Recruiting Advanced Analytics \[page 1489\]](#)

## 27.1.6 Uploading Job Patch Files for Recruiting Advanced Analytics

Customers can use a job patch to add data associated with requisitions that is not otherwise available in Recruiting Advanced Analytics. For example, a job patch file can pull in Recruiter or Hiring Manager data that is not available in Recruiting Marketing.

### Prerequisites

- Recruiting Management and Career Site Builder are integrated.
- Implemented both Recruiting Management and Career Site Builder Job Data.
- Configured Recruiter Single Sign-On.
- You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- Met all the requirements for uploading job patch files.

### Procedure

1. Open the Microsoft Excel file you've prepared with all the job patch data.
2. Access the job patch Excel add-in, and select the customer-specific job patch.

#### ⓘ Note

Recruiting Marketing Professional Services must either provide this add-in or perform the procedure themselves.

3. Save the file as a tab-delimited text (.txt) file using the following naming convention:  
**SiteID\_ClientName\_JOB\_YYYY\_MM\_DD.txt.**
4. Open the text file in a text editor. Ensure that none of the values are enclosed with quotation marks by doing a find and replace, replacing any double quotes with NULL.
5. From the Recruiting Command Center's [Site List](#) page, select  from the [Recruiting Advanced Analytics](#) column for the site, then select [Job Patch](#).
6. Select [Browse..](#) to upload your text file.
7. Preview the data in the [Job Patch](#) window to ensure that the data is properly aligned with the header columns.
8. Click [Save](#) to save the job patch data. If you exit before saving, your job patch data is not be processed.

**Task overview:** [Recruiting Advanced Analytics Configuration \[page 1475\]](#)

**Previous task:** [Purging Data from Recruiting Advanced Analytics \[page 1487\]](#)

**Next task:** [Changing an Integration From Ad Hoc Report and SFTP Method to OData Method \[page 1490\]](#)

## 27.1.7 Changing an Integration From Ad Hoc Report and SFTP Method to OData Method

Convert a customer from an existing SFTP integration to the OData integration method by disabling the scheduled SFTP job in Provisioning.

### Prerequisites

- You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- Configure the *Integration Settings*.

### Procedure

1. Log in to *Provisioning* and select the customer from your *List of Companies*.
2. Select *Manage Scheduled Jobs* from the list.
3. Find *RMK Analytics Monthly Feed* in the list of jobs.
4. From the *Actions* dropdown, select *Disable*.

**Task overview:** [Recruiting Advanced Analytics Configuration \[page 1475\]](#)

**Previous task:** [Uploading Job Patch Files for Recruiting Advanced Analytics \[page 1489\]](#)

**Next task:** [Configuring the SFTP Integration \[page 1491\]](#)

### Related Information

## 27.1.8 Configuring the SFTP Integration

Use SFTP integration configuration method when you don't want to use OData integration setup for Recruiting Advanced Analytics.

### Prerequisites

- You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- You have configured Recruiter SSO.
- You have a working integrated instance between Recruiting Management and the career site.

### Context

#### ⚠ Caution

This information is deprecated, and is provided for reference purposes for customers who have an existing Advanced Analytics configuration using SFTP, and who aren't yet ready to integrate using OData.

Using SFTP requires access to log on to the SuccessFactors instance, [Provisioning](#), and the SuccessFactors SFTP instance. Only configure the SFTP integration, if the customer requires a custom header row.

### Procedure

1. From the Recruiting Command Center's [Site List](#) page, select  from the [Recruiting Advanced Analytics](#) column for the site, then select [Integration Settings](#).

#### 📌 Note

If an error message occurs, your instance isn't configured correctly. Troubleshoot the error message to resolve the issue.

2. Ensure [SFTP](#) is selected when the [Integration Settings](#) screen loads.

### Note

If the *OData* option for *Integration Type* is selected, the customer isn't a legacy customer as *OData* was configured and is working. If this is a new Recruiting Marketing Advanced Analytics implementation, stop and follow the process for configuring OData integration.

If the *SFTP* option for *Integration Type* is selected, there's already an SFTP integration configured. In this case, don't to break the existing integration.

3. Complete the *Integration Settings*, then click *Save*:

| Option                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Config Site Name</i> | System-generated; don't change.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <i>System Name</i>      | System-generated; don't change.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <i>Header Row</i>       | System-generated; don't change.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <i>SFTP Credentials</i> | Enter the SFTP logon ID and password of the customer into <i>SFTP Credentials</i> . These credentials are for the SFTP account where the data can be found after it was extracted from Recruiting Marketing through a scheduled job. These should be the same credentials that were entered into the scheduled job in Provisioning.                                                                                                                                                   |
| <i>Remote Directory</i> | Make sure that the default value is set to <i>/RMK/To_RMK/</i> , and don't change it. This is the directory where the files are stored for Recruiting Advanced Analytics processing. This value is only modified in custom configuration scenarios.                                                                                                                                                                                                                                   |
| <i>Notify</i>           | <p>Enter e-mail addresses for anyone who anyone wants to monitor the data, such as the implementation consultant, as well as the customer.</p> <p>Everyone added in <i>Notify</i> receives daily notification emails if a status is unmapped. The emails stop once the status becomes mapped or the <i>Process Data</i> box isn't selected.</p> <p>Separate multiple e-mail addresses with semicolons. There's no way to validate an e-mail, so enter it carefully and correctly.</p> |
| <i>Get Data</i>         | Select to enable the integration.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>Process Data</i>     | Select the checkbox.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

→ Recommendation

If you don't select this option, unmapped statuses may go unnoticed because nobody gets daily e-mail notifications.

## Results

Once the form has been saved, the integration is configured.

The data is retrieved at 12:00 PM and processed at 1 AM in the data center's local time on the scheduled date. If it's a new integration, the first time the integration runs, it retrieves available data from 1/1/2010 to the present. Each subsequent time the process runs, it retrieves data going back to the beginning of the last run date.

**Task overview:** [Recruiting Advanced Analytics Configuration \[page 1475\]](#)

**Previous task:** [Changing an Integration From Ad Hoc Report and SFTP Method to OData Method \[page 1490\]](#)

## 27.1.8.1 Adding Reports to Advanced Analytics Using the SAP SuccessFactors HCM suite

Add reports to the SuccessFactors instance to configure SFTP integration, so that you can set up an Ad-hoc Report and schedule job in Recruiting Management to complete SFTP integration.

### Prerequisites

Engage with Professional Services to get the report.

### Context

#### ⚠ Caution

This information is deprecated, and is provided for reference purposes for customers who have an existing Advanced Analytics configuration using SFTP, and who are not yet ready to integrate using OData.

### Procedure

1. Place the report **report\_RMK\_Analytics.sfr** on your system from where you can find it for later use.
2. Log on to the SAP SuccessFactors instance of the customer.
3. Go to ► [Analytics](#) ► [Reporting](#) ► [Ad Hoc Reports](#) ►.
4. Click [Upload Report](#).
5. Enter **RMK Analytics - do not modify** in the [Report Name](#) field.
6. Click ► [Save](#) ► [Back to Ad Hoc Reports](#) ► [OK](#) ► after the report loads.
7. Find the **RMK Analytics - do not modify** report in the list, and click the report name to run it.
8. Click [Generate Report](#).

### Results

All the cells are populated in the generated report. Blank cells might mean that the Recruiting module in the customer instance is not live yet and the configuration does not work.

## 27.1.8.2 Scheduling Recruiting Management to Recruiting Advanced Analytics Data Export

Set up an Ad-hoc Report and scheduled job in Recruiting Management to complete the SFTP integration.

### Prerequisites

You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

#### ⚠ Caution

This information is deprecated, and is provided for reference purposes for customers who have an existing Advanced Analytics configuration using SFTP, and who aren't yet ready to integrate using OData.

Recruiting Advanced Analytics is a combination of career site and Applicant Status Tracking (ATS) data. This ATS can be Recruiting Management or another third-party ATS. To use Recruiting Management with Recruiting Advanced Analytics, set up an Ad-hoc Report and scheduled job in Recruiting Management to transfer data from one product to another.

### Procedure

1. Go to ► [Provisioning](#) ► [Managing Job Scheduler](#) ► [Manage Scheduled Jobs](#) ► [Create New Job](#) ►.
2. Enter the required job information in the [Job Definition](#) section.

| Field     | Value                      |
|-----------|----------------------------|
| Job Name  | RMK Analytics Monthly Feed |
| Job Owner | SuccessFactors Admin ID    |
| Job Type  | Ad Hoc Reports Extract     |

3. Enter the [Job Parameters](#).
  - a. In the [Report id](#) field, select your report ID, **RMK Analytics - do not modify**.

- b. Select the second *Take Action* option, then select *Edit*.
  - c. Enter **`${startOfCurrentMonth}`** as the *Expression*, then select *OK*.
  - d. Select **CSV** in the *Report Format* dropdown field.
  - e. Select the *File available in FTP?* checkbox.
4. Enter the FTP information in the *Server Access* section:

| Option                 | Description                                         |
|------------------------|-----------------------------------------------------|
| <b>Host Address</b>    | Select <i>SF hosted SFTP server</i> .               |
| <b>FTP Login</b>       | Enter the customer's FTP login ID.                  |
| <b>FTP Password</b>    | Enter the customer's FTP password.                  |
| <b>SFTP Protocol</b>   | Select <i>SFTP Protocol</i> checkbox.               |
| <b>Test Connection</b> | Click and verify that the connection is successful. |

5. Enter the file information in the *File Access* section:

| Option                 | Description                                                                                                                                                                    |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>File Path</b>       | Enter <b><code>/RMK/To_RMK</code></b> .                                                                                                                                        |
| <b>File Name</b>       | Enter, for example, <b><code>320_SuccessFactors_ATS_\$DATE.csv</code></b> . This value is formatted as <b><code>[customer site ID]_[customer name]_ATS_\$DATE.csv</code></b> . |
| <b>Date Format</b>     | Select <b>yyyyMMdd</b> format from the dropdown.                                                                                                                               |
| <b>File Encryption</b> | Select <i>None</i> .                                                                                                                                                           |

6. Set up at the job schedule in *Job Occurrence & Notification*:

| Option                              | Description                                                            |
|-------------------------------------|------------------------------------------------------------------------|
| <b>Occurrence</b>                   | Select <i>Recurring</i> .                                              |
| <b>Recurring Pattern</b>            | Monthly, 2 days of every month                                         |
| <b>Start Date</b>                   | The current date in <b>MM/DD/YYYY</b> format and a time in the future. |
| <b>Additional E-mail Recipients</b> | Add any desired additional e-mail recipients.                          |
| <b>Send E-mail when job starts</b>  | Leave unchecked.                                                       |

7. Select *Create Job*.
8. Return to *Manage Scheduled Jobs* and select *RMK Analytics Monthly Feed* from the list of available jobs. In the *Actions* dropdown, select *Run it Now*, then click *OK*.
9. Change the start date parameter by selecting *RMK Analytics Monthly Feed* from the list of available jobs, then selecting **► Actions ► Edit ►**. Enter the expression **`${startOfPreviousMonth}`** and click *OK*.
10. Select **► Update Job ► Submit Now ►** from the bottom of the screen.

## 27.2 Advanced Analytics Administration

The charts and graphs in the Advanced Analytics tool allows you to measure candidate sourcing trends. They allow you to view data by measure and give you the ability to cut your data across various dimensions to reveal specific data trends.

Use this tool to see how effective your sourcing strategies are, from visit to hire, over a period of time. By dynamically capturing career site and application status data, advanced analytics can help you to determine the cost of hiring a candidate and which tools generate the best return on your investment.

When you open Advanced Analytics, the default view displays your sourcing data in an unfiltered, or at the most general state. The columns in your data set table represent measures that you can use to analyze your data and the rows represents a data dimension of data that you can use to narrow your set of candidate sourcing data. You can customize your view of the data set table by selecting the settings icon and defining the columns that you want to use to analyze your data. In the *Time Period* area you can determine the period of time for the data that you want to display.

### Advanced Analytics Report Columns [page 1497]

Candidate statuses from SAP SuccessFactors Recruiting are mapped to five statuses in Advanced Analytics that appear as report columns by default. There are additional columns that appear due to Career Site Builder activity.

### Advanced Analytics Career Site Source and Applicant Data Filters [page 1498]

You can filter your reports by specific career site and applicant data, the table lists the available source data you can drill down in Advanced Analytics.

### Using Advanced Analytics Filters [page 1499]

You can use a combination of filters and subfilters that allow you to drill down sourcing data to define the information you want to view in Advanced Analytics.

The graphical component in Advanced Analytics displays trend lines that can help you visualize sourcing data trends over period of time.

## 27.2.1 Advanced Analytics Report Columns

Candidate statuses from SAP SuccessFactors Recruiting are mapped to five statuses in Advanced Analytics that appear as report columns by default. There are additional columns that appear due to Career Site Builder activity.

The table contains information about the available report columns you can use for your reports:

| Report Column         | Activity Source               | Description                                                                                                                                                                                                                                                                                                                 |
|-----------------------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Visits                | Career Site Builder           | Visits occur when a candidate passes from a source to your system and are recorded each time this line is crossed. Visits aren't recorded when a candidate navigates to different pages inside the your system.                                                                                                             |
| Subscriptions         | Career Site Builder           | Subscriptions are when candidates join your talent community. Candidates join the community by signing up for job emails or by completing the <a href="#">Create an Account</a> page when applying for a job or when they join <a href="#">The Talent Community</a> . A candidate can only join your Talent Community once. |
| Application Started   | Career Site Builder           | An Apply Start happens when a candidate clicks through the Apply Now section for a job on your system. If a candidate applies for multiple jobs during the same session, multiple Apply Starts are counted. If they apply to the same job multiple times however, it's only one Apply Start.                                |
| Visit Conversion      | N/A                           | Calculates visit conversion rate.                                                                                                                                                                                                                                                                                           |
| Application Completed | SAP SuccessFactors Recruiting | Apply Completes happen in your when a candidate submits an application for a job. Depending on where you're looking, in Advanced Analytics, Apply Completes may or may not include candidates that didn't come to you via your system.                                                                                      |
| Apply Conversion      | N/A                           | The percentage of candidates that completed their applications.                                                                                                                                                                                                                                                             |
| Qualified             | SAP SuccessFactors Recruiting | Candidates that pass the initial screening for a job that they applied for.                                                                                                                                                                                                                                                 |

| Report Column | Activity Source               | Description                                                                                                                                                                                                                                                                              |
|---------------|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interviews    | SAP SuccessFactors Recruiting | An Interview equates to an Interview status being recorded in your Applicant Tracking System for a candidate. Even if a candidate goes through multiple rounds of interviews, only one is recorded in Advanced Analytics per candidate per job.                                          |
| Offers        | SAP SuccessFactors Recruiting | If an offer is extended to a candidate and you track Offers in your Applicant Tracking System separately from Hires, it's included in your Offers number. If you don't track Offers separately from Hires, Advanced Analytics uses your number of Hires as the number of Offers as well. |
| Hires         | SAP SuccessFactors Recruiting | Hires are those candidates who receive a Hired status in your Applicant Tracking System. If your Hire count is lower in Advanced Analytics than you expect, a possible cause is that you're changing Hired candidate email addresses.                                                    |
| Source Cost   | N/A                           | Calculates the cost of sourcing.                                                                                                                                                                                                                                                         |
| Cost/Visit    | N/A                           | Calculates cost per visit based on sourcing data.                                                                                                                                                                                                                                        |
| Cost/Apply    | N/A                           | Calculates the cost to application based on sourcing data.                                                                                                                                                                                                                               |

In addition to viewing these data measures by source type, you can view their averages by selecting [Display options > Show averages](#). This provides you with averages for each column, rather than by source type, and lets you see the average number of visits per hire, application starts per hire, application completions per hire, qualified persons per hire, interviews per hire, offers per hire, and hires per hire. Knowing what these averages look like is important because not all sources are created equal, and the average column shows you the averages.

## 27.2.2 Advanced Analytics Career Site Source and Applicant Data Filters

You can filter your reports by specific career site and applicant data, the table lists the available source data you can drill down in Advanced Analytics.

| Source Data Filter Name                                                                                                                                                                 | Description                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| <i>Source Type</i>                                                                                                                                                                      | The sourcing entry point such as, email, social media, or direct contact associated with the sourcing data. |
| <div>  <b>Note</b><br/> <i>Source Type</i> is the default report filter for Advanced Analytics. </div> |                                                                                                             |
| <i>Source Engine</i>                                                                                                                                                                    | The website that's associated with your candidate sourcing data.                                            |
| <i>Campaign Tag</i>                                                                                                                                                                     | The campaign tag associated with your sourcing data.                                                        |
| <i>Department</i>                                                                                                                                                                       | The department associated with your sourcing data.                                                          |
| <i>Requisition #</i>                                                                                                                                                                    | The requisition number that is linked to your sourcing data.                                                |
| <i>Quarter</i>                                                                                                                                                                          | The quarter that the sourcing data is linked to.                                                            |
| <i>Date</i>                                                                                                                                                                             | The date associated with the sourcing data.                                                                 |
| <i>Job State</i>                                                                                                                                                                        | The state or region associated with the sourcing data.                                                      |
| <i>Category</i>                                                                                                                                                                         | The category associated with the sourcing data.                                                             |
| <i>Job Title</i>                                                                                                                                                                        | The job title associated with the sourcing data.                                                            |
| <i>Year</i>                                                                                                                                                                             | The year associated with the sourcing data.                                                                 |
| <i>Month Number</i>                                                                                                                                                                     | The month associated with the sourcing data.                                                                |
| <i>Job Country/Region</i>                                                                                                                                                               | The country/region code associated with the sourcing data.                                                  |
| <i>Job City</i>                                                                                                                                                                         | The city associated with the sourcing data.                                                                 |
| <i>Brand</i>                                                                                                                                                                            | You can view data associated with specific brand.                                                           |

## 27.2.3 Using Advanced Analytics Filters

You can use a combination of filters and subfilters that allow you to drill down sourcing data to define the information you want to view in Advanced Analytics.

### Procedure

1. In the SAP SuccessFactors system, go to ► [Recruiting](#) ► [Advanced Analytics](#) ►.
2. In the [Time Period](#) section, select the time period that of data that you want to measure.
3. Click the down arrow next to [Source Type](#) and choose the dimension of sourcing data that you wish to view. The following example displays the list of possible measures. Your dimension names differ if you've modified them during configuration.

# Advanced Analytics

[Browser](#)
[Detail Query Tool](#)

Time Period:

Rolling Year

Source Type

Source Type

Source Engine
Campaign Tag
Category
Department
Job Title
Requisition #
Year
Quarter
Month Number
Date
Job Country
Job State / Region
Job City

| S  | Visit | S |
|----|-------|---|
|    | 46    | 3 |
|    | 500   | 5 |
|    | 8     | 0 |
|    | 0     | 6 |
|    | 5     | 0 |
|    | 254   | 1 |
|    | 0     | 0 |
| TC | 813   | 7 |

Selecting additional dimensions adds to your drill path, allowing you to narrow your data set and retrieve more and more specific data. Each dimension you select, displays in real time and in the order that you chose them. Additionally, you can select a new dimension from the drill path by clicking the arrow for any of your selected dimensions. The following example shows three selected dimensions: Quarter, department, and source engine.

The information in the table updates dynamically or in real time to reflect the data set you defined.

- [Optional] Change the sort order of the data set when you choose the down arrow for any source type and selecting a different type.

## 27.2.4 Visualizing Data with Graphs in Advanced Analytics

The graphical component in Advanced Analytics displays trend lines that can help you visualize sourcing data trends over period of time.

### Procedure

- In the Advanced Analytics browser window, define the *Time Period*.
- Select a measure from the *Source Type* area.

The sourcing data for the measure you've chosen displays.

- To visualize the row of data, click the graph icon.

Visual graphs appear vertically on the right of the data set table for all columns with a value for your selected month. You can compare data in the graph by selecting multiple rows of data. Each column in the data table has a corresponding graph and represents the time period you defined for your data set.

- Customize your display with additional actions and your actions display on the graphic in real-time:

| Action                   | Behavior                                                                        |
|--------------------------|---------------------------------------------------------------------------------|
| Hover on a line          | Hovering over a line in the graph allows you to see the values for the column.  |
| Select additional months | When you select multiple months, they appear as additional lines in the graphs. |

| Action                                      | Behavior                                                                                                                                                                                                            |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Click on a month in a graph</b>          | The line representing the month for that specific graph is removed from the view, and the month you clicked becomes grayed out. This is a toggle; click the month name in the graph again to make the line visible. |
| <b>Click <a href="#">Year over year</a></b> | This populates the graphs with lines for all 12 months for your defined time period.                                                                                                                                |
| <b>Click the expand graph icon</b>          | Selecting the small square icon with arrows pointing outward, located to the right of the <a href="#">Year over year</a> . This hides the table and expands the graph view. Use this to see the graph details.      |

The following shows an example of graphs where the measure is set to [Month](#) and sourcing data for January, March, and November is selected, and the time period is January 2, 2014 to December 31, 2018:

Advanced Analytics Example

## 28 REST API to Check for Existing Candidate

The `candidateExistence` REST API helps to check whether a candidate is already part of the system. The check is performed for both internal and external candidates. For an external candidate, the validation is done using the candidate email address. You can use this API to check for 20 candidate email addresses in a single request. The `CandidateExistence` API only returns the email addresses of candidates who exist in the system. To check if an internal candidate exists in the system, you must include `userSSysId` as part of the payload.

For example, if you're checking for 20 candidate email addresses and only 14 exist in the system, then the results only display 14 email addresses. The remaining 6 don't appear as part of the response.

### Permissions

► [Manage Permission Roles](#) ► [Recruiting Permissions](#) ► [OData API Candidate Export](#) ►

**Use Case:** Check whether the candidate exists in the system using their email address.

### Request

|             |                                                                                                                           |
|-------------|---------------------------------------------------------------------------------------------------------------------------|
| HTTP Method | POST                                                                                                                      |
| URI         | Endpoint: <code>https://&lt;api-server&gt;/rest/recruiting/candidate/v1/candidateExistence/checkIfCandidatesExists</code> |

**Expected media type:** JSON

### Request Example

```
[  
  "candidate01@example.com",  
  "candidate02@example.com",  
  "candidate03@example.com",  
  "candidate04@example.com"  
]
```

**Result:** Return results are displayed only if the candidate already exists in the system.

## Response

### Response Payload:

```
{
  "emails": [
    "candidate02@example.com",
    "candidate03@example.com",
    "candidate04@example.com"
  ]
}
```

# 29 Maintaining the Recruiting System

## 29.1 Data Protection and Privacy in Recruiting

SAP SuccessFactors Recruiting includes comprehensive data protection and privacy features that are common to the entire SAP SuccessFactors HCM suite. It also supports similar, older features that are available for Recruiting only.

### Leading Practice for Data Protection and Privacy

Data protection and privacy works best when it's implemented for the entire suite, not product-by-product. We've centralized information about how to set up and use the latest data protection and privacy features for the SAP SuccessFactors HCM suite in a central guide.

#### → Recommendation

We highly recommend using the features described in the central *Data Protection and Privacy* guide.

### Older Features

Existing Recruiting customers sometimes use older data protection and privacy features that are available for Recruiting only and that have less comprehensive functionality. For now, Recruiting still supports the use of older versions of the Data Privacy Consent Statement (DCPS) and Data Retention Management (DRM) features.

#### → Recommendation

We expect to phase out support for these older features over time. We encourage you to adopt the newer, recommended versions of these features and plan for the eventual retirement of older ones.

### Related Information

[Data Retention Management in Recruiting \[page 1509\]](#)

[Setting Up and Using Data Protection and Privacy](#)

## 29.1.1 Consent Agreements in Recruiting

Consent agreements in Recruiting allow you to inform candidates that their personal data is being stored and explain how that data is handled.

As an administrator, you can use Data Privacy Consent Statements (DPCS) to create the consent agreements for your organization. Candidates must accept this statement before entering their data.

You can track candidates' DPCS acceptance to ensure that they have willingly submitted their data for storage.

### ⓘ Note

Data Privacy Consent Statement has two versions, 1.0 and 2.0. Do **not** implement the deprecated DPCS 1.0 version.

Some existing customers still use DPCS 1.0. We expect to phase out support for this older version over time. If you still use DPCS 1.0, start preparing for its eventual retirement and migrate to DPCS 2.0. Then use DPCS 2.0 to set up consent statements as described in *Setting Up and Using Data Protection and Privacy* in the SAP Help Portal.

## Related Information

[Migrating from DPCS 1.0 to DPCS 2.0 \[page 1506\]](#)

[Setting Up and Using Data Protection and Privacy](#)

### 29.1.1.1 Migrating from DPCS 1.0 to DPCS 2.0

The leading practice to create consent agreements is through DPCS 2.0. If you're still using DPCS 1.0, migrate to DPCS 2.0 and then configure so that candidates can accept the statement before entering the data.

## Prerequisites

- You have access to Provisioning.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Procedure

1. Go to ► [Provisioning](#) ► [Managing Recruiting](#) ► [Edit Candidate Privacy Options](#) ►, and clear all the selections in the [Data Privacy Settings](#) section.

2. Choose [Save Settings](#).

The DPCS 1.0 is now disabled.

3. Go to ► [Provisioning](#) ► [Company Settings](#) ► and select the [Data Privacy Consent Statement 2.0](#) option.

4. Choose [Save Feature](#).

The DPCS 2.0 is now enabled.

5. Go to ► [Provisioning](#) ► [Managing Recruiting](#) ► [Edit Candidate Privacy Options](#) ►.

6. Choose **DPCS 2** in the [Use DPCS Version](#) menu.

7. Select the relevant checkboxes in the [Data Privacy Settings](#) section.

| Setting                                                                                                                 | Description                                                                                                                                                                                                                      |
|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Enable external data privacy agreement setup, and require acceptance on external candidate registration</a> | Prompts external candidates to accept the most current version of the data privacy statement at the point they attempt to create an account or log in after a version change.                                                    |
| <a href="#">Enable internal data privacy agreement setup</a>                                                            | Prompts internal candidates to accept the most current version of the data privacy statement when they click their candidate profile on the <a href="#">Careers</a> tab, if they haven't accepted that version of the statement. |
| <a href="#">Enable intranet data privacy agreement setup</a>                                                            | Prompts intranet candidates to accept the most current version of the data privacy statement when they click the careers tab, if they haven't accepted that version of the statement.                                            |

## Next Steps

Configure DPCS 2.0 for Recruiting to create consent statements.

### ⚠ Caution

DPCS 2.0 is a critical feature and must be evaluated carefully before deactivation. Deactivation of DPCS 2.0 has the following implications:

- Once DPCS 2.0 is enabled, if there are any applications in statuses such as "Deleted on demand by Candidate", "Delete on demand by Admin", or other withdrawn statuses, the feature cannot be turned off. These statuses must be moved out to other applicable statuses before deactivation.
- DPCS 2.0 is tightly integrated with other features such as DRTM Purge, Candidate Search, and Data Retention Management. If these features are enabled, you must also evaluate and disable related configuration switches, accordingly.
- Disabling DPCS 2.0 requires careful handling due to potential data integrity, audit, or consistency issues, necessitating significant support for updating or removing purge rules. This increases the workload for Support and Product teams, demanding more consultative assistance for customers, and is further complicated by limited visibility into internal dependencies and processes.

[Creating Data Privacy Consent Statements](#)

### 29.1.2 Assigning Country/Region Specific Consent Settings

Use the [Country/Region Specific Consent Settings](#) tool to set up the rules for whether job applications can be forwarded to in-progress status when applicants haven't accepted their consent statements.

#### Prerequisites

You have the appropriate role-based permission for ► [Manage Recruiting](#) ► [Country/Region Specific Consent Settings](#) ►.

#### Context

The [Country/Region Specific Consent Settings](#) tool allows you to configure settings based on specific countries/regions.

What you specify in this tool impacts the visibility of some settings for the Recruiting user. For example, the settings here, in the combination with what applicants choose for their [Make My Profile Visible To](#) candidate profile setting, can affect whether a Recruiting user sees the [Allow applicants who have not yet accepted latest DPCS statement](#) setting in the [Forward to Requisition](#) dialog when forwarding applicants to additional job requisitions in the Applicant Management tool.

#### Procedure

1. From the Admin Center, go to [Country/Region Specific Consent Settings](#).
2. To create a new consent setting, choose [+ Add Another](#).
3. Select a country/region from the dropdown list for [Country/Region](#).

If the country/region you want is already configured and you want to change the settings, edit its values instead.

4. Choose the following pass-through types for the new and modified DPCS Pass Through Type columns:
  - [Allow](#) – applications can be moved to in-progress status.
  - [Allow After Confirmation](#) – applications can be moved after the Recruiting user confirms that the applicant is allowed without having accepted the latest statement.
  - [Don't Allow](#) – applicants can't be moved.

5. Save your settings.

## 29.1.3 Data Retention Management in Recruiting

Data Retention Management in Recruiting allows you to define how long candidate and job application data is stored before it can be removed. You can then use it to remove data after the retention time has elapsed.

**Do not** implement version 1.0 of Data Retention Management (DRM), which is deprecated. Use only DRM 2.0.

DRM 2.0 supports two options to anonymize your data:

1. **Data Retention Time Management (DRTM)** – provides comprehensive data protection and privacy across the HCM suite.

### → Recommendation

We highly recommend using DRTM even if you want to anonymize data covered by legacy function. You can refer to *Data Protection and Privacy (DRTM)* guide mentioned in the [Related Information](#) section of this page and configure your instance to use DRTM as per the prerequisites listed there.

2. **Legacy (non-DRTM) Data Retention Management (DRM)** – provides a similar capability, but only for certain types of data and with less thorough results. There won't be any enhancements made to the legacy feature. For more details and prerequisites, refer to the *Data Retention Management (Legacy and Non-DRTM)* guide mentioned in the [Related Information](#) section of this page.

You can use only one Data Anonymization option at the same time.

## DRTM Versus DRM

Know the differences between DRTM and DRM and choose the purge type that suits the need of your company.

| DRTM                                                                                                                                                                                                                                                                                                                                                                | DRM                                                                                                                                                                                                |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| You configure the <b>Country</b> and the <b>Retention period for each country</b> in <a href="#">Manage Data</a> admin tool. When you create a purge request in <a href="#">Data Retention Management</a> tool, you add <b>Country</b> to define the purge criteria and all the associated logic is pulled from the object defined in <a href="#">Manage Data</a> . | You add the <b>Country</b> and <b>Retention Period</b> to the purge criteria directly while creating a new purge request. There's no object definition involved here.                              |
| There's no option to configure <b>All</b> countries in the <a href="#">Manage Data</a> object definition.                                                                                                                                                                                                                                                           | You can configure the same retention period for <b>All</b> countries while creating DRM purge requests.                                                                                            |
| <b>Legal Minimum Obligation Period</b> isn't applicable to DRTM purge requests.                                                                                                                                                                                                                                                                                     | <b>Legal Minimum Obligation Period</b> is applicable only to DRM purge requests. This value will overrule the <b>Retention period</b> value that you provide while creating the DRM purge request. |

## Related Information

## 29.1.3.1 Migrating from DRM 1.0 to DRM 2.0

Migrate from DRM 1.0 to DRM 2.0 so you can use our newest and most comprehensive data retention management features.

### Prerequisites

- You have enabled Data Privacy Consent Statement 2.0 (DPCS 2.0) for Recruiting. Ensure that versions of Data Retention Management and Data Privacy Consent Statements always match.
- You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

### Context

In DRM 2.0, candidate records are anonymized rather than purged and the data is retained for reporting purposes.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Data Privacy Configurations](#) ►.
2. Erase all configured values for the individual countries/regions, for both the Candidate Profile and Application.
3. Save your changes.
4. Go to ► [Provisioning](#) ► [Managing Job Scheduler](#) ► [Manage Scheduled Jobs](#) ►.
5. Remove the existing DRM 1.0 job.
6. Save your changes.
7. Enable and configure data retention and data purge, as described in the *Data Protection and Privacy* guide.

To determine whether you should perform a legacy purge, refer to the *Data Retention Management (Legacy and Non-DRTM)* guide.

## 29.2 Business Rules in Recruiting

You can create custom business rules for your recruiting process.

SAP SuccessFactors Recruiting allows you to assign business rules to Recruiting-related templates, so that when there are changes in the data, the system can respond appropriately at runtime.

Examples of business rules in Recruiting include the following:

- All requisitions that are created for full-time employees in the Sales organization should include a potential calculated commission of 15% of the base salary.
- All offer approvals should have a set expiration date of 30 days after the creation date of the offer approval.

Using business rules in Recruiting automates the process and brings together a number of things that simplify the tasks of the recruiter.

Before you can create a business rule, you first need to set up your Recruiting templates, because you can't do anything with business rules until you have templates to associate them to. Once you've created your templates, you can configure different business rules for the various scenarios you want to create rules for.

The process of setting up business rules involves creating them using Recruiting rule scenario categories in [Configure Business Rules](#), then assigning them to Recruiting templates in [Manage Rules in Recruiting](#). Recruiting business rules don't do anything on their own until you specify them in [Manage Rules in Recruiting](#).

### Note

If you create business rules that include [Country/Region](#) or [State/Province](#) fields to the condition and if it isn't resolving to **true**, one of the reasons can be a change in their ISO codes. For more information about the necessary action, refer to *Actions to Consider When ISO Code Changes for Country/Region or State/Province*.

For more information about how to set up and use business rules or role-based permissions in general, refer to central guides on the SAP Help Portal.

## Related Information

[Using Role-Based Permissions](#)

[Actions to Consider When ISO Code or Label Changes for Country/Region or State/Province \[page 1628\]](#)

## 29.2.1 Enabling Business Rules for Recruiting

Turn on business rules for Recruiting.

### Context

Business rules enable organizations to automate decisions and help an organization achieve its goals. Enabling or disabling these rules gives you control to run only specific rules that are required by your organization.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Recruiting Settings](#) ►.
2. To enable business rules for Recruiting, select [Enable Recruiting Business Rules](#) in the [Business Rules](#) section.  
To disable business rules, deselect it.

## 29.2.2 Creating Business Rules for Recruiting

Create a business rule using the appropriate Recruiting rule scenario category, so that you can assign them to Recruiting templates, to customize and regulate your recruiting process.

### Prerequisites

You have Recruiting templates that were created in the [Recruiting Management](#) tab in ► [Admin Center](#) ► [Manage Templates](#) ►. You can't create a rule for job applications, job offers, or job requisitions unless you already have a template you can assign it to.

You have the following, as described in *Creating Business Rules*:

- [Enable Generic Objects](#) is enabled in Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- You've assigned the corresponding permissions under ► [Administrator Permissions](#) ► [Metadata Framework](#) ►.

In addition, some Recruiting rule scenarios have their own additional prerequisites or requirements. See the topics on candidate profiles, job requisitions, offers, and job applications for details.

## Context

This page describes the process for creating Recruiting-specific business rules and assigning them to Recruiting templates so that you can customize and regulate your recruiting process.

### Note

All new Recruiting-related business rules you create are made using the Recruiting-specific rule scenarios listed in ► [Configure Business Rules](#) ► [Recruiting](#) ►. You can't create **new** business rules using the legacy [Basic](#) option, but if you have any **existing** Recruiting-related business rules that were created using a [Basic](#) rule scenario, they can still be edited and executed.

After you prepare your system for business rules as described in *Implementing Business Rules in SAP SuccessFactors*, you can create and configure business rules for Recruiting.

Follow the instructions for creating conditions, statements, and variables in *Implementing Business Rules in SAP SuccessFactors*, using the configuration information in this section for the various Recruiting-related scenarios.

## Procedure

1. Perform the various prerequisite steps, as described in *Before Configuring Business Rules for Recruiting*.
2. Go to ► [Admin Center](#) ► [Configure Business Rules](#) ►.  
The [Business Rules Admin](#) page appears.
3. Choose + [\(Create New Rule\)](#).
4. Expand the [Recruiting](#) section to choose one of the scenarios for the business rule you want to create, and provide values for the [Rule Name](#), [Rule ID](#), and [Start Date](#) fields, a description of the scenario you're creating, as well as any additional fields specific to the scenario you choose:

| Option                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Configure Business Rules on Candidate Profile</b> | Choose this scenario to create a business rule on the candidate profile.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Job Application: Basic Business Rule Scenario</b> | Choose this scenario to create a business rule on the job application.<br>Select a job requisition template from the <a href="#">Job Requisition Template</a> dropdown list for the business rule you plan to define.                                                                                                                                                                                                                                                                                            |
| <b>Configure Business Rules on Offer Details</b>     | Choose this scenario to create a business rule on offer details, and complete the following: <ul style="list-style-type: none"><li>• <a href="#">Offer Detail Template</a>: Select a template from the dropdown list for the business rule you plan to define.</li><li>• <a href="#">Purpose</a>: Specify how you plan to use this business rule by choosing from the following: <a href="#">Field Change</a> (onChange), <a href="#">Initialize</a> (onInit), or <a href="#">Save</a> (onSave).</li></ul>       |
| <b>Configure Business Rules on Job Requisition</b>   | Choose this scenario to create a business rule on the job requisition, and complete the following: <ul style="list-style-type: none"><li>• <a href="#">Job Requisition Template</a>: Select a template from the dropdown list for the business rule you plan to define.</li><li>• <a href="#">Purpose</a>: Specify how you plan to use this business rule by choosing a <a href="#">Field Change</a> (onChange) rule, <a href="#">Initialize</a> (onInit) rule, or <a href="#">Save</a> (onSave) rule.</li></ul> |

| Option                                                                                                                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Configure AI-Assisted Skills Matching Eligibility for Job Requisition</b>                                                                                    | <p>As a recruiting administrator, you can control which job requisitions will use the AI-assisted Skills Matching feature. The rule is executed when a job requisition is created or updated (onSave). If the job requisition satisfies the criteria defined in the rule, then AI units are deducted when a candidate is hired for that job requisition.</p>                                                                                                                                                                                                                                                                           |
| <p>→ Remember</p> <p>A rule created for this rule scenario must be assigned to an object in <i>Manage Data</i>. See <b>Related Information</b> for details.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Trigger Automatic Initiation of Onboarding</b>                                                                                                               | <p>Use this rule to automatically initiate the onboarding process for specific job requisitions by specifying conditions as per the business requirement.</p> <p>If the rule evaluation executes to <b>True</b>, the onboarding process is automatically initiated for all job applications belonging to the selected job application template. If the rule evaluation executes to <b>False</b>, the onboarding process must be manually initiated for job applications belonging to the specified template.</p>                                                                                                                       |
| <b>Define Eligibility for Onboarding Initiation</b>                                                                                                             | <p>Use this rule to define the criteria that determine a job requisition's eligibility for initiating onboarding.</p> <p>If the rule evaluation executes to <b>True</b>, the <i>Applicant Workbench</i> displays the <i>Initiate Onboarding</i> option along with the eligibility status. The recruiter can then select the <i>Initiate</i> option to initiate the onboarding process successfully.</p> <p>This rule is configurable only if the <i>Apply Onboarding to Job Requisitions via Business Rule to Define Eligibility for Onboarding Initiation</i> option in the <i>Onboarding Integration Setup</i> page is selected.</p> |

### ⚠ Caution

When you choose a template to use in *Manage Rules in Recruiting* later, it only lets you choose from the list of rules you associate with that template.

Choose your template carefully, because you can't change your template choice after you save your rule. To change template associations, create a new rule and delete the old one.

5. Choose *Continue*.

You get to the [Configure Business Rules](#) page.

6. **Optional:** Add variables in the [Variables](#) section.
7. Create conditions in the [If](#) section, statements in the [Then](#) section, then optionally, add Else If conditions and Else statements, as described in [Create Business Rules](#).

This section provides some examples of if/then/else settings for some Recruiting-related tasks.

8. Save the rule.

## Results

You've created a business rule for Recruiting.

## Next Steps

You're now ready to go to ► [Admin Center](#) ► [Manage Rules in Recruiting](#) ► to associate your newly created rule with a Recruiting template. Refer to [Assigning Rules to a Template Using Manage Rules in Recruiting](#).

If you need to edit the rule later, you can do so by choosing ► [Take Action](#) ► [Make Correction](#) ►.

## 29.2.3 Searching for Business Rules

Search and filter business rules on the [Business Rules Admin](#) page.

## Context

On top of the [Business Rules Admin](#) page is the header section with a search box and a list of default filters. The search filters can contain different types of filters, such as date picker, select (from a dropdown list), and value help.

## Procedure

1. Go to ► [Admin Center](#) ► [Configure Business Rules](#) ►.

You get to the [Business Rules Admin](#) page that lists all business rules.

When you first open the page, the current date is set as the default date in the [As Of Date](#) filter, which is a required field.

2. **Optional:** To change which search filters are displayed in the header section, select [Adapt Filters](#). Select which filters to show on the filter bar, and then select [Go](#).

### Note

You can revert your changes by selecting [Restore](#).

The filters you've selected are displayed in the header section of the [Business Rule Admin](#) page.

3. Enter or select your search criteria using the search filters in the header section.
4. **Optional:** For fields with the value help icon (□), you can perform advanced searches using conditions.

### Note

You can directly enter the input notation and value in the search field.

For example: Enter **! (=1234)** in the [Rule ID](#) search field to exclude the rule with the ID "1234" from the search.

- a. Choose the value help icon (□) on a field.
  - b. In the [Define Conditions](#) dialog box, select the corresponding operators and enter the corresponding values you want to include or exclude from your search.  
  
For some fields, you have to choose the [Define Conditions](#) tab first.
  - c. Select [OK](#).
5. Select [Go](#) to show the results based on your search criteria.

The business rules returned as a result of the filters are displayed in the list section.

6. **Optional:** To change the settings of the list, select ⚙ [Settings](#). On the [View Settings](#) screen that opens, you can change the default columns to be displayed, sort the list by one or more fields, and group the list.

## Next Steps

You can export the filtered list of business rules.

To view rule details and perform further actions, select a rule. You get to the [Configure Business Rules](#) page of the selected rule.

## 29.2.4 Assigning Rules to a Template Using Manage Rules in Recruiting

Once you've created a business rule, you need to specify what kind of events will trigger it by associating the rule to a template in ► [Admin Center](#) ► [Manage Rules in Recruiting](#) ►.

### Context

#### ⓘ Note

The rule execution doesn't work if you assign rules directly in the XML template.

A rule can be triggered at two levels:

- [Field Change Rules](#): Used to associate a rule to a specific field in the template.
- [Template-level Rules](#): Used to associate a rule to a specific action that happens at the template level. For example, when a job requisition is saved.

Some Recruiting-specific rule scenarios require you to specify their purpose. The system recognizes whether the rule's purpose and displays only for that category when you're specifying it in [Manage Rules in Recruiting](#). For example, if you choose [On Initialize](#) when creating a job requisition rule scenario, the rule only appears in the [Initialize Rules](#) dropdown list, and not in [Save Rules](#) or [Field Change Rules](#).

You can perform the following actions for all the rules you assign:

| Label/Icon                                                 | Description                                                                             |
|------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| ↑ <a href="#">(Up)</a> and ↓ <a href="#">(Down)</a> arrows | Use these to change the sequence in which the rules will be executed.                   |
| 🗑️ <a href="#">(Delete)</a>                                | Use this to delete the rule.                                                            |
| <a href="#">Edit Rule</a>                                  | Choose this link to edit the rule in the <a href="#">Configure Business Rules</a> page. |

#### ⓘ Note

If the rule is selected and you then choose [Edit Rule](#), the [Configure Business Rules](#) page displays with the preloaded rule. If the rule isn't selected, the [Configure Business Rules](#) page displays where you can create a new rule.

### Procedure

1. Go to ► [Admin Center](#) ► [Manage Rules in Recruiting](#) ►.

The [Manage Rules in Recruiting](#) page displays. Here you can see the [Job Requisition](#), [Offer Detail](#), [Candidate](#), and [Job Application](#) tabs. By default, the [Job Requisition](#) tab is selected.

2. In the *Job Requisition*, *Offer Detail*, or *Job Application* tabs, choose [Include Inactive Templates](#).
3. In the *Job Requisition*, *Offer Detail*, or *Job Application* tabs, choose the ↓ (*Down*) on the template dropdown list to view the list of active and inactive templates, in alphabetical order.

The *Candidate* tab doesn't have a template dropdown list because there's only one Candidate Profile template.

The *Job Application* tab displays job **requisition** templates.

4. Choose a template from the template dropdown list.
5. In the *Field Change Rules* section, select + [Add Another](#) to display the *Field* and *Rule* dropdown lists.

The *Field Change Rules* section lets you choose a rule that was created in [Configure Business Rules](#) for this template, to apply to any of the fields that support business rules, and which are part of this template.

6. Under *Template-level Rules*, select a rule from the dropdown list to assign to a trigger:

| Tab                    | Template-level Rule Triggers                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Job Requisition</b> | <ul style="list-style-type: none"> <li>• Initialize Rules</li> <li>• Save Rules</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Offer Detail</b>    | <ul style="list-style-type: none"> <li>• Initialize Rules</li> <li>• Save Rules</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Candidate</b>       | <ul style="list-style-type: none"> <li>• Save Rules</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Job Application</b> | <ul style="list-style-type: none"> <li>• Save Rules</li> <li>• Rule for Offer Approval</li> <li>• Rule for Candidate Decisions on Offer Letter</li> <li>• Rule for Electronic Signature on Offer Letter</li> <li>• Rule for Offer Approval Template Selection</li> <li>• Rule for Completed Assessment</li> <li>• Rule for Background Check</li> <li>• Rule for Offer Letter Template Selection</li> <li>• Rule for Automatic Hiring</li> <li>• Rule for Conditional Offer Letter Paragraph</li> <li>• Rule for Eligibility for Onboarding Initiation</li> <li>• Rule for Automatic Initiation of Onboarding.</li> </ul> |

#### ⚠ Restriction

You can configure multiple rules using the same job requisition template but can assign only one of those rules. When there are multiple rules created for that template, they show up in the dropdown menu. When you link your rule, only the job requisition template that's configured for that rule is affected.

7. Choose [Save](#).

## 29.2.5 Raising a Message with a Rule

You can assign a message to rules so that users will receive additional information in case the rule condition is or isn't met.

### Procedure

1. In [Admin Center](#), go to [Manage Data](#).
2. Open the [Create New](#) dropdown list, and choose [Message Definition](#).
3. Enter the following details:

| In this field                | Enter                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Text</a>         | Write a message text that provides the user with all the necessary info they need to proceed. <div> <b>Note</b><br/>If you click the <a href="#">View Translations</a> icon beside this field, you can write a localized version of the message in various other languages.</div> |
| <a href="#">externalCode</a> | The external code of the message definition object.                                                                                                                                                                                                                                                                                                                  |
| <a href="#">externalName</a> | The external name of the message definition object.                                                                                                                                                                                                                                                                                                                  |
| <a href="#">Status</a>       | The status of the message definition object. If you want to introduce the message immediately, choose <a href="#">Active</a> .                                                                                                                                                                                                                                       |

## Example

If a user attempts to change the currency while the *Base Salary* and *Bonus* have already been specified in a job requisition, they'll get the following warning message:

The screenshot shows a rule configuration window. At the top, there's a header bar with 'If' on the left and 'Always True', 'Simplify Expression', and 'Clear All' on the right. Below the header, there's a condition box labeled 'and' with a plus icon. It contains two rules: 'Rule Engine Automation.Base Salary not equal to Null' and 'Rule Engine Automation.Bonus not equal to Null'. Below the condition box is a 'Then' section with a single action: 'Raise Message "CurrencyChange" with Warning severity. Warning: You have changed the currency but the Salary and Bonus have been provided. Please review the values and update accordingly.'

## 29.2.6 Scheduling a Rule for Job Requisition and Job Offer

In addition to having rules simply execute at run time, you can also schedule rules to run at specific times.

### Prerequisites

You've uploaded a CSV file containing all the necessary object IDs to an online storage location. If you want to use the JOB\_REQ template for your job, then the CSV file should contain requisition IDs, and if you want to use the JOB\_OFFER template it should contain detail IDs.

The file should look like a plain spreadsheet, with no headings or column names; just a single column of object IDs.

#### Note

- The file should contain no more than 5000 object IDs. Any more than this and the resulting job fails.
- You can't run a rule for all the potential IDs in a template.

### Procedure

1. In Provisioning, go to ► [Manage Scheduled Jobs](#) ► [Create New Job](#) ►.
2. Enter all the following information:

| Section                        | Entry                                                                                                                                   |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Job Definition</a> | <ul style="list-style-type: none"><li>• <a href="#">Job Name</a><br/>Give the job a name.</li><li>• <a href="#">Job Owner</a></li></ul> |

| Section                                           | Entry                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                   | <p>Specify who owns this job.</p> <ul style="list-style-type: none"> <li>• <a href="#">Job Type</a><br/>Choose <i>RCM Rule Execution Job</i>.</li> <li>• <a href="#">Job Parameters</a><br/>Choose either JOB_REQ (for a job requisition) or JOB_OFFER (for offer approval), select a template, and then specify the ID of the rule you want to run.</li> </ul> <div> <p><b>Note</b></p> <p>You can only run one rule per job. If you want to run multiple rules, create separate jobs for each rule.</p> </div> |
| <a href="#">Server Access</a>                     | Specify the logon details of the FTP server on which you stored the CSV file (see <a href="#">Prerequisites</a> section above).                                                                                                                                                                                                                                                                                                                                                                                  |
| <a href="#">File Access</a>                       | Specify the file path, name, and format (CSV) of the file, and indicate whether or not it's encrypted.                                                                                                                                                                                                                                                                                                                                                                                                           |
| <a href="#">Job Occurrence &amp; Notification</a> | <p>Specify on what date and time the job should run, and whether it should be recurring or not.</p> <p>If you want to run the job immediately, choose <a href="#">Run It Now</a>.</p>                                                                                                                                                                                                                                                                                                                            |

## Results

The job is created. You can check the status at any time in [Monitor Jobs](#). If the job is marked as [Completed](#) there, you can view the job requisition or job offer to verify that the field values have been updated.

## 29.2.7 Business Rules for the Candidate Application

You can create business rules to control the behavior of fields in the application flow in the reimagined Candidate Experience.

### Rule Scenarios

#### **Note**

Candidate Application scenarios don't support "raise message" rules, or rules that display a message when the rule is triggered. You can only create "set" rules, or rules that set the value of a particular field when the rule is triggered.

To create rules for the candidate application flow, use the following rule scenarios.

| Scenario Name                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Configure Save Rules on Candidate Application</a>         | <p>Create rules that are executed when a candidate tries to save data in the application.</p> <p>For example:</p> <ul style="list-style-type: none"><li>• <b>Qualification check.</b> When an application is saved with a disqualifying response to a question (such as entering an age under 18), automatically assign it the Disqualified status.</li><li>• <b>Auto-assign recruiters.</b> Based on the job location or department selected by a candidate, assign them to the right recruiter.</li></ul>                                                                                |
| <a href="#">Configure Field Change Rules on Candidate Application</a> | <p>Create rules that are executed when a candidate changes the value of a field in the application.</p> <p>For example:</p> <ul style="list-style-type: none"><li>• <b>Dynamic workflow.</b> When a candidate selects a country in the "Country of Residence" field, update the options displayed in the State/Province field.</li><li>• <b>Required documents.</b> When a candidate responds to a Yes to a question that required documentation (such as "Do you have a valid work permit?"), make the corresponding document field (such as "Upload Visa Document") mandatory.</li></ul> |
| <a href="#">Configure View Rules on Candidate Application</a>         | <p>Create rules that are executed when a page in the candidate application page loads.</p> <p>For example:</p> <ul style="list-style-type: none"><li>• <b>Conditional display.</b> Hide or show certain sections of the application (like work authorization or visa information) based on information in the candidate profile.</li><li>• <b>Required fields.</b> Make fields mandatory or optional, based on the job that the candidate is applying for (like requiring driver's license information for a driving job).</li></ul>                                                       |

## Supported Fields

- Hyperlinks
- Fields of type "instruction"
- Fields of type "textarea"

## Unsupported Fields

- Comments
- Fields in a background element (such as Education, Experience, or Mobility)

## 29.2.8 Business Rules for Candidate Profile

Define, automate, and run business rules on candidate profiles.

Business rules allows users with admin privileges to define rules for defaulting values of certain fields on the [Candidate Profile](#), when predefined criteria is met. It also helps you in automating tasks that are related to the values of the fields, defined on the candidate profile.

### ⓘ Note

Business rules on candidate aren't supported for background elements of the candidate.

[Rule Triggers for Candidate Profile \[page 1523\]](#)

You can specify which user actions will trigger a rule when they're creating and editing candidate profile.

[Supported Field Types for Candidate Profile \[page 1524\]](#)

These are the field types you can use with business rules for candidate profile.

### 29.2.8.1 Rule Triggers for Candidate Profile

You can specify which user actions will trigger a rule when they're creating and editing candidate profile.

| Trigger                            | Description                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Field Change Rules</a> | The user changes a value in a field. <div><h3>ⓘ Note</h3><p>The <a href="#">Save Rules</a> (onSave) trigger can default or update values into a <b>read-only</b> field. However, if the user doesn't have edit permission, they can't use the <a href="#">Field Change</a> (on-Change) trigger to default values into a <b>read-only</b> field in the requisition.</p></div> |

| Trigger                                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Template-level Rules</a> > <a href="#">Save Rules</a> | <p>The save rule is triggered under the following conditions:</p> <ul style="list-style-type: none"> <li>When candidates apply for a job from an internal career site (regardless of whether it's powered by Career Site Builder), or an external career site, the rule is triggered on the candidate profile data and not on the application.</li> <li>When candidates create and save their profile, as well as after any subsequent changes that are saved to the profile.</li> <li>When a Recruiting user creates a candidate profile on behalf of the candidate.</li> </ul> <div> <p><b>Note</b></p> <p>Rule are triggered only on the <b>Detailed Candidate Profile</b> page when it's saved. Business rules on the Candidate Profile aren't triggered on the first screen, when creating a candidate profile, and when asked to enter the five standard fields that are needed for candidate profile creation.</p> </div> |

#### Note

The system doesn't trigger business rules on Mobile Apply screens for either Career Site Builder-enabled external career sites, or internal career sites powered by Career Site Builder. When a recruiter makes changes in a candidate profile and saves them, however, the rules are triggered in the web application, as it is a non-Mobile Apply screen.

## 29.2.9.3 Posting Job Requisitions Using Rules

You can use rules to post job requisitions, either immediately or at a predetermined time in the future.

### Prerequisites

The job requisition has the status *Approved*, and hasn't yet been posted.

#### Note

Create job posting option is available, only when *Purpose* is set to *Save*.

### Procedure

1. Go to ► *Admin Center* ► *Configure Business Rules* ► *Recruiting* ►, choose + *(Create New Rule)*.
2. Expand the *Recruiting* section to choose the *Configure Business Rules on Job Requisition* option and provide values for the *Rule Name*, *Rule ID*, and *Start Date* fields and complete it.
3. Select *Job Requisition (All)* from the dropdown list in the *Job Requisition Template* field.
4. Specify the *Purpose* as *Save* (onSave) rule.
5. You have the choice of using one of the following subobjects within *Job Requisition (All)*. Select *var\_posting* in the *Variables* section and choose the type of job posting:
  - *External Posting*
  - *External Private Posting*
  - *Internal Posting*
  - *Internal Private Posting*
6. Add any *If* and *Then* conditions as necessary.
7. Set the start date and end date of the job posting.
  - You can do this either by manually entering a date and time, or by using the *Create DateTime()* rule function.
  - By default, the local date and local time is taken from the UTC+0 time zone. If you want to use your own time zone instead, enter the necessary difference in hours in the *Offset of Local Timezone* field. Accepted values here range from UTC-8 to UTC+8.
8. Save the rule.

#### Note

It isn't possible to DELETE a posting.

## Example

Here's a rule that posts a job requisition using today's date. The posted requisition will then be active for 60 days.

ENT4009860 (ENT4009860)

## 29.2.10 Business Rules for Job Applications

You can define business rules for job applications so you can automate standard and customized fields as default values when a job application is created.

[Rule Triggers for Job Applications \[page 1534\]](#)

You can specify user actions to trigger business rules for saving and editing job applications for candidates and recruiters.

[Supported System and Custom Fields for Job Application Business Rules \[page 1536\]](#)

You can set up business rules from job application system and custom fields with different level of access and data types.

[Supported Standard Fields for Job Application Business Rules \[page 1538\]](#)

There's a finite number of supported standard job application fields for creating business rules with specific permissions and their corresponding data types.

[Setting Up a Job Application Business Rule for Disqualified Status \(Example\) \[page 1542\]](#)

Use these If and Then conditions in *Configure Business Rules* to configure a business rule for job applications so that candidates who are under the age of 18 are moved to *Disqualified* status.

[Setting Up a Job Application Business Rule for Completed Assessments \(Example\) \[page 1544\]](#)

You can configure business rules that execute when vendors post assessment results back to recruiting system using SFAPL.

[Setting Up a Job Application Business Rule for Background Checks \(Example\) \[page 1549\]](#)

You can configure business rules that execute when vendors post background checks back to the recruiting system.

[Setting Up a Job Application Business Rule for When Candidates Accept or Decline eSign Offers \(Example\) \[page 1552\]](#)

You can configure business rule when the candidate accepted or declined an electronically signed offer letter from DocuSign.

[Setting Up a Job Application Business Rule for When Candidates Accept or Decline Online Offer Letters \(Example\) \[page 1556\]](#)

You can configure business rule once they've accepted or declined an online job offer letter.

[Setting Up a Job Application Business Rule to Change Candidate Status When Approved or Declined \(Example\) \[page 1560\]](#)

You can set up business rules that execute when an offer approval is approved or declined by the candidate when their job application and executes for *OnChange* and *OnSave* triggers.

[Setting Up a Job Application Business Rule to Select a Specific Offer Approval Template Setting Up a Job \[page 1564\]](#)

You can create a business rule that automatically selects the appropriate offer approval template for a given job requisition, when you create or edit the offer approval.

### 29.2.10.1 Rule Triggers for Job Applications

You can specify user actions to trigger business rules for saving and editing job applications for candidates and recruiters.

#### Field Change Rules

Candidate or recruiter:

- Edits or changes job applications

#### ⓘ Note

The redesigned Applicant Management tool lets Recruiting users control **all** applicant status changes through the [Move](#) button. For this reason, Applicant Management ignores any existing job application business rule scenario that uses a field change (OnChange) rule to update the applicant status field. Refer to *The Move Button in the Redesigned Applicant Management and Status Change Triggers in Business Rules* for more information.

## Template level Rules

Template-level Rule Triggers for Job Applications

| Triggers                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Save Rules</i>                                    | <p><i>Save Rules</i> (onSave) rules are triggered under the following conditions:</p> <ul style="list-style-type: none"> <li>• A recruiter saves an application.</li> <li>• A candidate saves or completes a job application.</li> <li>• Triggers when the candidate status changes using drag-and-drop.</li> </ul> <div> <p>→ Tip</p> <p>This rule is triggered only when candidates update their existing application or submit an application for a job, not when they save an application as a draft.</p> </div> <div> <p>ⓘ Note</p> <p>The <i>Save Rules</i> (onSave) trigger can default or update values into a <b>read-only</b> field. However, if the user doesn't have edit permission, they can't use the <i>Field Change</i> (on-Change) trigger to default values into a <b>read-only</b> field in the application.</p> </div> |
| <i>Rule for Offer Approval</i>                       | Executes when the last approver approves or declines the offer approval request. The candidate status is moved to either <i>Offer Accepted</i> or <i>Offer Rejected</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <i>Rule for Candidate Decisions on Offer Letter</i>  | The candidate status is moved to either <i>Offer Accepted</i> or <i>Offer Rejected</i> when the applicant accepts or declines an online job offer letter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <i>Rule for Electronic Signature on Offer Letter</i> | When the offer letter is signed by the applicant, when the rule runs, their job application status automatically moves to <i>Offer Accepted</i> status.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>Rule for Offer Approval Template Selection</i>    | Allows you to use a specific offer detail template for <i>Offer Approvals</i> for specific country/region, departments, division, location, other supported field, or objects under <i>Job Application Template</i> . Use these instructions when you want to set the template for a specific country/region.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <i>Rule for Completed Assessment</i>                 | Allows you to change application field data based on assessment results. For example, moving an applicant to a specific status when an assessment score is at least 70%.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <i>Rule for Background Check</i>                     | Allows you to execute rules when background checks are set to Completed, and when vendors post the results back to the Recruiting system. When executed, you can change application data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <i>Rule for Offer Letter Template Selection</i>      | Allows you to associate the rule created to preselect the offer letter template with a trigger so that the rules are triggered when the offer letter is initiated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Triggers                                                    | Description                                                                  |
|-------------------------------------------------------------|------------------------------------------------------------------------------|
| <a href="#">Rule for Automatic Hiring</a>                   | Allows you to route eligible applicants from Recruiting to Employee Central. |
| <a href="#">Rule for Conditional Offer Letter Paragraph</a> | Allows you to populate dynamic tokens on offer letters.                      |

**Note**

You can configure this rule only once for each template.

#### → Remember

Business rules won't trigger when candidate uses [Mobile Apply](#) to save or complete their application.

## 29.2.10.2 Supported System and Custom Fields for Job Application Business Rules

You can set up business rules from job application system and custom fields with different level of access and data types.

### Support System Fields for Job Applications

System fields can't be configured in recruiting templates and appear as fields in job application object.

#### Supported System Fields

| System Field Names                | Read or Write Access | Data Type | Definition                                                                                                                                                              |
|-----------------------------------|----------------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Last Modified</a>     | Read only            | Date      | Last time when job application was modified.                                                                                                                            |
| <a href="#">Last Modified By</a>  | Read only            | User      | Last individual that modified job application.                                                                                                                          |
| <a href="#">Candidate Applied</a> | Read only            | Boolean   | Boolean field set to true when a job application exists for the candidate.                                                                                              |
| <a href="#">Recruiter View</a>    | Read only            | Boolean   | Boolean field set to true when job application is updated by someone internally.<br><br>Set to false when the candidate applies for the first time or updates the form. |

#### Supported Custom Field Data Types

| Data Type | Read or Write Access | Set to Null |
|-----------|----------------------|-------------|
| number    | Read/Write           | Yes         |
| text      | Read/Write           | Yes         |
| Date      | Read/Write           | Yes         |
| boolean   | Read/Write           | Yes         |
| derived   | Read/Write           | Yes         |
| Picklist  | Read/Write           | Yes         |
| enum      | Read/Write           | Yes         |
| percent   | Read/Write           | Yes         |
| Currency  | Read/Write           | Yes         |

#### Restriction

APIs and mobile aren't supported.

## 29.2.10.3 Supported Standard Fields for Job Application Business Rules

There's a finite number of supported standard job application fields for creating business rules with specific permissions and their corresponding data types.

Standard Job Application Fields

| Field ID        | Read or Write Access | Data Type | Set to Null | Comments                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|----------------------|-----------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| averageRating   | Read only            | number    | Yes         |                                                                                                                                                                                                                                                                                                                                                                                                                                |
| applicationDate | Read only            | Date      | Yes         | Date when candidate applied.                                                                                                                                                                                                                                                                                                                                                                                                   |
| lastModified    | Read only            | Date      | Yes         | System field.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| reviewDate      | Read only            | Date      | Yes         | Value is autopopulated first time you open applicant profile.                                                                                                                                                                                                                                                                                                                                                                  |
| source          | Read only            | enum      | Yes         |                                                                                                                                                                                                                                                                                                                                                                                                                                |
| statusId        | Read/Write           | Picklist  | Yes         | <ul style="list-style-type: none"><li>Field values autopopulate through applicant status workflow.</li><li>When multistage application is enabled and other field permissions configured in the requisition XML file, configure the same field in application XML file</li><li>Seen in candidate profile as a dropdown that lists all statuses that can be changed that moves candidates from one status to another.</li></ul> |

## 29.2.10.4 Setting Up a Job Application Business Rule for Disqualified Status (Example)

Use these If and Then conditions in [Configure Business Rules](#) to configure a business rule for job applications so that candidates who are under the age of 18 are moved to [Disqualified](#) status.

### Prerequisites

You've started or saved a business rule for Job Applications by selecting [Job Application: Basic Business Rule Scenario](#) in [Configure Business Rules](#).

### Context

This specific example configures the rule so that candidates who are under the age of 18 are moved to [Disqualified](#) status.

### Procedure

1. Configure your [If](#) criteria:

| Operation and Functions              | Steps                                                                                                                                                                                                                                                                                                                                                   |

| <i>Field Type</i>           | Leave as <i>Value</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <i>Value Selection</i>      | <p>Where you select values available from the <i>status</i> picklist.</p> <ol style="list-style-type: none"> <li>1. Select <i>Disqualified</i> from the dropdown menu.</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                        |

3. Select *Save*.

## Results

You have created business rule that changes candidate status to **Disqualified**, when younger than the age of 18.

## Next Steps

You can now link your business rule with the job requisition template in *Manage Rules in Recruiting* tool.

**Task overview:** [Business Rules for Job Applications \[page 1533\]](#)

### 29.2.10.5 Setting Up a Job Application Business Rule for Completed Assessments (Example)

You can configure business rules that execute when vendors post assessment results back to recruiting system using SFAPI.

## Prerequisites

- You've started or saved a business rule for Job Applications by selecting *Job Application: Basic Business Rule Scenario* in *Configure Business Rules*.
- *Enable Assessment Integration (requires Candidate Workbench)* is checked in Provisioning.
- Role-based permissions for assessments enabled.
- Appropriate vendors uploaded and necessary assessment packages.
- Assessment integration configured as a feature permission type in job requisition template for specific statuses.

- Intelligent Services enabled.
- Business Rules enabled in [Manage Recruiting Settings](#).

## Context

This scenario allows you to change application field data based on assessment results. The steps describe the configuration of this business rule to execute so that when the assessment score is at least 70% or higher, moves the candidate to specific status.

### Note

This specific example configures the rule so that it executes when a vendor has submitted the assessment results and when an assessment is in completed status.

## Procedure

1. Configure your *If* criteria:

| Operation and Functions     | Steps                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <i>Left Expression</i>      | <ol style="list-style-type: none"> <li>Go to <i>If</i> section and select your left expression and locate <i>Job Application Template</i>.</li> <li>Go to left expression menu icon and select pencil picker icon.</li> <li>Select ► <i>Assesment Reports</i> ► <i>Recommendation</i> ► field from the list.</li> </ol> |
| <i>Set Expression Field</i> | Select <i>is equal to</i> .                                                                                                                                                                                                                                                                                             |
| <i>Field Type</i>           | Leave as <i>Value</i> .                                                                                                                                                                                                                                                                                                 |
| <i>Value Selection</i>      | Select <i>Recommended</i> .                                                                                                                                                                                                                                                                                             |

#### Note

There are different options you can select as different values, depending on the assessment package that's being used. For the purpose of this example, *Recommended* value is used.

- Select right expression menu at the end of the last *If* statement.
- Select ► *Add* ► *Expression* ►.
- Select *AND* to join your next expression when prompted.

| Operation and Functions     | Steps                                                                                                                                                                                                                                                                                                          |

| <i>Field Type</i>           | Select <i>Decimal</i> .                                                                                                                                                                                                                                                                                        |
| <i>Value Selection</i>      | Select <i>70</i> .                                                                                                                                                                                                                                                                                             |

#### Note

You can use different integer values. For this example, decimal is being used

#### Note

You can set different decimal values as a criteria. For this example, *70* is being used.

- Select your *Then* criteria:

When there are multiple rules created for that template, they show up in the dropdown menu. When you link your rule, only the job requisition template that's configured for that rule is affected.</p> </div> <ol style="list-style-type: none"> <li>Select <a href="#">Save</a> to finish.</li> </ol> |

## Results

You have created business rule that executes when a vendor has submitted the assessment results and when an assessment is in completed status.

## Next Steps

You can now link your business rule with the job requisition template in *Manage Rules in Recruiting* tool by linking it to the *Rule for Completed Assessment* rule.

## 29.2.10.6 Setting Up a Job Application Business Rule for Background Checks (Example)

You can configure business rules that execute when vendors post background checks back to the recruiting system.

### Prerequisites

- You've started or saved a business rule for Job Applications by selecting *Job Application: Basic Business Rule Scenario* in *Configure Business Rules*.
- *Other Background Check Vendor* enabled in *Background Check Central*.
- Fields defined for third-party background check vendors enabled in job requisition template.
- *Integration Center*
- *Background Check Initiate Permission* role-based permission enabled.

See related links for more information about role-based permissions and how to configure third-party vendors.

### Context

This scenario allows you to execute rules when background checks are set to completed and when vendors post the results back to recruiting system. When executed, you can change application data.

#### Note

*Other Background Check Vendor* is the only vendor integration type that's supported for this business rule.

### Procedure

1. Set up your *IF* condition based on whether the background check has been completed for candidates:

| Operation and Functions     | Steps                                                                                                                                                                                                                                                                                                                          |

## 29.2.10.7 Setting Up a Job Application Business Rule for When Candidates Accept or Decline eSign Offers (Example)

You can configure business rule when the candidate accepted or declined an electronically signed offer letter from DocuSign.

### Prerequisites

- You've started or saved a business rule for Job Applications by selecting *Job Application: Basic Business Rule Scenario* in *Configure Business Rules*.
- Job Application template uploaded with all standard fields configured.
- Applicant status sets configured for the selected job requisitions being used as the base object.

### Context

When the offer letter is signed by the candidate, when the rule runs, their job application status automatically moves to *Offer Accepted* status.

### Procedure

1. Configure your *If* criteria example:

| Operation and Functions | Steps                                                                                                   |
|-------------------------|---------------------------------------------------------------------------------------------------------|
| <i>Left Expression</i>  | 1. Go to <i>If</i> section and select your left expression and locate <i>Job Application Template</i> . |

| Operation and Functions     | Steps                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                             | <ol style="list-style-type: none"> <li>Go to left expression menu icon and select pencil picker icon.</li> <li>From the left expression dropdown, select ► <i>Job Application Template</i> ► <i>Offer Letter with Electronic Signature</i> ► <i>Status</i> ►.</li> </ol> <div> → Tip<br/> When status is selected, the field type is now a value field by default </div> |
| <i>Set Expression Field</i> | Select <b>is equal to</b>                                                                                                                                                                                                                                                                                                                                                |
| <i>Field Type</i>           | 1. Leave as <b>Value</b> .                                                                                                                                                                                                                                                                                                                                               |
| <i>Value Selection</i>      | Select <b>Accepted</b> .                                                                                                                                                                                                                                                                                                                                                 |

2. Select your *Then* criteria:

| Operation and Functions     | Steps                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Left Expression</i>      | <ol style="list-style-type: none"> <li>Go to the <i>Then</i> section of your business rule and select the <i>Left Expression</i>.</li> <li>Go to left expression menu icon and select pencil picker icon.</li> <li>Go to dropdown menu to select output type to <b>Set</b> that opens up the <i>Select Left Expression</i> dropdown field.</li> <li>From the left expression dropdown menu, select ► <i>Job Application Template</i> ► <i>Status</i> ►.</li> </ol> <div> → Tip<br/> When status is selected, the field type is now a value field by default </div> |

| <i>Field Type</i>           | Leave as <i>Value</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <i>Value Selection</i>      | Select <b>Offer Accepted</b> or any customizable status set that you want to use.. <div> → Tip<br/> The status set picklist value is customizable. You can set this condition to move to any status you want. </div>                                                                                                                                                                                                                                                                                                                                               |

## Operation and Functions

## Steps

- For your *Else If* statement when candidate declines the offer:

### Operation and Functions

### Steps

#### *Left Expression*

- Go to *Else If* section and select your left expression and locate *Job Application Template*.
- Go to left expression menu icon and select pencil picker icon.
- From the left expression dropdown, select ► *Job Application Template* ► *Offer Letter with Electronic Signature* ► *Status* ►.

#### → Tip

When status is selected, the field type is now a value field by default

#### *Set Expression Field*

Select **to be equal to**.

#### *Field Type*

Leave as *Value*.

#### *Value Selection*

Select **Declined**.

- Set up an additional *Then* statement based on when the candidate declines offer:

### Operation and Functions

### Steps

#### *Left Expression*

- Go to the *Then* section of your business rule and select the *Left Expression*.
- Go to left expression menu icon and select pencil picker icon.
- Go to dropdown menu to select output type to **Set** that opens up the *Select Left Expression* dropdown field.
- From the left expression dropdown, select ► *Job Application Template* ► *Status* ►.

#### → Tip

When status is selected, the field type is now a value field by default

#### *Set Expression Field*

Select **to be equal to**.

#### *Field Type*

Leave as *Value*.

## Operation and Functions

## Steps

### Value Selection

Select **Offer Rejected** or any customizable status set that you want to use..

#### → Tip

The status set picklist value is customizable. You can set this condition to move to any status you want.

5. Select **Save** to finish.
6. Go to ► [Admin Center](#) ► [Manage Rules in Recruiting](#) ► that opens up the [Manage Rules in Recruiting](#) page. Here you can link your business rule to fields for the application template being used:

## Operation and Functions

## Steps

### Select Template for Rule

1. Go to the [Job Application](#) tab of the [Manage Rules in Recruiting](#) page.
2. Go to [Job Requisition Template](#) field to select the job application template you want.

### Template-level Rules

1. Go to ► [Template-level Rules](#) ► [Rule for Electronic Signature on Offer Letter](#) ► [Add a Rule](#) ►. When you select [Add a Rule](#) link a dropdown menu appears.
2. Select the rule you want.

#### ⚠ Restriction

You can select **only** one rule.

3. Select **Save** to finish.

## Results

When you run the [Rule for Electronic Signature on Offer Letter](#), the candidate status is moved to [Offer Accepted](#) or [Offer Rejected](#).

**Task overview:** [Business Rules for Job Applications \[page 1533\]](#)

## 29.2.10.8 Setting Up a Job Application Business Rule for When Candidates Accept or Decline Online Offer Letters (Example)

You can configure business rule once they've accepted or declined an online job offer letter.

### Prerequisites

- You've started or saved a business rule for Job Applications by selecting *Job Application: Basic Business Rule Scenario* in *Configure Business Rules*.
- Job Application template uploaded with all standard fields configured.
- Applicant status sets configured for the selected job requisitions being used as the base object.

### Procedure

1. Configure your *If* criteria:

| Operation and Functions | Steps                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 29.2.10.9 Setting Up a Job Application Business Rule to Change Candidate Status When Approved or Declined (Example)

You can set up business rules that execute when an offer approval is approved or declined by the candidate when their job application and executes for *OnChange* and *OnSave* triggers.

### Prerequisites

You've started or saved a business rule for Job Applications by selecting *Job Application: Basic Business Rule Scenario* in *Configure Business Rules*.

### Context

The rule executes when:

- Last Approver that approves or declines the offer approval request.
- Executes for new and for approvals that changed status.

Candidate status is moved to either *Offer Accepted* or *Offer Rejected* when the rule executes successfully.

### Procedure

1. Configure your *If* criteria example:

| Operation and Functions     | Steps                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <i>Value Selection</i>      | Select <b>Offer Approved</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Operation and Functions

## Steps

### ⓘ Note

The status set picklist value is customizable. You can set this condition to move to any status you want.

2. Select your *Then* criteria:

## Operation and Functions

## Steps

### *Left Expression*

1. Go to the *Then* section of your business rule and select the *Left Expression*.
2. Go to left expression menu icon and select pencil picker icon.
3. Go to dropdown menu to select output type to **Set** that opens up the *Select Left Expression* dropdown field.
4. From the left expression dropdown, select ► *Job Application Template* ► *Status* ►.

### → Tip

When status is selected, the field type is now a value field by default.

### *Set Expression Field*

Select **to be equal to**.

### *Field Type*

Leave as *Value*.

### *Value Selection*

Select **Offer Approved** or any customizable status set that you want to use..

### → Tip

The status set picklist value is customizable. You can set this condition to move to any status you want.

### ⓘ Note

Mass Offer Approvals is supported. You can use *Approve All* as a value.

3. Set up your *Else If* statements for when offer is rejected.

## Operation and Functions

## Steps

### *Left Expression*

1. Select *Add Else If* and select the *Left Expression*.
2. Go to left expression menu icon and select pencil picker icon.

## Operation and Functions

## Steps

- From the left expression dropdown, select ► *Job Application Template* ► *Offer Approval (All)* ► *Offer Status* ►.

### → Tip

When status is selected, the field type is now a value field by default.

*Set Expression Field*

Select **to be equal to**.

*Field Type*

Leave as *Value*.

*Value Selection*

Select **Rejected**

### ⓘ Note

The status set picklist value is customizable. You can set this condition to move to any status you want.

- Set up your *Then* statement when offer approval is rejected.

## Operation and Functions

## Steps

*Left Expression*

- Go to the *Then* section of your business rule and select the *Left Expression*.
- Go to left expression menu icon and select pencil picker icon.
- Go to dropdown menu to select output type to **Set** that opens up the *Select Left Expression* dropdown field.
- From the left expression dropdown, select ► *Job Application Template* ► *Status* ►.

### → Tip

When status is selected, the field type is now a value field by default.

*Set Expression Field*

Select **to be equal to**.

*Field Type*

Leave as *Value*.

*Value Selection*

Select **Offer Declined** or any customizable status set that you want to use..

Operation and Functions

Steps

→ Tip

The status set picklist value is customizable. You can set this condition to move to any status you want.

5. Select [Save](#) to finish.
6. Go to ► [Admin Center](#) ► [Manage Rules in Recruiting](#) ► that opens up the [Manage Rules in Recruiting](#) page. Here you can link your business rule to fields for the application template being used:

Operation and Functions

Steps

Select Template for Rule

1. Go to the [Job Application](#) tab of the [Manage Rules in Recruiting](#) page.
2. Go to [Job Requisition Template](#) field to select the job application template you want.

Template-level Rules

1. Go to ► [Template-level Rules](#) ► [Rule for Offer Approval](#) ► [Add a Rule](#) ►. When you select [Add a Rule](#) link a drop-down menu appears.
2. Select the rule you want.

⚠ Restriction

You can select **only** one rule.

3. Select [Save](#) to finish.

## Results

When you run the [Rule for Offer Approval](#), the [Offer Approval](#) status is moved to the status you want to use for more than one condition such as approval and rejection in the same rule.

## 29.2.10.10 Setting Up a Job Application Business Rule to Select a Specific Offer Approval Template Setting Up a Job

You can create a business rule that automatically selects the appropriate offer approval template for a given job requisition, when you create or edit the offer approval.

### Prerequisites

- Applicant status sets configured for the selected job requisitions being used as the base object.

### Context

You can use an Offer Approval Template Selection rule to automatically select a specific offer detail template, based on the value of another field in the job application, such as a specific country/region, department, division, or location. This example shows you how to create a rule that selects the template based on a specific country/region.

#### 📘 Note

By default, Offer Approval Template Selection rules run when you **create** an offer approval and also when you **edit** an offer approval. If needed, you can disable rule execution on edit, so that the rules only run when you initially create the approval. To do that, go to ► [Admin Center](#) ► [Manage Recruiting Settings](#) ► [Offer Approval](#) ► and select the option [Disable rule execution on edit for Offer Approval Template Selection rules](#).

### Procedure

1. Go to ► [Admin Center](#) ► [Configure Business Rules](#) ►, select the scenario *Job Application: Basic Business Rule Scenario*, and create a business rule for a specified job requisition template.
2. Configure your *If* criteria:

| Operation and Functions     | Steps                                                                                                                                                                                                                                                                                                                                                                                                                              |

## 29.2.11.2 Supported Field Types for Offer Approval Business Rules

These are the field types you can use with business rules for job offer approvals.

[Approval date](#) is a date related to the specific version and is filled when the offer is approved. If an offer goes through multiple versions, only the final version of the offer has an approval date when using ad-hoc reports field [Approved date](#). For more information about supported fields for job offer approvals, see related links.

#### **Note**

For all editable fields, you can run business rules to write to those fields. However, if field is read-only, you can run business rules as read-only for that same field.

## Supported Field Types for Offer Approval Business Rules

|                            | Read/Write |                 |             |
|----------------------------|------------|-----------------|-------------|
| Field Type                 | Permission | Source Template | Set to Null |
| number                     | Read       | Job Requisition | Yes         |
|                            | Write      | Job Application |             |
| percent                    | Read       | Job Requisition | Yes         |
|                            | Write      | Job Application |             |
| text                       | Read       | Job Requisition | Yes         |
|                            | Write      | Job Application |             |

## 29.2.11.3 Supported Standalone and Offer Approval System Fields in Business Rules for Job Offers

Standalone and offer approval system fields are supported in business rules for job offers.

You can use this table view field type for all supported custom fields used when you create business rules for job offers. You can use the search field to specify the field you want to view properties of or you can use the filter link for that column.

| Field Name         | Field Data Type | Read/Write<br>Permission | Field Type<br>(Standalone,<br>Navigation, or<br>System) | Set to Null |
|--------------------|-----------------|--------------------------|---------------------------------------------------------|-------------|
| customDate1-10     | date            | Read<br>Write            | Standalone                                              | Yes         |
| customLong1-10     | number          | Read<br>Write            | Standalone                                              | Yes         |
| customPicklist1-10 | picklist        | Read<br>Write            | Standalone                                              | Yes         |
| customString1-15   | text            | Read<br>Write            | Standalone                                              | Yes         |
| Last Modified Date | date            | Read                     | Job Offer Appro-<br>val System Field                    | No          |
| Last Modified By   | user            | Read                     | Job Offer Appro-<br>val System Field                    | No          |
| Created Date       | date            | Read                     | Job Offer Appro-<br>val System Field                    | No          |
| Created By         | user            | Read                     | Job Offer Appro-<br>val System Field                    | No          |

### Note

You can use the customLong1-10 standalone fields in offer letter template in business rules to do any of these two options:

- Specify exact values of that standalone field.
- Populate calculated value based on other fields.

Since the field type is number data type, decimals appear truncated.

### 29.2.11.4 Special Handling of Fields in Business Rules for Offers

There are a number of field types that aren't supported at this time when creating business rules for offers.

#### Behavior of Foundation and Generic Objects in Business Rules for Offers

All standard foundation or generic object fields are read-only except for these objects sourced from the job requisition template:

| Object Type       | Field Label or Name | Field ID         |
|-------------------|---------------------|------------------|
| Foundation Object | Location            | location_obj     |
| Generic Object    | Position            | std_position_obj |

#### Field Types Not Supported in Business Rules for Offers

The following field types, sourced from the job requisition template, are not supported:

- picklist (mfield)
- jobCode
- textarea
- richText
- jobRole
- questions
- competencies
- Comments
- Approvers
- derived

## 29.2.11.5 Setting Up Business Rules for Job Offers (Example)

You can configure business rules for offer approvals using different navigation objects in job requisition and job application templates.

### Prerequisites

- Job requisitions, application, and offer details templates are configured.
- [Enable Recruiting Business Rules](#) are turned on in [Manage Recruiting Settings](#).

### Context

This scenario allows you to execute rules when the originator initiates a job offer approval that change values of any job requisition, job application, or candidate profile fields in the offer approval.

The steps in this topic are a sample use case when using navigation objects from job application template to specify bonus amount for all candidates in the United States for initiated offer approvals.

When you initiate offer approvals for jobs located in the country/region that you specified, their bonus amount appears as the one that's set in the rule.

### Procedure

1. Configure your *If* criteria:

| Operation and Functions | Steps                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 29.2.12 Business Rules for Offer Letters

Two Recruiting-specific business rule scenarios reduce the effort required for Recruiting users to create new offer letters.

Recruiting administrators can set up [Configure Rule to Preselect Offer Letter Templates](#) so that recruiters don't have to scroll through hundreds of templates when creating a new offer letter. You can also use [Configure Business Rules to Add Conditional Sections in Offer Letters](#) to define custom tokens, so that recruiters can insert them into offer letters.

Combined, these two business rule scenarios reduce the amount of time and effort Recruiting users spend in generating offer letters by selecting the template and letting them add tokens in place of writing paragraphs.

Both rule scenarios are located in [Recruiting](#), in ► [Admin Center](#) ► [Configure Business Rules](#) ► when you select + ([Create New Rule](#)). The rule scenarios are as follows:

| Scenario Name                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Configure Rule to Preselect Offer Letter Templates</a> | <p>An administrator can create this new business rule scenario for a rule that automatically identifies which specific template to use when a new offer letter is created.</p> <p>For example, a new offer letter could automatically use a template based on the brand associated with the job.</p> <p>To assign a new rule, go to ► <a href="#">Manage Rules in Recruiting</a> ► <a href="#">Job Application</a> ► Choosing a template from the <a href="#">Job Requisition Template</a> dropdown list expands the <a href="#">Template-level Rules</a> section to display <a href="#">Rule for Offer Letter Template Selection</a>. Click on <a href="#">Add a Rule</a> below it to select and assign the rule scenario to the rule.</p> |

| Scenario Name                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Configure Business Rules to Add Conditional Sections in Offer Letters</a> | <p>An administrator can define the contents of tokens with this new business rule scenario. Recruiting users can then add these tokens into offer letters to provide customized text based on the rule definitions, so that recruiters don't have to write this text manually.</p> <p>A recruiter could simply insert these tokens into the offer letter, letting the tokens automatically display the appropriate text. For example, a leave policy token could render different text depending on whether the job requisition was for a full- or part-time position.</p> <p>Rules can be as simple as adding the text directly into the rule, or very complex, including the use of lookup tables.</p> <p>Using extended functionality makes it possible to add formatting to offers, including images.</p> <p>Refer to <i>Tokens for Conditional Sections in Offer Letters</i> for more information.</p> |

## Related Information

[Tokens for Conditional Sections in Offer Letters \[page 1575\]](#)

[Creating Business Rules for Recruiting \[page 1512\]](#)

[Implementing the Metadata Framework \(MDF\)](#)

### 29.2.12.1 Tokens for Conditional Sections in Offer Letters

As part of creating a new rule that uses the [Configure Business Rules to Add Conditional Sections in Offer Letters](#) business rule scenario, update the templates to include conditional offer letter tokens.

In [Admin Center](#) > [Manage Offer Letter Templates](#), update the templates to include the new conditional offer letter tokens.

#### Note

There are 100 tokens available for the administrator to configure in the business rules, but by default, you only see the first 15 available tokens in the popup. Use the search field to find the required token.

Hovering over a token in the template shows its assigned label in [Manage Data](#).

Optionally, you can relabel these tokens so that they're easier for users to identify and use. To do so, you need user permission for the new [Manage MDF Recruiting Objects](#) > [ConditionalOfferLetterToken](#) role-based permission.

Once you have this permission, you can go to [Manage Data](#) and search for the option called [ConditionalOfferLetterToken](#). Clicking [Take Action](#), and [Make Correction](#) allows you to change the label for a token to assist users in knowing what each token will contain. The labels can be translated.

HTML formatting is supported within the rule, so you can use options such as `<b>`, `<br>` or `<p>` to format the text added using these new tokens.

Rules also support of **one** level of nested tokens.

## 29.2.13 Rule Functions in Recruiting

Information about the various rule functions that recruiting supports.

Recruiting supports all rule functions in the following groups:

- [Mathematical Functions](#)
- [String Functions](#)
- [Other Functions](#)

In addition, Recruiting also supports the following rule functions:

- calculateFTE
- convertDaysToYYMMDD
- createDate
- dayOfMonth
- dayOfWeek
- differenceCalendarYears
- differenceYearsRoundDown
- differenceYearsRoundUp
- getCalendarDays
- getCompletedMonths
- getCompletedWeeksBetween
- getEmployeeStatus
- getNumberOfDaysForYearOfDate
- getNumberOfMonthBetweenDates
- getPayScaleAmount
- getWeekdays
- getValueOfJobInfoStringOnEffectiveDate
- getYearOfDate
- getTimestampCurrentTimeUTCPlusOffsetMinutes
- getNextWorkingDay
- isEmployeeActive
- latestDateComparingTwoDates
- numberOfWorkingDaysOrHoursForPeriod
- numberOfHolidays

### 29.2.14 Rule Trace

Sometimes a rule doesn't run exactly as you intended, or results in unexpected errors. If this happens, you can trace a rule to try and figure out exactly what went wrong.

Using the [Business Rule Execution Log](#) tool, you can trace a rule and then analyze any errors within its execution details.

### 29.2.15 Mapping Fields With the Lookup Function

You can map Recruiting fields (such as enum) and any picklist and derived fields to foundation object or generic object (FO/GO) fields. That way, even though the fields are not of the same data type, you can still retrieve the value of one field and map it to the other.

Here's an example of some possible mapping implementations:

| Recruiting Field (Left-Hand Side) | Source Value (Right-Hand Side) | Supported by Rules? |
|-----------------------------------|--------------------------------|---------------------|
| Enum                              | FO/GO                          | No                  |
| Enum                              | Enum                           | No                  |
| Enum                              | Legacy picklist                | No                  |
| Enum                              | Derived                        | No                  |
| Derived                           | FO/GO                          | No                  |
| Derived                           | Enum                           | No                  |
| Derived                           | Legacy picklist                | No                  |
| Derived                           | Derived                        | No                  |
| Legacy picklist                   | FO/GO                          | No                  |
| Legacy picklist                   | Legacy picklist                | Yes                 |
| Legacy picklist                   | Enum                           | Yes                 |
| Legacy picklist                   | Derived                        | Yes                 |

| Recruiting Field (Left-Hand Side) | Source Value (Right-Hand Side) | Supported by Rules? |
|-----------------------------------|--------------------------------|---------------------|
| FO/GO                             | FO/GO                          | Yes                 |
| FO/GO                             | Legacy picklist                | Yes                 |
| FO/GO                             | Enum                           | Yes                 |
| FO/GO                             | Derived                        | Yes                 |

## 29.2.15.1 Mapping Legacy Picklist Fields from MDF Objects

Use a rule with the lookup function to map the value of a legacy picklist field from an MDF object.

### Procedure

1. In [Configure Object Definition](#), create a custom MDF object.  
We recommend creating a “master” object that contains a GO, an MDF picklist, and a string specified for it. That way you can reuse the same custom GO in other cases.
2. Configure an MDF picklist as a field in the MDF object, and then specify a valid PDF picklist source for the field  
In the [Valid Values Source](#) field, ensure you enter a source that exists in the MDF picklist.
3. In [Manage Data](#), create a custom GO. Be sure to enter data for all the values you want to map.
4. Create a rule that uses the lookup function to set the value of the legacy picklist in Recruiting to that of the MDF object.
5. Specify a trigger for the rule from the admin page [Manage Rules in Recruiting](#).
6. Trigger the rule.

## 29.2.15.2 Mapping Legacy Picklist Fields from Enum Fields

Use a rule with the lookup function to map the value of a legacy picklist field from an enum field.

### Procedure

1. In [Configure Object Definition](#), create a custom MDF object that contains an MDF picklist field and a string field.
2. Go to ► [Manage Data](#) ► [Create New](#) ►, and select your new custom MDF object. Enter all the necessary data.
3. Create a rule which uses the lookup function to set the value of the country/region (picklist) field based on that of the location (enum) field.

4. Specify a trigger for the rule from the admin page [Manage Rules in Recruiting](#).
5. Trigger the rule.

### 29.2.15.3 Mapping Legacy Picklist Fields from Derived Field Values

Use a rule with the lookup function to map the value of a legacy picklist field from a derived field value (for example, country/region or state).

#### Procedure

1. In [Configure Object Definition](#), create a custom MDF object that contains an MDF picklist and a string field.
2. Go to ► [Manage Data](#) ► [Create New](#) ► , and select your new custom MDF object. Enter all the necessary data.
3. Create a rule which uses the lookup function to set the value of the legacy picklist field based on that of the derived field.

When creating the rule, the picklist field is on the left-hand side. On the right-hand side, use the lookup function to select your custom MDF object.

4. Specify a trigger for the rule from the admin page [Manage Rules in Recruiting](#).
5. Trigger the rule.

### 29.2.15.4 Mapping MDF Objects from Legacy Picklist Fields

Use a rule with the lookup function to map the value of an MDF Object from a legacy picklist field.

#### Procedure

1. In [Configure Object Definition](#), create a custom MDF object that contains at least an MDF picklist field and a generic object
2. In the MDF object, configure an MDF picklist as a field.

The value you enter in the [Valid Values Source](#) field needs to exist in the MDF picklist.

3. Go to [Manage Data](#) and create an instance of a custom generic object (GO). Be sure to enter data for all fields which could potentially be mapped.
4. Create a rule which uses the lookup function to set the value of the MDF object based on that of the legacy picklist field.
5. Specify a trigger for the rule from the admin page [Manage Rules in Recruiting](#).
6. Trigger the rule.

## 29.2.15.5 Mapping MDF Fields from Enum Fields

Use a rule with the lookup function to map the value of an MDF Object from an enum field.

### Procedure

1. In [Configure Object Definition](#), create a custom generic object (GO) that contains a generic object field and a string field.
2. Go to [Manage Data](#) and add all the necessary information for your new custom GO.  
Be sure to enter the full string value of the enum field to be mapped.
3. Create a rule that uses the lookup function to set the value of the MDF object based on that of the enum field.
4. Specify a trigger for the rule from the admin page [Manage Rules in Recruiting](#).
5. Trigger the rule.

## 29.2.15.6 Mapping MDF Fields from Derived Fields

Use a rule with the lookup function to map the value of an MDF Object from a derived field.

### Procedure

1. In [Configure Object Definition](#), create a custom generic object (GO) that contains a generic object field and a string field.
2. Go to [Manage Data](#) and add all the necessary information for your new custom GO.
3. Create a rule which uses the lookup function to set the value of the MDF field based on that of the derived field.  
When creating the rule, the picklist field is on the left-hand side. On the right-hand side, use the lookup function to select your custom MDF object.
4. Specify a trigger for the rule from the admin page [Manage Rules in Recruiting](#).
5. Trigger the rule.

## 29.2.16 OData and Rules

You can trigger Recruiting business rules using the OData V2 APIs.

Use the following operations and triggers:

| For rules related to...                                                | You can use these OData operations                                            | And this rule triggers |
|------------------------------------------------------------------------|-------------------------------------------------------------------------------|------------------------|

## 29.3 Reporting

You can use Table Reports to build data pulls and flat file exports in Excel, PDF, or PowerPoint format. You can run them in the system, share between users, etc.

### Prerequisites

- Enable the [Additional Adhoc Sub domain Schemas Configuration](#) setting at ► [Provisioning](#) ► [Company Settings](#) . Then enable the [Recruiting V2](#) domain, for users with full access to all Recruiting data, or the [Recruiting V2 Secured](#) domain, for users who should have limited access to Recruiting data.
- Configure reportable fields in [Provisioning](#) by navigating to ► [Managing Recruiting](#) ► [Configure Reportable Custom Fields](#) .

#### Note

- Use the same labels for custom fields among all templates.
- Do not configure standard fields as custom reportable fields and do not configure the same field more than once in custom reportable fields.
- Limits on how many fields can be made reportable are listed as follows: This is same for all templates.
  - 100 text fields (includes Text, Textarea, Richtext, Boolean, and Hyperlink fields)
  - 40 number fields (includes Number, Percent, and Currency fields)

- 110 picklist fields (includes Picklist and Object fields)
  - 30 date fields
- Run succession sync in the *Synchronize Existing Data* tab in *Map Custom Fields to Extended Fields for Reporting* page from the data to become reportable.
  - *Role Based Permission*: ► *Admin Center* ► ► *Manage Permission Role* ► {Select Role} ► *Permissions* ► *User Permissions* ► *Reports Permission* ►
    - The permissions required to access Report Center and the reports are available in the *Reports Permission* folder. At a minimum, enable *Report Center* permission. You can also specify permissions specific to Analytics Tiles and Dashboards, Creating Reports, and Running Reports. To have these permissions, enable the options next to the applicable setting and select either All, if they should be able to access for all the allowed domains, or if you only want to enable for Recruiting, for example, you can select the *Others* option and then select the *Recruiting V2* domain.
  - You have access to Provisioning.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Context

## Procedure

1. Table reporting for Recruiting is enabled automatically in provisioning when the Recruiting module is enabled for the instance. However, if you want to override the default behavior, you can modify the following options:
  - *Provisioning* ► *Company Settings* ► *Analytics and Dashboard Tabs & Misc Reporting* ► *Additional Adhoc Sub domain Schemas Configuration* ► *Recruiting V2 / Recruiting V2 Secured* ►.
2. To create and run the reports, grant the following role-based permissions:
  - ► *Reports Permission* ► *Create Report* ► *Recruiting V2 and/or Recruiting V2 Secured* ►.
  - ► *Reports Permission* ► *Run Report* ► *Recruiting V2 and/or Recruiting V2 Secured* ►.
3. To schedule reports, grant the role-based permissions: ► *Reports Permission* ► *Schedule Reports* ►

## 29.3.1 Folders in Reporting

Most standard fields are reportable in Ad Hoc Reporting and custom fields can be made reportable in

► [Provisioning](#) ► [Custom reportable fields](#) ►.

If you follow the suggested process for configuring XML templates, all custom fields should be Reportable Custom Fields

The number of custom fields that can be configured is not changeable. Field IDs should be placed in the configuration mapping. Fields have to be mapped to the correct field type (picklist to picklist, etc.) A succession sync (green confirmation message on screen and email with a non-zero record count) must be run for content to be reportable. The page does not function reliably in Internet Explorer; after saving or syncing, manually refresh the page before taking a next action.

Interview Central content is not reportable (but see two app fields that summarize interview results and are reportable). Pre-screen question content is not reportable. Job description and other rich text fields are not reportable.

| Report Folder          | Description                                                                                                                                                                                                                                                                                                                                                                                                    |

| Job Req Templates      | Contains basic information about the job requisition XML templates that exist in the instance, like system-generated template ID number.                                                                                                                                                                                                                                                                       |
| Application Templates  | Contains basic information about the application XML templates that exist in the instance, like system-generated template ID number.                                                                                                                                                                                                                                                                           |
| Job Requisition        | Contains data from requisition records that have been created in the instance.                                                                                                                                                                                                                                                                                                                                 |
| Posting                | <p>Contains data regarding current job posting status on all requisitions that have been created in the instance.</p> <p>A requisition may have a 1-to-many relationship with the postings, so one requisition may show up multiple times in a report that uses this data if it has been posted to multiple locations.</p>                                                                                     |
| Offer Letter           | <p>Contains data regarding offer letters that have been created, such as the date of offer letter generation and the mode by which the offer letter was sent/recorded.</p> <p>Offer detail fields appear here in all instances but for clients using offer approval functionality, these fields are legacy and should not be used. This data should be reported on from the Offer Details folders instead.</p> |
| Candidate Search Audit | <p>Related to US OFCCP laws.</p> <p>Contains tracked search activity, such as criteria, searcher, results and actions taken on the search results.</p> <p>For more information on OFCCP tracking and reporting see <b>OFCCP Reporting</b> in the <i>Recruiting Management Implementation</i> guide.</p>                                                                                                        |

| Report Folder          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Candidate              | Contains data from the candidate profile records that exist in the instance. Does not include background element data.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Candidate Tags         | Contains data on tags that have been applied to candidate profile records in the instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Application            | Contains data from the application records that exist in the instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Family Role            | N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| App Status Audit Trail | <p>Contains data on every applicant status through which the application has been moved, or has skipped past.</p> <p>You can generate reports to detail the amount of time that a candidate or an application has spent in each status, using the 'App Status Audit Trail' report.</p> <div> <p><b>Note</b></p> <ul style="list-style-type: none"> <li>In the statuses 'Forwarded' and 'Invited to Apply' the Candidate has not yet applied. Therefore, no application exists in the system and he or she is not considered as an applicant.</li> </ul> </div> |
| Job Req Status Audit   | Contains data on every time the requisition status has been changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Job Req Operator       | <p>Contains data on all operators on the requisition.</p> <p>A requisition has a 1-to-many relationship with the operators, so one requisition will show up multiple times in a report that uses this data since there are multiple operators assigned to the requisition.</p> <p>In general it is preferable to report on operators using the operator-specific folders to maintain a 1-to-1 relationship between the operator and the requisition.</p>                                                                                                       |
| Job Req Originator     | Contains data about the user who created the requisition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Recruiter              | Contains data about the user who is currently listed in the related operator field on the requisition.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Hiring Manager         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Candidate Application Comments | <p>Contains data from the comments that are made in the Comments portlet in the application record.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Candidate Profile Comments     | <p>Contains data from the comments that are made in the Comments portlet in the candidate profile record.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| RecruitingOffer Detail         | <p>Contains data from the Offer Details approval forms.</p> <p>A requisition may have a 1-to-many relationship with the applications since multiple applicants may be hired on one requisition, so one requisition may show up multiple times in a report that uses this data if multiple candidates were hired.</p> <p>An application may have a 1-to-many relationship with the Offer Details forms since multiple versions of the form can be created, so one application may show up multiple times in a report that uses this data if it has multiple copies of an offer approval details form.</p> <p>In most cases it is better to use the Last Offer Detail folder to pull offer data.</p> |
| Last Offer Detail              | <p>Contains data from the most recent Offer Details approval form.</p> <p>A requisition may have a 1-to-many relationship with the applications since multiple applicants may be hired on one requisition, so one requisition may show up multiple times in a report that uses this data if multiple candidates were hired.</p>                                                                                                                                                                                                                                                                                                                                                                    |

## Report Folder

## Description

### Referral

You can generate reports to detail the amount of time that a candidate has spent in the Forwarded and Invited to Apply statuses, using the 'Referral' report.

#### Note

- Before the Q4 2016 release, there was no solution available to distinguish between the time a candidate spent in the 'Forwarded' and "Invited to Apply" statuses. This will reflect in the report.
- All the records that have been created before the Q4 2016 release, will be marked with the symbol '\*'. In such cases, a zero with an asterisk will appear in the 'Forwarded' category. In this case, the time that will be displayed under 'Invited to Apply' will actually represent a sum of time the candidate spent in both, 'Forwarded' and 'Invited to Apply' statuses.
- Once an agency forwards any candidate for first time two records in the Referral table are created:  
**AGCandRef** - To indicate that an agency owns this candidate till ownership exists  
**AGCandFw** - Pertains to particular job requisition for which the candidate is forwarded to  
For subsequent forwards by the same agency - only rows with filter type **AGCandFw** will be created.  
In case the ownership expires or new agency forwards the same candidate - two records will be created, with both referral filters

|                              |                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Agency Recruiter             | Contains data of agency users in Admin Tools setup agencies.                                                                                                                                                                                                                                                                                 |
| Agency                       | Contains data of agency record entries in Admin Tools.                                                                                                                                                                                                                                                                                       |
| Application History          | Contains a history of all changes that were made on the application, as shown in the application audit trail data (including field-level change history if that field level auditing is enabled.)                                                                                                                                            |
| JobReq Posting Audit History | <p>Contains a full history of all job posting activity, including postings that were removed.</p> <p>A posting may have a 1-to-many relationship with the posting events, so one posting type like External may show up multiple times in a report that uses this data since the posting may have been added and removed multiple times.</p> |
| WorkFlow Status              | Contains the current route map step of the requisition.                                                                                                                                                                                                                                                                                      |
| Audit Trail                  | Contains the action history of the requisition.                                                                                                                                                                                                                                                                                              |
| Route Entry                  | Contains the full route map history of every step the requisition has passed through, is presently in or has yet to pass through.                                                                                                                                                                                                            |

| Report Folder                     | Description                                                                                                                                                                                                   |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Candidate Profile Fields Audit    | Contains a history of all changes that were made on the candidate profile, as shown in the candidate profile audit trail data (including field-level change history if that field level auditing is enabled.) |
| Application Assessment Order      | Contains the application record information about the order data on third party assessments, if the standard assessment integration is in use.                                                                |
| Assessment Result                 | Contains the application record information about the assessment results from third party assessments, if the standard assessment integration is in use.                                                      |
| Candidate: <background element>   | One folder present per background element. Contains the candidate profile current background element data.                                                                                                    |
| Application: <background element> | One folder present per background element. Contains the candidate profile background element data as captured (snapshot) at the point a recruiting user first viewed the application.                         |

## 29.3.2 Recruiting V2

Recruiting V2 is a report schema that provides the user full access to all Recruiting data.

A user with create access to this reporting capability can put together a report with any columns from any folder and view all data in the results. In general this level of access would only be granted to an administrator, or to recruiters or recruiting management if the client has a relaxed data access policy within the recruiting department. This reporting schema is unlikely to be used for Hiring Managers, although some clients do grant Hiring Managers **Run** privileges to this schema and then only **Share** reports to those hiring managers where there are predefined filters built in to the report to restrict their data results.

### Note

This feature is enabled for you considering the reports that were being run and the performance impact.

To enhance the performance of *Recruiting V2* Ad Hoc reports, you can no longer use the *Run Online* option for the following columns:

Run Online Option Is Disabled for the Following Columns

| View Groups                           | Columns                                                                                                                                                                                                                                                                            |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Application Status Audit Trail</i> | <ol style="list-style-type: none"> <li>1. Application ID</li> <li>2. Created By</li> <li>3. Created Date</li> <li>4. Days in status</li> <li>5. Is Current Status</li> <li>6. Skipped Status</li> <li>7. Status Comment</li> <li>8. Time In Status (days:hours:minutes)</li> </ol> |

| View Groups                         | Columns                                                                                                                                                                                                                                                             |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Application History</a> | <ol style="list-style-type: none"> <li>1. Modified By User First Name</li> <li>2. Modified By User ID</li> <li>3. Modified By User Last Name</li> <li>4. Proxied By User First Name</li> <li>5. Proxied By User ID</li> <li>6. Proxied By User Last Name</li> </ol> |
| <a href="#">Job Requisition</a>     | Candidate Progress                                                                                                                                                                                                                                                  |

The [Run Online](#) option is disabled for the existing reports as well, if the columns that are mentioned are selected. Reports having these columns can be generated offline using the [Run offline](#) option in CSV, Excel, PPT, or PDF format. However, if you select any other columns, apart from the one mentioned in the list, you can generate a report in both online and offline mode.

Let us consider an example where you create an Ad Hoc report of type [Recruiting V2](#). Go to [Columns](#) tab and select [Application History](#) from [All Columns](#) and select the following columns: [Modified By User First Name](#), [Modified By User ID](#), [Modified By User Last Name](#), and [Proxied By User First Name](#).

On the [Report Listing Page](#), when you click [Run Report](#), the [Run Online](#) option is disabled.

#### Note

For better performance, we recommend you to use [Openings Filled](#) column instead of [Openings Filled \(Deprecated\)](#), while creating any Recruiting V2 reports. [Openings Filled \(Deprecated\)](#) column would still work for the existing reports.

## 29.3.3 Recruiting V2 Secured

Recruiting V2 is a reporting schema similar to Recruiting V2 but with an extra layer of security.

The user who has the create report permission can essentially generate data on all available objects in Recruiting. V2 Secured reports have a "Requisitions" option that forces users to refine their criteria and select their relationship to the returned data. This can be read as "Show me data where I am the... <select relationship>" (for example, Hiring Manager, Recruiter, etc.). Because of this extra security, clients more frequently distribute this level of reporting access to their end-users. There's also an option for [Detailed Requisition Filters](#) that are configured in [Provisioning](#).

[Detailed Requisition Filters](#) lets you select criteria, select a field from the requisition, and pick from a list of values you have access to.

#### Note

[Detailed Requisition Filters](#) feature is unavailable in instances with RBP disabled. However, all other V2 Secured functionality works with non-RBP instances.

While using detailed requisition filters with Recruiting V2 secured, you must select the desired fields to use in [Provisioning](#). You can configure the desired fields as detailed requisition filters in [Provisioning](#) > [Manage](#)

[Recruiting](#) > [Recruiting Security Field Set Up](#) . In the [Recruiting Security Field Setup](#) page, you can select several fields as filters to limit access for reports. You can select a maximum of 20 fields as filters.

Once you select fields in the [Recruiting Security Field Setup](#) page and save them, you can grant access to a user or a group. You have specific filters to identify the users who should have this access and select the specific values for each of the fields these users should report on. In the [Manage Detailed Requisition Reporting Privileges](#) page, use the following options to grant access to users or groups:

- [Manage permissions through individual users](#)  
Use the filters to search for multiple users to grant the same access for all or specific users. A maximum number of 50 users are listed to select from and grant access. You can also search for a specific user by name or username and then select the specific options for each field. All the options are by default set to None.
- [Manage permissions through a group of users](#)

#### Note

If you don't update the selections for each field in the [Manage Detailed Requisition Reporting Privileges](#) page, then selecting one of these fields in the V2 Secured reports will display field values that will be blank.

Once you have enabled the fields in [Provisioning](#) and granted access in the [Manage Detailed Requisition Reporting Privileges](#) page, you can select the [Detailed Requisition Filters](#) option on the [Requisitions](#) tab of the report. Next, select the [Select Criteria](#) link to show the values that you enabled in [Provisioning](#).

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

If you don't configure the desired fields in Provisioning, the existing reports (before the Q3 2016 Release) that use detailed requisition filters won't work.

## Enhanced Performance of Certain Columns

To enhance the performance of [Recruiting V2 Secured](#) adhoc reports, you can no longer use the [Run Online](#) option for the following columns:

Columns Where Run Online Option Is Disabled

| View Groups                                    | Columns                                                                                                                                                                                                                                                                   |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Application Status Audit Trail</a> | <ol style="list-style-type: none"><li>1. Application ID</li><li>2. Created By</li><li>3. Created Date</li><li>4. Days in status</li><li>5. Is Current Status</li><li>6. Skipped Status</li><li>7. Status Comment</li><li>8. Time In Status (days:hours:minutes)</li></ol> |

| View Groups                | Columns                                                                                                                                                                                                                                                                              |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Application History</i> | <ol style="list-style-type: none"> <li>1. Last Modified By User First Name</li> <li>2. Last Modified By</li> <li>3. Last Modified By User Last Name</li> <li>4. Proxied By User First Name</li> <li>5. Proxied By User ID</li> <li>6. Proxied By User Last Name</li> </ol>           |
| <i>Job Requisition</i>     | Candidate Progress <div>  <b>Note</b><br/> This column actually displays the status of the candidate who is furthest in the pipeline, but it's not necessarily the status of that candidate. </div> |

The [Run Online](#) option is disabled for the existing reports as well, if the columns mentioned in the table are selected. Reports having these columns can be generated offline using the [Run offline](#) option in [CSV](#), [Excel](#), [PPT](#) or [PDF](#) format. However, if you select any other columns, apart from the one mentioned in the list, you can generate a report in both online and offline mode.

Let us consider an example where you create an adhoc report of type [Recruiting V2 Secured](#). Go to [Columns](#) tab and select [Application History](#) from [All Columns](#) and select the following columns: [Modified By User First Name](#), [Modified By User ID](#), [Modified By User Last Name](#), and [Proxied By User First Name](#).

On the [Report Listing Page](#) when you click [Run Report](#), the option is disabled.

#### Note

For better performance, we recommend you to use [Openings Filled](#) column instead of [Openings Filled \(Deprecated\)](#), while creating any Recruiting V2 Secured reports. [Openings Filled \(Deprecated\)](#) column would still work for the existing reports.

## 29.3.4 Adding Recruiting in Cross Domain Reports

Learn how you can include Recruiting as a domain while generating cross domain reports in Report Center.

### Prerequisites

You have the Create Report permission.

## Context

You can include both the Recruiting V2 and Recruiting V2 Secured report schemas while generating cross domain reports in SAP SuccessFactors Analytics using the Ad Hoc tools or Online Report Designer.

To include Recruiting report schemas in cross domain reports while using Ad Hoc tools in SAP SuccessFactors Analytics:

## Procedure

1. Go to ► [Admin Center](#) ► [Reporting](#) ►
2. Choose [New](#) to create a new report.
3. Select [Cross Domain Report](#) to create a query that contains multiple domains in a single list report..
4. Select any one of the two Recruiting report schemas, [Recruiting V2](#) or [Recruiting V2 Secured](#) as a domain.

### Note

You can start by selecting any schema at this step. The Recruiting schemas were used in this step to serve as an example. In addition, you can also select the recruiting schemas during the add domain step if you selected another domain's schema in this step.

5. Choose [Select](#).
6. Choose [Add Domain](#) to add another domain of your choice to the cross domain report.
7. Perform the usual steps involved in creating a cross domain report.

### Note

The Cross Domain feature for Recruiting is also available while creating a cross domain report using Online Report Designer.

## 29.3.5 Recruiting Standard Reports

The SAP SuccessFactors Reports team has produced several standard reports for client use.

The client's instance must meet minimum standards of configuration in order for the reports to work. If those minimum standards of configuration are not met, the reports will error. To avoid such errors, remap the report so that it looks for custom fields instead of the missing standard fields.

Refer to *SAP Note 2082053 – Standard Recruiting Management Reports* for information on Ad Hoc reporting.

## Related Information

[SAP Note 2082053](#) 

## 29.3.6 Visual Publisher and BIRT

Visual Publisher (also known as BIRT Reporting) is an open source, third-party tool similar to Business Objects or Crystal Reports. It can be plugged in to SAP SuccessFactors Ad Hoc reporting to provide clients more powerful tools to manipulate the data.

Visual Publisher provides abilities that Ad Hoc 2 doesn't support, such as relabeling columns, performing calculations, and adding graphs, titles and introductory text.

The Standard Recruiting Reports are built in Visual Publisher. These can be enabled for a client at no cost, and the client does not have to purchase Visual Publisher to use these reports.

There is a cost associated with enabling Visual Publisher. The client should expect to provide a knowledgeable technical resource to work with this tool. SAP SuccessFactors doesn't supply training or support on the tool; since this is an open source tool, there is online training available. Some SAP SuccessFactors partner companies choose to provide training classes at a cost.

Refer to *SAP Note 2456768 – How to enable Visual Publisher* for information on Ad Hoc reporting.

### Related Information

[2456768 – How to enable Visual Publisher?](#) 

## 29.3.7 YouCalc

YouCalc is a tool to build interactive graphic representations of data. It uses the data from Ad Hoc Reporting.

The Recruiting YouCalc widget appears on the top of the Requisition tab. This is the only pre-built YouCalc attribute in Recruiting today.

Clients can commission custom YouCalc dashboards to appear in the Reporting tab of the application.

## 29.4 Using the Check Tool to Solve Issues

Get an overview of potential problems and errors in your configuration that you can try to solve yourself before you contact Technical Support about an issue.

### Prerequisites

- You've enabled the Metadata Framework.
- You have the following  [Administrator Permissions](#)  [Check Tool](#)  permissions:

- [Access Check Tool](#) authorizes users to access the tool.
- [Allow Configuration Export](#) authorizes users to attach configuration information to a ticket.
- [Allow Check Tool Quick Fix](#) authorizes users to run quick fixes for the checks that have this feature. A quick fix can be used to immediately correct any issues found by that check.

For more information about role-based permissions, refer to [List of Role-Based Permissions](#).

#### → Tip

Refer to [Guided Answers for the Check Tool](#)  for a guided navigation through the available check tool checks and more information on each check.

## Context

The check tool provides an overview of the issues found in the system. New checks that are being added in a new release go through a first initial run to return a result. After the initial run, checks are run on a regular basis (at least monthly). We recommend you open the check tool after you upgrade to a new release to see whether issues have been found by new checks.

In addition to these runs performed by the system, you can also run individual checks after you make changes to the system, for example, after updating data models or picklists. For more information, refer to the application-specific documentation.

## Procedure

1. Go to  [Admin Center](#)  [Check Tool](#) .

The [Check Tool](#) page opens displaying the results of the first tab **System Health**.

2. Depending on the check type of the check you're interested in, select the corresponding tab.

| Tab                           | Description                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">System Health</a> | <p>Displays configuration checks that have returned errors or warnings after the last run. We recommend you solve these in a timely manner.</p> <p>To display all checks, select all result types in the <a href="#">Result Type</a> search filter and select <a href="#">Go</a>.</p>                                                                                           |
| <a href="#">Migration</a>     | <p>Displays the migrations that are still pending, either because the check tool couldn't automatically migrate all issues or because new issues have been found after the last run. We recommend you solve these in a timely manner.</p> <p>To display all checks, turn on the <a href="#">Show completed migrations also</a> search filter and select <a href="#">Go</a>.</p> |

| Tab                        | Description                               |
|----------------------------|-------------------------------------------|
| <a href="#">Validation</a> | Displays a list of all validation checks. |

**Note**

Validation checks require one or more parameters for execution, therefore we can't run these checks automatically. You need to enter input parameters and run the corresponding check manually to get results.

- To solve a check that returned issues, select it.

The detail view opens to the right side of the screen with more information on the check and on how to solve the issue.

- Evaluate the results and resolve the issues. If the check provides a quick fix that you can use to immediately correct issues found during a check run, select the [Quick Fix](#) button.
- If you encounter an error you can't resolve, contact Technical Support by creating a ticket.

## Next Steps

To verify that you've solved the underlying issue, select the checkbox for the corresponding checks and choose [Run Checks](#). You can also wait until the next automatic run to see if the issue has been solved.

### Note

If the check you selected requires one or more prechecks (checks that need to be run successfully first), the prechecks are run first even if you haven't selected them.

## Related Information

[Running Checks \[page 1595\]](#)

[Using the Quick Fix Feature \[page 1599\]](#)

## 29.4.1 Benefits of the Check Tool

The SAP SuccessFactors check tool helps you identify and resolve issues when your system doesn't work as you expect.

If your SAP SuccessFactors applications are behaving in unexpected ways, it is likely that it has a configuration or data conflict: you have some data that is inconsistent or a configuration error. The check tool quickly identifies these types of problems so that you can avoid support tickets. You might still need to create a support ticket if the problem is severe, but even in severe cases, the check tool can save you time because it can export the results

of the check and your configuration for Technical Support. The support engineer, therefore, can identify the issue more quickly.

When you open the check tool, you see:

- A list of issues in your configuration or data and the severity of each issue.
- A solution or recommendation to address the issue.

## 29.4.2 Running Checks

Trigger the execution of individual checks to find potential issues in the system, or to check if an issue has been solved in the meantime.

### Prerequisites

- You've enabled the Metadata Framework.
- You have the following [Administrator Permissions](#) > [Check Tool](#) permissions:
  - [Access Check Tool](#)
  - [Allow Configuration Export](#)
  - [Allow Check Tool Quick Fix](#)

### Context

In addition to the job runs performed automatically by the system, you can also run individual checks. For example:

- You want to check whether the issue has been solved.
- You want to run a check as a prerequisite or post-step of a task. For example, you made changes to the system (such as updating data models or picklists), and you want to verify that your changes didn't cause any new issues. For more information, refer to the application-specific documentation.
- Validation checks need to be run manually as they require input parameters.

### Procedure

1. Go to [Admin Center](#) > [Check Tool](#).

The [Check Tool](#) page opens displaying the results of the first tab [System Health](#).

2. Depending on the check type of the check you want to perform, select the corresponding tab.

A list of checks is displayed in the results table according to the predefined selection criteria.

3. **Optional:** If the check you're searching for is not listed in the results table, adjust the selection criteria and choose [Go](#).

You get a list of checks that fulfill the selection criteria you've entered.

4. Select the corresponding checks, and choose [Run Checks](#) from the top right of the results table.

**Note**

Please note that, for checks on the [Validation](#) tab, you can only select one row at a time. Execution of multiple checks at once is not possible.

Also, for validation checks you need to enter the required input parameters when running a check.

**Note**

If the check you selected requires one or more prechecks (checks that need to be run successfully first), the prechecks are run first even if you haven't selected them.

The [Results](#) column displays any issues found.

### Next Steps

Investigate and solve the underlying issue.

## 29.4.3 Check Types

Overview of the different check types and their purpose.

The check type groups those checks that have a common purpose. On the [Check Tool](#) page, each tab represents a check type.

Overview of Check Types

| Check Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                   | Automatic Job Runs                                                                                                                                  |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| System Health | <p>Checks that run without parameters and check configuration and data issues that need to be fixed.</p> <p>The predefined selection criteria displays only those that have returned errors or warnings after the last run. We recommend you solve these in a timely manner.</p> <p>To display all checks, select all result types in the <b>Result Type</b> search filter and select <a href="#">Go</a>.</p> | <ul style="list-style-type: none"><li>• Automatic initial run at the beginning of a new release</li><li>• Periodic runs (usually monthly)</li></ul> |

| Check Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                      | Automatic Job Runs                                                                                                                                 |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Migration  | <p>Checks that perform an automatic migration of features.</p> <p>When you open the page, only pending migrations are displayed. To display also the completed migrations, turn on the <a href="#">Show completed migrations also</a> search filter and select <a href="#">Go</a>.</p>                                                                                                                                           | <ul style="list-style-type: none"> <li>Automatic initial run at the beginning of a new release</li> <li>Periodic runs (usually monthly)</li> </ul> |
| Validation | <p>Checks which need one or more parameters for execution, for example:</p> <ul style="list-style-type: none"> <li>A specific template</li> <li>A specific user</li> <li>A specific time frame</li> </ul> <p>Validation checks can be triggered by single selection and choosing the <a href="#">Run</a> button. A popup appears with input fields for the parameters. Execution of multiple checks at once is not possible.</p> | Only triggered through user                                                                                                                        |

If the check tool hasn't been opened in 90 days, periodic check runs become inactive until you open the Check Tool again.

To reactivate periodic runs, you must open the Check Tool once. Use the [CheckToolUIUsed](#) check to verify that periodic check runs are active.

## 29.4.4 Check Results

After you run checks in the check tool, it returns the results of the checks so that you can resolve the issues found.

The results of a check are displayed in the [Result](#) column. If you run the checks multiple times to see how you're resolving issues, you can select a previous result from the [History](#) dropdown list.

### Note

To display the [History](#) dropdown list, select a check. On the details screen that opens on the right side of the page, expand the header. The [History](#) dropdown list is directly below the check title.

#### Possible Results of Check Tool

| Result          | Action                                                                                          |
|-----------------|-------------------------------------------------------------------------------------------------|
| No issues found | If the tool can't find issues, you see a green check mark in the <a href="#">Result</a> column. |

| Result             | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Issues found       | <p>If the tool finds issues, it reports the number of issues and a yellow  (<i>Warning</i>) icon or a red alarm icon.</p> <ul style="list-style-type: none"> <li>The yellow icon indicates a low severity issue. The system proposes a solution.</li> <li>The red icon indicates a high severity issue. You must take action, which could include creating a support ticket.</li> </ul> |
| Pending migrations | <p>If the tool finds pending migrations that need to be completed by the user, you can see a yellow warning icon or a red alarm icon in the <i>Status</i> column on the <i>Migration</i> tab.</p>                                                                                                                                                                                                                                                                        |
| Completed          | <p>If the tool finds no issues with migration, or the migration has already been completed, you see a green check mark in the <i>Status</i> column on the <i>Migration</i> tab.</p>                                                                                                                                                                                                                                                                                      |

#### Note

- Select the *Export Results* button to download the check results. Ensure you run the check before exporting the check results. If not you can view only the first 100 check results.
- The downloaded check result table can display a maximum number of 10,000 rows.

## Related Information

[Creating Technical Support Tickets from the Check Tool \[page 1598\]](#)

## 29.4.5 Creating Technical Support Tickets from the Check Tool

When the check tool reports a serious issue that you can't solve, you might need to contact Technical Support. You can create a support ticket from within the check tool.

## Prerequisites

You've run the check tool. You can find the check tool by going to ► *Admin Center* ► *Check Tool* ►. You create the ticket from the details page of the tool.

## Procedure

1. Select the check you can't solve.

The detail view opens to the right side of the screen with more information on the check and on how to solve the issue.

2. On the [Result](#) tab, scroll down to the results table to look for the errors you want to report on.  
You usually contact Technical Support for high severity issues not low severity issues.
3. On the [Check Information](#) tab, under [Need Assistance?](#), copy the component ID.  
For example, LOD-SF-EC is the component ID for Employee Central.
4. Create a customer case in the relevant category.
5. When you create the ticket, paste the component ID into the ticket.

## 29.4.6 Using the Quick Fix Feature

The check tool includes a quick fix feature that you can use to immediately correct issues found during a check run.

### Prerequisites

The checks you want to solve with a quick fix have run and provide a check result with error or warning.

### Procedure

1. Go to [Admin Center](#) > [Check Tool](#)

The **Check Tool** page opens.

2. Select the check you want to fix.

The details screen opens on the right side of the page with more information about the check. If the check includes a quick fix, the [Quick Fix](#) button is displayed on the [Result](#) tab, under [Proposed Solution](#).

3. Choose [Quick Fix](#) to start fixing the issue.

A third screen opens to the right side, with step 1, called [Select Correction](#), that shows one or more corrections for the issue.

4. Select the correction you want to carry out and choose [Step 2](#) to proceed to [Final Approval](#).

In the [Final Approval](#) step, you can opt to change your mind and not carry out the fix.

5. If you want to proceed, choose [Step 3](#).

The system confirms that the fix is now running.

6. Choose [Close](#) to complete the procedure.

After a short time, the system runs the check again to verify that the fix has run correctly.

## 29.4.7 Exports

### 29.4.7.1 Exporting Configuration Information

Export the configuration information from your system and attach it to the Support ticket created from the check tool. This information can help Support identify the issue of a check you can't solve yourself.

#### Prerequisites

You have the ► [Administrator Permissions](#) ► [Check Tool](#) ► [Allow Configuration Export](#) ► permission.

#### Context

##### ⚠ Restriction

Export of configuration information is supported only in the following applications:

- Payroll Information
- Position Management
- Time Off
- Time Sheet

#### Procedure

1. Go to ► [Admin Center](#) ► [Check Tool](#) ►.

The [Check Tool](#) page opens with a list of all applications for which you can use the check tool..

2. Select the corresponding application.

If the application has the export configuration feature enabled, you can see an information message at the bottom of the page with a link.

3. Choose the [Export Configuration](#) link in the information message.

#### Results

The system downloads a file with the configuration information for the application you've selected.

## Next Steps

Attach the downloaded file to the Support ticket you created from the check tool.

## 29.4.7.2 Exporting Check Results

After you run checks in the check tool, you can export the results.

### Context

- Ensure you run the check before exporting the check results. If you don't do this, you can view only the first 100 check results.
- The downloaded check result table can display a maximum number of 10,000 rows.

### Procedure

On the [Result](#) tab, select the [Export Results](#) button to download the check results.

## 29.4.7.3 Exporting a List of All Checks

Get an overview of all checks available in the system by exporting a CSV file.

### Procedure

1. Go to [Admin Center](#) > [Check Tool](#).

The [Check Tool](#) page opens.

2. In the top-right corner, select [Export all checks](#).

A CSV file with all checks available in the system is downloaded, including check descriptions and application area.

#### Note

The list includes also checks that you can't access from the user interface if you don't have the corresponding applications set up, or if you lack the required permissions.

## 29.5 Manage Templates

The Manage Templates tool in the Admin Center can be used with Recruiting Management templates. You can track the version as well as the author of any new changes made to the Recruiting Management system configuration using the templates. You can also restore earlier versions of the configuration, and undo any changes that were recently made.

### ⚠ Caution

It's important to remember that the Manage Templates tool is powerful . Modifications made to templates can have a direct impact on candidate experience, integrations, custom integrations, and other downward integrations. Only qualified individuals who are familiar with the configurations must modify the templates.

### → Remember

- Make sure that the job requisition template is available in OData Dictionary as well as **JobRequisition** Entity.

### 29.5.1 Enabling Template Management in Admin Center

Enable the [Manage Templates](#) tool so it can be used to modify Recruiting templates directly in Admin Center.

#### Context

The Manage Templates tool allows you to make minor modifications to Recruiting templates in Admin Center, without requesting a change to XML configuration in Provisioning. It keeps track of change versions so you can revert unwanted changes and restore a previous version if necessary.

### ⚠ Caution

This is a powerful tool. Modifying templates has a direct impact on the candidate experience and on integrations. Use role-based permissions to ensure that only qualified individuals who are familiar with template configuration can access and use the tool.

#### Procedure

1. Go to role-based permissions and assign [Manage Recruiting Templates](#) and [Manage Recruiting Settings](#) permission to the appropriate roles.
2. Go to ► [Admin Center](#) ► [Upgrade Center](#) ► [Optional Upgrade](#) ► and complete the [Enable Generic Objects](#) upgrade.

3. Go to ► [Admin Center](#) ► [Upgrade Center](#) ► [Recommended Upgrades](#) ► and complete the [Manage Templates](#) upgrade.

## Results

You can use the Manage Templates tool to modify an existing template, view the template versions and audit logs, and restore previous versions of a template.

## Next Steps

Make sure that the job requisition template is available in OData Dictionary as well as [JobRequisition](#) Entity.

## 29.5.2 Modifying a Template in the Manage Templates Tool

This section describes the procedure to modify an existing Recruiting Management template using the Manage Templates tool.

## Prerequisites

Enable [Manage Templates](#).

## Context

You can modify an existing Recruiting Management template in the Manage Templates tool. To do so, perform the following procedure:

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Templates](#) ► [Recruiting Management](#) ►.

This [Recruiting Management](#) tab shows a list of the types of templates that are available for Recruiting Management.

2. Choose any template type.

A list appears, showing all of the available templates for the chosen type. In this list, you can see the number and status of the versions for each template under the [Version](#) column.

3. Select a template to open it in an editable pane and make your desired changes.

This example shows that when you're updating the template, if the default locale of the instance is en\_US, the template name is configured as the following:

```
<template-name><![CDATA[Permanent Employees]]></template-name>  
<template-name lang="de_DE"><![CDATA[Festeinstellungen & Zeitarbeitskräfte]]></  
template-name>  
<template-name lang="en_US"><![CDATA[Permanent Employees & Timeworkers]]></  
template-name>
```

When you save this template, the en\_US template name (Permanent Employees & Timeworkers) gets replaced by the default template name (Permanent Employees).

4. Choose [Save as Draft](#) to return to this version and make edits, or [Publish](#) to create a new version of the template and publish the changes to your environment.

#### Note

To delete a field from a template, make sure to remove all permissions and references to the field to avoid errors.

## Related Information

[Enabling Template Management in Admin Center \[page 1602\]](#)

## 29.5.3 Viewing Version and Audit Log and Template Versions

View the changes made to the Recruiting Management templates using the Manage Templates tool.

## Prerequisites

Enable [Manage Templates](#).

## Context

You can retrieve a log of the versions to assess the changes made to Recruiting Management templates. The Version and Audit Log also provides information about the author of the changes made, a timestamp at which the change was made, the version number and status, and the type of change that was made to the template. To view

the versions of the changes made to the templates and the Version and Audit Log, perform the following example procedure:

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Templates](#) ► [Recruiting Management](#) ►.

This [Recruiting Management](#) tab shows a list of the types of templates that are available for Recruiting Management.

2. Choose any template type.

A list appears, showing all of the available templates for the chosen type. In this list, you can see the number and status of the versions for each template under the [Version](#) column.

3. Select a number displayed in the [Version](#) column for any template.

This displays the Version and Audit Log for the chosen template.

## Related Information

[Enabling Template Management in Admin Center \[page 1602\]](#)

## 29.5.4 Restoring Recruiting Management Template

You can view the different versions available for a Recruiting Management template using the Version and Audit Log in the Manage Templates tool. Using the Version and Audit Log, you can also restore an earlier version of a template, if desired.

## Prerequisites

Enable [Manage Templates](#).

## Context

To restore a preceding version of a Recruiting Management Template, perform the following example procedure:

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Templates](#) ► [Recruiting Management](#) ►. This [Recruiting Management](#) tab

A list of the types of templates that are available for Recruiting Management displays.

2. Choose any template type.

A list appears that shows all of the available templates for the chosen type. In this list, you can see the number and status of the versions for each template under the [Version](#) column.

3. Choose a number displayed in the [Version](#) column for any template. This will display the Version and Audit Log for the chosen template.
4. Select [Restore](#) in the [Action](#) column of a desired version to restore that version of the template.
5. Review the template or make additional edits to the template and then choose [Save as Draft](#) or [Publish](#).

## Related Information

[Manage Templates \[page 1602\]](#)

## 29.6 Enabling the Merging of Duplicate Candidate Profiles

Candidates sometimes create more than one candidate profile in Recruiting. In such situations, you can merge the profiles into a single profile.

## Prerequisites

- [Enable Merge Duplicate Candidate Profiles](#) is selected in Provisioning.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

- You have the [Manage Duplicate Candidates](#) permission.

## Context

When creating a candidate profile, the system is designed to avoid duplicate candidate profiles by requiring the double entry of a candidate's email address.

For any candidate profile that's marked as a potential duplicate, you can go to the [Manage Duplicate Candidates](#) directly from the Candidate Profile using the link in the alert message. This link opens the Potential Duplicate Candidates list, where you can choose the next steps to manage the duplicate candidates.

These behaviors apply when Candidate Profiles are created through [External Candidate View](#), [Recruiter View](#), or [Agency User View](#). It doesn't apply to profiles created through Employee Referral.

### Points to Remember

- You can't undo a candidate merge.
- Only one pair of candidates can be merged at a time. You can't merge candidates in bulk or merge all candidates found by the duplicate search results at once.
- Duplicate candidates can only be merged from [Admin Center](#), not from the candidate profile user interface.
- Internal candidates can be merged with external candidates, or external candidates can be merged with external candidates, but internal candidates can't be merged with internal candidates.
- A combination of first name, last name, and address fields are used to identify potential duplicates.
- The system also checks email address and primary phone number fields to identify duplicate candidates.
- Phone number validation only applies to instances where Mobile Apply or Recruiting Marketing aren't enabled.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Duplicate Candidates](#) ►.
2. Select [Check country/region code and phone number](#) in the [Advanced Options](#) tab.
3. Choose [Save](#).

If the formatting of phone numbers doesn't match, the system doesn't recognize the numbers as duplicates. For example, the system wouldn't identify the same phone number with and without hyphens as a duplicate.

4. To view duplicate candidates, go to ► [Admin Center](#) ► [Manage Duplicate Candidates](#) ► [Potential Duplicate Candidate List](#) ►.

## Results

The [Potential Duplicate Candidate List](#) tab lists the duplicate candidates that are found in the system and lets you merge them manually.

## Next Steps

Select the row of matched candidates to compare the basic data of candidates side by side to confirm that the candidates are actual duplicates. Once the potential set of duplicate candidates is identified, you can select the Master candidate and merge them.

## Related Information

[Using Role-Based Permissions](#)

### 29.6.1 Working with Duplicate Candidates

This feature manifests in both the recruiting user view and administrative user view (depending on permissions).

In the recruiting user view, a user viewing a candidate profile is warned, if the profile appears to be a possible duplicate of another profile. This appears as a yellow warning sign in the upper right-hand corner of the Candidate Profile record. When a candidate is identified as a potential duplicate, a warning message appears next to the candidate's name.

Users who have permissions to the [Manage Duplicate Candidates](#) option in [Admin Center](#) can merge candidate profiles. There's no functionality to merge candidate profiles from the Candidate Profile user interface itself — merging is reserved as an administrative function.

In [Admin Center](#) > [Recruiting](#) > [Manage Duplicate Candidates](#) feature there are two subtabs:

- Potential Duplicate Candidate List
- Manually Merge Duplicate Candidates

#### Potential Duplicate Candidate List

If you want to proactively manage duplicate candidates, select [Update List](#) in this tab. The system searches through the entire candidate database and attempts to find possible duplicate candidates. This comparison job can take a long time to run. You have to be trained to initiate this job as part of regular system maintenance, if you wish to use it and plan to come back in a few hours or the next day to work with the list of duplicates.

Clicking on a line of matched candidates allows you to compare the candidates' basic data side by side so that you can confirm that the candidates are actual duplicates.

Once a potential set of duplicate candidates is identified and selected, the system asks, **Are these duplicate candidates?**

If you select [No](#), the candidates are marked off so they don't appear in the Potential Duplicate Candidate List, and the duplicate candidate warning message isn't shown on the Candidate Profile user interface.

If you select [Yes](#), the user is then prompted to select which candidate becomes the master candidate.

#### Note

If you're merging an external and internal candidate, only the internal candidate has to be made as the Master Candidate.

## Manually Merge Duplicate Candidates

If you're aware of a specific duplicate, choose the [Manually Merge Duplicate Candidates](#) tab to search for each of the candidate profiles and perform a merge. The recruiting user can specify whether to search for an internal or external candidate and then search by either e-mail (contactEmail) or username (primaryEmail). The candidate's primaryEmail and contactEmail can be the same value, especially when you have selected [Use E-mail as Username](#) option in Provisioning.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

You're prompted to select which candidate becomes the master candidate. If you're merging an external and internal candidate, only the internal candidate has to be made as the Master Candidate.

The master candidate profile is the profile retained after the merge. If there's a conflicting data, such as differing phone numbers stored in the same cell phone number field, the data from the master candidate record is retained. The primaryEmail (username) and password from the master candidate record are retained.

Once you select a master candidate, the user is prompted to choose whether they wish to notify the candidate of the merge activity through e-mail. There are options to notify the master candidate, secondary candidate, or both.

Additionally, you can edit the candidate notification e-mail before sending. The default e-mail language is set in

► [Admin Center](#) ► [Recruiting](#) ► [Recruiting E-mail Triggers](#) ► [Candidate Merge Notification](#) ►.

Once merged, only the master candidate appears in the candidate search results. All applications associated with both profiles are now associated to the master profile. If the candidate applied to the same requisition twice with different profiles, the duplicate applications exist. The recruiting user should disposition one and proceed in the hiring process with the other.

Potential duplicate candidates are flagged based on the following criteria:

- First Name
- Last Name
- City
- Country/Region
- First 10 letters of address or phone number or first five digits of Zip code

The City, Address, Phone Number, and Zip Code fields are normalized to remove spaces, dashes, and periods.

Only the first 10 letters of the Address field are compared, which helps avoid missing a duplicate simply because the street address is spelled out differently, such as **Lane** versus **Ln**, **Street** versus **St**, and so on.

(If the administrative user has reviewed the potential duplicate candidate set, determined they aren't duplicates and marked them off, the preceding criteria becomes void; the candidates aren't considered as potential duplicates even though the data matches.)

### ⓘ Note

The comparison criteria aren't configurable.

## 29.6.2 Check on Duplicate Candidate Creation

Prevent creating duplicate candidates when a candidate profile with the phone number and country/region code already exists.

Creating a duplicate candidate account in an external career site with an existing phone number and country/region code is restricted regardless of whether Recruiting Marketing is enabled or disabled. The check is validated based on the combination of phone number and country/region code. The existing duplicate candidate accounts that were created before the Q4 2019 release remain the same.

To validate phone number of duplicate candidates, enable the option *Check country/region code and phone number* in ► *Advanced Options* ► *Manage Duplicate Candidates*. ▢

The phone number validations are done on the candidate profiles that are created through the following:

- External Candidate View
- Recruiter View
- Agency User view

## 29.7 Job Analyzer for Recruiting

The Job Analyzer is designed to help you create the best job description possible by providing salary and language recommendations. This unique capability is made possible by the use of machine learning techniques, combined with historical applicant data to determine any gender-biased language.

### Note

Currently, gender bias scan and skills analysis are available for any English language Job Requisition, while salary analysis is only available for jobs located in the US.

### Job Analyzer Tool in Job Requisition

The Job Analyzer Tool is available on the *Job Description* page in SAP SuccessFactors Recruiting Management.

When a user is creating a Job Requisition in SuccessFactors Recruiting, the Job Analyzer provides insights on the effectiveness of the content of the requisition. This information includes analysis of SuccessFactors data, analysis on the effectiveness of the job description, analysis on whether the job description introduces gender biases (bias language checker), and insights and indexes of external aggregated open web data through smart search APIs.

Job Analyzer Tool

## 29.7.1 Enabling Job Analyzer Using Upgrade Center

Enable the Job Analyzer to get insights into the effectiveness of your job requisitions.

### Prerequisites

The metadata framework (MDF) is enabled.

### Context

The Job Analyzer includes:

- analysis of system data;
- analysis of the effectiveness of the job description;
- analysis of gender biases in the job description;
- insights and indexes of external, aggregated open web data through smart-search APIs.

### Procedure

1. Go to [Admin Center](#) [Upgrade Center](#).
2. Choose *Job Analyzer* in the *Optional Upgrades* section.

3. Choose [Upgrade Now](#).  
The [Upgrade to Job Analyzer](#) dialog appears with a confirmation message.
4. Choose [Yes](#) to proceed.  
A success message is displayed.
5. Choose [Ok](#) to close the dialog.

## Results

The Job Analyzer is enabled and available to people with the relevant permissions.

### → Remember

It can take up to 30 minutes for changes to take effect in the system. You may need to log out and log back in to see changes.

## Next Steps

Give the appropriate roles the following permissions:

- [Administrator Permissions](#) > [Manage System Properties](#) > [View Job Analyzer Salary Section](#) (available in Recruiting only)
- [Administrator Permissions](#) > [Manage System Properties](#) > [View Job Analyzer Gender Check Section](#) (available in Recruiting and in Job Profile Builder)

## 29.7.2 Feature Details of Job Analyzer Tool

The main features of Job Analyzer tool include Gender Bias Scan, Recommended Skills, Salary, and Machine Learning Notes. Each of these features helps you to create an effective and gender-neutral job descriptions.

[Salary Section in Job Analyzer \[page 1613\]](#)

The Salary Benchmark section of Job Analyzer tool allows you to get an overall understanding about the salary information that you have entered in the Job Description.

[Gender Bias Section in Job Analyzer \[page 1615\]](#)

The Gender Bias section of the Job Analyzer tool allows you to gauge the language used in the Job Description based on the score. It also suggests you with the alternatives to avoid gender-bias terms in the Job Description.

#### [Recommended Skills Section in Job Analyzer \[page 1616\]](#)

The Recommended skills section of the Job Analyzer Tool allows you to identify or mark the relevant and irrelevant skills that are detected in the Job Description through machine learning technology.

#### [Feedback Data in Job Analyzer \[page 1617\]](#)

User feedback can be directly gathered in the Job Analyzer to improve the performance of the Machine Learning features. Job Analyzer provides feedback options for Recommended Salary and Gender Bias Scan.

#### [Machine Learning Notes \[page 1618\]](#)

The Machine Learning results displayed in the Job Analyzer are the outcome of the SAP Machine Learning framework.

## 29.7.2.1 Salary Section in Job Analyzer

The Salary Benchmark section of Job Analyzer tool allows you to get an overall understanding about the salary information that you have entered in the Job Description.

Salary ?

Higher 

The job category associated to your job requisition is: **Engineers, All Other (onet 17-2199.00)**

I agree: ☒ ☐

The market salary range for this category in **Pennsylvania, US** is: **\$68,520 - \$117,350** ?

Median market salary: **\$91,540**

Recommended salary: **\$106,027** ? **15.83%** above the median market rate.

I agree: ☒ ☐

The salary offering you entered is above the ideal predicted salary; this will expedite effective hiring for this position.

| Market Salary Range  | This is the range between the 25 <sup>th</sup> and 75 <sup>th</sup> percentiles of salary data aggregated with official data from the U.S. Bureau of Labor Statistics. The data is filtered to correspond to the Job Requisition ONET Detailed Occupation Title (see <b>Matched Job Category</b> ), in the geographical area matched with your Job Requisition's location (see <b>Matched Locations</b> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Market Salary Median | This is the Median Salary of the data aggregated with official data from BLS. The data corresponds to the Job Requisition ONET Detailed Occupation Title and Matched Location.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Matched Job Category | <p>This is the O*NET SOC-2010 Detailed Occupation Title that best matches your Job Requisition title and description. This is based on the SAP SuccessFactors' proprietary job classification algorithm trained over millions of job postings gathered over job boards data.</p> <p>You can provide positive or negative feedback by agreeing or disagreeing on whether the Job Analyzer has correctly categorized the Job Requisition into a Job Category.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Matched Location     | This is the administrative area that was matched to your Job Requisition Location field to filter the market salary data. As of the Q1 2018 Release, the matched area is at the US State level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Recommended Salary   | <p>This is the recommendation given by our proprietary prediction algorithm. It expresses the ideal salary of the job you are looking to fill, taking into account the following factors:</p> <ul style="list-style-type: none"> <li>• Job Title</li> <li>• Matched ONET category of the Job</li> <li>• Skills detected in your Job description</li> <li>• Desired level of experience detected in your Job description</li> <li>• Matched Location of the Job</li> </ul> <p>The Salary prediction algorithm is based on the data analyzed over 10 million and more external job postings aggregated by the SAP Recruiting Posting (formerly Multiposting) technology, over public job boards &amp; career sites. This has been adjusted with public salary data (from the U.S. Bureau of Labor Statistics).</p> <p>You can provide feedback using <b>thumbs up</b> or <b>thumbs down</b> option to agree or disagree with the salary recommendations. Additionally, you can state whether the salary is too high or too low while using the <b>thumbs down</b> option.</p> |

## 29.7.2.2 Gender Bias Section in Job Analyzer

The Gender Bias section of the Job Analyzer tool allows you to gauge the language used in the Job Description based on the score. It also suggests you with the alternatives to avoid gender-bias terms in the Job Description.

| Insight                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Language Overall Score | Gives an overall rating of the Gender Bias score results. If the Job Requisition contains only neutral wordings, the score is 5/5. This Score is impacted by the amount of non-neutral vocabulary (masculine and feminine), and by the imbalance between masculine and feminine.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Gender Bias Scan       | <p>Gives the proportion of indirect masculine and feminine bias words in the job description and the proportion of neutral vocabulary. This provides the most notable biased words detected in the text.</p> <p>The Gender Detection algorithm also provides alternatives that are marked as neutral, whenever such alternatives exist for a biased word. Selecting one of the proposed neutral alternatives results in the replacement of the biased word with the selected word throughout the Job Description.</p> <p>If Job Analyzer doesn't provide any alternatives for a given biased word, or if you aren't satisfied with any of the suggestions, you can enter a custom word of your own in the text box. You can validate this custom word by clicking <a href="#">Replace</a> option. This action results in the following:</p> <ul style="list-style-type: none"><li>• The biased word is replaced by the selected replacement, throughout the Job Description.</li><li>• The custom word is sent to the Job Analyzer and is aggregated into a global, growing syllabus of replacement suggestions.</li></ul> <div><p><b>Note</b></p><p>You can revert any changes of words by clicking <a href="#">Undo</a> option, but ensure that the Job Analyzer isn't refreshed before you perform this action.</p></div> |

### Note

- Job Analyzer is used for Job Summaries (Short Description) and Job Description (Long Description) Job Profile sections using Job Profile Builder.
- The [Gender Bias Scan](#) section in Job Analyzer Tool supports all the available English locales. An error message is displayed when the locale isn't supported.

## Gender Bias Detection

SAP SuccessFactors uses a combination of data analysis and natural language processing techniques to build the Gender Bias Detection algorithm. The foundation of the algorithm is sociological research, showing that certain wordings in certain contexts carry out societal biases that can, statistically, prevent people from applying to a Job (women being statistically more impacted than men).

For a more complete contextual and sociological explanation, see the Related Information section.

The building of the Gender Bias Detection algorithm follows these three high-level steps:

1. Gathering the base data. Base data is the wordings that were proven to be perceived as gender biased. This is gathered from academic research and curated by linguistic specialists.
2. Expanding the collection of potentially biased words, using Word Embedding. Word Embedding is a Machine Learning technique that can, under certain conditions, uncover semantic and conceptual associations between different words.  
For example, if **caring** is among the list of **feminine biased** words provided by the original research, word embedding could find out that **supporting** is conceptually close enough to **caring** to carry a similar feminine bias, even though it wasn't considered in the original research.
3. Validating and correcting the expanded collection of biased words by confronting it to historical recruitment data. For example, how many past job advertisements contained certain words and the actual impact on the gender of the past applicants.

All data used in building this algorithm is academic research data and public data.

### 29.7.2.3 Recommended Skills Section in Job Analyzer

The Recommended skills section of the Job Analyzer Tool allows you to identify or mark the relevant and irrelevant skills that are detected in the Job Description through machine learning technology.

▼ Recommended skills 2 

These results are generated by our machine learning technology.  
You can mark the skills you find irrelevant.

The following skills were detected in your job description: 

Retail sales  

Communication  

You might want to consider these related skills: 

Cosmetics  

Bank  

Merchandising  

Mechanics  

Animation (movies)  

Freight transport  

Fashion  

Luxury  

Merchandise  

Conflict of laws

| Related Skills  | <p>These are the hard skills that are generally associated with the Job category on the market and potential applicants might use when conducting keyword searches. This serves as a suggestion for possibly adding up additional skills in the Job Description, if relevant.</p>                                                                                                                                                                        |

### Note

The *Recommended skills* section in Job Analyzer Tool supports all the available English locales. An error message is displayed when the locale is not supported.

## 29.7.2.4 Feedback Data in Job Analyzer

User feedback can be directly gathered in the Job Analyzer to improve the performance of the Machine Learning features. Job Analyzer provides feedback options for Recommended Salary and Gender Bias Scan.

For *Recommended Salary* in *Salary Benchmark* section, you can provide feedback using **thumbs up** and **thumbs down** options to agree or disagree with the salary recommendations. Additionally, you can state whether the salary is too high or too low while using the **thumbs down** option.

In the Gender Bias Scan, you can input your own custom words to replace biased words throughout the Job Description.

This feedback data is sent to Job Analyzer and stored to be aggregated and processed, for the sole purpose of re-training and continually improving the relevance and performance of the algorithm that Job Analyzer uses. It also expands the syllabus of neutral replacement words using the community's inputs.

The tone of your job description is rather masculine.

! 1 outstanding masculine word:

✓ Masculine Word

*Biased Language found in Job Descriptions*

junior →

Overly masculine terms can deter people applying to jobs.  
Consider using a gender neutral term.

Sample Feedback Data

The only data that is sent along with feedback is the minimal set of information that is required to apply this technical re-training. Here is the description of information that is sent and information that is **not** sent while giving feedback to the Job Analyzer.

| Data Sent with Feedback                                                                                                                                                                                   | Data not Sent with Feedback                                                                                                                                                                                                      |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"><li>• Anonymized Job Title and Location of the Job Requisition.</li><li>• Job Analyzer results that led to this feedback.</li><li>• The custom word provided.</li></ul> | <ul style="list-style-type: none"><li>• Personally Identifiable Information - No PII is sent or stored back for post-processing.</li><li>• User identification information - All feedback sent are strictly anonymous.</li></ul> |

## 29.7.2.5 Machine Learning Notes

The Machine Learning results displayed in the Job Analyzer are the outcome of the SAP Machine Learning framework.

The framework articulates around the following capacities:

- Collecting data on Job Postings that are publicly available on job boards and career sites.
- Normalizing the data to store it in a unified repository, with classification algorithms.
- Enriching the Job postings data with models trained both on the SuccessFactors Recruiting Posting data, SuccessFactors Recruiting Management Job Requisition data, and on academic sources.
- The machine learning algorithms classify individual words of the job description into three classes - male biased, female biased, and neutral. The algorithms are trained on labeled dataset to make predictions. The labeled dataset contains words labeled with their gender bias (for example, 'dominant' with label 'male bias'). We build the labeled dataset from linguistic research and historic applicants ratios for past job postings. Then we process these labeled words through a word-association framework, and train a model that can infer predictions on the gender bias for any new word encountered in job descriptions.

## 29.8 Managing Reportable Custom Fields

You can configure custom fields as reportable for the Job Requisition, Job Application, and Candidate Profile recruiting templates directly in Admin Center.

### Prerequisites

You have the [Manage Reportable Custom Fields](#) permission.

## Context

You can map your custom fields as reportable in the [Manage Reportable Custom Fields](#) tool. This tool allows you to map, sync, and edit, your custom fields for reporting after you configure them in your recruiting templates.

### Note

Fields that were previously mapped in provisioning are automatically migrated to the new tool.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage Reportable Custom Fields](#) ►.
2. Select the Recruiting template you want to map fields for from the left pane.
3. Choose [Edit Fields](#).
4. Select the relevant field type.

### Note

The supported field types are Text (Text, Text Area, Rich Text, Boolean, Hyperlink, and Object), Small Text (Text, Boolean, Hyperlink, and Object), Number (Percentage, Currency), Picklist, and Date fields.

5. Select a relevant field ID from the dropdown for the fields you wish to map.
6. Choose [Save](#).
7. Select the [Sync Fields](#) button.

## Results

You have mapped and synced the custom fields to the template for reporting.

## 29.9 Configuring Reportable Custom Fields for Ad Hoc Reporting

You can configure custom reportable fields for ad hoc reporting to receive an email confirmation about the successfully synced records.

## Prerequisites

You have access to Provisioning.

## → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

## Context

When you create custom fields, especially custom picklist fields, map them as custom reportable fields. This allows them to appear in ad-hoc reporting and can also have other positive downstream effects. Without custom reportable field mapping, the display options might appear blank.

- Reporting relies on field positions in reportable custom fields remaining unchanged. For example, if you create a reportable custom field, don't change it after it has been used somewhere (for example, in the Offer Details XML file, or an ad-hoc report).
- Use the same labels for custom fields among all templates. The ad-hoc report builder uses the first label for the corresponding custom ID as the report column header. Therefore, it's required to standardize the custom fields across all offer detail templates.
- Don't configure standard fields as custom reportable.
- Don't configure the same field more than once in Custom Reportable Fields.
- You can run a validation check to ensure that there is no custom field type mismatch between the fields configured in the Application template and [Configure Reportable Custom Fields](#) in Provisioning.
- Misconfigured custom reportable fields can cause application errors.

### Note

Don't use hyphens when naming custom field-id values. Use underscores instead. This applies only to custom fields.

After you configure fields in the Recruiting XML templates, you must map and sync the fields for reporting.

## Procedure

1. Go to ► [Provisioning](#) ► [Configure Reportable Custom Fields](#) ►.
2. Enter the custom fields defined in the XML file.
3. Click [Save Extended Field Mapping](#).

### Caution

Sync data doesn't always work on the first try. Once the page refreshes upon save, refresh again before you click [Synchronize Existing Data](#). Watch for the green confirmation message at the top of the page to confirm that the sync worked correctly. In case you don't see it, try again. If you sync something, before refreshing the page, you might lose the data you entered.

4. Click [Synchronize Existing Data](#). If you have added or changed custom Candidate reporting fields, this option updates any reportable data.

→ Tip

- Changing the configuration of reportable custom fields after records have been created can cause values to report improperly in the Recruiting and V2 Secured schemas.
- There are 100 text fields, 40 number fields, 110 picklist fields, and 30 date fields available as reportable custom fields for each XML definition - Job Requisition, Application, and Candidate Profile. The number of available fields isn't configurable.

## Results

You receive an email confirmation that reports the number of records successfully synced.

## 29.10 Recruiting on the Home Page

SAP SuccessFactors Recruiting includes the following features on the home page.

### Prerequisites

Recruiting includes content on the home page if:

- For the Talent Pool quick actions:
  - [Talent Pools](#) feature enabled in ► [Admin Center](#) ► [Manage Recruiting Settings](#) ►.
  - You have View permission for MDF Object Pool.
- You can receive Recruiting notification cards in Microsoft Teams, if you've enabled the SAP SuccessFactors App for Microsoft Teams. For more information, see **Related Information**.

### ⓘ Note

- When an approver updates a field value during approval, the updated value only reflects the next to-do cards, but not in the current to-do list of that approver.
- You see the fields on the to-do cards regardless of your permissions access them.
- If the Location ENUM field is configured on a job requisition, then on the HPV4 card, the location ENUM values are not translated even after supporting translations.

| Name                                                                                                                                                            | Description                                                                                                                                                                                      | Where Shown                                                                                                                                         | When Shown                                                                                                                                                                                                                                                                                                                  | Prerequisites                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | On Mobile App? |

## 29.11 XML Field Labels

Each template with field definitions supports the declaration of a field label element; the format of the field label element can vary based on the template.

Include for every field, a field label without a language declaration, for occasions when the system is can't determine the language of the viewing user.

For every field, include one field label per language pack enabled in the instance.

Some fields ignore the field labels declared in the XML and instead are managed in Provisioning.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

Sample format for Req, Application, Event, Event Application, Candidate Profile field definition, and Offer labels:

```
<field-label mime-type="text-plain"><![CDATA[Default Field Label]]></field-label>
<field-label mime-type="text-plain" lang="en_US"><![CDATA[US English Field Label]]></field-label>
<field-label mime-type="text-plain" lang="es_ES"><![CDATA[Spain Spanish Field Label]]></field-label>
```

Sample format for Candidate Profile Background Element labels and Background Element fields, and labels for corporate data and succession data models:

```
<label>Default Label</label>
<label xml:lang="en_US">US English Field Label</label>
<label xml:lang="es_ES">Spain Spanish Field Label</label>
```

Exporting a succession data model can cause the underscores in the language pack references to be replaced by dashes.

For requisitions to store multiple translated copies of the same field content, the recruiting user populates some field types with the same content multiple times (once in English, once in French, and so on). Because candidates are only expected to enter in their information one time, in the language of their choice, and not repeat their data entry in multiple language packs, the candidate profile and application work differently. Each record only stores one copy of content, and that content appears as the field values no matter what the language pack is of the viewing user.

Application field labels, even if translated in all language packs, only appear as translated if the requisition is posted in the language pack of the viewing candidate. For example, if you enable English, French, and Spanish for your system, but only post a requisition in English and Spanish, candidates viewing your system in French don't see French labels on the application fields. Instead, they see no labels, or the default labels for the instance.

For simplified Chinese

#### Sample Code

```
<field-label lang="zh_CN"><![CDATA[Category simplified Chinese]]></field-label>
```

For the field definition tag

#### Sample Code

```
<field-definition id="filter2" type="picklist" required="true" custom="false">
  <field-label><![CDATA[Category]]></field-label>
  <field-label lang="en_US"><![CDATA[Category]]></field-label>
  <field-label lang="zh_CN"><![CDATA[Category simplified Chinese]]></field-label>
  <field-description><![CDATA[Job Category]]></field-description>
  <field-description lang="en_US"><![CDATA[Job Category]]></field-description>
  <picklist-id>category</picklist-id>
</field-definition>
```

## 29.12 Assignment ID in Recruiting

Assignment ID is an identifier assigned to a person to define the relationship between the person and a company. You can use Assignment ID to identify users and change it if needed.

### ⚠ Caution

Before you change assignment IDs, we recommend that you evaluate the risks associated with the inconsistencies. If assignment ID is not supported in the SAP SuccessFactors areas you've enabled, please don't make any changes to assignment ID at this time.

### Import Tools

The .csv data migration templates support an Assignment ID field, which can be used instead of User ID. If values for both the fields are included in the csv file, preference is given to the value provided in assignment ID field. Data migration templates with this support include:

- [Candidate Tag Assignments for Data Migration \[page 1409\]](#)
- [Candidate Tag Definitions for Data Migration \[page 1408\]](#)
- [Application Attachments for Data Migration \[page 1412\]](#)
- [Requisition Fields for Data Migration \[page 1401\]](#)

### ODaT API

The following OData APIs support access to Assignment ID information through User-type navigation.

| Updated OData API                                                                                                                 | More Information                                     |
|-----------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
| Added the navigation property <i>user</i> for <b>Candidate</b> entity.                                                            | <a href="#">Candidate and CandidateBackground_*</a>  |
| Added the navigation property <i>user</i> for <b>CandidateEmployeeReferral</b> entity.                                            | <a href="#">CandidateEmployeeReferral</a>            |
| Added the navigation property <i>user</i> for <b>CandidateLight</b> entity.                                                       | <a href="#">CandidateLight</a>                       |
| Added the navigation property <i>alumniUser</i> for <b>CandidateProfileConversionInfo</b> entity.                                 | <a href="#">CandidateProfileConversionInfo</a>       |
| Added the navigation properties <i>userNav</i> and <i>referredByNav</i> for <b>JobApplication</b> entity.                         | <a href="#">JobApplication</a>                       |
| Added the navigation properties <i>createdByNav</i> and <i>lastModifiedByNav</i> for <b>JobApplicationAssessmentOrder</b> entity. | <a href="#">JobApplicationAssessmentOrder</a>        |
| Added the navigation property <i>lastModifiedByNav</i> for <b>JobApplicationAudit</b> entity.                                     | <a href="#">JobApplicationAudit</a>                  |
| Added the navigation property <i>createdByUserNav</i> for <b>JobApplicationBackgroundCheckRequest</b> entity.                     | <a href="#">JobApplicationBackgroundCheckRequest</a> |
| Added the navigation property <i>commentatorNav</i> for <b>JobApplicationComments</b> entity.                                     | <a href="#">JobApplicationComments</a>               |

| Updated OData API                                                                                                                                                      | More Information                               |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------|
| Added the navigation property <i>submittedByNav</i> for <b>JobApplicationOnboardingData</b> entity.                                                                    | <a href="#">JobApplicationOnboardingData</a>   |
| Added the navigation properties <i>createdByNav</i> , <i>lastModifiedByNav</i> , and <i>lastModifiedProxyUserNav</i> for <b>JobApplicationStatusAuditTrail</b> entity. | <a href="#">JobApplicationStatusAuditTrail</a> |
| Added the navigation properties <i>createdByNav</i> and <i>lastModifiedByNav</i> for <b>JobOffer</b> entity.                                                           | <a href="#">JobOffer</a>                       |
| Added the navigation properties <i>createdByNav</i> and <i>lastModifiedByNav</i> for <b>JobOfferApprover</b> entity.                                                   | <a href="#">JobOfferApprover</a>               |
| Added the navigation property <i>referredByNav</i> for <b>JobReqFwdCandidates</b> entity.                                                                              | <a href="#">JobReqFwdCandidates</a>            |
| Added the navigation properties <i>lastModifiedByNav</i> and <i>lastModifiedProxyUserNav</i> for <b>JobRequisition</b> entity.                                         | <a href="#">JobRequisition</a>                 |
| Added the navigation properties <i>createdByNav</i> and <i>lastModifiedByNav</i> for <b>JobRequisitionAssessment</b> entity.                                           | <a href="#">JobRequisitionAssessment</a>       |
| Added the navigation property <i>userNav</i> for <b>JobRequisitionOperator</b> entity.                                                                                 | <a href="#">JobRequisitionOperator</a>         |
| Added the navigation properties <i>postedByNav</i> and <i>lastModifiedByNav</i> for <b>JobRequisitionPosting</b> entity.                                               | <a href="#">JobRequisitionPosting</a>          |
| Added the navigation properties <i>createdByNav</i> and <i>lastModifiedByNav</i> for <b>OfferLetter</b> entity.                                                        | <a href="#">OfferLetter</a>                    |
| Added the navigation properties <i>currUserNav</i> and <i>targetUserNav</i> for <b>RCMAdminReassignOfferApprover</b> entity.                                           | <a href="#">RCMAdminReassignOfferApprover</a>  |

## User Interface

When you hire an external candidate and then process the candidate as a new user, the system generates an Employee Profile. If you have enabled Employee Central, the system issues a unique Employee ID for the candidate when the hiring is successful and populates this [employeeID](#) on the external candidate profile. This field is available only if the standard [employeeID](#) field is configured on the candidate profile XML and is mapped to [empld](#) field in Succession Data Model.

If you haven't enabled Employee Central, the [employeeID](#) field on the external candidate profile is populated with **assignmentId** instead of **userSysID**. Note that this [employeeID](#) field was earlier populated using **userSysID**.

## 29.13 Actions to Consider When ISO Code or Label Changes for Country/Region or State/Province

When the ISO codes or labels are updated within SAP SuccessFactors, you need to ensure that the updated values are reflected on the following Recruiting pages:

| Feature                                                                                                     | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ► <a href="#">Admin Center</a> ► <a href="#">Set Up Job Board Options</a> ►                                 | <p>If you've enabled this feature and have configured a custom select, then update your custom select by adding the latest ISO codes for country/region and state/province.</p> <div><p><b>Note</b></p><p>If you've enabled this feature and have configured <a href="#">All</a> or <a href="#">None</a> options, then you don't need to update the ISO codes. ## 29.14 Translation

When a new language pack is enabled in Provisioning, many system labels are immediately translated with a standard set of translations.

### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

Typically translation projects are initiated after the client signs off on iteration 3 configuration and the client's configuration choices are stabilized. Translations should be planned as part of an overall project timeline and should have an iterative testing/configuration process planned.

SuccessFactors does not provide translation services. A translation project consists of:

1. SuccessFactors providing translation workbooks wherein all configured content is listed
2. The client or a translation service hired by the client reviews the workbooks and provides all needed translations
3. SuccessFactors configures the translations per the client's direction
4. The client tests the translations and provides feedback and change requests
5. Repeat through three iterations

Translations are managed through several different methods.

1. Provisioning Field Labels
  1. Job Requisition System Field Labels
  2. Application Field Labels
  3. Internal and External Applicant Search Settings
2. XML Field Labels
  1. Requisitions
  2. Events
  3. Candidate Profile
  4. Applications
  5. Event Application
  6. Offer Approval
  7. Corporate Data Model
  8. Succession Data Model
3. Admin Translations
  1. Applicant Status
  2. Recruiting Emails
  3. System Emails
  4. Picklists
  5. Route Maps
  6. Rating Scales
  7. Career Sites
  8. Privacy Statements
  9. Header/Footer Templates
  10. Custom Help Text
  11. Competencies
  12. Questions
4. Tier-3 Standard System Translation Overrides
  - Replacement of any system-supplied translation (max: 25 per language pack)

There is no set format for the translation workbooks or test results and change requests. Sample workbooks attached (Not all translatable content may be included in the sample workbooks.) If you're good with Excel you can put together formulae such that the client's input is used to generate your XML and you can copy and paste the final translations from Excel into your XML editor and save a final draft but this is not generally expected of consultants. The alternative method is to update the XML by hand with the translations provided in the Excel file.)

A consultant's computer may not be set up to work with all the languages enabled in a client's instance, so prior to beginning a translation project it is beneficial to experiment and ensure that the appropriate language packs are

correctly set up on the computer and in the programs on the computer used to manage the translated content. OpenOffice is advised over MS Word. UTF-8 encoding should always be used on every XML, .csv and Excel file involved in a translation project. All file uploads in SuccessFactors should be done with UTF-8 encoding selected. Failure to set up the computer, files and imports in appropriate encoding can result in mangled translation output, with weird characters, question marks, and other distortions of the translated content. This is especially true when working with double-byte characters but can also occur when working with special characters from Windows, like the Windows curly apostrophes. Clients should endeavor to use standard characters rather than Windows.

### 29.14.1 Managing Form Template Names

In all languages other than the default language of the instance the form template name can be translated and changed.

► [Admin Center](#) ► [Form Templates](#) ► [Template Name](#) ►

### 29.14.2 Managing Provisioning Field Labels

Standard fields and buttons on the requisition have standard supplied translations, but these fields are often re-purposed and renamed, and therefore the field labels need to be adjusted as well.

#### → Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Technical Support.

Although these field ids may have translations specified in the XML, those translations are not applied in the system. These field id labels and translations are managed in Provisioning. For requisitions, this includes button permissions.

► [Provisioning](#) ► [Managing Recruiting](#) ► [Application Field Labels](#) ►

## 29.14.3 Managing Job Application Field Labels

Manage the labels of standard fields in a job application so that they can be consumed in Ad-hoc reports.

### Prerequisites

You have the [Administrator Permissions](#) > [Manage Recruiting](#) > [Manage Job Application Field Labels](#) permission.

### Context

You can customize existing labels in the supported languages. These labels defined in [Manage Application Field Labels](#) are only consumed in **Ad-hoc reports**. For the application form and candidate summary page, labels defined in application template are taken into consideration. Previously, these settings were managed in Provisioning.

### Procedure

1. Go to [Admin Center](#) > [Manage Job Application Field Labels](#).
2. Select the language in which you want to edit field labels.
3. Modify your changes and choose [Save](#).
4. Choose [Cancel](#) to revert your changes.

### Results

You've modified and saved the field labels of a job application in the desired language.

## 29.14.4 Managing Job Requisition System Field Labels

Manage the names of Job Requisition field yourself instead of requesting changes through SAP Cloud Support.

### Prerequisites

You have the [Administrator Permissions](#) > [Manage Recruiting](#) > [Manage Job Requisition System Field Labels](#) permission.

## Context

You can now customize the labels for the standard fields in a Job Requisition template. The Recruiting user or a Hiring Manager sees the labels while creating or viewing the requisition record. The field labels also control what a candidate sees during a job search. Previously, creating labels for the standard fields were managed in Provisioning.

## Procedure

1. Navigate to [Admin Center](#).
2. Enter **Manage Job Requisition System Field Labels** in the [Tool Search](#).
3. Select a language to edit the field labels.
4. Update the labels and click [Save](#).
5. Click [Cancel](#) to revert your changes.

## 29.14.5 Admin Translations

Set up the translation features through [Admin Center](#).

To select both the default language as well as any additional languages, go to ► [Admin Center](#) ► [Manage Recruiting Languages](#) ►. You need to select at least one language in the [Enabled Languages](#) field to set up translations. The following table shows the various recruiting-related features that allow translation settings:

| Features         | Translatable Content                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Applicant status | <p>Translatable content includes:</p> <ul style="list-style-type: none"><li>• Internal Label</li><li>• Candidate Label</li><li>• Next Step Text</li><li>• Emails</li></ul> <p>Toggle between languages and set the appropriate field labels in each language.</p> <div><p><b>Note</b></p><p>The email template selected for a recipient in language A will need to be reselected in language B; selecting a template in one language doesn't select it in all languages. Set up Recruiting Email translations before applicant status translations to make this easier.</p></div> <p>Although status name is the value that is available in Ad Hoc Reports, this content is not presently translatable.</p> |

| Features          | Translatable Content                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Recruiting emails | <p>Translatable content includes:</p> <ul style="list-style-type: none"> <li>• Template name</li> <li>• Subject</li> <li>• Body</li> <li>• Tokens will automatically populate in the appropriate language, if a translated value for that token is available.</li> </ul> <p>Toggle between languages and set the appropriate field labels in each language.</p>                                                                                                                                                                                                                                             |
| System emails     | <p>Translatable content includes:</p> <ul style="list-style-type: none"> <li>• Subject</li> <li>• Body</li> <li>• Tokens will automatically populate in the appropriate language, if a translated value for that token is available.</li> </ul> <p>Toggle between languages and set the appropriate field labels in each language.</p>                                                                                                                                                                                                                                                                      |
| Picklists         | <p>Translatable content includes picklist values.</p> <p>All enabled languages will appear on the picklist csv file; populate the appropriate column with the appropriate language and reload the file.</p> <p>Picklist fields store the picklist options; the language of the viewing user determines which language pack value appears in the user interface.</p> <p>If the user is viewing a requisition, application, offer etc in a language pack that is not enabled in Recruiting, picklist fields are not editable because the system cannot figure out which picklist values to show the user.</p> |
| Route maps        | Refer to platform documentation for route maps and translations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Rating scales     | Refer to platform documentation for rating scales and translations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## 29.14.6 Translation Limitations

Be aware of the limitations on translation capability:

- Rating scale label as displayed in the Interview Central rating scale hover-over will display in the default language of the instance
- Text data values on Candidate Profile, Application, Offer Details, Interview Feedback Forms and any other non-Requisition object can only be entered in a single language
- Candidates who apply to a job that is not posted in the candidate's chosen language will see the field labels in the default language of the instance

## 29.15 Governance and Compliance

### 29.15.1 Candidate Search Audit

Enable Candidate Search warning and audit reporting so you can track candidate searches in Recruiting.

Go to ► [Provisioning](#) ► [Company Settings](#) ► [Enable Candidate Search OFCCP compliance warning and auditing \(for US-based job reqs\)](#) ► to enable a pop-up window that requires users to accept the number of search results before they can see matching candidates.

Users can accept the search and see results or they can refine the search criteria. This adheres to the Internet Applicant Rule: once search results are accepted, you should have a process to review and disposition all of the results.

Candidate searches are tracked and can be reported on, using ► [Ad hoc Reporting](#) ► [Candidate Search Audit](#) ►.

Reporting data shows the search criteria, number of results, the related requisition (if any — this is collected when the user launches their candidate search from the requisition.), the language of the search, whether the search was on internal or external candidates, the date of the search, who performed the search, every candidate returned in the search (so one search can produce multiple lines on the report), and the action taken as a result of the search (email or forward.)

This allows you to prove the search methodology as fair, if they are audited.

### 29.15.2 OFCCP Candidate Profile Snapshot

A snapshot (copy) of the candidate profile is taken when an application is viewed by a recruiting user (recruiter, hiring manager, etc.) for the first time.

This information is stored with the application in the More Information and Background Elements sections, and is shown whenever the application is viewed. This ensures the candidate profile information is locked and will not change in the recruiting user's view, even if the candidate edits their candidate profile during the time that the job application is being processed.

This is an important aspect of OFCCP compliance because it ensures that all recruiting users are making hiring decisions based on a consistent understanding of the candidate's data throughout the application process. This

also ensures that candidates cannot complicate any legal proceedings by changing their data to make the client seem to be practicing unfair hiring.

If the client is seeking to adhere strongly to OFCCP best practices, do not configure the `EDIT_CANDIDATE_SNAPSHOT` capability in the Application XML, since that allows the candidate profile snapshot data to be edited and changed.

## 29.15.3 EEOC Data Collection

Your organization is responsible for configuring the system to meet requirements of the U.S. Equal Employment Opportunity Commission (EEOC), where applicable.

Consult your organization's legal counsel. For more information about EEO data collection, consult the EEOC website.

Consider including the following standard fields in the job applications for data collection:

- Field ID `ethnicity` can be used so applicants can specify their ethnic identification, such as whether or not they identify as Hispanic or Latino. This field is defined as a picklist, so you can specify the values you wish to provide in the dropdown menu.
- Field ID `race` can be used so that applicants can specify their racial identification. This field is defined as a picklist, so you can specify the values you wish to provide in the dropdown menu.
- Field ID `gender` can be used so that applicants can specify their gender identification. Although gender is defined as a picklist, it appears as radio buttons and doesn't respect any picklist value changes (that is, you can't add options to this field.) Since it's not possible to add a "do not wish to disclose" option, leave this field unrequired so that applicants may choose to leave the field set as "Not Selected."

Some organizations— such as those who are federal contractors— may also wish to include the following standard fields for data collection:

- Field ID `veteranStatus` can be used so that applicants can specify their veteran status. This field is defined as a picklist, so you can specify the values you wish to provide in the dropdown menu.
- Field ID `disabilityStatus` can be used so that applicants can specify their disability status. This field is defined as a picklist, so you can specify the values you wish to provide in the dropdown menu.

## 29.15.4 OFCCP Reporting

SF also provides a pre-built file-ready OFCCP report that can be set up in a client's instance upon request (requires the client to be using the correct fields in their configuration).

See the Standard Reports Guide.

## 10. OFCCP "Applicant Flow" Report

A report is required to be submitted annually to the Federal Government by organizations under OFCCP guidelines. The format and content is defined by the OFCCP and as such this report is intended only to provide information to assist with populating the form.

### OFCCP "Applicant Flow" Report

## OFCCP Applicant Flow Report

## 29.15.5 VETS100 Reporting

SuccessFactors also provides a pre-built file-ready VETS100 report that can be set up in a client's instance upon request (requires the client to be using the correct fields in their configuration).

See the Standard Reports Guide.

## 8. Veterans Report

The Veterans report will produce information that supports the creation of the VETS100 report. There are 4 Vets-100 statuses. Of these, there are only 3 of the 4 total veteran's statuses that should be collected from an applicant. Newly Separated Veteran / Other Protected Veteran / Veteran of the Vietnam Era. The HRIS system should be the system of record of all hire information, and as such should be the system of record for Special Disabled Veteran. Currently the SF recruiting system only captures 1 of these statuses in a standard field: Veteran of the Vietnam Era. Therefore this is the only field included in the standard report until such a time as the other fields are available.

### Veterans Report

| Department / Division / Location |                    |                       | Veteran of the Vietnam Era | Not Veteran of the Vietnam Era | Not specified | Grand Total |
|----------------------------------|--------------------|-----------------------|----------------------------|--------------------------------|---------------|-------------|
| Sales                            | ACE Enterprises    | Boston, MA            | 0                          | 6                              | 1             | 7           |
|                                  |                    | ACE Enterprises Total | 0                          | 6                              | 1             | 7           |

### VETS100 Report

## 29.15.6 Accessibility

SAP SuccessFactors is committed to delivering software that is available for everybody, including and especially people with disabilities.

Although our applications include many accessibility features, you may need to provide client-side, third-party assistive technologies, such as the JAWS screen reader, to be used in conjunction with SAP SuccessFactors applications.

Refer to *Accessibility in SAP SuccessFactors* for more details.

## 29.16 Deep Links in Recruiting

You can provide links directly into specific areas of Recruiting Management. These URLs are known as deep links, and are absolute rather than relative, meaning they are always the same.

| Description          | Linked Feature                                    | Deep Link                                   |

## 29.17 Setting Up and Using External Password Policy

You can specify a different set of rules for the password strength on passwords set up by external candidates and agency users than the rules applied to internal candidates.

### Prerequisites

- Ensure that you've enabled [Manage External Password Policy](#) permission in [Admin Center](#).

### Context

Use the [Manage External Password Policy](#) page to set the password and login policy for external candidates and agencies. You can also reactivate external candidate account and external agency account from the same page.

#### → Remember

If SAP Customer Data Cloud is enabled in your instance, the password policy settings are not applicable for external candidates. These settings and policies are only applicable to Agencies. For more information, refer to **Important Notes for Console User** in the **Related Information** section.

## Procedure

1. Go to ► [Admin Center](#) ► [Manage External Password Policy](#) ►.
2. Enter values in the [Password and Login Policy Settings: Applied to External Candidates and Agencies](#) page.

### Note

- If SAP Customer Data Cloud is enabled in your instance, then the page title that is displayed will be replaced to [Password and Login Policy Settings: Applied to Agencies. All settings and updates made in this page will only be applicable to agencies](#). For more information, refer to **Important Notes for Console User** in the **Related Information** section.
- If Identity Authentication Services (IAS) is also enabled for agency users, then agency users will need to manage password and policy settings for their users in the IAS console.

3. Choose [Set Password and Login Policy](#).

## Results

The rules specified are made visible to candidates on the account creation screen if the candidate hovers over the Password Policy link. The candidate can see a bar next to their password field indicating their password strength and the point where their password becomes acceptable.

|-------------------------------------------------------------------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Password Reset Email                                              | Your email ID     | Locked-out candidates and agency users are prompted to send an email request to this address to have their accounts reactivated. Accounts can be reactivated from the candidate profile by any user who has permission to view that candidate, or by using the <a href="#">Reactivate External Candidate Account</a> section. Locked-out agency users can be reactivated by using the <a href="#">Reactivate External Agency Account</a> section. If the configured email address of a candidate does not appear on the user interface to unblock or reset their password, the candidate can unblock themselves by selecting the Forget Password option. |
| Case Sensitive (recommended)                                      | Selected          | For the external candidate, the primaryEmail field value must be used to look up the candidate. Causes the password to distinguish between capitalized and noncapitalized letters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Mixed Case required                                               | Selected          | Requires a password that includes at least one uppercase letter and one lowercase letter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Non-alpha characters required                                     | Selected          | Requires a password that includes at least one character other than a letter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Set Welcome Password and Reset Password link expiration (in days) | 1                 | Specifies the number of days after which the link is sent to the email account of the user for creating or resetting the password expire.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

#### Note

The duration of link expiration for the [Set Welcome Password and Reset Password link expiration \(in days\)](#) option is set to 1 day by default.

#### Note

- If SAP Customer Cloud is enabled in your instance, then the page title that is displayed will be replaced to *Password and Login Policy Settings: Applied to Agencies. All settings and updates made in this page will only be applicable to agencies.* For more information, refer to **Important Notes for Console User** in the **Related Information** section.
- If Identity Authentication Services (IAS) is also enabled for agency users, then agency users will need to manage password and policy settings for their users in the IAS console.

## 29.18 Qualtrics Survey Integrations with SAP SuccessFactors Recruiting

### 29.18.1 Qualtrics Email Feedback for Application Status Updates

Configure SAP SuccessFactors Recruiting and Intelligent Services to send employee information to Qualtrics, so that you can send surveys in email to candidates find out how they feel about the job application process they just went through.

Creating this integration requires:

- SAP SuccessFactors Recruiting
- A Qualtrics account that includes a Candidate Experience license.
- Enabling Intelligent Services.
- Enabling Integrated Gateway Services.

You use your Qualtrics account to create surveys and view their results. All the settings to configure the contents and schedule for the email survey are performed in Qualtrics.

To add Qualtrics feedback opportunities, enable and integrate Qualtrics with your SAP SuccessFactors system. Refer to *Integrating SAP SuccessFactors with Qualtrics* for details.

## Related Information

### 29.18.2 Qualtrics Feedback for Job Applicants

Creating a Qualtrics integration for Recruiting will add a feedback opportunity on the job application confirmation page that appears after a candidate successfully submits a job application.

You need to have a career site using Career Site Builder.

You can create these integrations both for internal as well as external applicants, which means you can ask different questions for these two groups.

Qualtrics surveys allow you to gain feedback about a candidate's job application experience, and allows you to ask questions such as:

- How would you rate the application process?
- How would you rate your level of job experience?
- Was this section easy to use?
- Did you encounter any issues with the application process?

To add Qualtrics feedback opportunities, enable and integrate Qualtrics with your SAP SuccessFactors system. Refer to *Integrating SAP SuccessFactors with Qualtrics* for details.

#### ⓘ Note

You can improve your candidate's experience by using the purpose-build, preconfigured Candidate Experience program from Qualtrics, which provides a robust set of capabilities specific to your recruiting-related campaigns.

Existing recruiting-related in-app surveys you created using Employee Experience will continue to work. If you purchase a license for the Candidate Experience program, you'd then retire your existing SAP SuccessFactors Recruiting surveys and create new ones in the Candidate Experience.

### 29.18.3 Qualtrics Feedback Tabs in Career Site Pages

You can add JavaScript code in Career Site Builder to add a Qualtrics feedback tab to all your career site pages, or to a specific career site page.

This feature allows you to add a small *Feedback* tab on a career site page. The location where you insert the JavaScript code depends on whether you want to add it for all your career site pages, or to just a specific page.

To add Qualtrics feedback opportunities, enable and integrate Qualtrics with your SAP SuccessFactors system. Refer to *Integrating SAP SuccessFactors with Qualtrics* for details.

#### ⓘ Note

You can improve your candidate's experience by using the purpose-build, preconfigured Candidate Experience program from Qualtrics, which provides a robust set of capabilities specific to your recruiting-related campaigns.

Existing recruiting-related in-app surveys you created using Employee Experience will continue to work. If you purchase a license for the Candidate Experience program, you'd then retire your existing SAP SuccessFactors Recruiting surveys and create new ones in the Candidate Experience.
